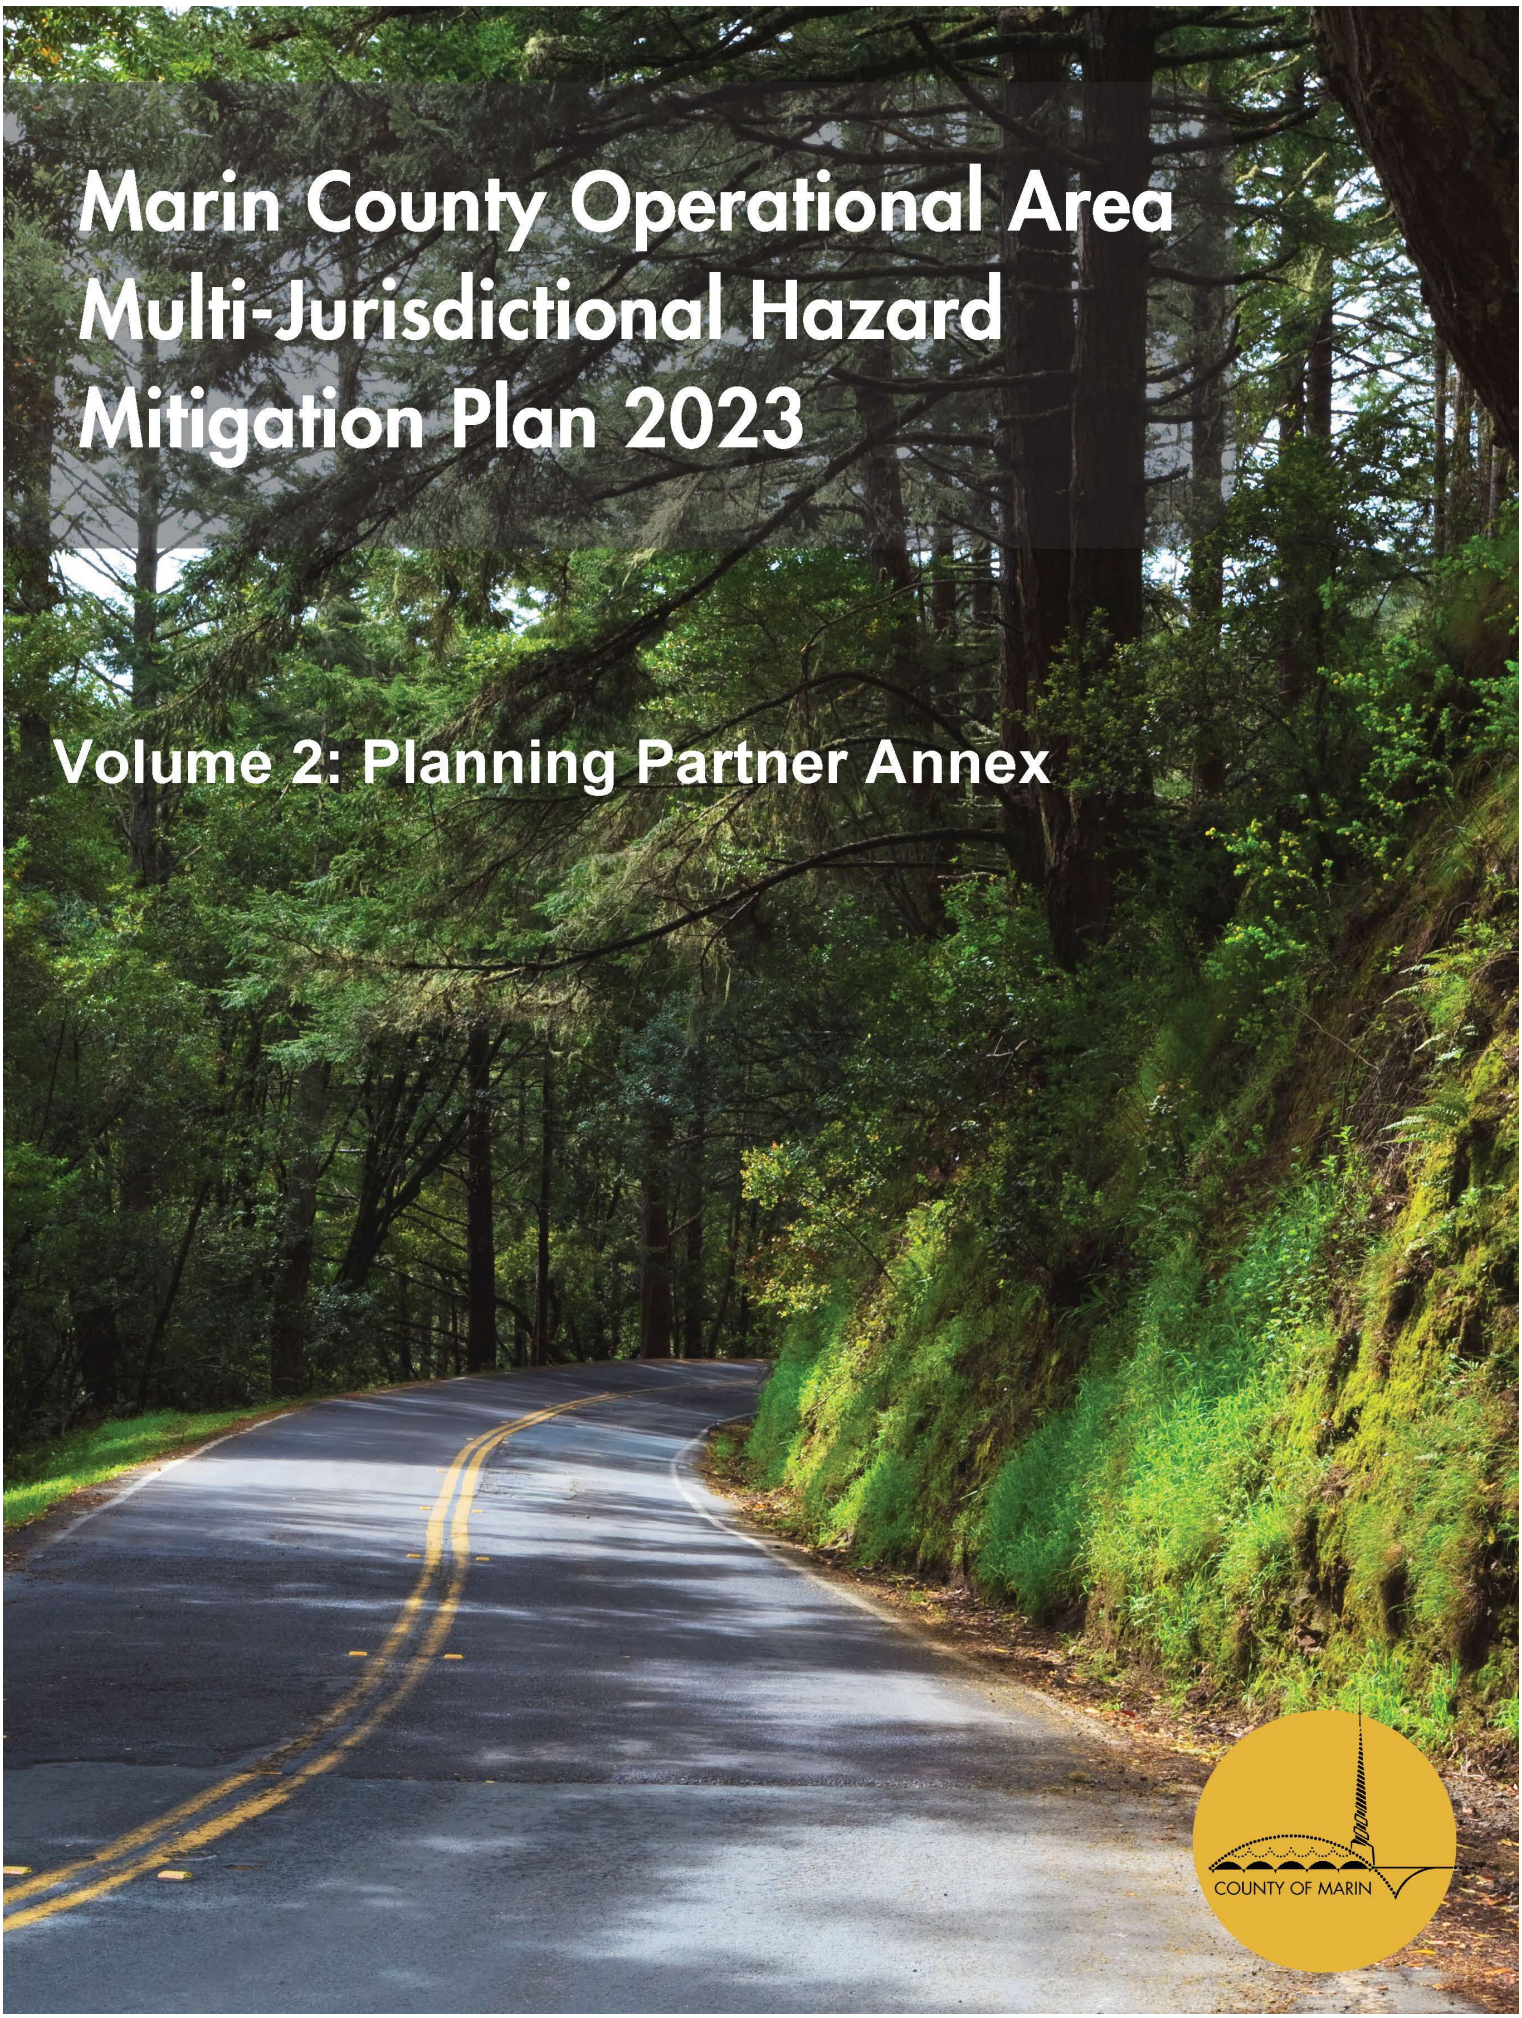
Marin County Operational Area Multi-Jurisdictional Hazard Mitigation Plan 2023

Volume 2: Planning Partner Annex



Cover Photo: The image provided by the Marin County Office of Emergency Management, illustrates the precarious balance of mitigating potential wildfire fuels to ensure a safe evacuation corridor while preserving the exquisite natural beauty unique to Marin County.

ACKNOWLEDGEMENTS

The Marin County Office of Emergency Management and Preparative Consulting would like to thank those collaborators and planning partners who participated in the planning and development of this Volume 2: Planning Partner Annex to the Marin County Operational Area Multi-Jurisdictional Hazard Mitigation Plan.

The official Marin County Operational Area Hazard Mitigation Steering Committee provided the oversight and dedication to this project that was required and without their commitment, this project would not be possible.

As with any working plan, this document represents planning strategies and guidance as understood as of the date of this plan's release. This plan identifies natural hazards and risks and identifies the hazard mitigation strategy to reduce vulnerability and make the planning partner jurisdictions and special districts of the Marin County Operational Area more disaster resistant and sustainable.

INTRODUCTION

The Federal Emergency Management Agency (FEMA) encourages multi-jurisdictional planning for hazard mitigation. All participating jurisdictions must meet the requirements of Chapter 44 of the Code of Federal Regulations (44 CFR):

"Multi-jurisdictional plans (e.g. watershed plans) may be accepted, as appropriate, as long as each jurisdiction has participated in the process and has officially adopted the plan." (Section 201.6(a)(4)).

For the 2023 Marin County Operational Area Multi-Jurisdictional Hazard Mitigation Plan Update, a unified effort between the planning partners was formed to leverage resources and to meet requirements of the federal Disaster Mitigation Act for as many eligible local governments and special districts as possible. The Disaster Mitigation Act defines a local government as follows:

"Any county, municipality, city, town, township, public authority, school district, special district, intrastate district, council of governments (regardless of whether the council of governments is incorporated as a nonprofit corporation under State law), regional or interstate government entity, or agency or instrumentality of a local government; any Indian tribe or authorized tribal organization, or Alaska Native village or organization; and any rural community, unincorporated town or village, or other public entity."

Two types of planning partners participated in this process for the 2023 Marin County Operational Area Multi-Jurisdictional Hazard Mitigation Plan Update, with distinct needs and capabilities:

- Incorporated municipalities
- Special districts

Each participating planning partner prepared a jurisdictional or district profile which are contained in this volume.

THE PLANNING PARTNERSHIP

Initial Solicitation and Letters of Intent

A planning team made up of Marin County OEM and consultant staff solicited the participation of all eligible municipalities and special districts at the outset of this project. A kickoff meeting was held on October 26, 2022, to identify potential stakeholders and planning partners for this process. The purpose of the meeting was to introduce the planning process to jurisdictions and districts in the County that could have a stake in the outcome of the planning effort.

All eligible local governments in the planning area were invited to attend. The goals of the meeting were as follows:

- Provide an overview of the Disaster Mitigation Act.
- Review the 2023 Marin County Operational Area Multi-Jurisdictional Hazard Mitigation Plan Update and planning partnership
- Outline the work plan for this hazard mitigation plan.
- Describe the benefits of multi-jurisdictional planning.

- Outline planning partner expectations.
- Solicit planning partners.
- Solicit volunteers/recommendations for the steering committee.

Local governments wishing to join the planning effort were asked to provide the planning team with a "letter of intent to participate" that agreed to the planning partner expectations (see Appendix A) and designated a point of contact for their jurisdiction. In all, the planning team received formal commitment from 13 planning partners in addition to the County. A map showing the location of participating special purpose districts is provided at the end of this introduction. Maps showing risk assessment results for participating cities are provided in the individual annexes for each city. Risk assessment maps for all planning areas countywide are provided in Volume 1 of this hazard mitigation plan.

Planning Partner Expectations

The planning team developed the following list of planning partner expectations, which were provided and discussed at the kickoff meeting:

- Complete a "letter of intent to participate."
- Designate a lead point of contact for this effort.
- Support and participate in the selection and function of the Steering Committee.
- Provide support required to implement the public involvement strategy.
- Participate in the process through opportunities such as:
  - Steering Committee meetings
  - Public meetings or Town Hall Meetings
  - Workshops and planning partner specific training sessions
  - Public review and comment periods prior to adoption.
- Complete the tasks required to develop the jurisdictional or district profiles and Annex.
- Perform a "consistency review" of all technical studies, plans and ordinances specific to hazards.
- Review the risk assessment and identify hazards and vulnerabilities specific to the jurisdiction or district.
- Review and determine if the mitigation recommendations chosen in Volume 1 will meet the needs of the jurisdiction.
- Create hazard mitigation actions that identifies each project or program, who will oversee the task, how it will be financed, and when it is estimated to occur.
- Formally adopt the hazard mitigation plan.

By adopting this plan, each planning partner also agrees to the plan implementation and maintenance protocol established in Volume 1. Failure to meet these criteria may result in a partner being dropped from the partnership by the Steering Committee, and thus losing eligibility under the scope of this plan.

SECTION 1.0: INTRODUCTION

1.1 INTRODUCTION

The City of Belvedere, Community Profile has been prepared in conjunction with the Marin County Multi-Jurisdictional Hazard Mitigation Plan (MJHMP), establishing an inter-jurisdictional process for the development and implementation of effective hazard mitigation strategies in association with identified hazards that pose real or potential threats to the City of Belvedere.

1.2 PLANNING PROCESS

The majority of Marin County is unincorporated sparsely populated rural and protected lands. Most of the 262,000 county population is consolidated into the Eastern portion of the county. The Marin County MJHMP Steering Committee and broader Planning Team approached the development of the Marin County MJHMP and the associated jurisdictional and district profiles from a coordinated and collaborative planning and public engagement unity of effort.

The Marin County and City of Belvedere Steering Committee felt a unified effort, led by the County Office of Emergency Management (OEM), would be the most effective approach for this planning process. This approach allowed the small participating jurisdictions and districts with limited staffing and resources to take advantage of the combined efforts of the County, the City of Belvedere and the other participating planning areas to reach a broader segment of each of their own populations and do so in a way to ensure greater equity and inclusion of the public in this planning process. Extensive and coordinated public outreach was done involving the City of Belvedere and all participating jurisdictions and districts with an eye towards equity, inclusion, openness, accessibility, and ensuring they meet the population where they live, work, or recreate to provide the public convenience of access and ease of participation in this planning process.

Marin County is very different from most California Counties in that the populated portion of the County where the participating jurisdictions and district's planning areas are located has the same climate, similar topography, and are exposed to many of the same hazards. Only three jurisdictions, Larkspur, Ross, and San Anselmo, are not coastal jurisdictions and are not impacted by Tsunami or Sea Level Rise.

This unity of effort approach allowed the Marin County and City of Belvedere Steering Committee to establish a more robust Planning Team representing local Belvedere, countywide, regional, state, and federal stakeholders servicing the Marin County and City of Belvedere planning area. These stakeholders were in a unique position to provide informed and specific information and recommendations on hazard mitigation goals and actions, as well as population needs and social vulnerability for each of the jurisdictional and district planning areas. This united effort allowed the planning team to attend fewer meetings than they would have been required to attend if they were required to attend separate meetings for each participating jurisdiction and district. The reduced number of meetings allowed the planning team the opportunity and time to provide more detailed and thoughtful contributions to the planning effort.

In addition to providing representation on the coordinated Marin County and City of Belvedere Multi-Jurisdictional Hazard Mitigation Plan Steering Committee, the City of Belvedere involved additional internal planning team members to support the broader planning process. The City of Belvedere jurisdictional representatives for the coordinated Marin County Multi-Jurisdictional

Hazard Mitigation Plans Steering Committee and the Planning Team Members are represented below.

1.2.1 Steering Committee Members (Jurisdictional Representatives)

Primary Point of Contact
Robert Zadnik, City Manager
Telephone: 415-435-8906
E-mail: rzadnik@cityofbelvedere.org

Alternate Point of Contact
Laurie Nilsen, Emergency Svs, Coord.
Telephone: 415-789-2805
E-mail: lnilsen@tiburonpd.org

This annex was developed by the primary point of contact with assistance from the members of the local mitigation planning team listed in Table 1 and Table 2.

Belvedere	Samie Malakiman	Associate Planner	415-435-8931	smalakiman@cityofbelvedere.org

Table 1: Local Hazard Mitigation Planning Team Members

This 2023 Marin County Operational Area (OA) MJHMP is a comprehensive update of the 2018 Marin County OA MJHMP. The planning area and participating jurisdictions and organizations were defined to consist of unincorporated Marin County, five special districts, and the eleven incorporated jurisdictions to include the City of Belvedere. All participating jurisdictions are within the geographical boundary of Marin County and have jurisdictional authority within this planning area.

The Marin County and City of Belvedere Steering Committee led the planning process based on the contribution and input from the whole community stakeholders who identified the community's concerns, values, and priorities. The Steering Committee met and reviewed the mitigation recommendations and strategies identified within this plan. Each participating local jurisdiction established a mechanism for the development and implementation of jurisdictional mitigation projects, as identified within this plan and associated locally specific supporting documents. As deemed necessary and appropriate, participating jurisdictions will organize local mitigation groups to facilitate and administer internal activities.

The Marin County and City of Belvedere Steering Committee assisted with the planning process in the following ways:

- Attending and participating in the Steering Committee meetings.
- Identification of potential mitigation actions.
- Updating the status of mitigation actions from the 2018 Marin County OA MJHMP.
- Collecting and providing other requested data (as available).
- Making decisions on plan process and content.
- Reviewing and providing comments on plan drafts; including annexes.

- Informing the public, local officials, and other interested stakeholders about the planning process and providing opportunity for them to be involved and provide comment.
- Coordinating, and participating in the public input process.
- Coordinating the formal adoption of the plan by the governing boards.

1.2.2 Steering Committee Planning Process

The Marin County and City of Belvedere Steering Committee met monthly to develop the plan. Email notifications were sent out to each Steering Committee member to solicit their participation in the Steering Committee meetings. The meetings were conducted using a Zoom platform videoconferencing. Meeting attendees signed in using the chat feature to record their attendance.

The Marin County and City of Belvedere Steering Committee agreed to make and pass plan-based general policy recommendations by a vote of a simple majority of those members present. The Steering Committee will also seek input on future hazard mitigation programs and strategies from the mitigation planning team by focusing on the following:

- Identify new hazard mitigation strategies to be pursued on a state and regional basis, and review the progress and implementation of those programs already identified.
- Review the progress of the Hazard Mitigation program and bring forth community input on new strategies.
- Coordinate with and support the efforts of the Marin County OEM to promote and identify resources and grant money for implementation of recommended hazard mitigation Strategies within local jurisdictions and participating public agencies.

During the planning process, the Marin County and City of Belvedere Steering Committee communicated through videoconferencing, face-to-face meetings, email, telephone conversations, and through the County and City websites. The County and City website included information for all stakeholders on the MJHMP update process. Hannah Tarling of the Marin County Office of Emergency Management and Preparative Consulting established a Microsoft 365 SharePoint folder which allowed the Steering Committee members and Marin OEM and Preparative Consulting to share planning documents and provide a format for the planning partners to submit completed documents and access other planning related documents and forms. Draft documents were also posted on this platform and the Marin County OES website so that the Steering Committee members and the public could easily access and review them.

1.2.3 Coordination with Stakeholders and Agencies

Opportunities for involvement in the planning process must be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other private and nonprofit interests (44 CFR, Section 201.6(b)(2)).

Early in the planning process, the Marin County and City of Belvedere Steering Committee reached out to the following Local and Regional Agencies involved in hazard mitigation activities to invite them to participate in this planning process as a member of the Planning Team. These individuals work with Marin County and the City of Belvedere communities and could provide subject matter expertise and relevant information to the planning process

regarding the community history, hazard risk, vulnerability, and impact, mitigations efforts, community needs, demographics, and social vulnerability, economic concerns, ecology, and other community services and needs.

The Marin County and City of Belvedere Steering also determined that data collection, risk assessment analyses, mitigation strategy development, and plan approval would be greatly enhanced by inviting other local, state and federal agencies and organizations to participate in the process. Based on their involvement in hazard mitigation planning, their landowner status in the County, the City of Belvedere and/or their interest as a neighboring jurisdiction, representatives from the following groups were invited to participate on the Planning Team:

Eighty-five planning partners participated in this update, as listed in Table 2.

Table 2: 2023 MJHMP Planning Team Members

Several opportunities were provided for the groups listed above to participate in the City of Belvedere's planning process. At the beginning of the planning process, invitations were extended to these groups to actively participate on the Planning Team. Participants from these groups assisted in the process by attending several videoconferencing meetings where hazard vulnerability and risk were discussed along with hazard mitigation strategies and actions. Planning Team members provided data and other applicable information directly as requested in meetings, emails, telephone calls, videoconferencing, worksheets, or through data contained

on their websites or as maintained by their offices. This information was used to develop hazard vulnerability and risk profiles along with mitigation actions.

These key agencies, organizations, and advisory groups received meeting announcements, agendas, and minutes by e-mail throughout the plan update process. They supported the effort by attending meetings or providing feedback on issues. All the agencies were provided with an opportunity to comment on this plan update and were provided with a copy of the plan to review and offer edits and revisions. They were also provided access to the Marin County OEM hazard mitigation plan website to review all planning documents and hazard mapping tools.

Each was sent an e-mail message informing them that draft portions of the plan were available for review. In addition, the complete draft plan was sent to the California Governor's Office of Emergency Services (Cal OES) and FEMA Region IX for a pre-adoption review to ensure program compliance.

In addition, through the public meetings conducted at the beginning of the planning process, members of the planning team, the public, and other key stakeholders were invited to participate in the planning process through public outreach activities.

Further as part of the public outreach process, all planning areas engaged in public outreach and education by providing information on their City of Belvedere website or though press releases directing the public to the main Marin County OEM website that provided coordinated and detailed public information of the planning process and how the public could participate. All planning areas were invited to attend the public meetings and to review and comment on the plan prior to submittal to Cal OES and FEMA. Additional public outreach action is detailed in the 1.2.4 PUBLIC ENGAGEMENT section of this annex.

The following planning meetings were held with the planning team:

Table 3: City of Belvedere & Marin County MJHMP Planning Meetings

1.2.4 PUBLIC ENGAGEMENT

Early discussions with the Marin County OEM established the initial plan for public engagement to ensure a meaningful and inclusive public process with a focus on equity and accessible to the whole community. The Public Outreach efforts mirrored the Planning Team approach with a unified effort, led by the County OEM and the City of Belvedere, involving all participating jurisdictions and districts. Public outreach for this plan update began at the beginning of the plan development process with a detailed press release from Marin County and the City of Belvedere informing the community of the purpose of the hazard mitigation planning process for the Marin County OA planning area and to invite the public to participate in the process.

Public involvement activities for this plan update were conducted by Marin County, the City of Belvedere, and all participating jurisdictions and districts and included press releases; website postings; a community survey; stakeholder and public meetings; and the collection of public and stakeholder comments on the draft plan which was posted on the Marin County and City of Belvedere website. Information provided to the public included an overview of the mitigation status and successes resulting from implementation of the 2018 plan as well as information on the processes, new risk assessment data, and proposed mitigation strategies for the plan update.

Equity and Whole Community Approach

The Marin County OEM and the Marin County and City of Belvedere Steering Committee prioritized equity and engagement of the whole community in the development of the Marin County OA MJHMP by establishing a framework with key actions for each step of the planning process. Elements of the equity approach included:

Engaging hard-to-reach populations

This effort was to ensure the greatest equity and access to the public to enable participation in the process. The Marin County OEM outreach strategy is to “meet people where they are.” The Town Hall meetings were conducted at different familiar locations within the county where people could easily access them and were conducted on both a weekday and weekend, and in the evening and during the daytime. The meetings were offered in-person with a virtual

broadcast using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. After the meeting, Marin County OEM uploaded the recorded meeting to their website to allow the public on demand access to the meeting.

Translation and Interpretation Services

The survey and outreach materials were provided in both English and Spanish to improve accessibility among populations with limited English proficiency. The website uses Google Translate for accessibility in multiple languages. Interpretation services were offered for both town hall meetings. Each town hall meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

Three stakeholder and public meetings were held, two at the beginning of the plan development process and one prior to finalizing the updated plan. Where appropriate, stakeholder and public comments and recommendations were incorporated into the final plan, including the sections that address mitigation goals and strategies. Specifically, public comments were obtained during the plan development process and prior to plan finalization.

All press releases and website postings are on file with the Marin County OEM. Public meetings were advertised in a variety of ways to maximize outreach efforts to both targeted groups and to the public at large. Advertisement mechanisms for these meetings and for involvement in the overall MJHMP development process include:

- Development and publishing of an MJHMP public outreach article
- Providing press releases to local newspapers and radio stations
- Posting meeting announcements on the local County MJHMP website
- Email to established email lists
- Personal phone calls

The public outreach activities were conducted with participation from and on behalf of all jurisdictions participating in this plan.

The Marin County and City of Belvedere Steering Committee has made the commitment to periodically bring this plan before the public through public meetings and community posting so that citizens may make input as strategies and implementation actions change. Public meetings will continue to be held twice a year after the first and third MJHMP meetings. Public meetings will continue to be stand-alone meetings but may also follow a council meeting or other official government meeting. The public will continue to be invited to public meetings via social media messaging, newspaper invitations, and through the website for each jurisdiction participating in the plan. Each jurisdiction is responsible for assuring that their citizenry is informed when deemed appropriate by the Steering Committee.

WEBSITE

At the beginning of the plan update process, Marin County OEM established a hazard mitigation website https://emergency.marincounty.org/pages/lhmp on behalf of all the planning areas to ensure consistent messaging and information, to keep the public posted on plan development milestones, and to solicit relevant input. The website also provided information on signing up for Alert Marin, provided detailed information about the hazard mitigation process and plan

development, provided a URL and QR code link to the survey in both English and Spanish, and provided information about upcoming town hall meetings. (See Figure 1)

The site's address was publicized in all press releases, surveys and public town hall meetings. Each planning partner also established a link on their own agency website. Information on the plan development process, the Steering Committee, a link to the Hazard Mitigation survey, and drafts of the plan were made available to the public on the site. Marin County intends to keep a website active after the plan's completion to keep the public informed about successful mitigation projects and future plan updates.

Figure 1: Marin County OEM MJHMP Website

PUBLIC MEETINGS

Two separate Marin County MJHMP Public Town Hall Meeting were conducted at different locations within the County, on different days of the week and during different times of the day. This effort was to ensure the greatest equity and access by the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." Each Town Hall Meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

The first Town Hall Meeting was conducted on Thursday, April 13, 2023, from 6:00 pm to 7:30 pm, at the Marin County Board of Supervisors Chambers, Marin County Civic Center, 3501 Civic Center Drive, Room #330 San Rafael, CA 94903. The in-person meeting was also broadcast virtually using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. Each of the jurisdictions participating in the MJHMP released a Press Release on their respective websites announcing the Public Town Hall Meeting and providing the date, time, and URL link to the Zoom Meeting for the public to log in and attend the Zoom Meeting. Marin County OEM also posted a notice for the Public Town Hall Meeting

on their Facebook account. At the conclusion of the presentation, a question and answer session was held to answer questions from the attendees.

The second Town Hall Meeting was conducted on Saturday, April 29, 2023, from 10:00 am to 11:30 am, at the Marin County Health and Wellness Center, 3240 Kerner Ave. Rooms #109 and #110 San Rafael, CA. 94903. The meeting followed the same format as the first and hosted the same access level of equity and accessibility.

The Marin County MJHMP Public Town Hall Meeting was recorded and downloaded from Zoom and made available to all of the jurisdictions and districts to place on their websites and local Access TV for the public to view.

Meeting participants were also invited to complete the Hazard Mitigation Survey and were provide the URL link to the Survey Monkey website to complete the survey.

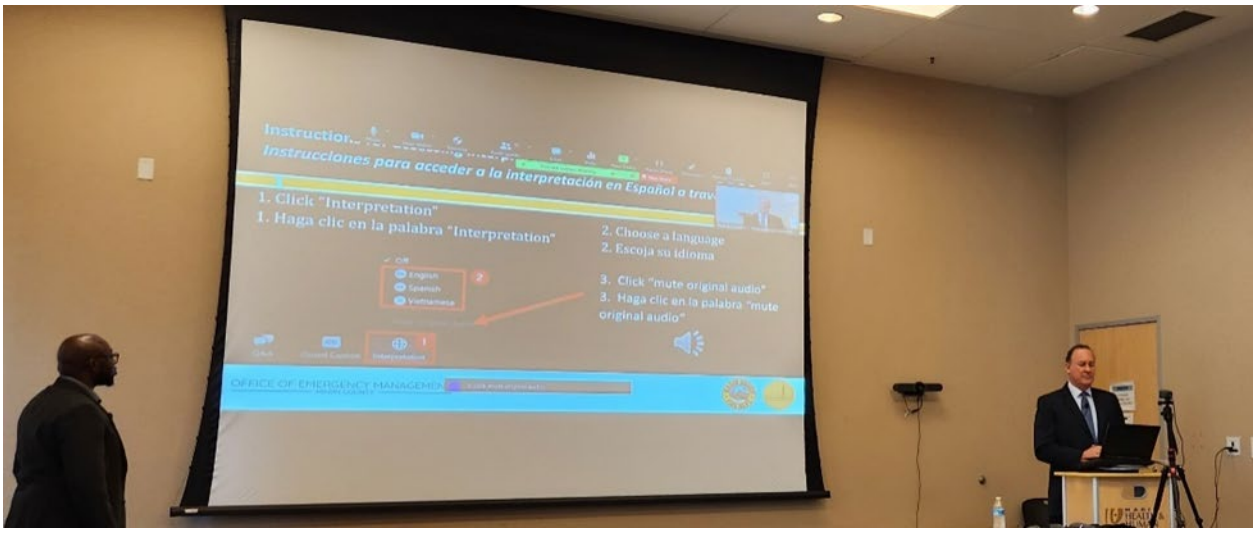

Figure 2: Marin County OEM MJHMP Public Town Hall Meeting

SOCIAL MEDIA

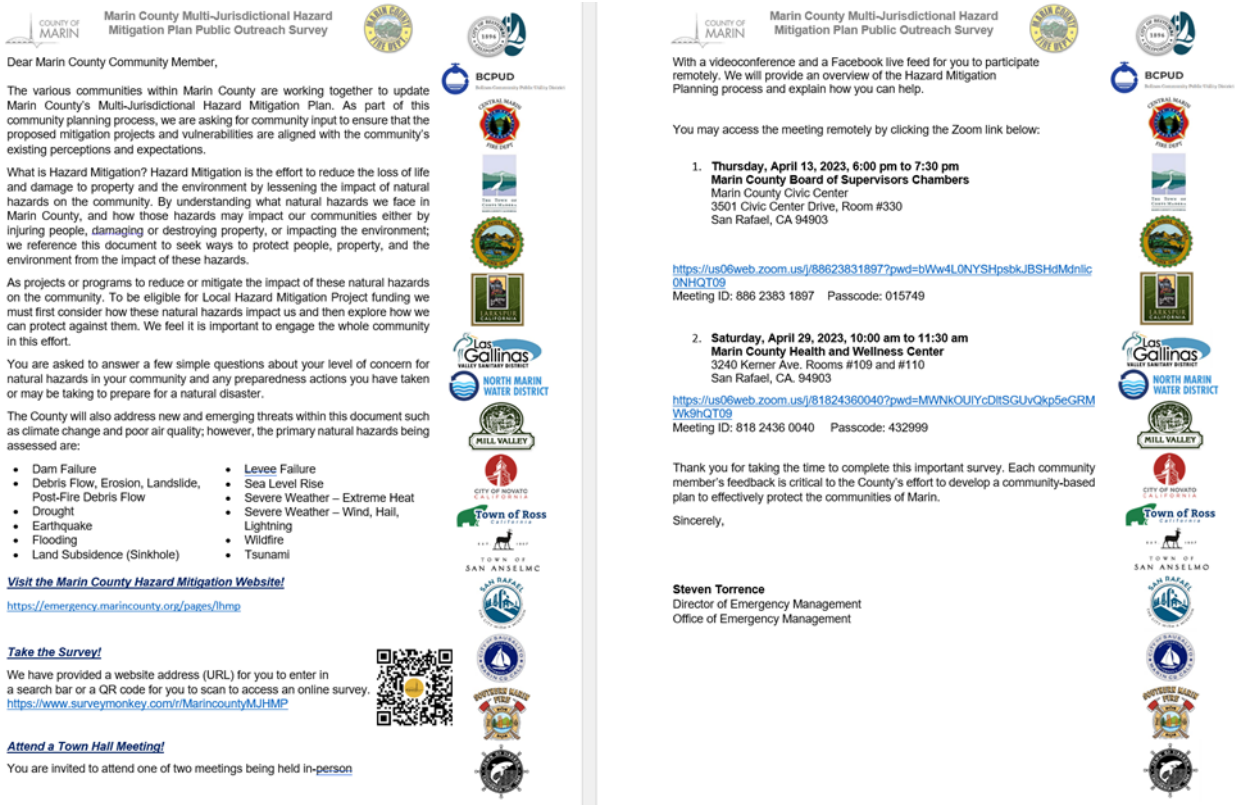
Marin County and its participating jurisdictions utilized several forms of social media to reach residents and customers. Information about the Hazard Mitigation Planning process was communicated to the public via Facebook, Twitter, and local access TV. Residents and customers were invited to complete the Hazard Mitigation Plan survey which was accessible via an attached URL or QR Code and provide feedback on potential hazard mitigation projects or programs.

The results of the survey were provided to each of the planning partners and used to support the jurisdictional annex process. Each planning partner was able to use the survey results to help identify actions as follows:

- Gauge the public's perception of risk and identify what citizens are concerned about.
- Identify the best ways to communicate with the public.
- Determine the level of public support for different mitigation strategies.
- Understand the public's willingness to invest in hazard mitigation.

PRESS RELEASES

Press releases were distributed over the course of the plan's development as key milestones were achieved and prior to each Marin County MJHMP Public Town Hall Meeting. All press releases were made available to the community in both English and Spanish.



Marin County Multi-Jurisdictional Hazard Mitigation Plan Public Outreach Survey

Dear Marin County Community Member,

The various communities within Marin County are working together to update Marin County's Multi-Jurisdictional Hazard Mitigation Plan. As part of this community planning process, we are asking for community input to ensure that the proposed mitigation projects and vulnerabilities are aligned with the community's existing perceptions and expectations.

What is Hazard Mitigation? Hazard Mitigation is the effort to reduce the loss of life and damage to property and the environment by lessening the impact of natural hazards on the community. By understanding what natural hazards we face in Marin County, and how those hazards may impact our communities either by injuring people, damaging or destroying property, or impacting the environment; we reference this document to seek ways to protect people, property, and the environment from the impact of these hazards.

As projects or programs to reduce or mitigate the impact of these natural hazards on the community. To be eligible for Local Hazard Mitigation Project funding we must first consider how these natural hazards impact us and then explore how we can protect against them. We feel it is important to engage the whole community in this effort.

You are asked to answer a few simple questions about your level of concern for natural hazards in your community and any preparedness actions you have taken or may be taking to prepare for a natural disaster.

The County will also address new and emerging threats within this document such as climate change and poor air quality; however, the primary natural hazards being assessed are:

- Dam Failure
- Debris Flow, Erosion, Landslide, Post-Fire Debris Flow
- Drought
- Earthquake
- Flooding
- Land Subsidence (Sinkhole)
- Levee Failure
- Sea Level Rise
- Severe Weather – Extreme Heat
- Severe Weather – Wind, Hail, Lightning
- Wildfire
- Tsunami

Visit the Marin County Hazard Mitigation Website!

https://emergency.marincounty.org/pages/lhmp

Take the Survey!

We have provided a website address (URL) for you to enter in a search bar or a QR code for you to scan to access an online survey. https://www.surveymonkey.com/r/MarincountyMJHMP

Attend a Town Hall Meeting!

You are invited to attend one of two meetings being held in-person

Marin County Multi-Jurisdictional Hazard Mitigation Plan Public Outreach Survey

With a videoconference and a Facebook live feed for you to participate remotely. We will provide an overview of the Hazard Mitigation Planning process and explain how you can help.

You may access the meeting remotely by clicking the Zoom link below:

1. **Thursday, April 13, 2023, 6:00 pm to 7:30 pm**
   Marin County Board of Supervisors Chambers
   Marin County Civic Center
   3501 Civic Center Drive, Room #330
   San Rafael, CA 94903

Meeting ID: 886 2383 1897 Passcode: 015749

2. **Saturday, April 29, 2023, 10:00 am to 11:30 am**
   Marin County Health and Wellness Center
   3240 Kerner Ave. Rooms #109 and #110
   San Rafael, CA. 94903

https://us06web.zoom.us/j/81824360040?pwd=MWNkOUlYcDltSGUvQkp5eGRMWk9hQT09
Meeting ID: 818 2436 0040 Passcode: 432999

Thank you for taking the time to complete this important survey. Each community member's feedback is critical to the County's effort to develop a community-based plan to effectively protect the communities of Marin.

Sincerely,

Steven Torrence
Director of Emergency Management
Office of Emergency Management

Figure 3: Hazard Mitigation Plan Public Outreach Press Release

SURVEY

A hazard mitigation plan survey (see Figure 4) was developed by the Steering Committee and made available to the public in both English and Spanish. The survey was used to gauge household preparedness for natural hazards and the level of knowledge of tools and techniques that assist in reducing risk and loss from natural hazards. This survey was designed to help identify areas vulnerable to one or more natural hazards. The answers to its ten questions helped guide the Steering Committee in defining our hazards, and selecting goals, objectives, and mitigation strategies. The survey was available on the hazard mitigation plan website, advertised in press releases, and at town hall meetings. Finally, the survey and the process of public input was advertised throughout the course of the planning process. The survey was available to the public on March 13, 2023, and closed on June 12, 2023. At the conclusion of the planning process 293 surveys were completed by the public.

Public Comments Considered by the Planning Team

The Planning Team used the following information gathered from the Public Outreach Survey to inform decisions regarding hazard mitigation strategies, actions, and priorities.

- Climate Change, Wildfire, and Drought were the top hazards of concern for the public.

- Text messages, mail, and the County website were the preferred methods for receiving hazard mitigation information.
- 48% of respondents expressed that they were “Very Much” concerned and 31% were “Moderately” concerned that a natural disaster could impact their home or place of residence.
- 85% of respondents own their own home.
- 99% of respondents have access to the internet.

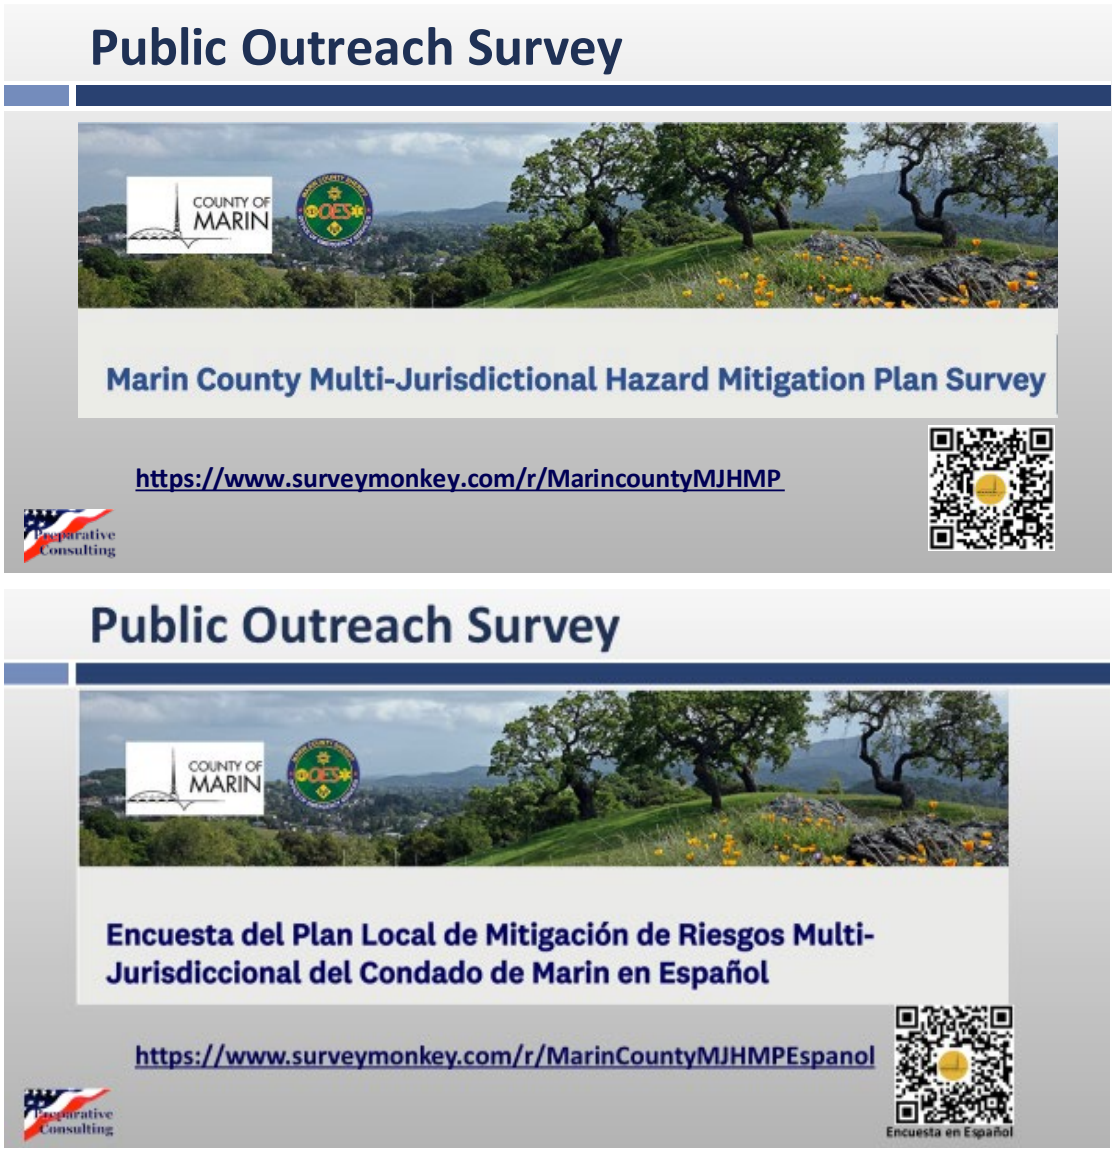

Figure 4: Hazard Mitigation Plan Survey

PUBLIC COMMENT ON THE PLAN

To solicit public feedback on the draft plan, Marin OEM engaged in a multi-faceted approach intended to reach as many Marin residents as possible, including members of the community who are under-served and under-represented. All members of the community had the opportunity to provide initial comments on the plan during a two-week period from Wednesday, December 4, 2023, to Wednesday, December 18, 2023. Although the initial comment period was listed as two weeks, the public could submit comments indefinitely via the County's website to support the County's continuous improvement efforts. The base plan, as well as city, town and special district annexes, were available for download on emergency.marincounty.org (include photos). The website additionally asked for feedback in a survey in English and Spanish (include photos), the survey was designed to establish where that person lives or works, their top hazards of concern, elicit feedback on the plan and offer a place for them to share projects to reduce risk in their community. The survey collected responses from the community in English and in Spanish.

The website and survey were shared through traditional and social media (photos) The Marin Independent Journal (Marin IJ) used the press release to write an article (hopefully; include photos). Social media accounts were updated four times with an initial ask, two reminders, and a closing announcement. The Marin OEM Public Information Officer coordinated with the Marin County Public Information Officers (MAPIO) working group to distribute information to partner jurisdictions (city, town, and special districts) to share this information on their social media sites and with the communities in the area.

To reach those who may not be engaged digitally, the planning team worked with Marin County Community Response Teams, (CRTs are a collaboration of non-profit organizations supporting underrepresented communities in four zones) to conduct outreach with half-sheet flyers in English and Spanish to share in the 4 CRT zones (southern Marin, north Marin, west Marin, San Rafael). These half sheets were also shared county-wide at libraries, including in areas not covered by CRTs, like at the Fairfax library. CRTs are designed to reach Marin's traditionally underserved and underrepresented communities, so by conducting outreach through this method, we were able to inform residents who may not have been engaged otherwise, including residents in Marin City, West Marin, and the Canal District of San Rafael.

After December 18, 2023, the various participating jurisdiction and district profiles remained on the Marin County OEM website for public comments. The City of Belvedere had an additional 14-day comment period for the City of Belvedere Community Profile where their profile was posted on the City website for final public comment from January 29 – February 5, 2024.

The 14-day public comment period gave the public an opportunity to comment on the draft plan update prior to the plan's submittal to Cal OES. Comments received on the draft plan are available upon request. All comments were reviewed by the planning team and incorporated into the draft plan as appropriate.

Public Comments Considered by the Planning Team

The Marin County OEM posted the draft Hazard Mitigation Plan and hazard mitigation actions on their website and solicited public comments on the content. The City of Belvedere distributed press releases directing the community to the Marin County OEM website to review the draft plans. The Planning Team gathered public comments and information on the

Marin County OEM website regarding proposed and current Hazard Mitigation Actions. The Planning Team used the comments and suggestions to inform decisions regarding hazard mitigation strategies, actions, and priorities. Most comments included ideas for hazard mitigation projects and comments on the effectiveness of current mitigation projects. These comments were used to revise the proposed hazard mitigation actions which resulted in the final list of hazard mitigation actions listed in 3.5 Hazard Mitigation Actions.

1.3 Overview and History

Approximately seven miles north of San Francisco and at the tip of the Tiburon Peninsula, Belvedere is flanked by the Richardson Bay to the west and north, Belvedere Cove and Raccoon Straits to the south, and the Town of Tiburon to the east. In addition to being surrounded by water, Belvedere also has an interior lagoon and two land "bridges" that connect the largest portion of the City to the rest of the Tiburon Peninsula. Regional access to the Tiburon Peninsula is provided by U.S Highway 101 (U.S. 101), a major north-south freeway linking Marin County with Sonoma County (north) and San Francisco (south). There are two main gateways into the City of Belvedere: San Rafael Avenue at Tiburon Boulevard and Beach Road at Tiburon Boulevard. Bus service to the Tiburon Peninsula is provided by Golden Gate Transit, which is operated by the Golden Gate Bridge, Highway, and Transportation District. Just outside of the Planning Area, the ferry terminal in Tiburon provides Marin residents with ferry access to San Francisco. Two nearby creeks, Arroyo Corte Madera del Presidio and Corte Madera Creek, empty into the Richardson and San Francisco bays.

Home to approximately 2,100 residents, the City of Belvedere is the smallest jurisdiction in Marin County. The City encompasses just 2.2 square miles, of which 1.75 square miles is water. This leaves only 0.45 square miles (287 acres) of developable land. Belvedere can be represented by four distinct districts. Belvedere Island has the largest land area and is the most varied in terms of topography and landforms. Belvedere Lagoon forms a second, flatter portion of the City that surrounds the interior waterway. West Shore Road borders Richardson Bay and is a third characteristically different area, with Bayfront homes along the western edge of Belvedere Island. A final area is located on Corinthian Island facing Belvedere Cove, where the island's residents share borders with the Town of Tiburon.

Belvedere is predominantly a residential community, with well over 90 percent of its land area either in residential use or zoned residential. Nearly all employment needs, and most residential service needs, are met outside Belvedere. Commercial uses within the City consist only of the portion of the Boardwalk Shopping Center area that lies within the City boundary and the office spaces found along Beach Road near the San Francisco Yacht Club. Overall, residential uses account for 231.4 acres, commercial uses occupy 25.2 acres, utilities and institutional uses occupy 5.7 acres, while parks and open spaces occupy 15.1 acres. Vacant land accounts for 9.8 acres. Utilities, roads, and right-of-way uses compose 59.3 acres of the City.

1.4 GOVERNMENT

The City of Belvedere is governed by a five-person City Council. The City Council elects one of its members to serve as Mayor, the executive head of the City; and appoints a City Manager, the administrative head of the city. The city consists of 7 departments: the Climate and Environment, City Clerk and Elections, Finance, Human Resources, Planning and Building, Police, and Public Works.

The City Council assumes responsibility for the adoption of this plan; and the City Manager will oversee its implementation.

The City of Belvedere contracts with Tiburon Fire Protection District for both ambulatory and fire services. Tiburon Fire Protection District is a combination department with 21 career safety employees, one clerical and one finance officer, 13 volunteer firefighters, and 6 trainee firefighters. Protecting the City of Belvedere and the city of Belvedere, California and the surrounding area, the Fire District's boundaries represent a diverse community with responsibility for commercial, residential, wildland/urban interface, and parts of the San Francisco Bay to Angel Island State Park. The Tiburon Fire Protection District was established in April 1941 and remained an all-volunteer fire department until December 1959. In 1981 the Tiburon Fire District contracted with the City of Belvedere, providing emergency medical and fire related services to the City.

The Belvedere Police Department was founded in 1897. following the City's incorporation by 1896. The Police Department has seven sworn officers and has a collaborative relationship with the Tiburon Police Department. The Tiburon Police Station also houses the Emergency Operations Center, which is equipped to manage disaster response for Tiburon and Belvedere. The Police Department and Emergency Operations Center are also responsible for developing and maintaining the Emergency Operations Plan for the entire Tiburon Peninsula.

1.5 WEATHER AND CLIMATE

The City of Belvedere lies approximately 62 feet (19 meters) above sea level. In Belvedere, the summers are long, comfortable, arid, and mostly clear and the winters are short, cold, wet, and partly cloudy. Over the course of the year, the temperature typically varies from 48°F to 73.1°F and is rarely below 43°F or above 62.3°F. The difference in precipitation between the driest month and the wettest month is 8 inches. The annual rainfall is 42 inches. The month of highest relative humidity is February (80%). The month with the lowest relative humidity is June (69%). The month which sees the most rainfall is January. The driest month of the year is July.

	January	February	March	April	May	June	July	August	September	October	November	December
Avg. Temperature °C (°F)	9.4 °C (48.9) °F	10.2 °C (50.3) °F	11.3 °C (52.4) °F	12.3 °C (54.1) °F	14 °C (57.2) °F	15.9 °C (60.7) °F	16.3 °C (61.3) °F	16.7 °C (62) °F	16.8 °C (62.3) °F	15.3 °C (59.6) °F	12.2 °C (53.9) °F	9.6 °C (49.4) °F

1.6 DEMOGRAPHICS

The California Department of Finance shows an overall estimated decrease in the population of Marin County and the City of Belvedere since the last plan update in 2018. Of the total estimated 257,135 residents of Marin County in 2022 based on the 2020 U.S. Census Survey, 190,148 residents live in the incorporated county and 66,987 residents live in the unincorporated county.

The City of Belvedere had an estimated population of 9,542 in the 2018 plan. 2020 U.S. Census Survey estimated the City's population at 9,146. However, revised estimates for 2022 estimated the population to decrease to 8,956 population.

Table 4: City of Belvedere Estimated Jurisdictional Population

Jurisdiction	Population 2022 (Estimate)	Population 2020	Population 2018 (Estimate)	Percent Change 2018-2022
Marin County	257,135	262,321	262,179	-1.92%
City of Belvedere	2,080	2,126	2,102	-1.04%

1.7 Social Vulnerability and Risk

The California Governor's Office of Emergency Services (Cal OES) has initiated the "Prepare California" grant program focused on building community resilience amongst vulnerable individuals living in the areas of the state most susceptible to natural disasters. The Prepare California Initiative is aimed at reducing long-term risks from natural disasters by investing in local capacity building and mitigation projects designed to protect communities.

Prepare California leverages funds approved in Governor Gavin Newsom's 2021-22 State Budget and is designed to unlock federal matching funds for community mitigation projects that vulnerable communities would otherwise be unable to access. This program is intended for communities that are the most socially vulnerable and at the highest risk for future natural hazard events. The state identified communities by prioritizing California census tracts according to their estimated hazard exposures and social vulnerability.

The National Risk Index is a dataset and online tool to help illustrate the United States communities most at risk for 18 natural hazards: Avalanche, Coastal Flooding, Cold Wave, Drought, Earthquake, Hail, Heat Wave, Hurricane, Ice Storm, Landslide, Lightning, Riverine Flooding, Strong Wind, Tornado, Tsunami, Volcanic Activity, Wildfire, and Winter Weather.

For purposes of this plan the following National Risk Index (NRI) hazards are profiled in support of eight of the twelve Marin County OA MJHMP Hazards. NRI data was not available for Dam Failure, Land Subsidence, Levee Failure, or Sea Level Rise.

Table 8: NRI Hazards and Marin County MJHMP Hazards	
NRI Hazards	Marin County MJHMP Hazards
Earthquake	Earthquake
Riverine Flooding	Flooding
Coastal Flooding	Flooding
Wildfire	Wildfire
Landslide	Debris Flow
Drought	Drought
Heat Wave	Severe Weather -Extreme Heat
Tsunami	Tsunami
Strong Wind	Severe Weather – Wind, Tornado

Table 8: NRI Hazards and Marin County MJHMP Hazards
Source: FEMA National Risk Index 2023

The National Risk Index leverages available source data for Expected Annual Loss due to these 18 hazard types, Social Vulnerability, and Community Resilience to develop a baseline relative risk measurement for each United States county and Census tract. These measurements are calculated using average past conditions, but they cannot be used to predict future outcomes for a community. The National Risk Index is intended to fill gaps in available data and analyses to better inform federal, state, local, tribal, and territorial decision makers as they develop risk reduction strategies.

Calculating the Risk Index

Risk Index scores are calculated using an equation that combines scores for Expected Annual Loss due to natural hazards, Social Vulnerability and Community Resilience:

Risk Index = Expected Annual Loss × Social Vulnerability ÷ Community Resilience

Hazard Type Risk Index

Hazard type Risk Index scores are calculated using data for only a single hazard type, and reflect a community's Expected Annual Loss value, community risk factors, and the adjustment factor used to calculate the risk value. Table 9 illustrates the NRI Hazard Type Risk Index for Belvedere Census Tract 1230.00.

Table 9: NRI Hazard Type Risk Index for Belvedere Census Tract 1230.00

Hazard Type	EAL Value	Social Vulnerability	Community Resilience	CRF	Risk Value	Score
Riverine Flooding	$744,354	Very Low	Very High	0.64	$474,190	96.3

Table 9: NRI Hazard Type Risk Index for Belvedere Census Tract 1230.00
Source: FEMA National Risk Index 2023

Figure 10 illustrates the Social Vulnerability Map for Belvedere Census Tract 1230.00.

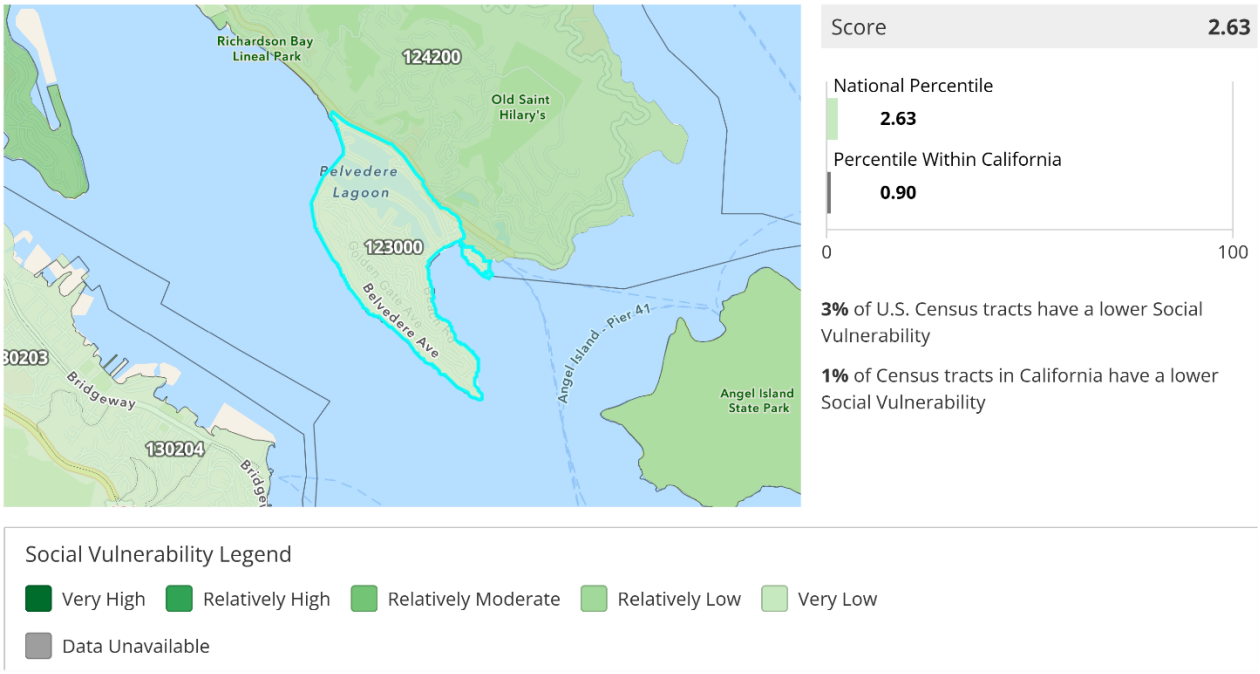

Figure 10: City of Belvedere Social Vulnerability Map Census Tract 1230.00
Source: FEMA National Risk Index 2023

Most socially vulnerable residents in Marin County reside in parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and the unincorporated areas of Marin City and Santa Venetia. This aligns with what the County knows about Marin residents. However, discrepancy lies in the western, more rural area of the county. West Marin is comprised of seven villages, and other populated areas, that are distanced from the centralized resources in the eastern part of the county. At three local elementary school in West Marin (2022-2023 school year), students eligible for free and reduced lunch program are, 62%, 41%, and 52%, a reflection of the financial capacity of local families. West Marin is home to many farms that may employ and house underrecognized workers that may not have taken part in a census survey, what the SVI is calculated from. In the fourth quarter of FY 2021/22 the bus routes traveling to West Marin (Rural Routes) were the only service category to have increased in ridership since pre-COVID (increase 0.1%; Marin Transit, 2022) showing the reliance of West Marin residents on public transportation; however, this data continues to adjust based upon the increase in alternate methods of mass transportation. Considering this, the County of Marin acknowledges that unique social factors in West Marin require different approaches than other parts of the County.

Looking to the community resilience index (CRI) results, the data is only calculated at the county-level and compared across the nation. As a whole, Marin County is considered to have a "very high" ability to prepare for anticipated natural hazards, adapt to changing conditions, and withstand and recover rapidly from disruptions when compared to the rest of the U.S. Unfortunately, this metric does not give us the distinct experiences of the diverse communities across Marin.

When the Estimated Annual Loss Index, Social Vulnerability Index, and Community Resilience Index are aggregated as one, final results of the National Risk Index show Marin County as a

whole to have “Relatively High” risk, this is due to the financial implications a disaster may have on the county. When broken out by census tract, five tracts are in the highest category (“Very High Risk”), this matches generally with the same tracts that are ranked in as higher social vulnerability; parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and unincorporated areas of Santa Venetia.

The median income for a household in the City of Belvedere was $192,292 and the per capita income for the City was $119,477. Approximately 0 percent of families and 1.3 percent of the population were below the poverty line (2010 data, U.S. Census Bureau).This poverty line is lower than other communities within Marin County. The two census tracts reflect both a Relatively Low and Very Low Social Vulnerability Index in the City.

The median income for a household in the City of Belvedere was $246,500 and the per capita income for the City was $153,697. Approximately 4.4 percent of families and 5.8 percent of the population were below the poverty line (2020 data, U.S. Census Bureau). However, the census tract reflects a Very Low Social Vulnerability Index in the City.

1.8 Economy and Tax Base

Table 10 shows income by household in The City of Belvedere as of 2021.

Table 10: Household Income for The City of Belvedere as of 2021

Household Income	Number	Percent
Total Households	900	-
Less than $10,000	42	4.7
$10,000 to $14,999	10	1.1
$15,000 to $24,999	43	4.8
$25,000 to $34,999	18	2.0
$35,000 to $49,999	24	2.7
$50,000 to $74,999	43	4.8
$75,000 to $99,999	61	6.8
$100,000 to $149,999	85	9.4
$150,000 to $199,999	62	6.9
$200,000 or more	512	56.9
Median household income (dollars)	$246,500	
Mean household income (dollars)	$389,540

1.10 HISTORICAL PROPERTIES

The City of Belvedere has one registered historically significant homes, public buildings, or landmarks. To inventory these resources, the Marin County OA MJHMP Planning Team collected information from a number of sources:

- California Department of Parks and Recreation Office of Historic Preservation (OHP) OHP is responsible for the administration of federally and state mandated historic preservation programs to further the identification, evaluation, registration, and protection of California's irreplaceable archaeological and historical resources. OHP administers the National Register of Historic Places, the California Register of Historical Resources, California Historical Landmarks, and the California Points of Historical Interest programs.
- City of Belvedere Chamber of Commerce.
- City of Belvedere website.

As defined by the National Environmental Policy Act (NEPA), any property over 50 years of age is considered a potential historic resource and is potentially eligible for the National or California Register. Thus, in the event that the property is to be altered, or has been altered, as the result of a major federal action, the property must be evaluated under the guidelines set forth by NEPA. Structural mitigation projects are considered alterations for the purpose of this regulation. Similar regulations exist for buildings under the California Environmental Quality Act (CEQA)

Table 13: Historic Sites in Belvedere

Name/Landmark State Plaque Number	National Register (NR)	State Landmark	California Register	Date Listed (NR)	Jurisdiction

SECTION 2.0: HAZARD IDENTIFICATION AND RISK ASSESSMENT

The City of Belvedere identified hazards that affect the city and developed natural hazard profiles based upon the countywide risk assessment, past events and their impacts. Figure 12 shows the top hazards that the Jurisdiction is at risk from according to the hazard mitigation Steering Committee.

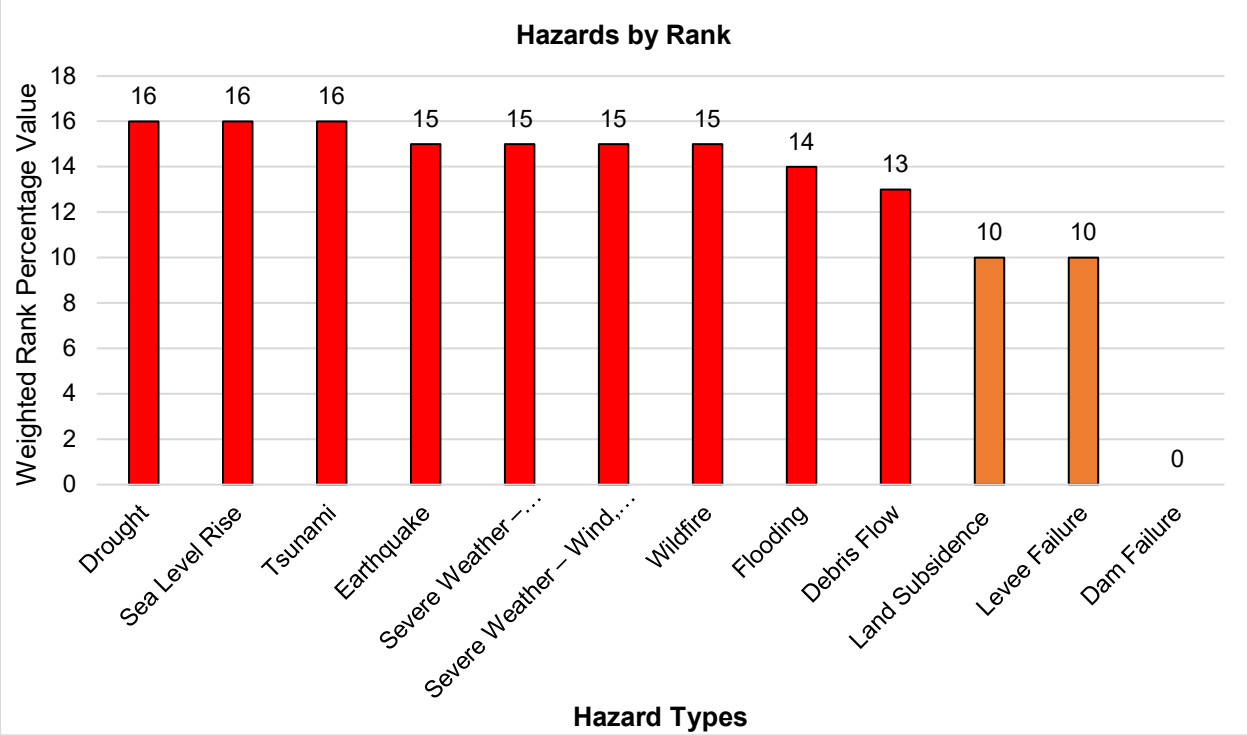

Figure 12: City of Belvedere Risk Assessment – Planning Team Top Hazards

Figure 13: Risk Rank Categorization	
Risk Level	**Risk Numerical Score**
High Risk	**12 - 16**
Serious Risk	**8 - 11**
Moderate Risk	**4 - 7**
Low Risk	**1 - 3**

Figure 13: Hazard Risk Categorization

Each Marin County MJHMP participating jurisdiction and organization reviewed and approved the Top Hazards identified by the Planning Team. Each participating jurisdiction and district then completed a more complex assessment tool to further develop their hazard assessment and prioritization.

The planning process used the available FEMA tools to evaluate all the possible threats faced. The primary tool selected was the Hazard Assessment and Prioritization Tool. This matrix allowed the participating jurisdiction or organization to assess their own level of vulnerability and mitigation capability. Each participating Jurisdiction and organization assessed the top hazards for:

- Probability/ Likelihood of Future Events
- Geographic Extent
- Magnitude/ Severity
- Climate Change Influence
- Significance

Probability/ Likelihood of Future Events

- **Unlikely:** Occurs in intervals greater than 100 years - Less than 1% probability of occurrence in the next year or a recurrence interval greater than 100 years.
- **Occasional:** Occurring every 11 to 100 years - 1-10% probability of occurrence in the next year or a recurrence interval of 11 to 100 years.
- **Likely:** Occurring every 1 to 10 years - 10-90% probability of occurrence in the next year or recurrence interval of 1 to 10 years.
- **Highly Likely:** Occurring almost every year - 90-100% probability of occurrence in the next year or a recurrence interval of less than 1 year.

Geographic Extent

- **Negligible:** Less than 10% of the planning area
- **Limited:** 10-25% of the planning area
- **Significant:** 25-75% of planning area
- **Extensive:** 75-100% of planning area

Magnitude/ Severity

- **Weak:** Limited classification on scientific scale, slow speed of onset or short duration of event, resulting in little to no damage.
- **Moderate:** Moderate classification on scientific scale, moderate speed of onset or moderate duration of event, resulting in some damage and loss of services for days.
- **Severe:** Severe classification on scientific scale, fast speed of onset or long duration of event, resulting in devastating damage and loss of services for weeks or months.
- **Extreme:** Extreme classification on scientific scale, immediate onset or extended duration of event, resulting in catastrophic damage and uninhabitable conditions.

Table 14: Select Hazards Magnitude and Severity Scale					
Hazard	**Scale/Index**	**Weak**	**Moderate**	**Severe**	**Extreme**
Drought	Palmer Drought Severity Index	+1.99 to -1.99	-2.00 to -2.99	-3.00 to -3.99	-4.00 and below
Earthquake	Modified Mercalli	I to IV	V to VII	VIII	IX to XII
	Richter Magnitude	2,3	4,5	6	7,8
Tornado	Fujita Tornado Damage Scale	FO	F1, F2	F3	F4, F5

Table 14: Select Hazards Magnitude/ Severity Scale or Index

Climate Change Influence

- **Low:** Minimal potential impact

- **Medium:** Moderate potential impact
- **High:** Widespread potential impact

Significance

- **Low:** Minimal potential impact - Two or more criteria fall in lower classifications, or the event has a minimal impact on the planning area. This rating is sometimes used for hazards with a minimal or unknown record of occurrences or for hazards with minimal mitigation potential.
- **Medium:** Moderate potential impact - The criteria fall mostly in the middle ranges of classifications and the event's impacts on the planning area are noticeable but not devastating. This rating is sometimes used for hazards with a high extent rating but very low probability rating.
- **High:** Widespread potential impact - The criteria consistently fall in the high classifications and the event is likely/highly likely to occur with.

2.1 CLIMATE CHANGE

The County of Marin and associated jurisdictions profiled jointly recognize that the earth's climate is forcibly being augmented due to humans' reliance on fossil fuels and non-natural resources which pose negative impacts on the earth's climate. Reliance on fossil fuels and non-natural products results in the climate shifting to include unseasonable temperatures, more frequent and intense storms, prolonged heat and cold events, and a greater reliance on technological advancements to maintain the wellbeing of community members and balance of the environment. The forced adaptation to climatic shifts is necessary for the County and jurisdictions to understand and include with these assessments.

Locally to Marin, drought and rain events have already had devastating impacts to critical infrastructure, agriculture, and water resources; and globally, unseasonable temperatures have been identified as the cause for enhanced wildfires, severe droughts, ice sheets and glaciers disappearing, and persons emigrating from their countries due to a lack of sustainable, local resources. Melting land ice contributes additional water to the oceans and as ocean temperatures rise the water expands, both of which contribute to increase rates of sea level rise. Marin is bordered on the west by the Pacific Ocean and on the east by San Francisco Bay, making it particularly vulnerable to flooding and erosion caused by sea level rise.

The cause of current climate change is largely human activity, burning fossil fuels, natural gas, oil, and coal. Burning these materials releases greenhouse gases into Earth's atmosphere. Greenhouse gases trap heat from the sun's rays inside the atmosphere causing Earth's average temperature to rise. This rise in the planet's temperature was formerly called, "global warming", but climate change has shown to include both intense heat and cold shifts. The warming of the planet impacts local and regional climates. Throughout Earth's history, climate has continually changed; however, when occurring naturally, this is a slower process that has taken place over hundreds and thousands of years. The human influenced climate change that is happening now is occurring at an abnormally faster rate with devastating results.

GLOBAL OBSERVED AND PROJECTED IMPACTS AND RISKS
Source: Intergovernmental Panel on Climate Change, Headline Statements from the Summary for Policymakers, 2022

- Human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability.
- Global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans.
- Beyond 2040 and depending on the level of global warming, climate change will lead to numerous risks to natural and human systems.
- The magnitude and rate of climate change and associated risks depend strongly on near-term mitigation and adaptation actions, and projected adverse impacts and related losses and damages escalate with every increment of global warming.
- Multiple climate hazards will occur simultaneously, and multiple climatic and non-climatic risks will interact, resulting in compounding overall risk and risks cascading across sectors and regions.

FUTURE TRENDS/ IMPACTS
Source: Study Confirms Climate Models are Getting Future Warming Projections Right – Climate Change: Vital Signs of the Planet (nasa.gov)

Global Warming

- If global warming transiently exceeds 1.5°C in the coming decades or later, then many human and natural systems will face additional severe risks.
- An estimated 60% of today's methane emissions are the result of human activities. The largest sources of methane are agriculture, fossil fuels, and decomposition of landfill waste.
- The concentration of methane in the atmosphere has more than doubled over the past 200 years. Scientists estimate that this increase is responsible for 20 to 30% of climate warming since the Industrial Revolution (which began in 1750).
- According to the most recent National Climate Assessment, droughts in the Southwest and heat waves (periods of abnormally hot weather lasting days to weeks) are projected to become more intense, and cold waves less intense and less frequent.
- The last eight years have been the hottest years on record for the globe.

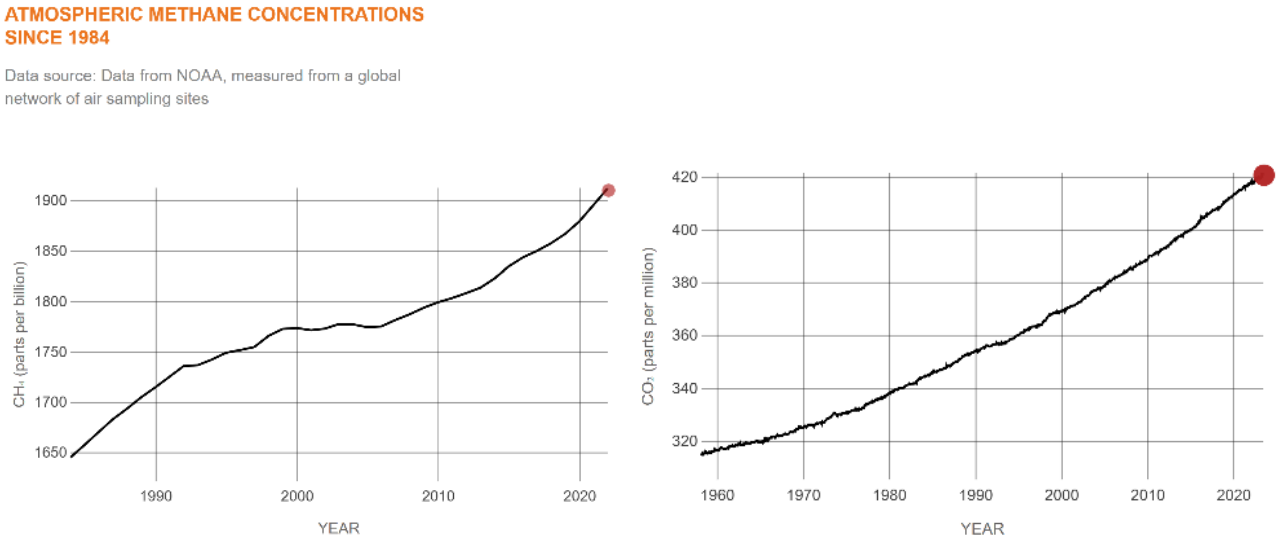

Figure 14: NASA Global Temperature Change CO2 Gas
Source: NASA Global Climate Change, 2022

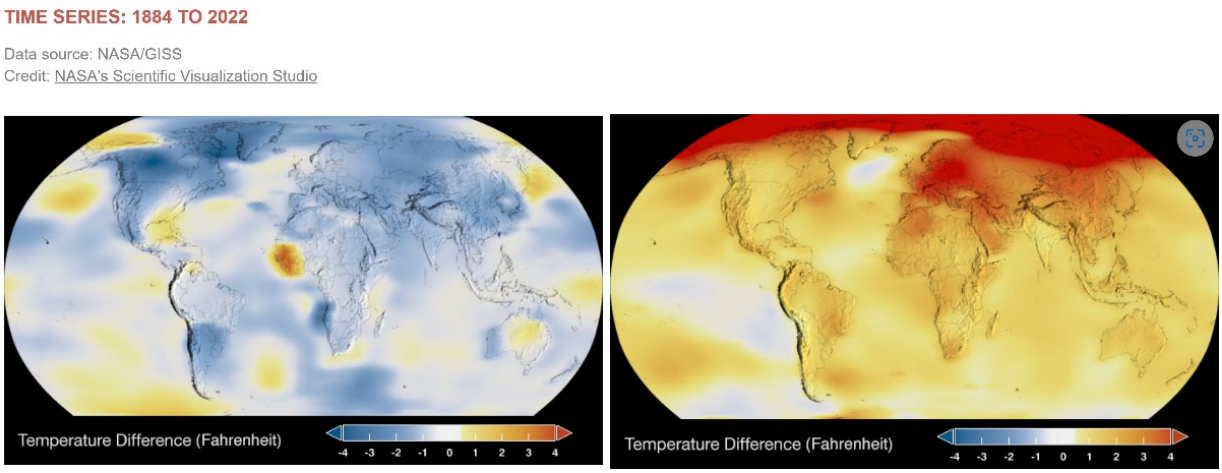

Figure 15: NASA Global Temperature Change 1884 to 2022
Source: NASA Global Climate Change, 2022

Drought

- A NASA-led study in 2022 concluded that the 22-year-long megadrought in southwestern US was the driest the territory had experienced in at least 1,200 years and was expected to persist through at least 2022.

Sea Level Rise

- Global sea levels are rising as a result of human-caused global warming, with recent rates being unprecedented over the past 2,500-plus years.
- U.S. Sea Level Likely to Rise 1 to 6.6 Feet by 2100.

- Global sea level has risen about 8 inches (0.2 meters) since reliable record-keeping began in 1880. By 2100, scientists project that it will rise at least another foot (0.3 meters), but possibly as high as 6.6 feet (2 meters) in a high-emissions scenario.
- Sea ice cover in the Arctic Ocean is expected to continue decreasing, and the Arctic Ocean will very likely become essentially ice-free in late summer if current projections hold. This change is expected to occur before mid-century.
- An indicator of changes in the Arctic sea ice minimum over time. Arctic sea ice extent both affects and is affected by global climate change.

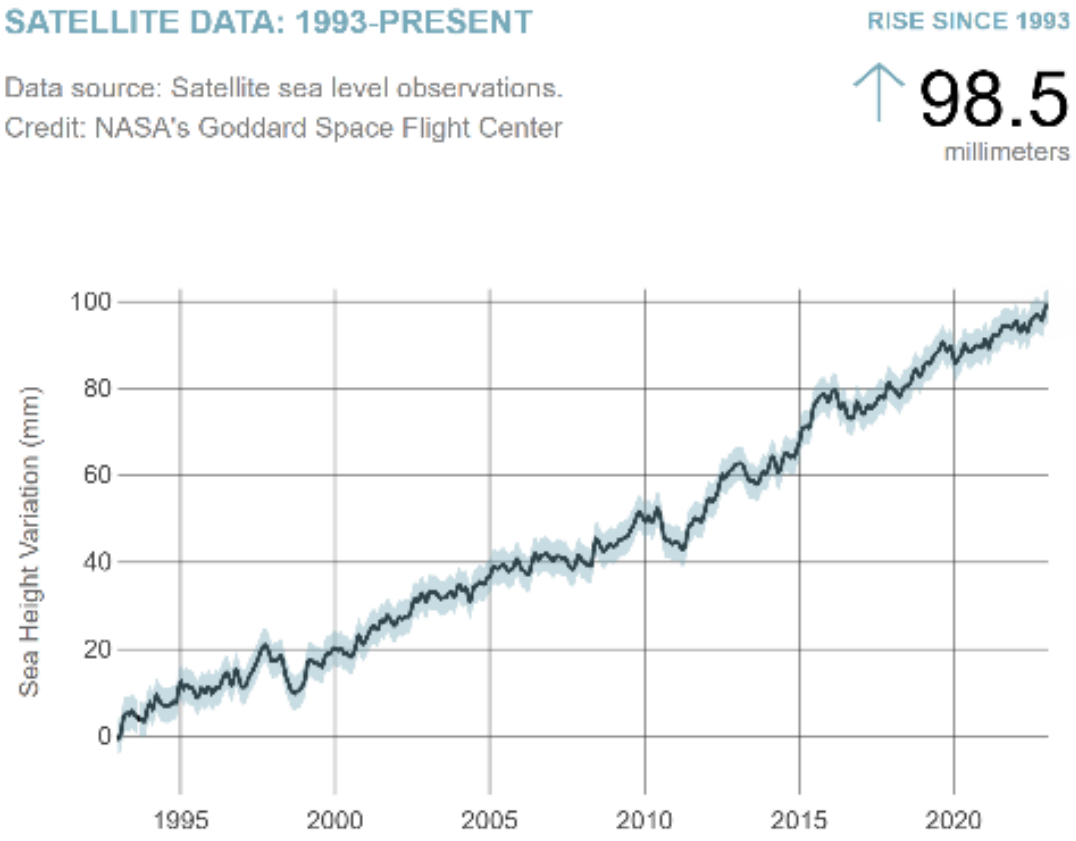

Figure 16: NASA Global Temperature Change Sea Level
Source: NASA Global Climate Change, 2022

Wildfire

- Warming temperatures have extended and intensified wildfire season in the West, where long-term drought in the region has heightened the risk of fires.
- Scientists estimate that human-caused climate change has already doubled the area of forest burned in recent decades. By around 2050, the amount of land consumed by wildfires in Western states is projected to further increase by two to six times.
- Even in traditionally rainy regions like the Southeast, wildfires are projected to increase by about 30%.

Flooding (Precipitation)

- Climate change is having an uneven effect on precipitation (rain and snow) in the United States, with some locations experiencing increased precipitation and flooding, while others suffer from drought.
- On average, more winter and spring precipitation is projected for the northern United States, and less for the Southwest, over this century.
- Projections of future climate over the U.S. suggest that the recent trend toward increased heavy precipitation events will continue. This means that while it may rain less frequently in some regions (such as the Southwest), when it does rain, heavy downpours will be more common.

Extreme Cold

- The length of the frost-free season, and the corresponding growing season, has been increasing since the 1980s, with the largest increases occurring in the western United States.

According to the California Natural Resource Agency (CNRA), climate change is already affecting California and is projected to continue to do so well into the foreseeable future. Current and projected changes include increased temperatures, sea level rise, a reduced winter snowpack, altered precipitation patterns, and more frequent storm events. Over the long term, reducing greenhouse gases can help make these changes less severe, but the changes cannot be avoided entirely. Unavoidable climate impacts result in a variety of secondary consequences including detrimental impacts on human health and safety, economic continuity, ecosystem integrity and provision of basic services. Climate change is being profiled in the 2023 Marin County OA MJHMP as a standalone hazard while addressing each of the other natural hazards. The Marin County OA is considering climate change issues when identifying future mitigation actions.

California is experiencing a climate crisis that is increasingly taking a toll on the health and well-being of its people and on its unique and diverse ecosystems. Every Californian has suffered from the effects of record high temperatures, dry winters, prolonged drought, and proliferating wildfires in recent years. California's biodiversity is threatened as alterations to habitat conditions brought about by a changing climate are occurring at a pace that could overwhelm the ability of plant and animal species to adapt.

Indicators of Climate Change in California
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

- Since 1895, annual average air temperatures in California have increased by about 2.5 degrees Fahrenheit (°F). Warming occurred at a faster rate beginning in the 1980s.
- Recent years have been especially warm: Eight of the ten warmest years on record occurred between 2012 and 2022; 2014 was the warmest year on record.
- Of all the Western states, California endured the hottest temperatures for the longest time, driving the average statewide temperature to the second warmest over the past 128 years.
- Extreme heat ranks among the deadliest of all climate-driven hazards in California, with physical, social, political, and economic factors effecting the capacity of individuals,

workers, and communities to adapt, and with the most severe impacts often on communities who experience the greatest social and health inequities.

- Glaciers have essentially disappeared from the Trinity Alps in Northern California
- In 2020, wildfire smoke plumes were present in each county for at least 46 days.
- The 2022 fire season saw more fires than the previous fire season along with continued extreme drought and heat conditions.
- The drought, begun in 2019, was the third statewide drought declared in California since 2000.
- This drought has been marked by extreme swings; the state received record-breaking amounts of precipitation in October and December 2021 that were offset by the driest January, February, and March 2022 dating back more than 100 years. The year 2023 opened with California simultaneously managing both drought and flood emergencies.
- A series of storms in late December 2022 and early January 2023 broke rural levees, disrupted power, flooded roads, downed trees, and eroded coastal land.
- Sea level rise accelerates coastal erosion, worsens coastal flooding during large storms and peak tidal events, and impacts important infrastructure positioned along our state's 1,100-mile coast.
- The western drought which impacted all of California and the western United States was nearly lifted due to unseasonably heavy rains in late 2022 and early 2023.

The graph below shows the relative change, in millimeters, in sea levels at Crescent City (1933-2020), San Francisco (1900-2020), and La Jolla (1925-2020).

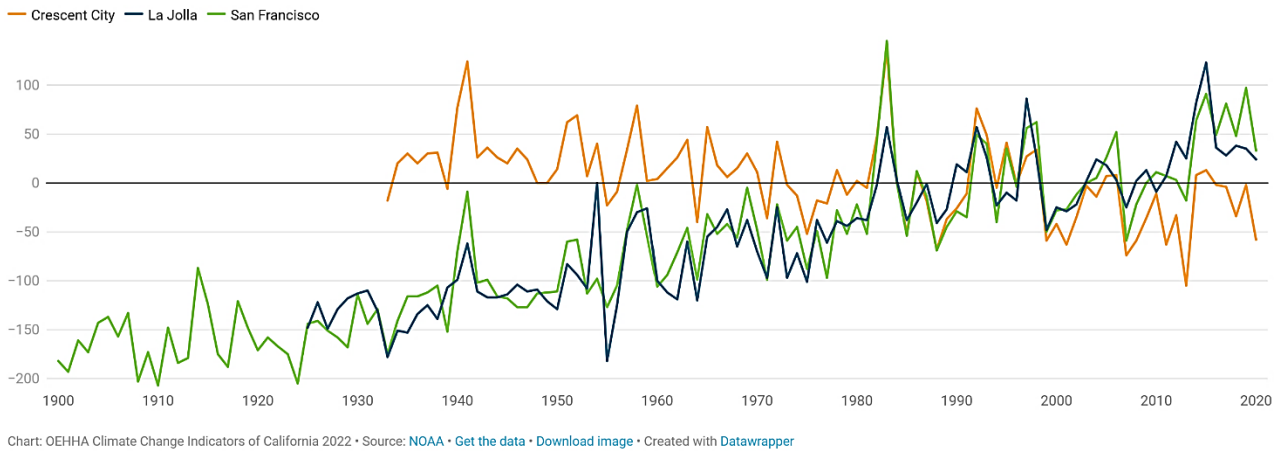

Figure 17: Annual Mean Sea Level Trends
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

Climate Change in the Marin County Operational Area

Climate change is already having significant impacts across California. Temperatures are warming, heat waves are more frequent, and precipitation has become increasingly variable. Climate change will continue to alter Marin County OA ecosystems as a result of rising temperatures, changes in precipitation, and sea level rise, which will increase the severity and occurrence of natural hazards across the Marin County OA well into the future. Coastal cooling processes that keep temperatures down, such as fog, will continue to decrease. Rising temperatures will exacerbate drought conditions and raise the potential for significant wildfires

and associated smoke as vegetation becomes drier and tree mortality increases. Forested woodlands that play a major role in carbon reduction will gradually transition into chaparral and shrublands. There will be more extreme storms and weather events, including expanded heat waves and increased rain events with changes in precipitation. Significant rain events will lead to an increase in flooding and the potential for severe landslides. Shoreline communities will become inundated with sea level rise and high tide events. Marshlands and wetlands that act as natural storm barriers will disappear as they transition into open water.
Notable impacts from climate change that are already evident in the Marin County OA and surrounding region as identified in a 2020 Marin County Civil Grand Jury Report include:

- From 1895-2018, the average temperature in Marin County increased by 2.3 degrees Fahrenheit.
- Over the past century, sea level rise in the San Francisco Bay Area rose by eight inches and has accelerated rapidly since 2011.
- The threat of wildfires in 2019 was so severe that Pacific Gas and Electric shut off electric power to the County for multiple days.

Climate change will continue to affect homes, businesses, infrastructure, utilities, transportation systems and agriculture across the Marin County OA. The risk to socially vulnerable populations will increase as they feel the immediate impacts of climate change more significantly and are less able to adapt to climate change and recover from its impacts.

The Marin County OA has adopted numerous planning initiatives and mitigation measures to help combat the effects of climate change across the OA. The Marin Climate Energy Partnership (MCEP), which is a partnership program of Marin County jurisdictions, the County, and Marin County regional agencies, adapted a model Climate Action Plan (CAP) that is intended to support countywide implementation efforts and is currently being used to update additional climate action plans for other jurisdictions in Marin County. The CAP supports the Climate Action Plan for the unincorporated County, which was completed in 2020. The MCEP also collects data and report on progress in meeting each County jurisdictions' individual greenhouse gas emission targets. In June 2023, the County published the Greenhouse Gas Inventory for Unincorporated Community Emissions for the Year 2021. Marin County OA jurisdictions have already met their greenhouse reduction goals for 2020 and are about halfway to meeting the statewide goal to reduce emissions 40% below 1990 levels by the year 2030. Marin County also formed a Sea Level Marin Adaptation Response Team in 2018 and had a Sea Level Rise Vulnerability Assessment and associated Adaptation Report completed for the County and each of its jurisdictions in 2017 as part of their Bay Waterfront Adaptation and Vulnerability Evaluation. Additional Marin County OA climate change mitigation initiatives include Marin Clean Energy, Electrify Marin, the Marin Solar Project, the Marin Energy Watch Partnership, Resilient Neighborhoods, and Drawdown: Marin.

2.2 HAZARDS

Of the hazards profiled in the Marin County MJHMP, those noted in the table are specific for the City of Belvedere as per the planning team.

Table 15: City of Belvedere Hazard Risk Assessment						
Hazard	Probability/ Likelihood of Future Events	Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Debris Flow	Occasional	Extensive	Severe	Medium	Medium	**13.00**
Drought	Highly Likely	Extensive	Moderate	High	High	**16.00**
Earthquake	Highly Likely	Extensive	Extreme	None	High	**15.00**
Flooding	Highly Likely	Limited	Severe	High	Medium	**14.00**
Land Subsidence (Sinkhole)	Occasional	Limited	Moderate	Medium	Medium	**10.00**

Tsunami	Highly Likely	Limited	Extreme	Medium	High	**15.00**
Wildfire	Highly Likely	Significant	Severe	High	High	**16.00**

Table 16: Hazard Risk Assessment
Source: Marin County

2.2.1 Debris Flows

For the purposes of the Marin County OA MJHMP, debris flows are classified as landslides (including rockslides) and mud flows.

A landside is the breaking away and gravity-driven downward movement of hill slope materials, which can travel at speeds ranging from fractions of an inch per year to tens of miles per hour depending on the slope steepness and water content of the rock/soil mass. Landslides range from the size of an automobile to a mile or more in length and width and, due to their sheer weight and speed, can cause serious damage and loss of life. The rate of a landslide is affected by the type and extent of vegetation, slope angle, degree of water saturation, strength of the rocks, and the mass and thickness of the deposit. Some of the natural causes of this instability are earthquakes, weak materials, stream and coastal erosion, and heavy rainfall. In addition, certain human activities tend to make the earth materials less stable and increase the chance of ground failure. These activities include extensive irrigation, poor drainage or groundwater withdrawal, removal of stabilizing vegetation and over-steepening of slopes by undercutting them or overloading them with artificial fill. These activities can cause slope failure, which normally produce landslides.

Landslide material types are often broadly categorized as either rock or soil, or a combination of the two for complex movements. Rock refers to hard or firm bedrock that was intact and in

place prior to slope movement. Soil, either residual or transported material, means unconsolidated particles. The distinction between rock and soil is most often based on interpretation of geomorphic characteristics within landslide deposits but can also be inferred from geologic characteristics of the parent material described on maps or in the field. Landslide movements are also based on the geomorphic expression of the landslide deposit and source area, and are categorized as falls, topples, spreads, slides, or flows. Falls are masses of soil or rock that dislodge from steep slopes and free fall. Topples move by the forward pivoting of a mass around an axis below the displaced mass. Lateral spreads move by horizontal extension and shear or tensile fractures. Slides displace masses of material along one or more discrete planes and can either be rotational or transitional. Flows mobilize as a deforming, viscous mass without a discrete failure plane.

Natural conditions that contribute to landslide include the following:

- Degree of slope
- Water (heavy rain, river flows, or wave action)
- Unconsolidated soil or soft rock and sediments
- Lack of vegetation (no stabilizing root structure)
- Previous wildfires and other forest disturbances
- Road building, excavation and grading
- Earthquake

In addition, many human activities tend to make the earth materials less stable and, thus, increase the chance of ground movement. Human activities contribute to soil instability through grading of steep slopes or overloading them with artificial fill, by extensive irrigation, construction of impermeable surfaces, excessive groundwater withdrawal, and removal of stabilizing vegetation.

Another hazard related to landslide and erosion is the fall of a detached mass of rock from a cliff or down a very steep slope (rockfall). Weathering and decomposition of geological materials produce conditions favorable to rockfalls. Other causes include ice wedging, root growth, or ground shaking (earthquake). Destructive landslides and rockfalls usually occur very suddenly with little or no warning time and are short in duration.

Landslide susceptibly can be characterized by looking at both slope class and rock strength. Landslide susceptibility classes express the generalization that on very low slopes, landslide susceptibility is low even in weak rock, and that landslide susceptibility increases with slope and in weaker rocks. Very high landslide susceptibility includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks. Figure 18 shows landslide susceptibility classes.

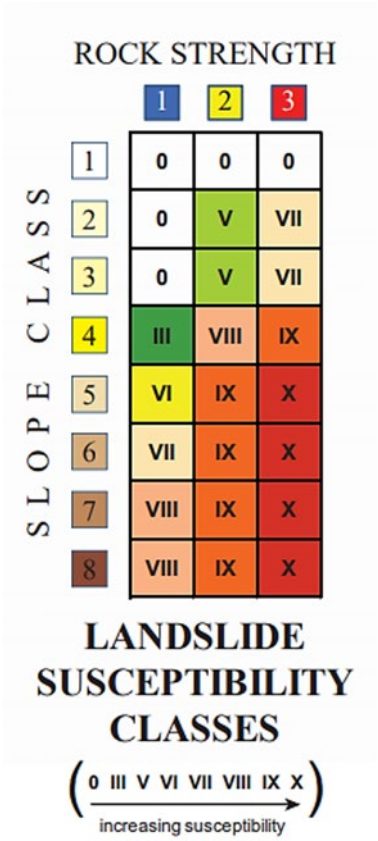

Figure 18: Landslide Susceptibility Classes
Source: USGS

A mud flow is a general term for a mass-movement landform and process characterized by a flowing mass of fine-grained earth material with a high degree of fluidity. Heavy rainfall, snowmelt, or high levels of groundwater flowing through cracked bedrock may trigger a movement of soil or sediments. Floods and debris flows may also occur when strong rains on hill or mountain slopes cause extensive erosion and/or what is known as "channel scour." Some broad mud flows are rather viscous and therefore slow; others begin very quickly and continue like an avalanche. Mud flows are composed of at least 50% silt and clay-sized materials and up to 30% water.

The point where a muddy material begins to flow depends on its grain size and the water content. Fine grainy material or soil has a smaller friction angle than a coarse sediment or a debris flow, but falling rock pieces can trigger a material flow, too. When a mud flow occurs it is given four named areas, the 'main scarp', in bigger mud flows the 'upper and lower shelves', and the 'toe'. See Figure 19 for the typical areas of a mud flow, with shelves (right) and without (left). The main scarp will be the original area of incidence, the toe is the last affected area(s). The upper and lower shelves are located wherever there is a large dip (due to mountain or natural drop) in the mud flow's path. A mud flow can have many shelves.

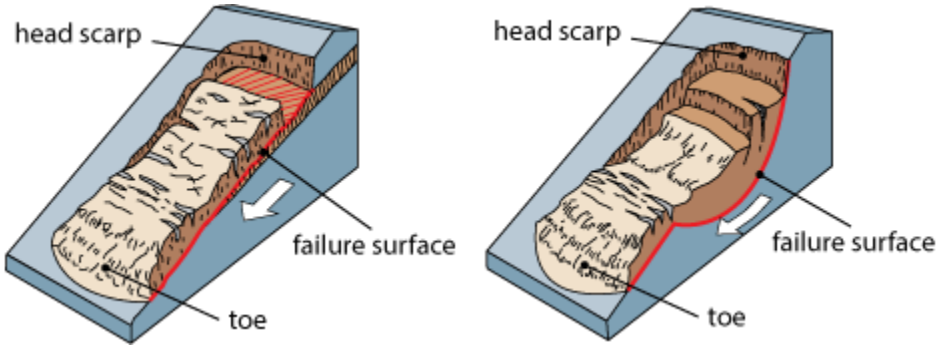

Figure 19: Mud Flow Areas
Source: Washington Department of Natural Resources

If large enough, mud flows can devastate villages and country-sides. Mud flows are common in mountain areas prone to wildfire, where they have destroyed many homes built on hillsides without sufficient support after fires destroy vegetation holding the land. The area most generally recognized as being at risk of a dangerous mud flow are:

- Areas where wildfires or human modification of the land have destroyed vegetation
- Areas where landslides have occurred before
- Steep slopes and areas at the bottom of slopes or canyons
- Slopes that have been altered for construction of buildings and roads
- Channels along streams and rivers
- Areas where surface runoff is directed

A landslide in Belvedere would most likely occur in areas where the terrain is steeper and is more susceptible to movement of hill slope materials. Most of Belvedere south of San Rafael Avenue and the area around Bellevue Avenue has areas of steeper terrain and has high susceptibility to a landslide. These areas are primarily residential and consist of numerous winding streets and hillside homes that could be damaged or destroyed by a landslide. The area around Bellevue Avenue near the Corinthian Yach Club also has high landslide susceptibility and consists of numerous homes that could be susceptible to a landslide. The perimeter of the Belvedere Lagoon and areas along Beach Road where there are numerous homes have some susceptibility to a landslide. Both Tiburon Boulevard and Paradise Drive, the only two primary access points to the Tiburon Peninsula, both have sections with high landslide susceptible. The Belvedere Police Department, City Hall and Community Center building lies in an area with little to no landslide susceptibility.

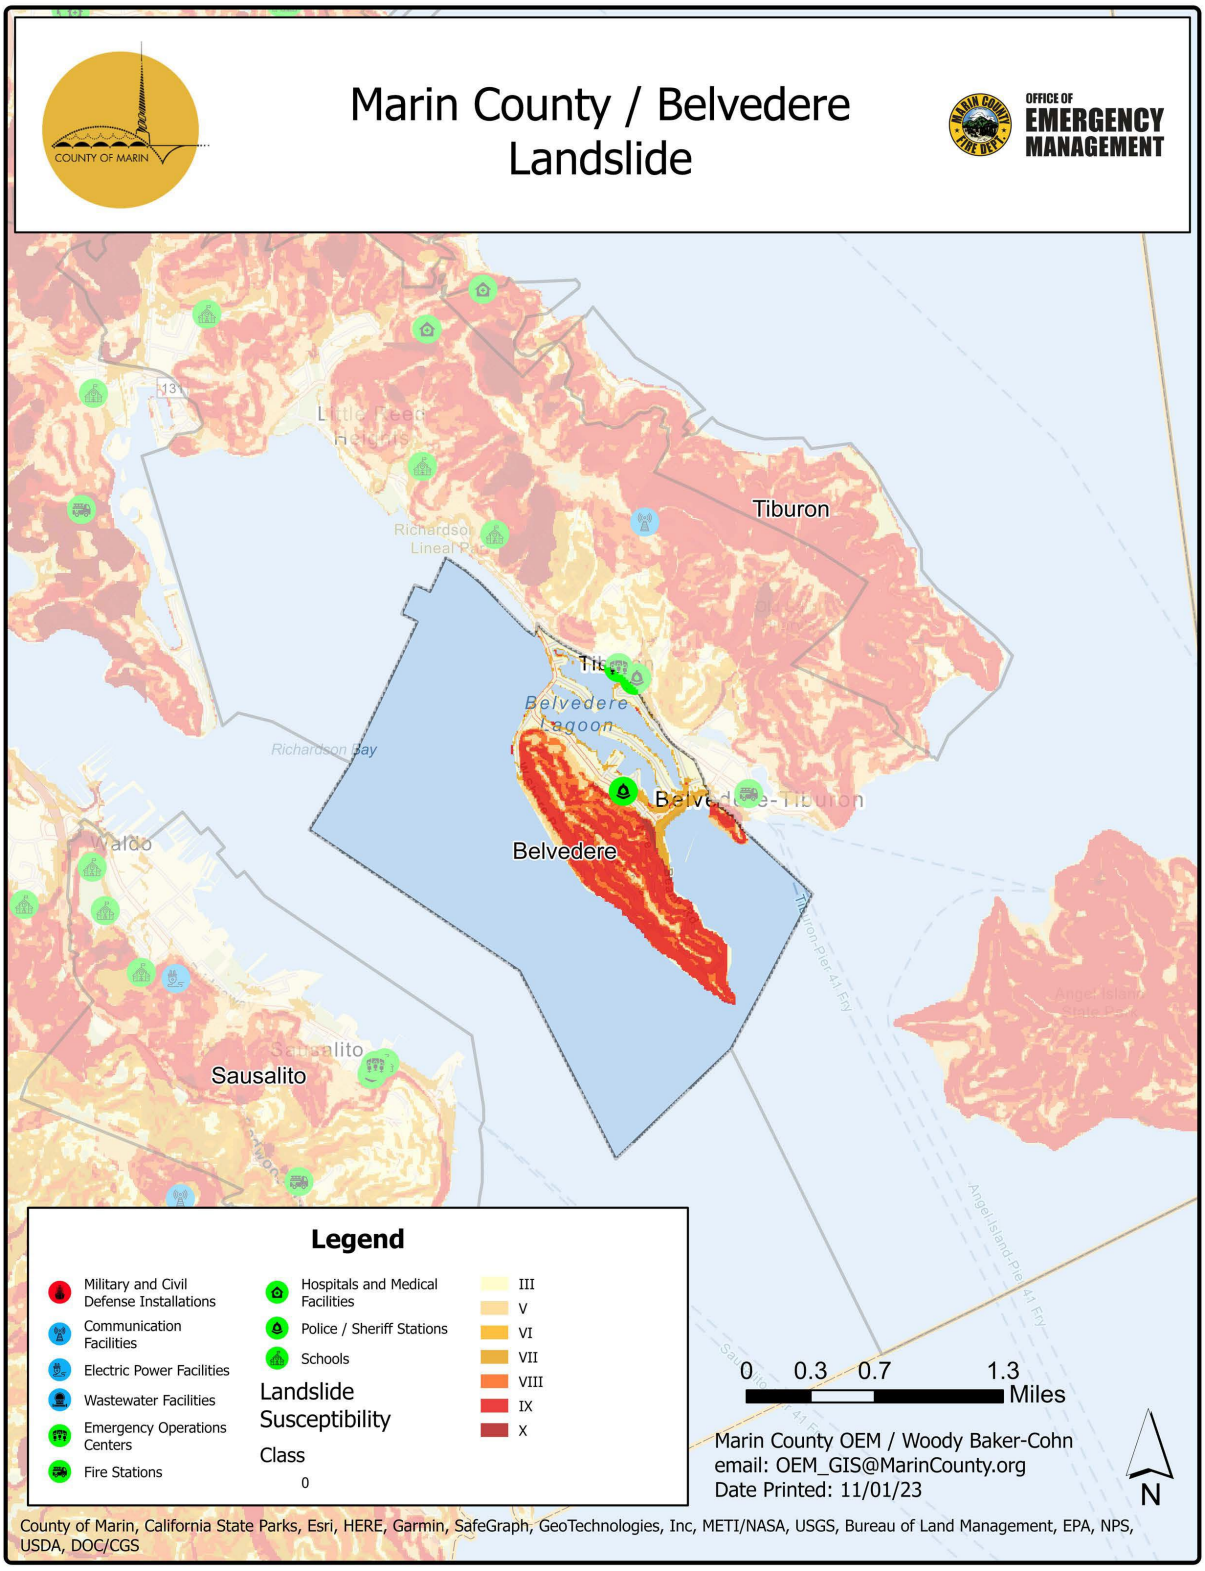

Figure 20: City of Belvedere Debris Flow Critical Facilities and Infrastructure
Source: Marin County OEM

A landslide having major impacts on any of the roads in Belvedere could affect the ability of residents to reach their homes and could affect the provision of emergency and essential services. An earthquake has the potential to cause landslides in the areas of Belvedere with landslide susceptibility. A rain event in Belvedere could potentially contribute to mudslides that could impact homes in Belvedere. There are no creeks that flow directly into Belvedere.

There have been no major debris flows in Belvedere since the last plan update.

On 12/16/2014, an overnight cloudburst triggered flood and mudslide damage on the Tiburon Peninsula. Mud flooded driveways and lawns, and garbage cans floated away on a Belvedere Street. Mud, water and debris cascaded down a short stretch of the road that angles southward into San Rafael Avenue just north of Richardson Bay. One driveway was 6 inches deep in mud and leaves. A blocked culvert contributed to the mud flows.

Figure 21: City of Belvedere Mud Flows – December 16, 2014
Source: Marin County OEM

Climate Change and Future Development Considerations

Extreme storm events and more frequent wildfires as a result of climate change have the potential to increase the amount and severity of landslides, including disastrous debris flows. Climate change is leading to more volatile precipitation patterns around the world with very dry stretches punctuated by storms that drop large amounts of rain in a short amount of time. Landslides in wetter regions of California, including the Marin County OA, move on average faster and farther downhill during rainy periods compared to drought years, according to a 2022 study by the American Geophysical Union (AGU)[1], showing the increased potential for landslides in the Marin County OA in rainy years. As development increases in the numerous canyons and around the many open spaces of the Marin County OA, the potential for significant impacts from a landslide and/or mudflow increases. Further development of the residential areas of Belvedere that have a higher landslide susceptibility, including south of San Rafael Avenue, will expose more people and property to landslide risk. With increased rain events as a result of climate change, more residents throughout Belvedere could be susceptible to mud flows. Future development should take into account the movement of mud and debris after a

[1] Landslide Sensitivity and Response to Precipitation Changes in Wet and Dry Climates. https://agupubs.onlinelibrary.wiley.com/doi/10.1029/2022GL099499

major rain event, particularly down streets and driveways in areas where there are no natural water channels.

2.2.2 DROUGHT

A drought is a deficiency in precipitation over an extended period, usually a season or more, resulting in a water shortage causing adverse impacts on vegetation, animals, and/or people. It is a normal recurrent feature of climate that occurs in virtually all climate zones, from very wet to very dry. Drought is a temporary aberration from normal climatic conditions and can thus vary significantly from one region to another. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Drought is a complex issue involving many factors—it occurs when a normal amount of moisture is not available to satisfy an area's usual water-consuming activities.

There are several types of drought which can often be defined regionally based on its effects:

- Meteorological drought is usually defined by a period of below average water supply, based on the degree of dryness (in comparison to normal or average) and the duration of the dry period. Drought onset generally occurs with a meteorological drought.
- Agricultural drought occurs when there is an inadequate water supply to meet the needs of the state's crops and other agricultural operations such as livestock. Agricultural drought links various characteristics of meteorological (or hydrological) drought to agricultural impacts, focusing on precipitation shortages, soil water deficits, reduced ground water or reservoir levels needed for irrigation.
- Hydrological drought is defined as deficiencies in surface and subsurface water supplies. It is generally measured as stream flow, snowpack, and as lake, reservoir, and groundwater levels. Hydrological drought usually occurs following periods of extended precipitation shortfalls.
- Socioeconomic drought occurs when a drought impacts health, well-being, and quality of life, or when a drought starts to have an adverse economic impact on a region.

Drought can occur in all areas of Belvedere, though its effects would be most felt in the hilly areas and the area along the Tiburon Boulevard bike path where the risk of brush fires and tree mortality would increase. Dry trees in public spaces and in the tree-lined hillside neighborhoods of Belvedere can become a safety hazard to the public due to falling limbs or the toppling of the tree itself. An increase in brush fires as a result of drought could impact residences in the area.

Climate Change and Future Development Considerations

Climate change increases the odds of worsening drought. Warmer temperatures enhance evaporation, which reduces surface water and dries out soils and vegetation. This makes periods with low precipitation in the summer drier than they would be in cooler conditions. Climate also alters the timing of water availability as warmer winter temperatures cause less precipitation to fall. During droughts, communities in the Marin County OA including Belvedere may have limited access to water for household use, including drinking, cooking, cleaning, and watering plants, as well as for agriculture, transportation, and power generation. Drought may lead to higher water costs, rationing, or even the decimation of important water sources like

wells in the Marin County OA. As more people move into the Marin County OA and Belvedere, additional strain will be placed on the OA's water supply. Drought can affect livestock and crops in the Marin County OA, impacting its economy. Drought can increase the occurrence and severity of wildfires and tree mortality in the Marin County OA including in the open spaces around Belvedere. Impacts to residents and infrastructure from wildfire as a result of drought will increase as more development occurs in the mountainous and hilly areas of the Marin County OA including Belvedere where wildfires are more likely to occur. Drought also increases the amount of carbon dioxide in the atmosphere, including by decreasing land productivity, which reduces the amount of vegetation storing carbon dioxide. In addition, increases in drought-related wildfire and soil erosion can release carbon dioxide sequestered in trees and plants back into the atmosphere. This will only worsen climate change for the Marin County OA into the future. When considering future development, the Marin County OA including Belvedere can help prepare for both future droughts and climate change by practicing and promoting water conservation and enhancing water efficiency throughout landscapes, city plans, and water infrastructure. The Marin County OA can also identify alternative water supplies, create drought emergency plans, and encourage farmers to plant drought-resistant crops.

2.2.3 EARTHQUAKE

Earthquakes are sudden rolling or shaking events caused by movement under the earth's surface. Earthquakes happen along cracks in the earth's surface, called fault lines, and can be felt over large areas, although they usually last less than one minute.

The amount of energy released during an earthquake is usually expressed as a magnitude and is currently measured by seismologists on the Moment Magnitude (Mw Scale). The Mw Scale was developed to succeed the previously used Richter Scale and is measured on a scale of zero to ten with increasing values reflecting increasing intensity.

The other commonly used measure of earthquake severity is intensity, which is an expression of the amount of shaking at any given location on the ground service. Intensity is most commonly measured on the Modified Mercalli Intensity (MMI) Scale (see Figure 22).

Intensity	Shaking	Description/Damage
I	Not felt	Not felt except by a very few under especially favorable conditions.
II	Weak	Felt only by a few persons at rest,especially on upper floors of buildings.
III	Weak	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Light	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Moderate	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Strong	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Very strong	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Severe	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Violent	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	Extreme	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.

Figure 22: Modified Mercalli Intensity Scale
Source: USGS

Figure 23 gives intensities (measured on the MMI scale) that are typically observed at locations near the epicenter or earthquakes of different magnitudes.

Richter Magnitude Scale	Typical Maximum Modified Mercalli Intensity Scale
1.0 – 2.9	I
3.0 – 3.9	II – III
4.0 – 4.9	IV – V
5.0 – 5.9	VI – VII
6.0 – 6.9	VII – IX
7.0 or higher	VIII or higher

Figure 23: Mercalli Scale vs. Magnitude
Source: USGS

The extent of ground shaking also depends in large part on how soft the underlying soil is. Soft soils amplify ground shaking (see Figure 24). This was observed during the 1989 Loma Prieta Earthquake when the most significant damages experienced in San Francisco were in the Marina District, which was built on fill.

Soil type A	Vs > 1500 m/sec	Includes unweathered intrusive igneous rock. Occurs infrequently in the bay area. We consider it with type B (both A and B are represented by the color blue on the map). Soil types A and B do not contribute greatly to shaking amplification.
Soil type B	1500 m/sec > Vs > 750 m/sec	Includes volcanics, most Mesozoic bedrock, and some Franciscan bedrock. (Mesozoic rocks are between 245 and 64 million years old. The Franciscan Complex is a Mesozoic unit that is common in the Bay Area.)
Soil Type C	750 m/sec > Vs > 350 m/sec	Includes some Quaternary (less than 1.8 million years old) sands, sandstones and mudstones, some Upper Tertiary (1.8 to 24 million years old) sandstones, mudstones and limestone, some Lower Tertiary (24 to 64 million years old) mudstones and sandstones, and Franciscan melange and serpentinite.
Soil Type D	350 m/sec > Vs > 200 m/sec	Includes some Quaternary muds, sands, gravels, silts and mud. Significant amplification of shaking by these soils is generally expected.
Soil Type E	200 m/sec > Vs	Includes water-saturated mud and artificial fill. The strongest amplification of shaking due is expected for this soil type.

Figure 24: Soil Types
Source: USGS

An earthquake fault is defined as “a fracture or fracture zone in the earth’s crust along which there has been displacement of the sides relative to one another.” For the purpose of planning there are two types of faults, active and inactive. Active faults have experienced displacement in historic time, suggesting that future displacement may be expected. Inactive faults show no evidence of movement in recent geologic time, suggesting that these faults are dormant.

Two types of fault movement represent possible hazards to structures in the immediate vicinity of the fault: fault creep and sudden fault displacement. Fault creep, a slow movement of one side of a fault relative to the other, can cause cracking and buckling of sidewalks and foundations even without perceptible ground shaking. Sudden fault displacement occurs during an earthquake event and may result in the collapse of buildings or other structures that are found along the fault zone when fault displacement exceeds an inch or two. The only protection against damage caused directly by fault displacement is to prohibit construction in the fault zone.

An earthquake could occur anywhere in and around Belvedere due to the number of active faults within and near Marin County.

Earthquake Shake Intensity

The colors on Figures 25 and 26 represent the level of ground shaking intensity of a potential future earthquake. The result is expressed as the level of ground shaking (**expressed as a percentage of gravity**) that on average occurs every 500 years.

This map shows the expected relative intensity of ground shaking and damage in California from anticipated future earthquakes. The shaking potential is calculated as the level of ground motion that has a 2% chance of being exceeded in 50 years, which is the same as the level of ground-shaking with about a 2500 year average repeat time. The relatively long-period (1.0 second) earthquake shaking is shown here. Long period-shaking affects tall, relatively flexible buildings, but also correlates well with overall earthquake damage.

Earthquake Shaking Potential Maps for California depict expected intermediate period (1s or 1hz) ground motions with 2% exceedance probability in 50 years.

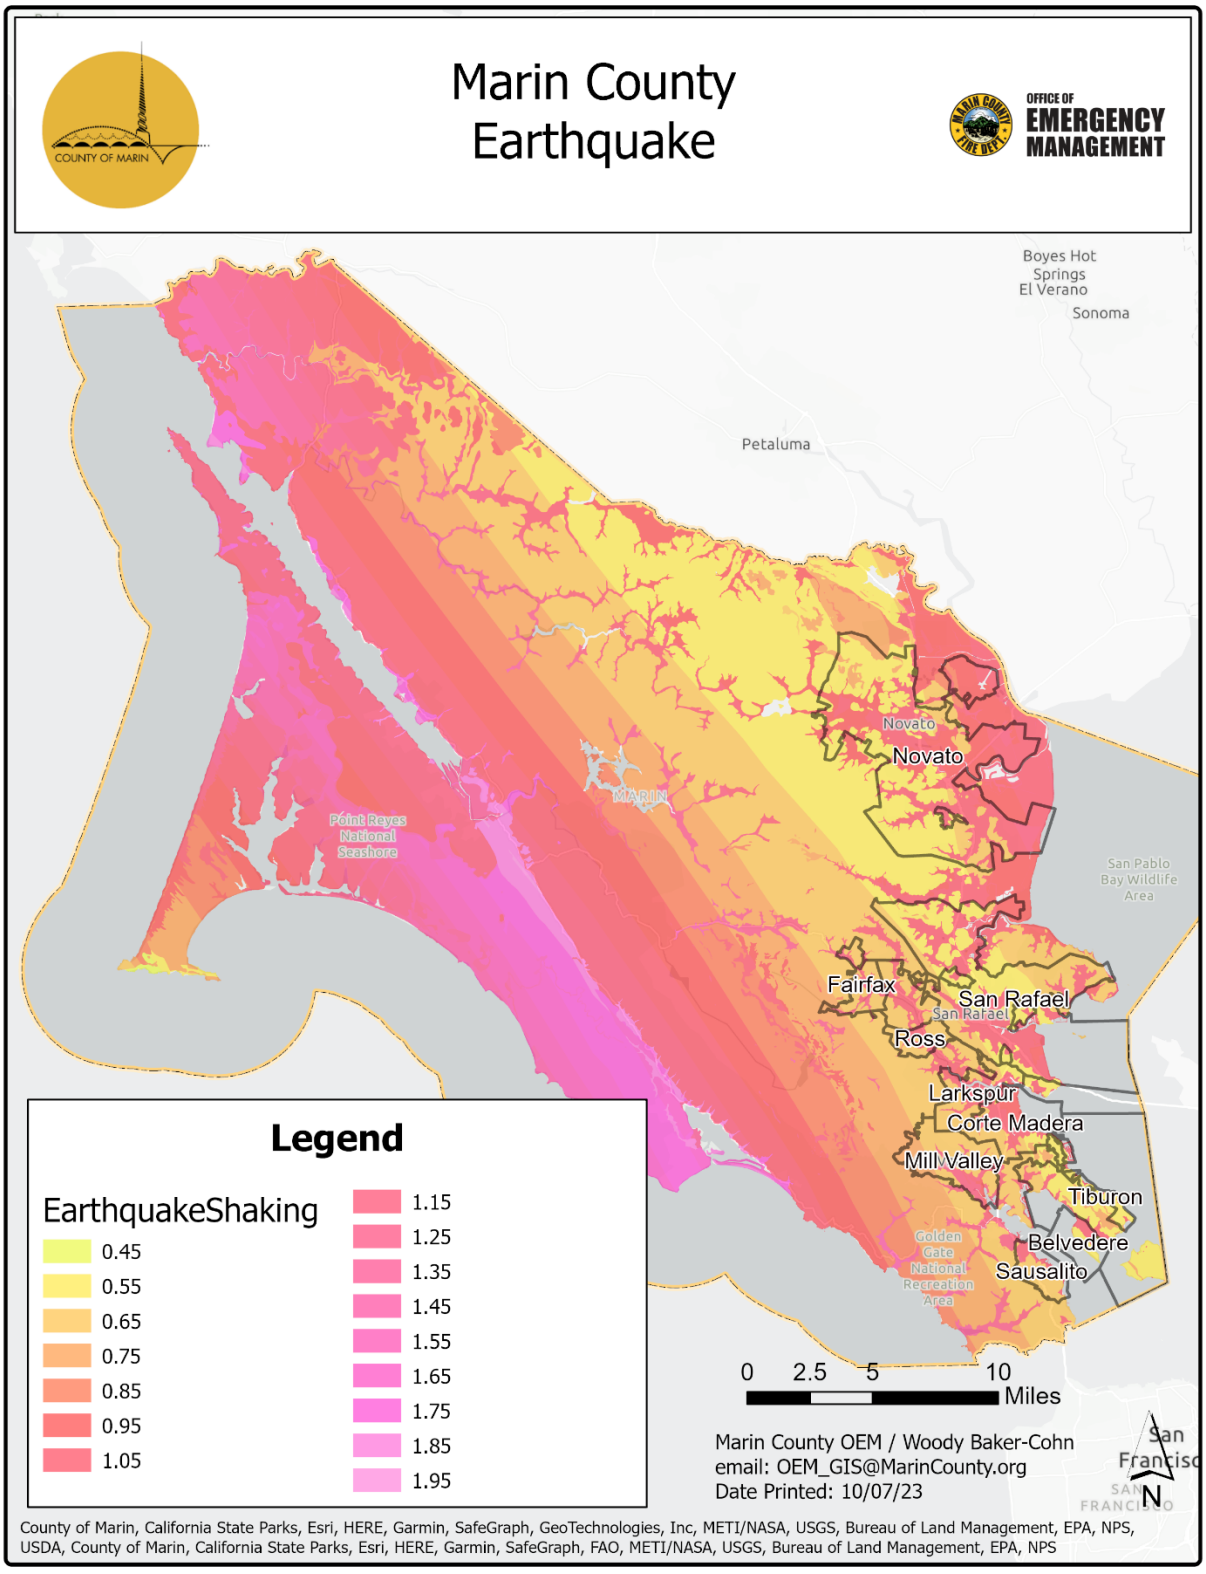

Figure 25: Marin County Earthquake Impact and Fault Lines
Source: Marin County OEM

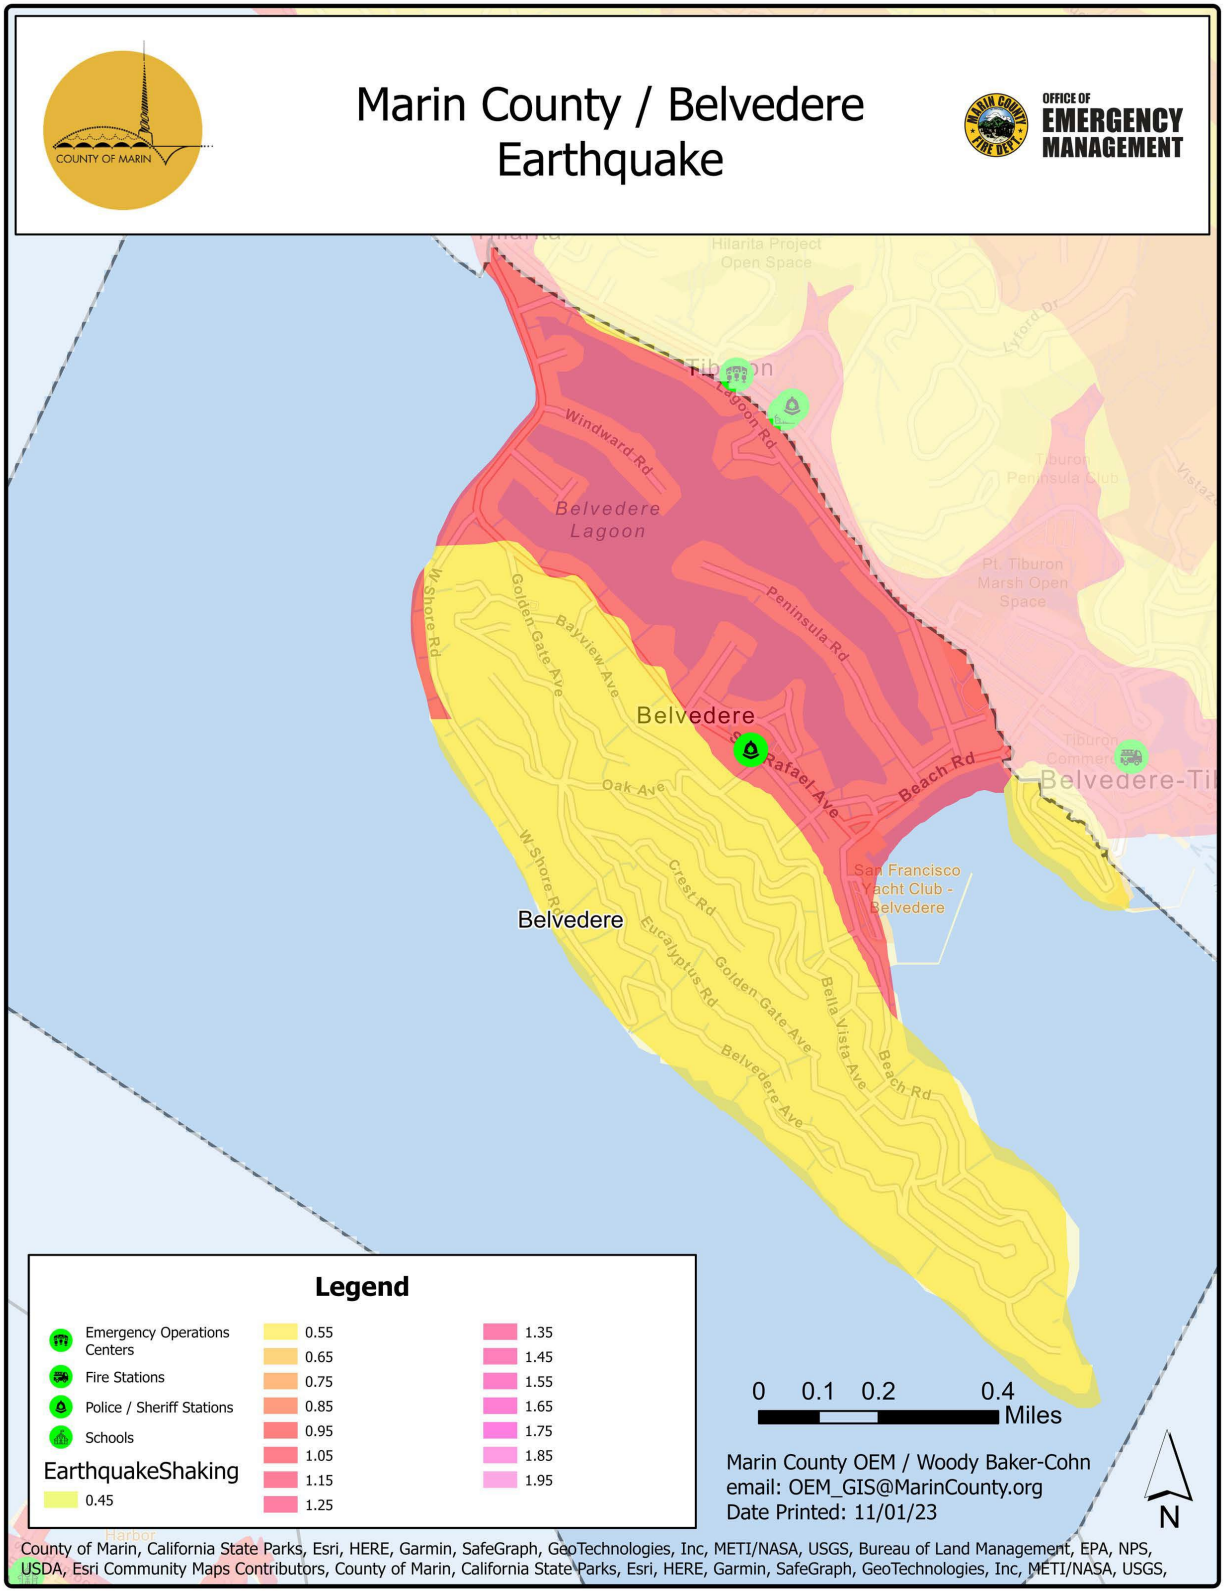

Figure 26: City of Belvedere Earthquake Critical Facilities and Infrastructure
Source: Marin County OEM

Belvedere is located directly between the San Andreas and Hayward faults. A moderate to extreme earthquake originating from either of these major faults or any of the other faults in the region could have major impacts to the city. All buildings located in Belvedere are vulnerable to earthquake damage, but depending upon construction, some buildings are expected to perform better than others. There is increased risk of shaking and liquefaction in lowland areas of Belvedere from an earthquake, particularly in the area around the Belvedere Lagoon where superficial deposits and fill are more prevalent. Belvedere used to be an island before fill was used to create the lagoon and surrounding neighborhood. There are hundreds of residences and several commercial buildings that lie around the Belvedere Lagoon in areas with higher earthquake shaking vulnerability. Tthe Belvedere Police Department, City Hall and Community Center building lies in this area. Vulnerable structures include bridges and older buildings that have not undergone major seismic retrofitting. Utility infrastructure throughout the city could be impacted by an earthquake.

Earthquakes could also cause landslides in areas of Belvedere with steeper terrain, causing damage to homes and roads as a result of shifting soils.

Belvedere hasn't yet experienced a significant earthquake. Marin County was sparsely populated at the time of the 1906 San Francisco Earthquake, and the effects across the County were relatively minimal. Likewise, the 1989 Loma Prieta Earthquake caused minimal impacts across Marin County as the epicenter of the quake was further south in Santa Cruz County. Smaller earthquakes with minimal to no impacts are routinely felt in Belvedere.

Climate Change and Future Development Considerations

There is no direct link between climate change and seismic activity that could impact the Marin County OA including Belvedere, so climate change is not expected to cause any changes to the frequency or intensity of seismic shaking. According to a 2018 study by the Institute of Physics (IOP)[2], climate change could result in "isostatic rebounds," or a sudden upward movement of the crust because of reduced downward weight caused by glaciers. As glaciers are known to melt when overall global temperatures increase, climate change could indirectly lead to an increase in seismicity in the Marin County OA including Belvedere. Climate change could also impact earthquakes felt in the Marin County OA as droughts can further deteriorate existing fault lines and pumping groundwater can put further pressure on the earth's crust. Future development in the populated areas of Marin County OA where seismic shaking and subsidence are more prevalent could exacerbate the impacts of an earthquake. This includes the lowlands of Belvedere, particularly around Belvedere and including Mallard Pointe, where the risk of subsidence and subsequent earthquake shaking are higher. Future development in these areas could expose more people and infrastructure to earthquake shaking as a result of climate change.

2.2.4 FLOODING

Flooding is the rising and overflowing of a body of water onto normally dry land. Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. The area adjacent to a channel is the floodplain. Floodplains are illustrated on inundation maps, which show areas of potential flooding and water depths. In its common usage, the floodplain most often refers to that area that is inundated by the 100-year flood, the flood that has a one percent chance in any given year of being equaled or exceeded. The 100-year flood is the national minimum standard to which communities regulate their floodplains through the National Flood Insurance Program. The 200-year flood is one that has 0.5% chance of being equaled or exceeded each year. The 500-year flood is a flood that has a 0.2 percent chance of being equaled or exceeded in any given year. The potential for flooding can change and increase through various land use changes and changes to land surface, which result in a change to the floodplain. A change in environment can create localized flooding problems inside and outside of natural floodplains by altering or confining natural drainage channels. These changes are most often created by human activity such as construction of bridges or channels. In areas where flow contains high sediment load, such as Easkoot Creek in Stinson Beach (due to an active landslide upstream), the flow carrying capacity of the channel may be reduced dramatically during a single flood event. Coastal floodplains may also change over time as waves and currents alter the coastline (especially wetlands) and sea levels rise.

Flooding can occur in several ways:

Riverine flooding – Riverine flooding, defined as when a watercourse exceeds its "bank-full" capacity, generally occurs as a result of prolonged rainfall, or rainfall that is combined with snowmelt and/or already saturated soils from previous rain events. This type of flood occurs in river systems whose tributaries may drain large geographic areas and include one or more independent river basins. The onset and duration of riverine floods may vary from a few hours to many days and is often characterized by high peak flows combined with a large volume of runoff. Factors that directly affect the amount of flood runoff include precipitation amount, intensity and distribution, the amount of soil moisture, seasonal variation in vegetation, snow depth, and water-resistance of the surface due to urbanization. In the Marin County OA, riverine flooding can occur anytime from November through April and is largely caused by heavy and continued rains, sometimes combined with snowmelt, increased outflows from upstream dams, and heavy flow from tributary streams. These intense storms can overwhelm the local waterways as well as the integrity of flood control structures. Flooding is more severe when antecedent rainfall has resulted in saturated ground conditions. The warning time associated with slow rise riverine floods assists in life and property protection.

Flash flooding – Flash flooding describes localized floods of great volume and short duration. This type of flood usually results from a heavy rainfall on a relatively small drainage area. Precipitation of this sort usually occurs in the winter and spring. Flash floods often require immediate evacuation within the hour and thus early threat identification and warning is critical for saving lives.

Localized/Stormwater flooding – Localized flooding problems are often caused by flash flooding, severe weather, or an unusual amount of rainfall. Flooding from these intense weather events usually occurs in areas experiencing an increase in runoff from impervious surfaces associated with development and urbanization as well as inadequate storm drainage systems.

Tidal flooding – Tidal flooding develops when high tides exceed either the top of bank elevation of tidal sloughs and channels, or the crest of bay levees. An especially high tide event that occurs during alignment of the gravitational pull between the sun and the moon, causing tidal water levels to rise to higher-than normal levels. King tides are normal, predictable events that occur semi-annually during winter months. Typically storms in which high tides coincide with peak stormwater flow may be damaging to municipal infrastructure and private property.

The area is also at risk to flooding resulting from levee failures and dam failures. Dam failure flooding is discussed separately in the Dam Failure Section of this document; levee failure flooding is discussed separately in the Levee Failure Section of this document. Regardless of the type of flood, the cause is often the result of severe weather and excessive rainfall, either in the flood area or upstream reach.

A weather pattern called the "Atmospheric River" contributes to the flooding potential of the area. An Atmospheric River brings warm air and rain to the West. A relatively common weather pattern brings southwest winds to the Pacific Northwest or California, along with warm, moist air. The moisture sometimes produces many days of heavy rain, which can cause extensive flooding. The warm air also can melt the snowpack in the mountains, which further aggravates the flooding potential. In the colder parts of the year, the warm air can be cooled enough to produce heavy, upslope snow as it rises into the higher elevations of the Sierra Nevada or Cascades. Forecasters and others on the West Coast often used to refer to this warm, moist air as the "Pineapple Express" because it comes from around Hawaii where pineapples are grown. A diagram of an atmospheric river event is shown in Figure 27.

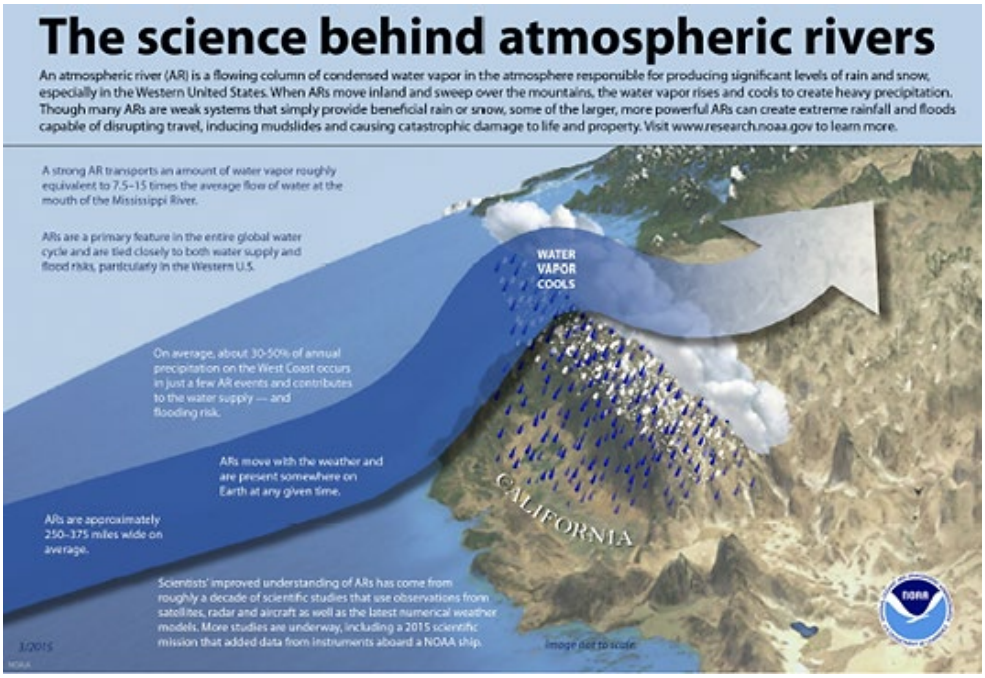

Figure 27: Diagram of an Atmospheric River Event
Source: NOAA

The Marin County OA is susceptible to various types of flood events. In coastal areas, flooding may occur when strong winds or tides result in a surge of seawater into areas that are above

the normal high tide line. Other types of flooding in Marin include isolated ponding and stormwater overflow. Isolated ponding is when pools form on the ground and can occur in any area that doesn't drain effectively – for example, in a natural depression in the landscape. Stormwater overflow is when storm drains back up. Stormwater drainage systems quickly convey rainwater through underground pipes to creeks and the Bay. When the storm drains are obstructed or broken or when the water bodies to which they lead to are already full, water backs up onto the streets. Although stormwater overflow and isolated ponding also occur throughout the County, the effects are typically not widespread or significantly damaging.

Flooding in Belvedere generally results from a combination of high tides from Richardson Bay and San Francisco Bay and from storm runoff in low-lying areas around the Belvedere Lagoon. There are no creeks in Belvedere, though significant flooding events can cause flooding and mud flows down local roads. Most of the lowland areas in Belvedere, including around the Belvedere Lagoon, are in the 100-year floodplain, with a few areas along West Shore Road and San Rafael Avenue in the 500-year floodplain. Hundreds of residences and several commercial buildings around the Belvedere lagoon lie in the 100-year floodplain and could be susceptible to flooding. Both San Rafael Avenue and Beach Road lie in the 100-year floodplain. Dozens of residences and the Belvedere Police Department, City Hall and Community Center building lie in the 500-year floodplain and could be susceptible to flooding. The Tiburon Fire Protection District Station #11 lies in the 100-year floodplain.

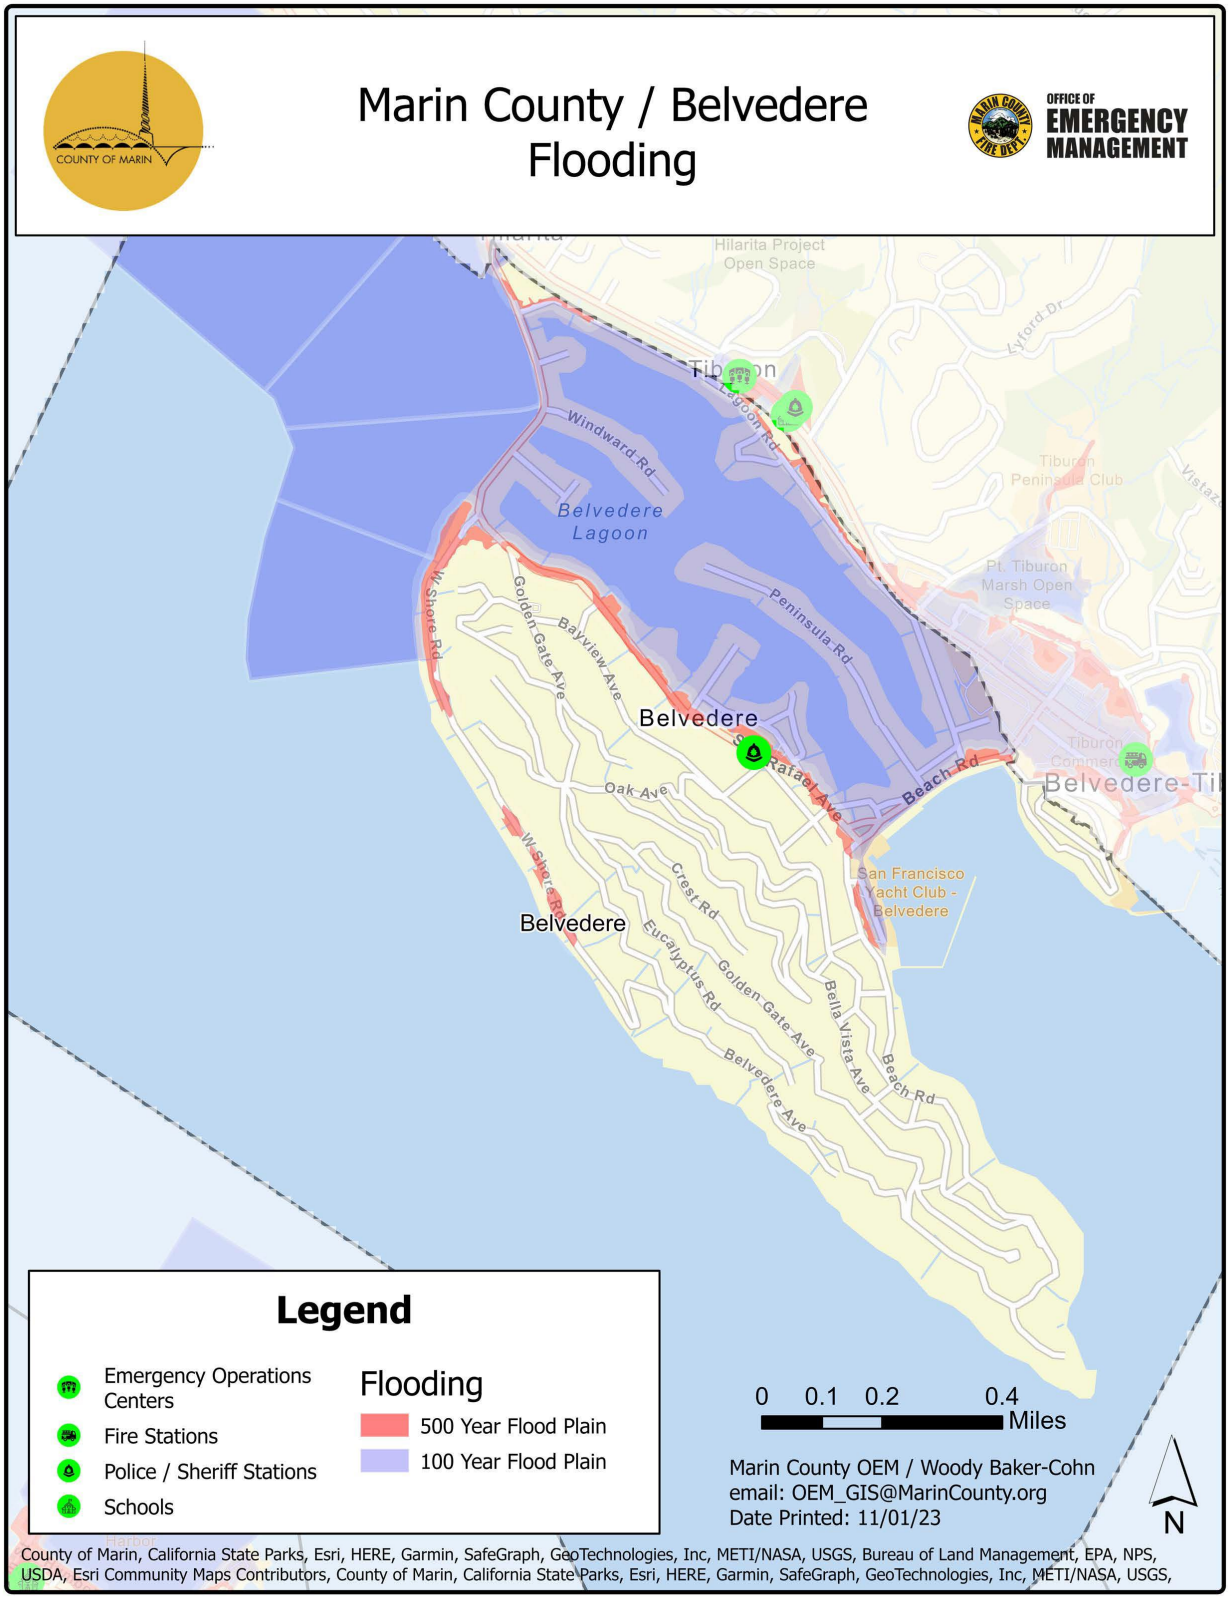

Figure 28: City of Belvedere Flooding Critical Facilities and Infrastructure
Source: Marin County OEM

Table 17 shows the number of residential structures by flood zone in the City of Belvedere.

Table 17: Residential Structures in The City of Belvedere by Flood Zone		
Flood Zone	FEMA Flood Zone Designations	Improved Residential Parcels
High Risk Areas		
A	Areas with a 1% annual chance of flooding and a 26% chance of flooding over the life of a 30-year mortgage. Because detailed analyses are not performed for such areas; no depths or base flood elevations are shown within these zones.	
AE	The base floodplain where base flood elevations are provided. AE Zones are now used on new format FIRMs instead of A1-A30 Zones.	**1245**
A1-30	These are known as numbered A Zones (e.g., A7 or A14). This is the base floodplain where the FIRM shows a BFE (old format).	
AH	Areas with a 1% annual chance of shallow flooding, usually in the form of a pond, with an average depth ranging from 1 to 3 feet. These areas have a 26% chance of flooding over the life of a 30-year mortgage. Base flood elevations derived from detailed analyses are shown at selected intervals within these zones.	
AO	River or stream flood hazard areas, and areas with a 1% or greater chance of shallow flooding each year, usually in the form of sheet flow, with an average depth ranging from 1 to 3 feet. These areas have a 26% chance of flooding over the life of a 30-year mortgage. Average flood depths derived from detailed analyses are shown within these zones.	
AR	Areas with a temporarily increased flood risk due to the building or restoration of a flood control system (such as a levee or a dam). Mandatory flood insurance purchase requirements will apply, but rates will not exceed the rates for unnumbered A zones if the structure is built or restored in compliance with Zone AR floodplain management regulations.	
A99	Areas with a 1% annual chance of flooding that will be protected by a Federal flood control system where construction has reached specified legal requirements. No depths or base flood elevations are shown within these zones.	
High Risk - Coastal Areas		
V	Coastal areas with a 1% or greater chance of flooding and an additional hazard associated with storm waves. These areas have a 26% chance of flooding over the life of a 30-year mortgage. No base flood elevations are shown within these zones.	
VE, V1 - 30	Coastal areas with a 1% or greater chance of flooding and an additional hazard associated with storm waves. These areas have a 26% chance of flooding over the life of a 30-year mortgage. Base flood elevations derived from detailed analyses are shown at selected intervals within these zones.	**17**

Moderate to Low-Risk Areas		
B and X (shaded)	Area of moderate flood hazard, usually the area between the limits of the 100-year and 500-year floods. B Zones are also used to designate base floodplains of lesser hazards, such as areas protected by levees from 100-year flood, or shallow flooding areas with average depths of less than one foot or drainage areas less than 1 square mile	**2390**
C and X (unshaded)	Area of minimal flood hazard, usually depicted on FIRMs as above the 500-year flood level. Zone C may have ponding and local drainage problems that don't warrant a detailed study or designation as base floodplain. Zone X is the area determined to be outside the 500-year flood and protected by levee from 100-year flood.	
Undetermined Risk Areas		
D	Areas with possible but undetermined flood hazards. No flood hazard analysis has been conducted. Flood insurance rates are commensurate with the uncertainty of the flood risk.	
Total		**3,652**

Table 18: City of Belvedere Critical Facilities in the Flood Zones
Source: Marin County/FEMA DFIRM

Although the City of Belvedere has not experienced recent catastrophic flooding, floodwaters can be deep enough to drown people and move fast enough to sweep people and vehicles away, lift buildings off foundations, and carry debris that smashes into buildings and other property. Flood waters can cause significant erosion which can lead to slope instability, severely damaging transportation and utility infrastructure by undermining foundations or washing away pavement. If water levels rise high enough to get inside buildings, flooding can cause extensive damage to personal property and the structure itself. Flood events that develop very quickly are especially dangerous because there may be little advance warning. Flooding may occur when

strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Tide elevations within Richardson Bay and San Francisco Bay have the potential to significantly impact the Belvedere storm drain system. Belvedere sees flooding from king tides in Richardson Bay and San Francisco Bay and this is only expected to increase with sea level rise and climate change, placing increased stress on Belvedere's San Rafael Avenue sea wall. Flooding of both San Rafael Avenue and Beach Road simultaneously could impact ingress and egress into the residential area of Belvedere south of San Rafael Avenue, including the Belvedere Police Department, City Hall and Community Center, and potentially cut off access into the area entirely.

The Tiburon Peninsula saw nearly 40 inches of rain between October 2022 and March 2023, including nearly 24 inches between 12/29/2022 and 1/15/2023 that wreaked havoc, with storms frequently downing trees and power lines and flooding roads.

Climate Change and Future Development Considerations

Climate change is expected to affect California's precipitation patterns, which are likely to influence future flood events. A 2017 study[3] found that the number of very intense precipitation days in California is projected to more than double by the end of the century, increasing 117 percent, making it likely that flood events will become more frequent in the Marin County OA including Belvedere. Climate change is expected to alter rainfall patterns in Northern California, including the Marin County OA. As the climate warms, rain events are predicted to become more intense. The Marin County OA including Belvedere will likely experience more rain inundation events that lead to flooding and increase the potential threat of levee failure, tree mortality, and other potential hazards. Sea level rise as a result of climate change will exacerbate the impacts of tidal flooding in the lowland areas of the Marin County OA including around the Belvedere Lagoon. Future development in these areas including in Mallard Pointe will expose more people and infrastructure to the effects of tidal flooding and storm surge as a result of climate change.

2.2.5 Land Subsidence

Land subsidence is a gradual settling or sudden sinking of the Earth's surface owing to subsurface movement of earth materials. The principal causes are aquifer-system compaction, drainage of organic soils through groundwater pumping, underground mining, hydro-compaction, natural compaction, sinkholes, and thawing permafrost. More than 80 percent of the identified subsidence in the United States is a consequence of underground water exploitation. The increasing development of land and water resources threatens to exacerbate existing land-subsidence problems and initiate new ones.

Sinkholes can form in three primary ways. Dissolution sinkholes form when dissolution of the limestone or dolomite is most intensive where the water first contacts the rock surface. Aggressive dissolution also occurs where flow is focused in preexisting openings in the rock, such as along joints, fractures, and bedding planes, and in the zone of water-table fluctuation where groundwater is in contact with the atmosphere. See Figure 29 for a picture and description of how dissolution sinkholes form.

[3] Precipitation in a Warming World: Assessing Projected Hydro-Climate Changes in California and other Mediterranean Regaions. https://www.nature.com/articles/s41598-017-11285-y

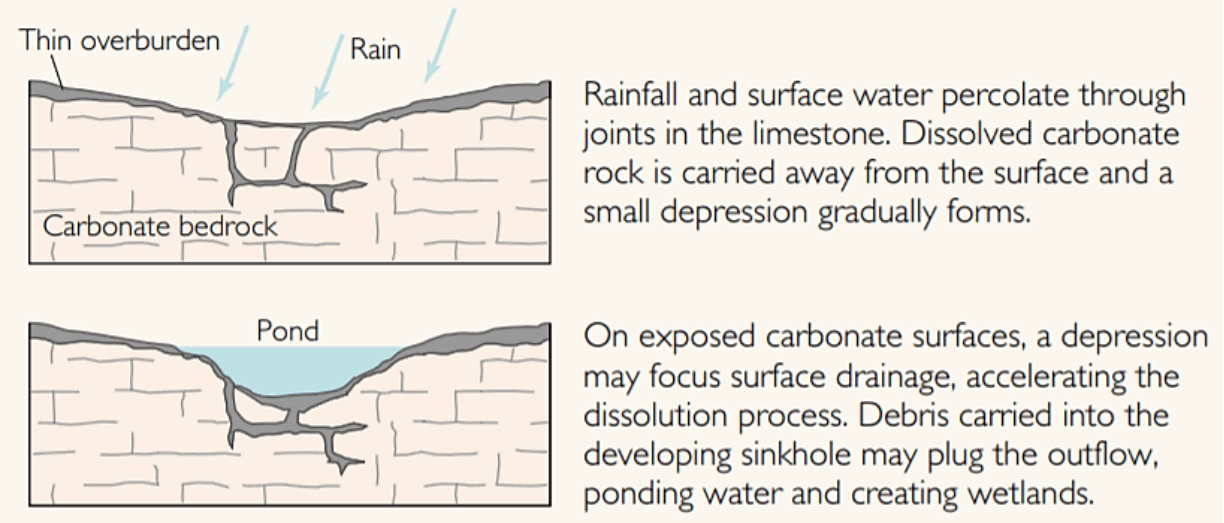

Figure 29: Dissolution Sinkhole Formation
Source: USGS

Cover-subsidence sinkholes tend to develop gradually where the covering sediments are permeable and contain sand. In areas where cover material is thicker, or sediments contain more clay, cover-subsidence sinkholes are relatively uncommon, are smaller, and may go undetected for long periods. See Figure 30 for a picture and description of how cover-subsidence sinkholes form.

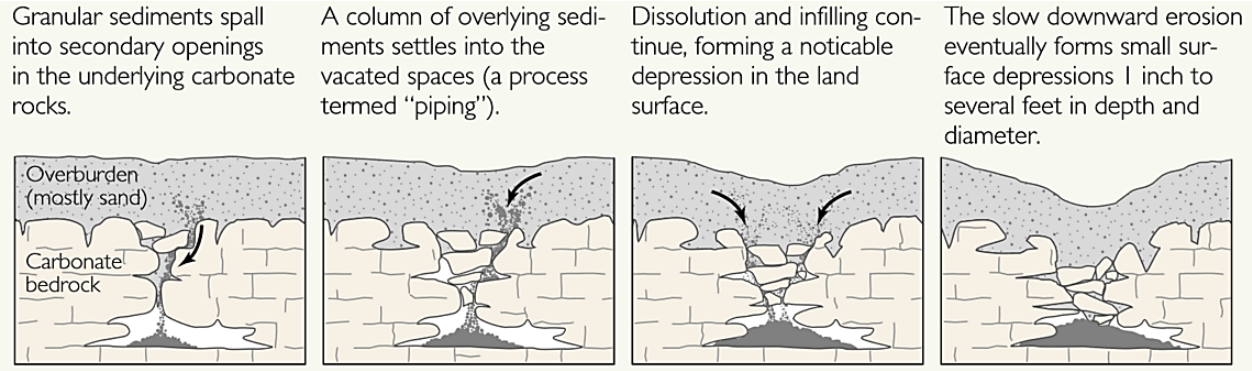

Figure 30: Cover-Subsidence Sinkhole Formation
Source: USGS

Cover-collapse sinkholes may develop abruptly over a period of hours and cause catastrophic damages. They occur where the covering sediments contain a significant amount of clay. Over time, surface drainage, erosion, and deposition of sediment transform the steep-walled sinkhole into a shallower bowl-shaped depression. See Figure 31 for a picture and description of how cover-collapse sinkholes form.

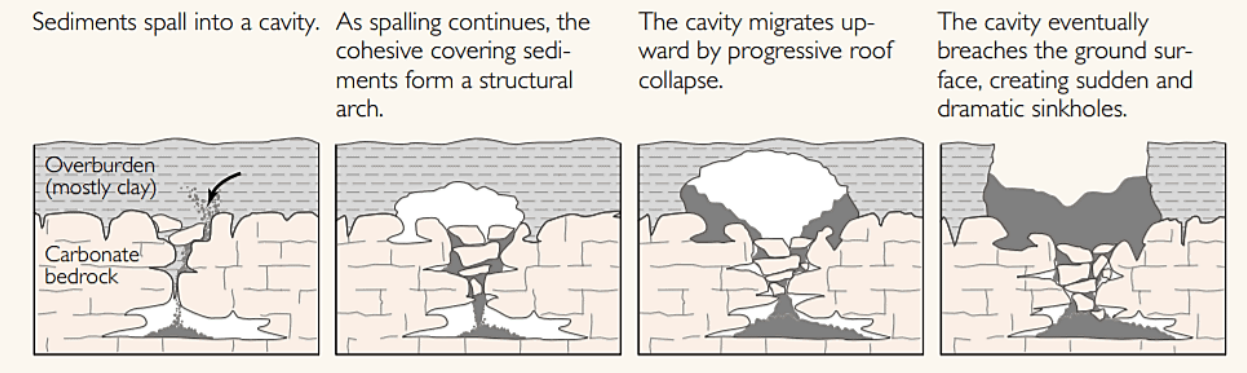

Figure 31: Cover-Collapse Sinkhole Formation
Source: USGS

New sinkholes have been correlated to land-use practices, especially from groundwater pumping and from construction and development practices that cause land subsidence. Sinkholes can also form when natural water-drainage patterns are changed and new water-diversion systems are developed. Some sinkholes form when the land surface is changed, such as when industrial and runoff-storage ponds are created. The substantial weight of the new material can trigger an underground collapse of supporting material, thus causing a sinkhole.

The overburden sediments that cover buried cavities in the aquifer systems are delicately balanced by groundwater fluid pressure. The water below ground helps to keep the surface soil in place. Groundwater pumping for urban water supply and for irrigation can produce new sinkholes in sinkhole-prone areas. If pumping results in a lowering of groundwater levels, then underground structural failure, and thus, sinkholes, can occur.

Areas in Belvedere designated with very high potential for land subsidence are generally located the Belvedere Lagoon. This area consists of hundreds of residences, several commercial buildings and the Belvedere Police Department, City Hall and Community Center building. Land subsidence could have numerous impacts for Belvedere, including the settling of businesses and homes as well as the shifting of roadways and utility infrastructure that run through the city. The lowland areas of Belvedere could anticipate increased rates of subsidence as bay waters saturate the soil from below.

There have been no major sinkholes recorded in Belvedere.

Climate Change and Future Development Considerations

Climate change could indirectly influence land subsidence as more severe and prolonged periods of drought may encourage more groundwater withdrawals. In coastal areas like the Marin County OA including Belvedere, land subsidence leads to higher sea levels and increased flood risk. The rate of land subsidence could increase across the Marin County OA including the lowland areas of Belvedere as a result of climate change. The impacts of land subsidence on infrastructure, including roads and underground utilities, in Belvedere could increase with future development in the lowland populated areas of the city, particularly the area around the Belvedere Lagoon and including Mallard Pointe, where land subsidence is more likely to occur.

2.2.6 LEVEE FAILURE

Levee failure is the overtopping, breach or collapse of the levee. Levees can fail in the event of an earthquake, internal erosion, poor engineering/construction or landslides, but levees most commonly fail as a result of significant rainfall or very high tides. During a period of heavy rainfall, the water on the water-body side of the levee can build up and either flow over the top ("overtopping") or put pressure on the structure causing quickening seepage and subsequent erosion of the earth. The overflow of water washes away the top portion of the levee, creating deep grooves. Eventually the levee weakens, resulting in a breach or collapse of the levee wall and the release of uncontrollable amounts of water. Figure 32 shows a levee and the multiple ways it can fail.

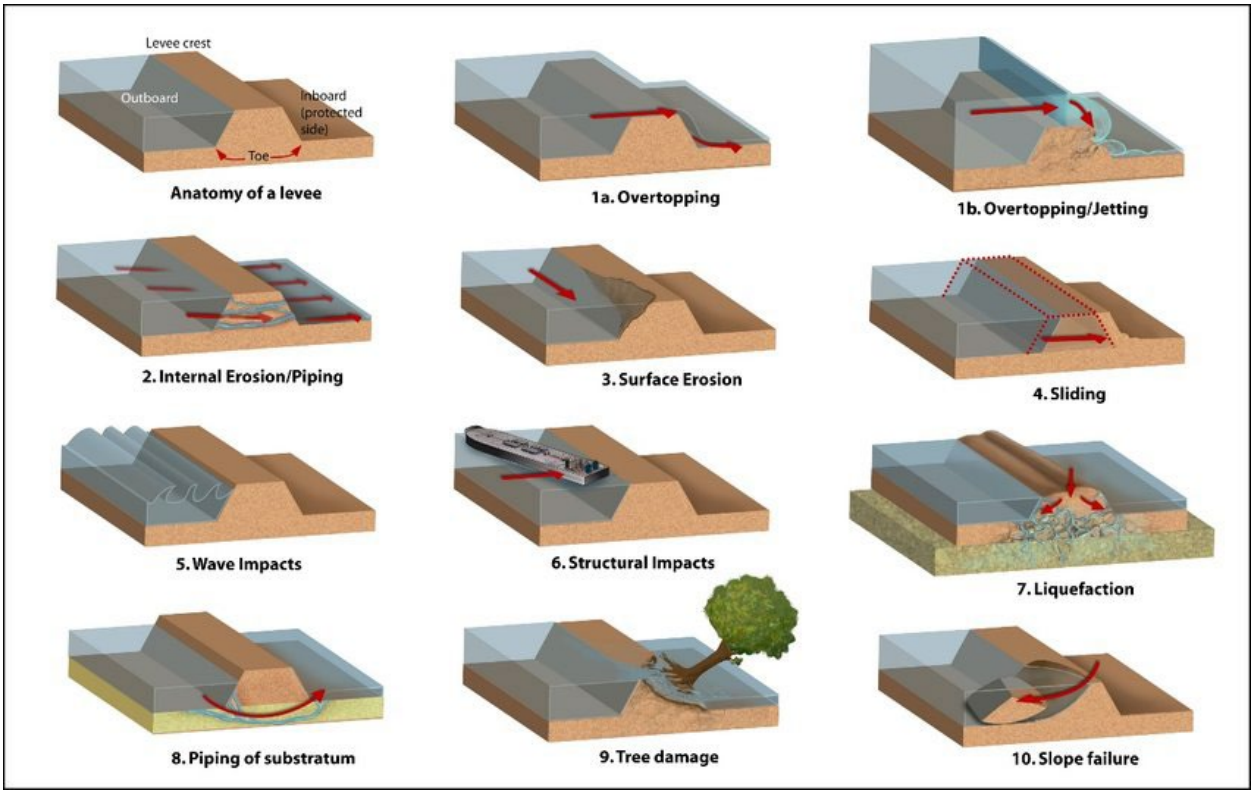

Figure 32: Levee Failure Mechanisms
Source: University of California

Belvedere is protected by one levee, the San Rafael Avenue sea wall along Richardson Bay. The seawall is 0.4 miles long with an undocumented height. Approximately 1,266 people and 349 buildings with a property value of $347 million in both the Town of Tiburon and Belvedere combined are at risk of a failure of the sea wall, including the area around the Belvedere Lagoon. The Belvedere Police Department, City Hall and Community Center building does not lie in the area at risk of a failure of the sea wall, though it lies just outside the area. A failure of the seawall during a high rain event could cause flooding across San Rafael Avenue and Beach Road. This could impact ingress and egress into the southern area of the city south of San Rafael Avenue, which includes the Belvedere Police Department, City Hall and Community Center building, and could potentially cut off access to this area entirely if both roads flood simultaneously.

On 10/10/2018, Belvedere declared a state of emergency due to increased shifting of the San Rafael Avenue sea wall. An inspection of the sea wall in 2017 revealed that portions of the concrete had crumbled and cracked and that a portion of the sea wall was sagging toward the water. The most problematic section directly across from Peninsula Road was at a high risk for failure. The levee had to be shored up.

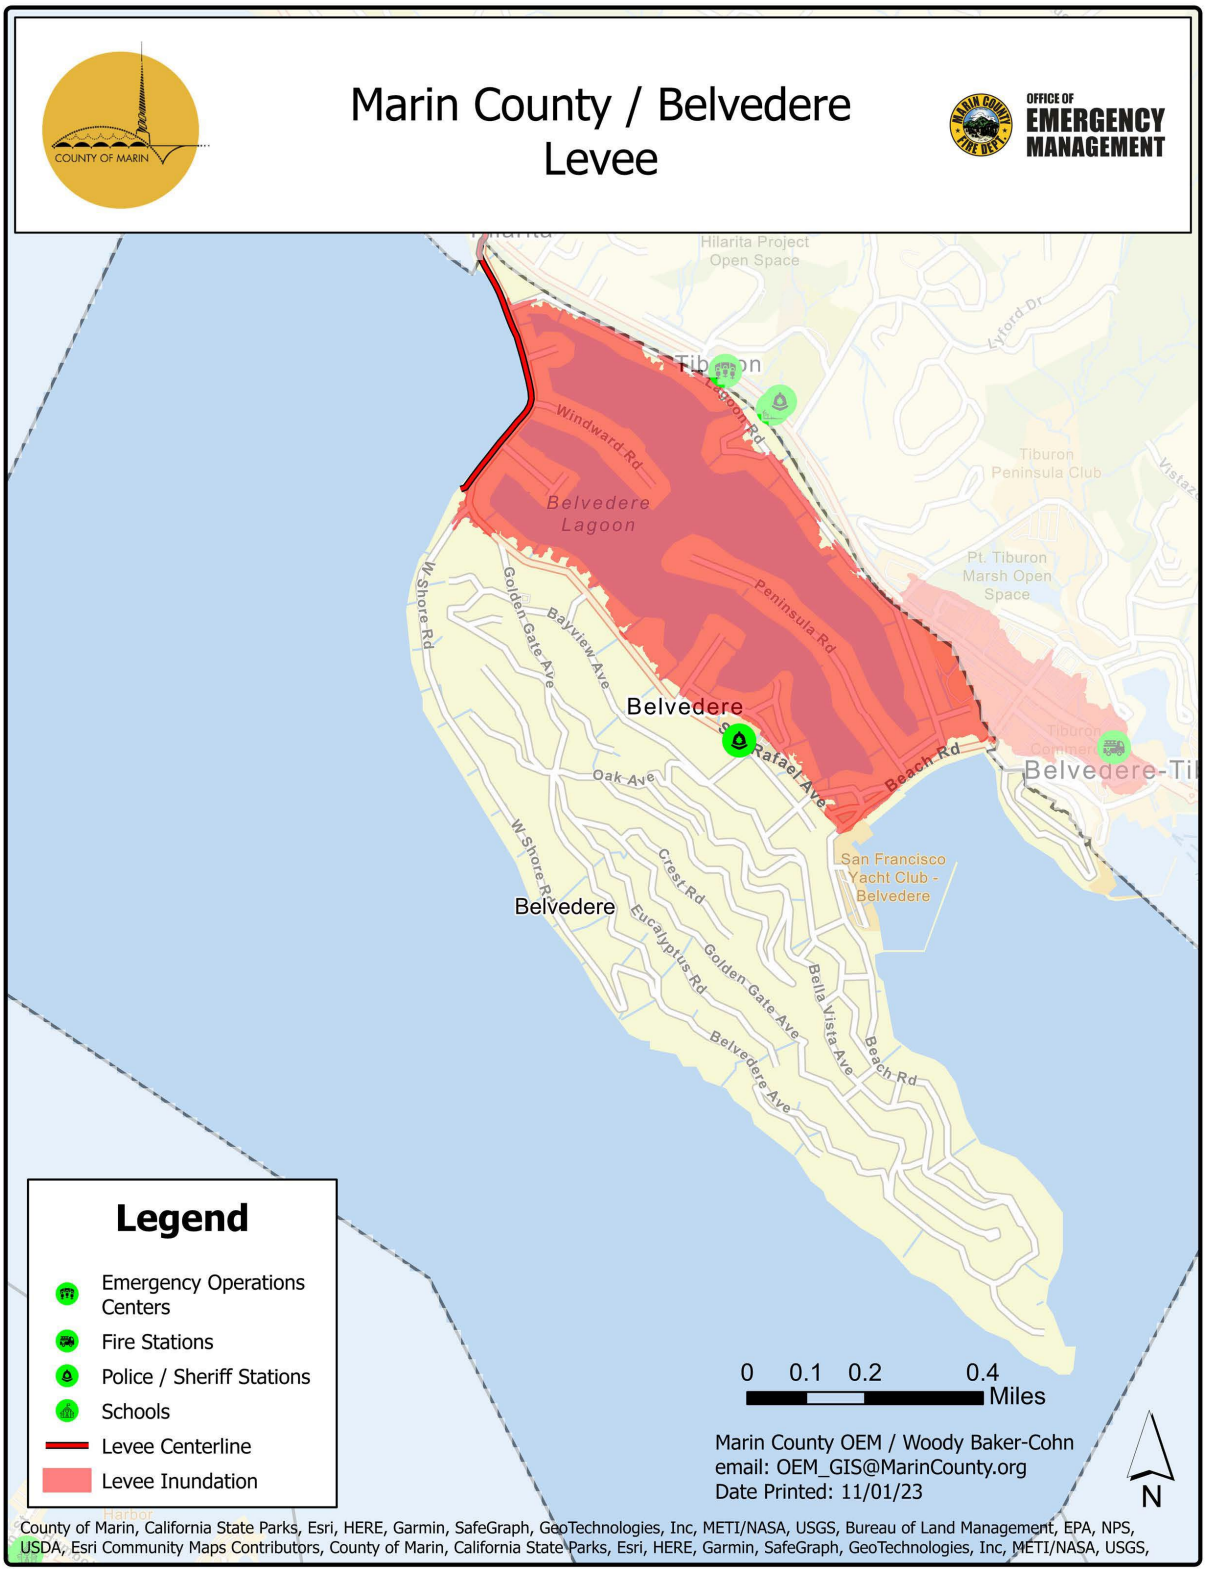

Figure 33: City of Belvedere Levee inundation and Critical Facilities Map
Source: Marin County OEM

Climate Change and Future Development Considerations

Climate change is expected to lead to an increase in the frequency and severity of major storm events, which can place added strain on levee systems. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in leveed areas across the Marin County OA including in Belvedere, increasing the potential for a levee failure. Rising seas will lead to increased stress on the levees around the Marin County OA shoreline including in Belvedere, particularly during a major tidal event and potential tsunami. As development increases in the populated areas of Belvedere, particularly around the Belvedere Lagoon including Mallard Pointe, the potential for significant impacts to residences, businesses and infrastructure will only increase.

2.2.7 Sea Level Rise

Climate change is the distinct change in measures of weather patterns over a long period of time, ranging from decades to millions of years. More specifically, it may be a change in average weather conditions such as temperature, rainfall, snow, ocean and atmospheric circulation, or in the distribution of weather around the average. While the Earth's climate has cycled over its 4.5-billion-year age, these natural cycles have taken place gradually over millennia, and the Holocene, the most recent epoch in which human civilization developed, has been characterized by a highly stable climate until recently.

The Marin County OA MJHMP is concerned with human-induced climate change that has been rapidly warming the Earth at rates unprecedented in the last 1,000 years. Since industrialization began, the burning of fossil fuels (coal, oil, and natural gas) at escalating quantities has released vast amounts of carbon dioxide and other greenhouse gases responsible for trapping heat in the atmosphere, increasing the average temperature of the Earth. Secondary impacts include changes in precipitation patterns, the global water cycle, melting glaciers and ice caps, and rising sea levels. According to the Intergovernmental Panel on Climate Change (IPCC), climate change will "increase the likelihood of severe, pervasive and irreversible impacts for people and ecosystems" if unchecked.

Through changes to oceanic and atmospheric circulation cycles and increasing heat, climate change affects weather systems around the world. Climate change increases the likelihood and exacerbates the severity of extreme weather – more frequent or intense storms, floods, droughts, and heat waves. Consequences for human society include loss of life and injury, damaged infrastructure, long-term health effects, loss of agricultural crops, disrupted transport and freight, and more. Climate change is not a discrete event but a long-term hazard, the effects of which communities are already experiencing.

Climate change adaptation is a key priority of the State of California. The 2013 State of California Multi- Hazard Mitigation Plan stated that climate change is already affecting California. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Rising sea levels are considered a secondary effect of climate change due to warming ocean temperatures and melting glacial ice sheets into the ocean. The California coast has already seen a rise in sea level of four to eight inches over the 20th century due to climate change. Sea level rise impacts can be exacerbated during coastal storms, which often bring increased tidal elevations called "storm surge." The large waves associated with such storm surges can cause flooding in low-lying areas, erosion of coastal wetlands, saltwater contamination of drinking water, disruption of septic system operations, impacts on roads and bridges, and increased stress on levees. In addition, rising sea levels results in coastal erosion as shoreline sediment is re-deposited back into the ocean. Evidence shows that winter storms have increased in frequency and intensity since 1948 in the North Pacific, increasing regional wave heights and water levels during storm events.

According to the 2017 "Rising Seas in California, An Update on Sea-Level Rise Science" report Marin County may experience impacts from Sea Level Rise over defined periods of time, to include long-term changes (second half of this century and beyond), and short- to mid-term projections (within the next two or three decades).

Parts of Belvedere are at a lower elevation than many of the coastal areas in Marin County. As such, the lowland areas in Belvedere, including the area around the Belvedere Lagoon that was built with fill, are particularly vulnerable to sea level rise and could experience between one and six feet of inundation (Mean High Water (MHW)), especially as these neighborhoods continue to subside over time. (Marin Shoreline Sea Level Rise Vulnerability Assessment, 2017). Hundreds of residences, several commercial buildings, and the Belvedere Police Department, City Hall and Community Center, lie in areas of Belvedere susceptible to sea level rise.

The following are key issues related to Belvedere sea level rise and a 100-year storm surge:

- San Rafael Avenue could be impacted after the medium-term, cutting off the first access point to the area of Belvedere south of it.
- Shoreline homes along West Shore and Beach Roads could expect impacts to utilities in the near and medium-terms, and potential structural impacts to any in water structures during storms, especially in the long-term.
- Residences around Belvedere Lagoon would be vulnerable to sea level rise flooding if the San Rafael Avenue sea wall is overtopped. These residences are also vulnerable to worsening subsidence.
- The Belvedere Corp Yard could be vulnerable to storm surge flooding in the near-term and tidal flooding in the long-term.
- Belvedere's Police Department, City Hall and Community Center building could expect impacts in the long-term, especially during storms. The park facility and roads fronting the building could expect flood waters sooner, creating potential access issues.

The assets most vulnerable to sea level rise and storm surges in Belvedere are single-family residential homes and San Rafael Avenue. Because the Belvedere Lagoon area was built on fill, several homes in the neighborhood around the lagoon could be vulnerable to subsidence. Several residences have already sunk below mean sea level, exposing them to additional potential flooding from sea level rise. Much of the Belvedere Lagoon area is protected from Richardson Bay by the San Rafael Avenue sea wall on the north and a wall with tides gates to the south. Some of the residences around the lagoon have vents and other utility lines under

the homes that could be vulnerable to increased saltwater exposure. Even if the lagoon is managed well enough to keep those homes bordering it dry, these homes may become isolated if tidewaters overtop the San Rafael Avenue sea wall or Beach Road. The lagoon area roads may experience increasing subsidence issues in addition to, and even before, flooding. In time, several additional roads in the lagoon area could be impacted by high tides on a regular basis. If the low-lying roads are compromised, people who live in the homes south of San Rafael Avenue could become isolated or prevented through travel for several hours or even several days a month. People with mobility or health constraints will be affected. If sea level rise occurs at the worst-case scenario predicted of five feet of sea level rise and a 100-year storm, much of the Belvedere Lagoon area could be lost to the sea, rendering the rest of Belvedere a potential island as it used to be. This would present major complications for those who travel through the lagoon area to get to their homes or jobs in the area of Belvedere south of San Rafael Avenue. The largest threat to emergency services is lost emergency vehicle access to Belvedere. High tides and storms could flood the roads in front of the Belvedere Police Department and, in the long-term, up to four feet of flooding could impact the property and the vehicles. In addition, though technically in Tiburon, the Tiburon Fire Department serves Belvedere and could be blocked from providing service if roads are severely flooded or if the station itself is flooded. Water transportation for recreational purposes is a major use of the San Francisco Yacht Club Marina off Belvedere. As sea level rises, the facility may need to make some adjustments or relocate. Several private piers and docks could also be damaged in storms and/or may need to be elevated.

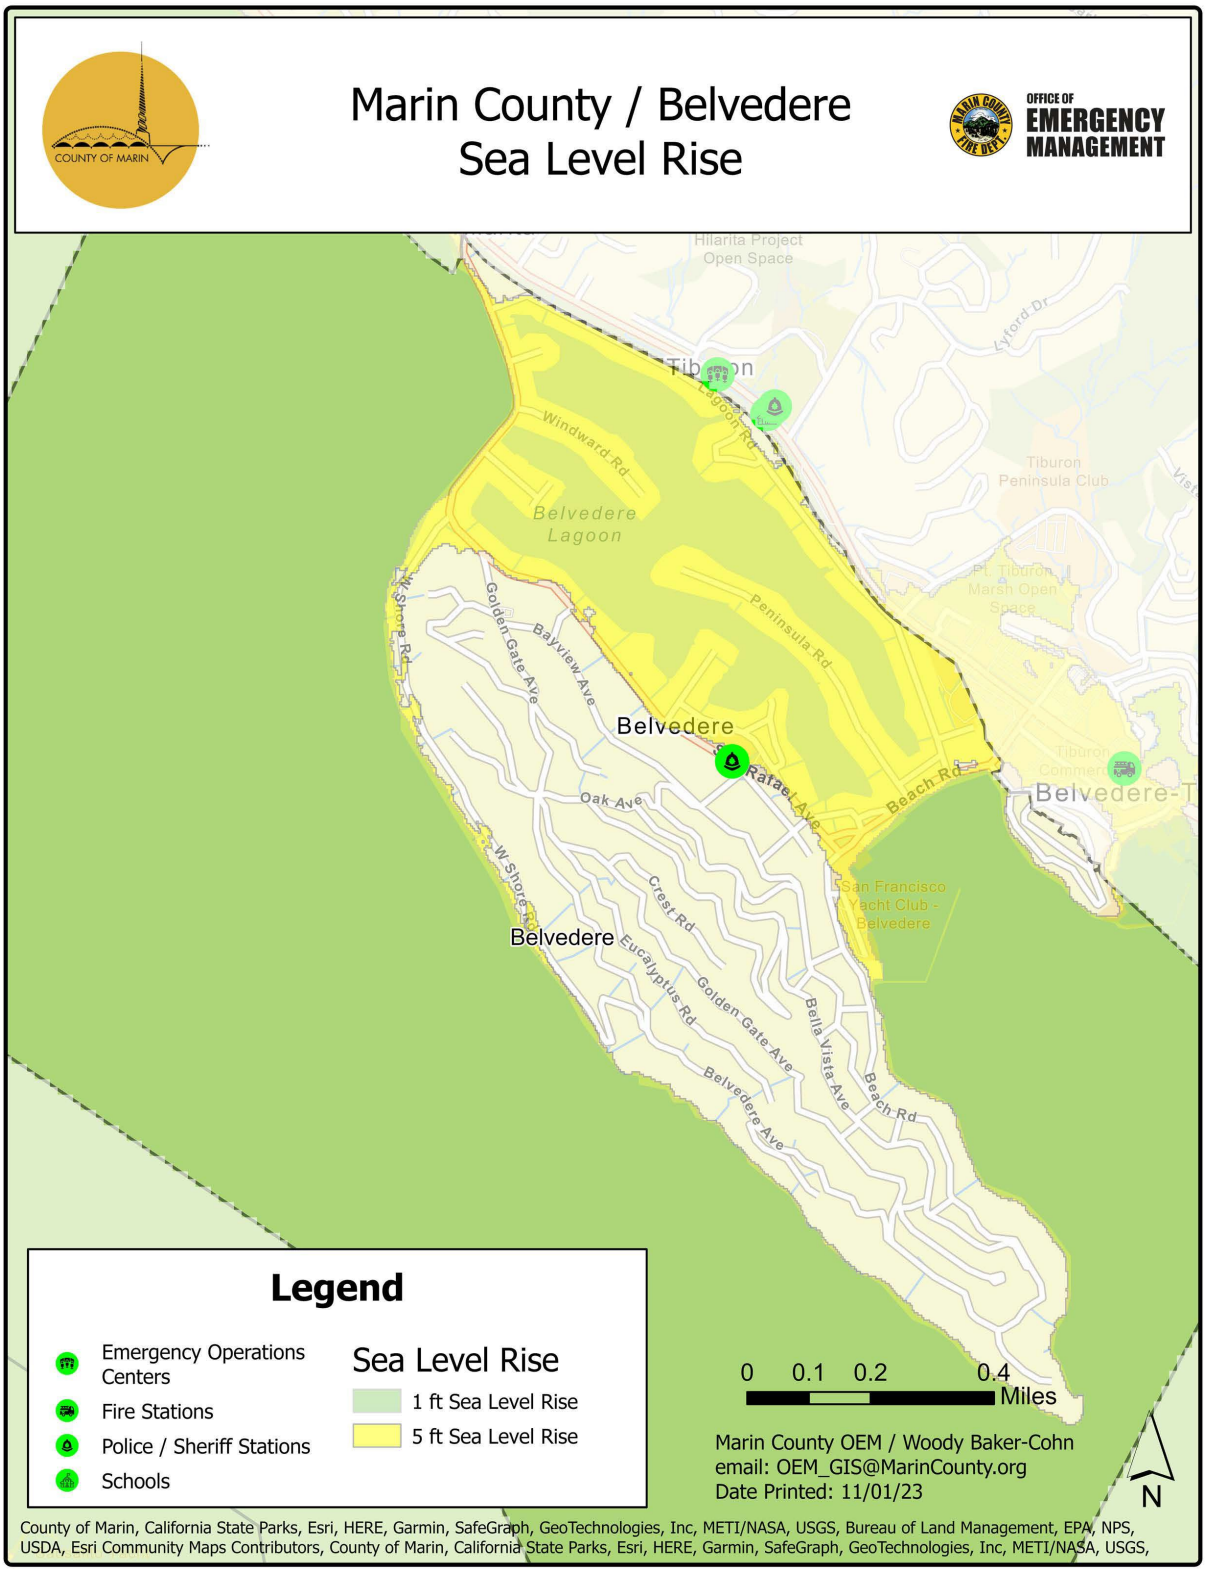

Figure 34: City of Belvedere Sea Level Rise
Source: Marin County OEM

The 2017 Marin Shoreline Sea Level Rise Vulnerably Assessment estimates that Belvedere could anticipate impacts to over 2,000 people and 550 living units with over $8.6 million in assessed property value as a result of a 100-year sea level rise scenario and including storm surge. Structures throughout the city can become damaged extensively with their foundations compromised over time. Of particular concern are those structures and infrastructure that have not been elevated to projected sea level rise heights over the next century. Sea level rise in Belvedere has the potential to exacerbate inland flooding when a significant rain or tidal event occurs, pushing water from the bays over their banks and into adjacent neighborhoods. Sea level rise can also cause increased subsidence along Belvedere's shoreline, which may damage underground water and wastewater pipelines and disrupt services. Belvedere would begin to experience seasonal, king tide, and storm surge flooding more frequently in the future.

Climate Change and Future Development Considerations

The two major causes of global sea level rise are thermal expansion of warming oceans and the melting of land-based glaciers and polar ice caps. Climate change is affecting natural and built systems around the world, including the California coast. In the past century, average global temperature has increased about 1.4°F, and average global sea level has increased 7 to 8 inches. Sea level rise in the San Francisco Bay Area is projected to increase by eight inches MHW in 2050 and could reach 4.5 to eight feet by 2021 if greenhouse gas emissions aren't reduced.

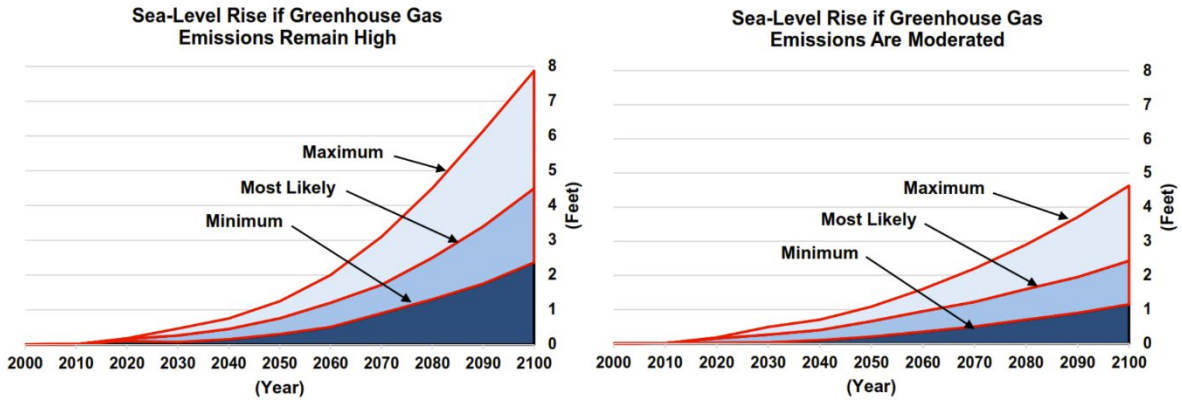

Figure 35: Projections of Sea Level Rise in the San Francisco Bay Area, 2000-2100
Source: 2019–2020 Marin County Civil Grand Jury, Climate Change: How Will Marin Adapt?

While the Marin County OA shoreline including around Belvedere already experiences regular erosion, flooding, and significant storm events, sea level rise will exacerbate these natural processes, leading to significant social, environmental, and economic impacts. The third National Climate Assessment cites strong evidence that the cost of doing nothing exceeds the costs associated with adapting to sea level rise by 4 to 10 times. Sea level rise will continue to affect the Marin County OA including Belvedere with increased tidal flooding and storm surge during severe weather events, and future development along the Marin County OA shoreline including around the Belvedere Lagoon will only amplify these impacts. Sea level can also lead to increased land subsidence and the potential of levee failure, particularly with the San Rafael Avenue sea wall. The impacts of a tsunami would also be magnified with rising seas. Future development in the coastal and lowland areas of Belvedere, including the Belvedere Lagoon area, will put more people and property at risk from flooding as a result of sea level rise. Roads

and utility infrastructure across Belvedere will continue to become inundated, impacting ingress and egress into the area of Belvedere south of San Rafael Avenue.

2.2.8 Severe Weather – Extreme Heat

Extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. A heat wave is an extended period of extreme heat, often with high humidity. When relative humidity is factored in, the temperature can feel much hotter as reflected in the Heat Index (see Figure 36):

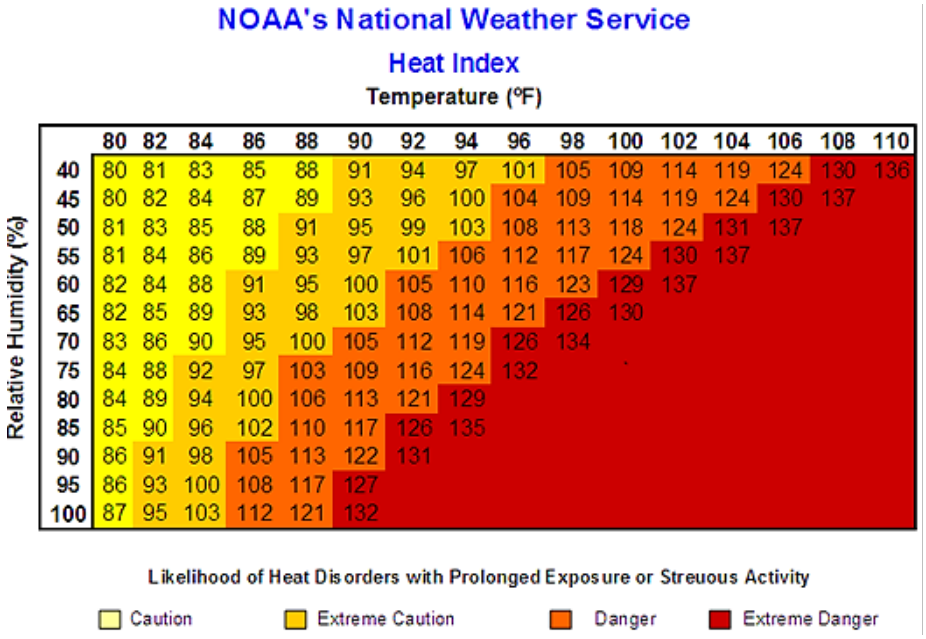

Figure 36: Heat Index
Source: NOAA

Heat kills by taxing the human body beyond its abilities. In a normal year, about 1,300 Americans succumb to the demands of summer heat. Heat is the leading weather-related cause of mortalities in the US. In 2006, California reported a high of 204 heat related deaths, with 98 reported in 2017 and 93 deaths reported in 2018.

Extreme heat has the potential to impact all areas of Belvedere and would be felt more at lower elevations in the city closer to the Town of Tiburon. Temperatures can feel warmer in this area due to the widespread presence of concrete and asphalt, which stores heat longer. Heat waves can cause power outages and can sicken people who are exposed to high temperatures too long, particularly infants and the elderly.

In September 2022 the Marin County OA experienced an Extreme Heat Event with temperatures exceeding 103 degrees.

Climate Change and Future Development Considerations

The primary effect of climate change is warmer average temperatures. The annual average daily high temperatures in California are expected to rise by 2.7°F by 2040, 5.8°F by 2070, and 8.8°F by 2100 compared to observed and modeled historical conditions. At the current rate,

annual average temperatures in the Marin County OA region and Bay Area will likely increase by approximately 4.4 degrees by 2050 and 7.2 degree by the end of the century unless significant efforts are made to reduce greenhouse emotions according to California's latest climate change assessment.

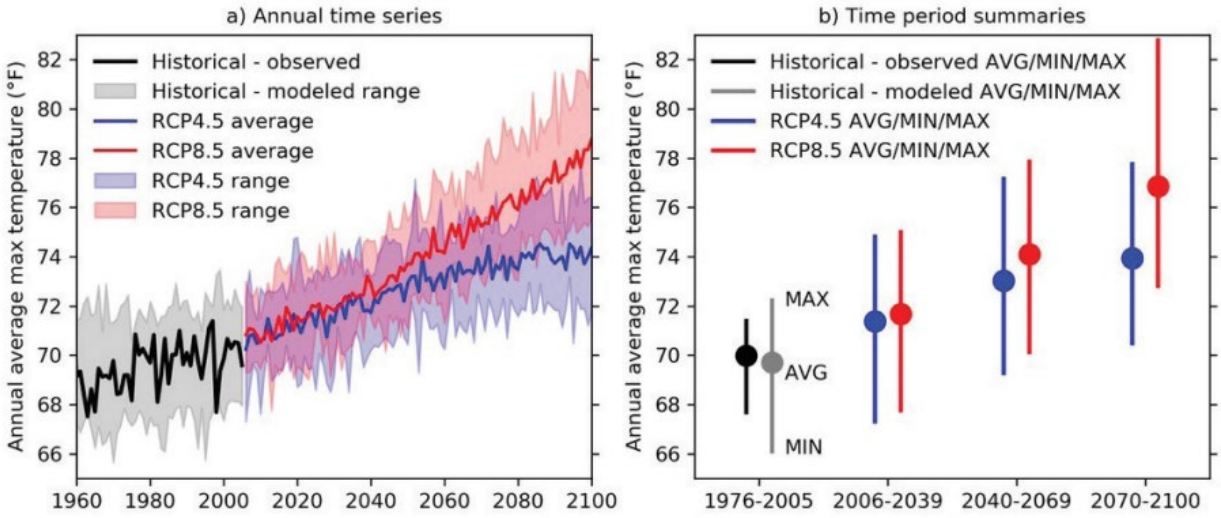

Figure 37: Annual Average Temperatures in the San Francisco Bay Area, 2000-2100
Source: California Climate Change Assessment (Fourth Edition)

As climate change accelerates in the 21st century, it is anticipated that extreme heat events will become more frequent and intense across the Marin County OA including in Belvedere. There will be increased residential and business needs for cooling and addressing heat-related issues. These effects would primarily be felt in the lowland areas of Belvedere where heat builds in developed areas. Heat waves also tax the energy grid. Future development in the Marin County OA including Belvedere could exacerbate the impacts from heat related events, particularly in electricity provision and water delivery. Increased temperatures will also lead to an increase in the occurrence and severity of wildfires across the Marin County OA including Belvedere as conditions become hotter and drier. These effects will primarily be felt in the open space areas of Belvedere including along the Tiburon Boulevard bike path where hotter and drier conditions are more apt to lead to wildfires. Future development near the open spaces around Belvedere could expose more people and infrastructure to the threat of wildfire as a result of increasing temperatures.

2.2.9 Severe Weather – High Wind & Tornado

High Wind

High wind is defined as a one-minute average of surface winds 40 miles per hour or greater lasting for one hour or longer, or winds gusting to 58 miles per hour or greater regardless of duration that are either expected or observed over land. These winds may occur as part of a seasonal climate pattern or in relation to other severe weather events such as thunderstorms. The Beaufort scale is an empirical measure that relates wind speed to observed conditions on land and is a common measure of wind intensity (see Figure 38).

Beaufort number	Description	Wind speed		Land conditions
		kts	km/h	
0	Calm	< 1	< 1	Calm. Smoke rises vertically.
1	Light air	1 – 2	1 – 5	Wind motion visible in smoke.
2	Light breeze	3 – 6	6 – 11	Wind felt on exposed skin. Leaves rustle.
3	Gentle breeze	7 – 10	12 – 19	Leaves and smaller twigs in constant motion.
4	Moderate breeze	11 – 15	20 – 28	Dust and loose paper raised. Small branches begin to move.
5	Fresh breeze	16 – 20	29 – 38	Branches of a moderate size move. Small trees begin to sway.
6	Strong breeze	21 – 26	39 – 49	Large branches in motion. Whistling heard in overhead wires. Umbrella use becomes difficult. Empty plastic garbage cans tip over.
7	High wind, Moderate gale, Near gale	27 – 33	50 – 61	Whole trees in motion. Effort needed to walk against the wind. Swaying of skyscrapers may be felt, especially by people on upper floors.
8	Gale, Fresh gale	34 – 40	62 – 74	Some twigs broken from trees. Cars veer on road. Progress on foot is seriously impeded.
9	Strong gale	41 – 47	75 – 88	Some branches break off trees, and some small trees blow over. Construction/temporary signs and barricades blow over. Damage to circus tents and canopies.
10	Storm, Whole gale	48 – 55	89 – 102	Trees are broken off or uprooted, saplings bent and deformed. Poorly attached asphalt shingles and shingles in poor condition peel off roofs.
11	Violent storm	56 – 63	103 – 117	Widespread vegetation damage. Many roofing surfaces are damaged; asphalt tiles that have curled up and/or fractured due to age may break away completely.
12	Hurricane	≥ 64	≥ 118	Very widespread damage to vegetation. Some windows may break; mobile homes and poorly constructed sheds and barns are damaged. Debris may be hurled about.

Figure 38: Beaufort Wind Scale
Source: NOAA

Windstorms in the Marin County OA are typically straight-line winds. Straight-line winds are generally any thunderstorm wind that is not associated with rotation (i.e., is not a tornado). It is these winds, which can exceed 100 mph, which represent the most common type of severe weather and are responsible for most wind damage related to thunderstorms.

Tornado

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes are the most powerful storms that exist, and damage paths can be in excess of one mile wide and 50 miles long. The Enhanced Fujita Scale (see Figure 39) is commonly used to rate the intensity of tornadoes in the United States based on the damages that they cause.

Enhanced Fujita Scale	
EF-0	65-85 mph winds
EF-1	86-110 mph winds
EF-2	111-135 mph winds
EF-3	136-165 mph winds
EF-4	166-200 mph winds
EF-5	>200 mph winds

Figure 39: Enhanced Fujita Scale
Source: NOAA

Tornadic waterspouts are tornadoes that form over water or move from land to water. They have the same characteristics as a land tornado. They are associated with severe thunderstorms, and are often accompanied by high winds and seas, large hail, and frequent dangerous lightning.

Figure 40: Waterspout Formation
Source: MarineInsights

All of Belvedere is susceptible to storms and damage from wind and tornadoes particularly those areas throughout the city that have increased susceptibility due to a higher presence of trees. Drought can increase the susceptibility of trees toppling over in a high wind event. Fallen trees could damage homes and other facilities. Power lines could be impacted by fallen trees

and wind, causing power outages. Roadways could also become blocked by fallen trees, affecting the ability of residents to reach their homes.

Belvedere has not experience a high wind event or tornado that caused notable damage.

Climate Change and Future Development Considerations

It is anticipated that the atmospheric rivers that deliver storms to Northern California may intensify because of climate change. This increase in storm intensity may bring more intense winds and potential tornados to Northern California, including the Marin County OA and Belvedere. Significant wind events and tornados can topple trees, particularly those that may be saturated, or drought stressed as a result of climate change. An increase in fallen trees in Belvedere as a result of increased storms due to climate change can lead to an increase in power outages. Future development in any of the areas of high tree cover throughout Belvedere including in residential areas will increase the effects of severe wind events.

2.2.10 TSUNAMI

Tsunamis consist of waves generated by large disturbances of the sea floor, which are caused by volcanic eruptions, landslides or earthquakes. Shallow earthquakes along dip slip faults are more likely to be sources of tsunami than those along strike slip faults. The West Coast/Alaska Tsunami Warning Center (WC/ATWC) is responsible for tsunami warnings. Tsunamis are often incorrectly referred to as tidal waves. They are actually a series of waves that can travel at speeds averaging 450 (and up to 600) miles per hour with unusual wave heights. Tsunamis can reach the beach before warnings are issued.

A tsunami experienced by Belvedere would most likely occur from an earthquake, the location of which would determine the amount of time that the tsunami waves would reach the city. Areas of Belvedere in the 100 and 500-year floodplain are at a lower elevation and lie in a tsunami hazard area, including most of the area around the Belvedere Lagoon. This area includes hundreds of residences, several commercial buildings and the Belvedere Police Department, City Hall and Community Center. Both San Rafael Avenue and Beach Road, the two access points into Belvedere, lie in a tsunami inundation zone. The California Geological Survey and the California Office of Emergency Services estimate that a thirteen-foot wall of water could impact the Belvedere Lagoon area in a major tsunami event. The tsunami inundation zone extends into the Town of Tiburon and includes the Tiburon Fire Protection District Station #11 that serves Belvedere. Belvedere could essentially become isolated in a major tsunami event, affecting the provision of emergency services to Belvedere residents. A major tsunami event could place increased stress on the San Rafael Avenue sea wall in Belvedere.

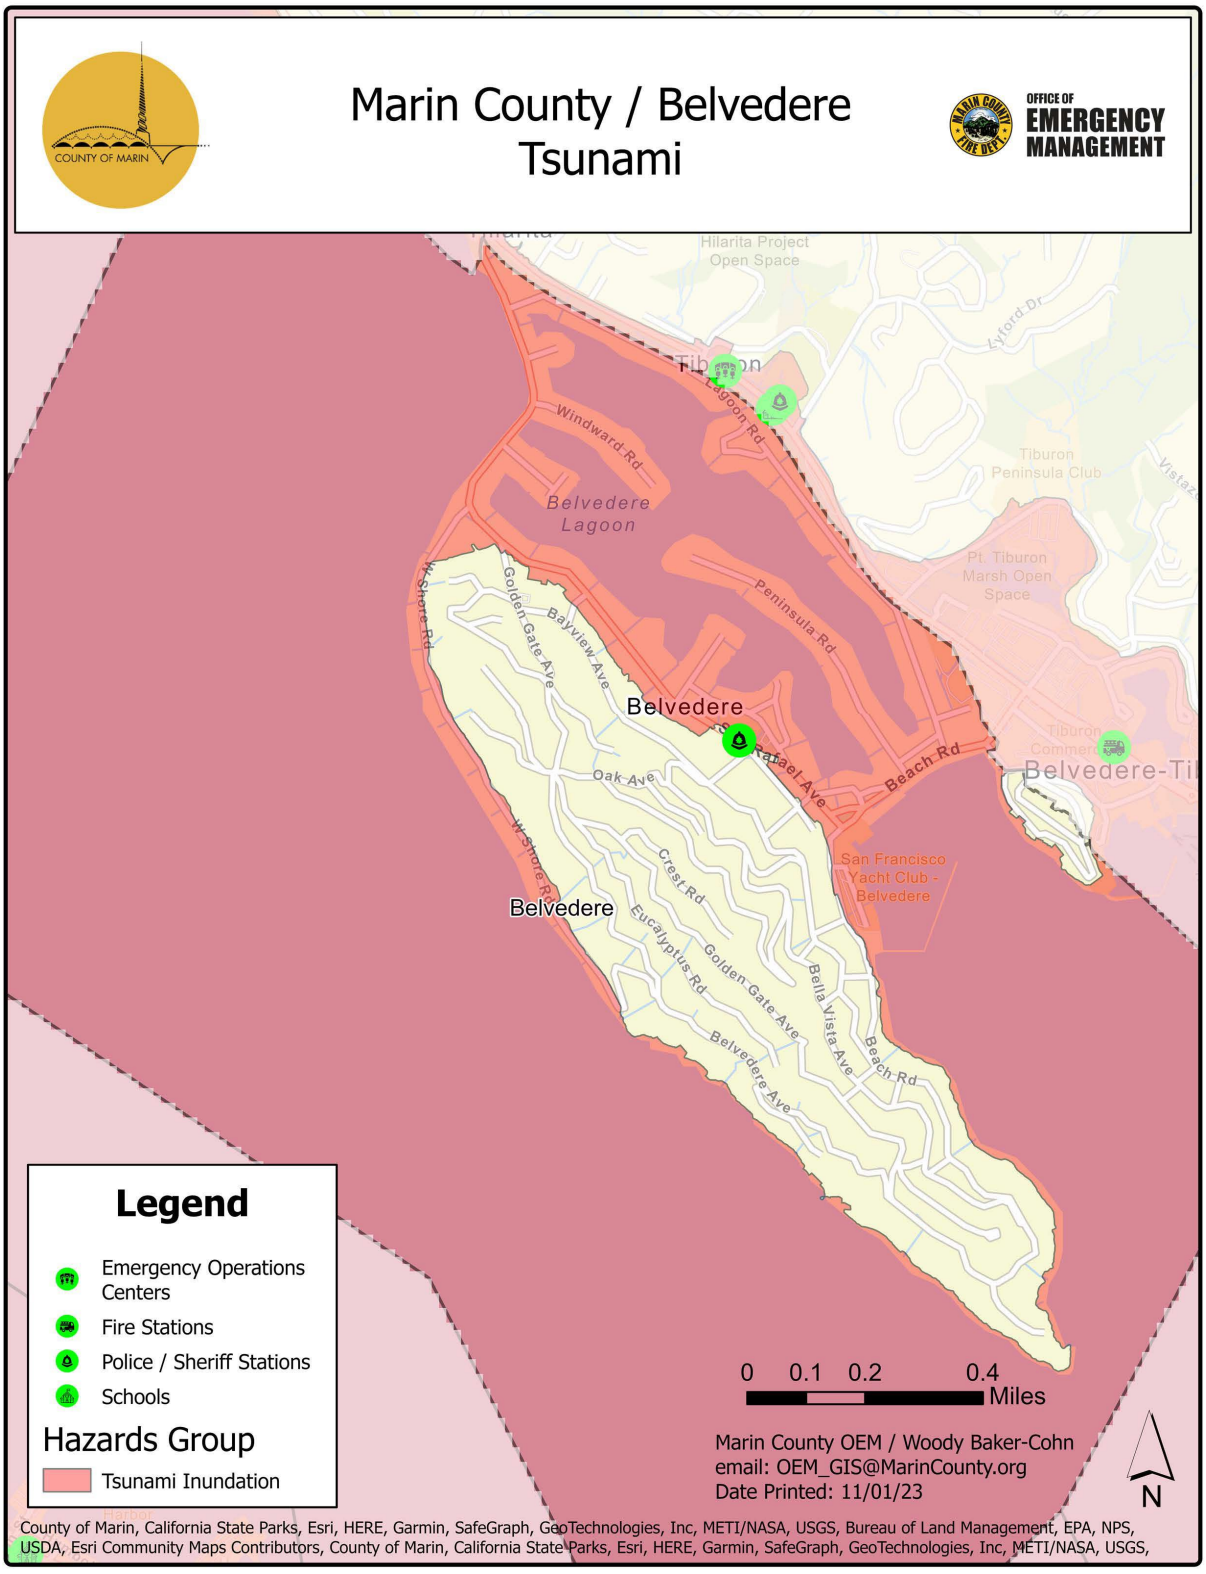

Figure 41: City of Belvedere Tsunami Critical Facilities and Infrastructure
Source: Marin County OEM

Belvedere has never experienced a tsunami, however, given its proximity to Richardson Bay and San Francisco Bay, it could potentially experience the impacts of one.

Climate Change and Future Development Considerations

The biggest threat to tsunamis is sea level rise which is a direct result of climate change. Sea level rise can make tsunamis worse than they already are because higher sea levels allow for tsunamis to travel further inland and cause even more damage. Sea level rise results in more vulnerable coastlines which make coastal communities even more vulnerable to an incoming tsunami as the natural buffer to absorb the energy of an incoming tsunami will cease to exist. This is particularly true in the Marin County OA including Belvedere, where the Belvedere Lagoon area lies in an area vulnerable to sea level rise. Furthermore, it has been theorized that ocean warming, caused by climate change, can impact the tectonic plates that rest below large bodies of water. Ultimately, this can result in more geological activities and worse tsunamis. Climate change has also affected ocean patterns, which could eventually lead to tsunamis distributing themselves across the ocean and impacting areas that are currently not susceptible to a tsunami. Tsunamis as a result of climate change and associated sea level rise will exacerbate the impacts of flooding in the lowland areas of the Marin County OA including Belvedere. This is particularly true in the Belvedere Lagoon area where additional storm surge as a result of a larger tsunami could cause greater impacts. Future development in this area including Mallard Pointe will expose more people and infrastructure to the effects of flooding in as tsunami inundation areas expand with climate change. Flooding could be exacerbated in Belvedere with a failure or overtopping of the San Rafael Avenue sea wall as a result of higher wave heights associated with a more significant tsunami and higher sea levels as a result of climate change.

2.2.11 WILDFIRE

A wildfire is a fire that occurs in an area of combustible vegetation. The three conditions necessary for a wildfire to burn are fuel, heat, and oxygen. Fuel is any flammable material that can burn, including vegetation, structures, and cars. The more fuel that exists and the drier that fuel is, the more intense the fire can be. Wildfires can be started naturally through lightning or combustion or can be set by humans. There are many sources of human-caused wildfires including arson, power lines, a burning campfire, an idling vehicle, trains, and escaped controlled burns. On average, four out of five wildfires are started by humans. Uncontrolled wildfires fueled by wind and weather can burn acres of land and everything in their path in mere minutes and can reach speeds up to 15 miles per hour or faster depending upon wind speed and ember distribution. On average, more than 100,000 wildfires burn 4 to 5 million acres of land in the United States every year. Although wildfires can occur in any state, they are most common in the Western states including California where heat, drought, and thunderstorms create perfect wildfire conditions.

Wildfires are of primary concern when they occur in the Wildland Urban Interface (WUI), which is defined as areas where homes are built near or among lands prone to wildfire. Even relatively small acreage fires may result in disastrous damages. Most structures in the WUI are not destroyed from direct flame impingement, but from embers carried by wind. The damages can be widely varying, but are primarily reported as damage to infrastructure, built environment, and injuries to people.

The pattern of increased damages is directly related to increased urban spread into historical forested areas that have wildfire as part of the natural ecosystem. Many WUI fire areas have long histories of wildland fires that burned only vegetation in the past. However, with new development, a wildland fire following a historical pattern may now burn these newly developed areas. WUI fires can occur where there is a distinct boundary between the built and natural areas or where development or infrastructure has encroached or is intermixed in the natural area. WUI fires may include fires that occur in remote areas that have critical infrastructure easements through them, including electrical transmission towers, railroads, water reservoirs, communications relay sites or other infrastructure assets.

Consequently, wildland fires that burn in natural settings with little or no development are part of a natural ecological cycle and may actually be beneficial to the landscape. Century old policies of fire exclusion and aggressive suppression have given way to better understanding of the importance fire plays in the natural cycle of certain forest types.

Warning times are usually adequate to ensure public safety, provided that evacuation recommendations and orders are heeded in a timely manner. While in most cases wildfires are contained within a week or two of outbreak, in certain cases, they have been known to burn for months, or until they are completely extinguished by fall rains.

Wildfire poses the greatest risk to human life and property in the Marin County OA's densely populated WUI, which holds an estimated 69,000 living units. The Marin County OA is home to 23 communities listed on CAL FIRE's Communities at Risk list, with approximately 80% of the total land area in the county designated as having moderate to very high fire hazard severity ratings. The county has a long fire history with many large fires over the past decades, several of which have occurred in the WUI. To compound the issue, national fire suppression policies and practices have contributed to the continuous growth (and overgrowth) of vegetation resulting in dangerously high fuel loads. The Community Wildfire Protection Plan (CWPP) provides a scientifically based assessment of wildfire threat in the WUI of the Marin County OA.

Fire protection in California is the responsibility of either the federal, state, or local government depending upon the location of the incident. On federally owned land, or federal responsibility areas (FRA), fire protection is provided by the federal government, and or in partnership with local agreements. In state responsibility areas (SRA), CAL FIRE typically provides fire protection. However, in some counties CAL FIRE contracts with county fire departments to provide protection of the SRA – this is the case in the Marin County OA, where CAL FIRE contracts with MCFD. Local responsibility areas (LRA) include incorporated cities and cultivated agriculture lands, and fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

CAL FIRE contracts with MCFD to provide wildland fire protection and associated fire prevention activities for lands designated by the State Board of Forestry as SRA.. The MCFD is responsible for the protection of approximately 200,000 acres of SRA within the county and is the primary agency that handles wildland fires. MCFD also provides similar protection services to approximately 100,000 acres of FRA in the Golden Gate National Recreation Area (GGNRA), the Muir Woods National Monument, and the Point Reyes National Seashore.

Figure 42 indicates the federal responsibility areas, state responsibility areas and local responsibility areas in the Marin County OA.

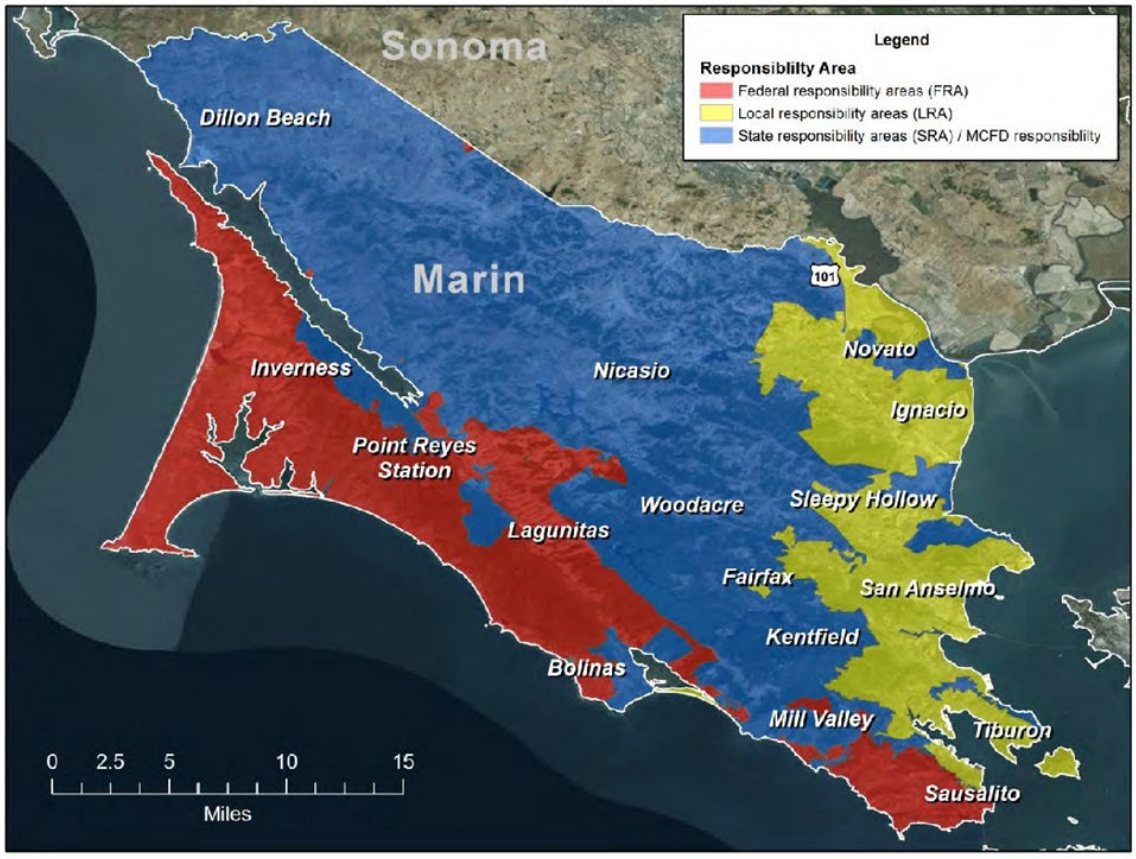

Figure 42: Federal, State and Local Responsibility Areas in the Marin County OA
Source: Marin Community Wildfire Protection Plan, 11/27/23

The mix of weather, diverse vegetation and fuel characteristics, complex topography, and land use and development patterns in the Marin County OA are important contributors to the fire environment. The MCFD Woodacre ECC currently manages the data from four Remote Automated Weather Stations (RAWS) for predicting fire danger utilizing the National Fire Danger Rating System (NFDRS) during the fire season. The RAWS are located in Woodacre, Middle Peak, Barnabe, Big Rock and a new station will be coming online in Novato.

The Marin County OA is bounded by the cool waters of the Pacific Ocean to the west, the San Francisco and Richardson Bays to the southeast, the San Pablo Bay to the east, and Sonoma County agricultural lands to the north. The combination of these large bodies of water, location in the mid-latitudes, and the persistent high pressure over the eastern Pacific Ocean results in several micro-climates. Weather in the OA consists of warm, dry summers and cool, wet winters. The climate in early fall and late spring is generally similar to the summer, and late fall is similar to winter. Spring is generally cool, but not as wet as the winter. While these general weather conditions are fairly representative of the typical Marin County OA weather, complex topography, annual variability of weather patterns, and less frequent and transient weather patterns are important to fire conditions.

In the late spring through early fall, the combination of frequent and strong high-pressure systems (known as the Pacific High) over California combined with the cool waters of the ocean/bays results in persistent fog and low clouds along the coast (including over the southern

Marin County OA near the San Francisco Bay) with winds. The fog often penetrates into the inland valleys of the northern and central Marin County OA, especially during overnight hours. At the coastline, mist from fog can keep the land surfaces modestly moist while inland land surfaces above the fog or inversion are often very dry.

The Pacific High that persists from late spring through early fall over the eastern Pacific, combined with a thermal low pressure over the Central Valley of California, results in an almost continuous sea breeze. These winds usher in cool and moist air and can be strong at times (15 to 25 mph), especially over the ridge tops and through northwest to southeast lying valleys, including San Geronimo/Ross, Hicks, Lucas Valleys, and Mill Valley and the Marin Headlands. These westerly winds are usually highest in the afternoon, decrease in the evening, and are light overnight before increasing again in the late morning/early afternoon.

Occasionally in the summer and more often in the fall, the Pacific High moves inland and centers over Oregon and Idaho, while low pressure moves from the Central Valley of California to southern California and Arizona. The resulting north-to-south pressure gradient can be strong enough to retard the typical sea breeze and can even result in winds blowing from the land to the ocean (offshore winds). As the offshore winds move air from the Central Valley to the coastal areas of California, the air descends and compresses, which greatly warms and dries the air. Under these “Diablo” wind conditions, temperatures in the Marin County OA can reach 100°F in the inland areas and even 80°F at the coast, and relative humidity can be very low. In addition, wind speeds can be high (20 to 40 mph), gusty and are often much faster over the mountains and ridge tops such as Mt. Tamalpais, Loma Alta, Marin Headlands and Mt. Burdell compared to low-lying areas. Wind speeds can be high over the ridges and mountains at all times of day under this “offshore” wind pattern and are often much slower or even calm at night in low-lying areas because nighttime cooling decouples the aloft winds from the surface winds. It is during these Diablo wind events that there is a high potential for large, wind-driven fires should there be an ignition. Historically, the largest and most destructive fires have occurred during these offshore (also known as Foehn) wind events including the Angel Island and the Vision fires which were located in West Marin.

A few times per year in the summer and early fall, monsoonal flow from Mexico may bring in moist and unstable air over central and northern California, which can result in thunderstorms with or without precipitation. With the otherwise dry summer conditions, lightning from this type of weather pattern can ignite fires. These monsoonal flow patterns are usually only one to two-day events.

Beginning in late November and lasting through the end of March, the Pacific High moves south and weakens, allowing storms that originate in the Gulf of Alaska to move over California.

These storms bring precipitation and, at times, strong winds out of the south. Each storm usually results in one fourth inch to several inches of rain over a day or so. Near Mt. Tamalpais, rainfall amounts are enhanced by orographic lifting, resulting in higher rain amounts in the Kentfield and Fairfax areas compared to the rest of the county. Typically, after the first rain in November, the cool weather and occasional storm keeps the ground wet through late Spring. However, in some years, significant rain does not occur until later in the year (e.g., early-to-late December) and there can be several weeks without any storms and rain. During storms, temperatures are usually mild.

When there are no storms over California, a land-breeze typically forms (i.e., winds blowing from the Central Valley to the Pacific Ocean). These winds can reach 30 mph, and travel through the southeast to northwest lying valleys, over low-lying ridges such as the Marin Headlands, and through the Golden Gate. These winds are usually highest in the mid-morning hours and decrease in the afternoon as the Central Valley warms during the day. The winds are associated with cold and modestly moist air.

In late February/early March through late April, the Pacific High strengthens and moves north, and storms impacting the county become less frequent. During this time of year there is often a low-pressure area over the desert in southwest California. The combination of the Pacific High to the north and low-pressure to the southwest results in strong winds blowing from the northwest to the southeast. Like the sea breeze, these winds bring in cool, moist air and are usually highest in the afternoon hours. Because of winter and spring rains, the land is wet and there is little danger of wildland fire despite the strong winds and only occasional precipitation. There is often little coastal fog this time of year.

Vegetation, which is also known as fuel, plays a major role in fire behavior and potential fire hazards. A fuel's composition, including moisture level, chemical make-up, and density, determines its degree of flammability. Of these, fuel moisture level is the most important consideration. Generally, live trees contain a great deal of moisture while dead logs contain very little. The moisture content and distribution of fuels define how quickly a fire can spread and how intense or hot it may become. High moisture content will slow the burning process since heat from the fire must first eliminate moisture.

In addition to moisture, a fuel's chemical makeup determines how readily it will burn. Some plants, shrubs, and trees such as chamise and eucalyptus (both present in the Marin County OA) contain oils or resins that promote combustion, causing them to burn more easily, quickly, and intensely.

Finally, the density of a fuel influences its flammability; when fuels are close together but not too dense, they will ignite each other, causing the fuel to spread readily. However, if fuels are so close that air cannot circulate easily, the fuel will not burn freely.

The Marin County OA has extensive topographic diversity that supports a variety of vegetation types. Marin County's OA has significant changes in topography with steep vegetated slopes which can also add to the ability of the fuel to further expand a wildfire.

Environmental factors, such as temperature, precipitation, soil type, aspect, slope, and land use history, all help determine the existing vegetation at any given location. In the central and eastern parts of the county, north facing slopes are usually densely wooded from lower elevations to ridge peaks with a mixture of mostly hardwood tree species such as coast live oak, California bay, Pacific madrone, and other oak species. Marshlands are also present throughout the county; once ignited marsh fires can be difficult to contain and extinguish.

Grasslands with a mixture of native and nonnative annual and perennial plant species occur most often in the northern and western parts of the county due to a combination of soil type, lower rainfall, and a long history of ranching. The southern and western facing slopes tend to have a higher percentage of grasslands, which in turn have the potential to experience higher rates of fire spread. Grassland fires are dangerous even without extreme fire weather scenarios

due to the rapid rate of fire spread; in some cases, fires spread so quickly that large areas can burn before response resources are able to arrive.

In the west portion of the county closer to the coast, where precipitation is higher and marine influence is greater, most areas are densely forested with conifer species (i.e., Bishop pine, Douglas-fir, and coast redwood) and associated hardwood species. Chaparral vegetation also occurs in parts of the county, especially on steeper south and west facing slopes. This mix of densely forested areas mixed with chaparral results in higher fuel loads and potentially higher fire intensity. Expansion of the residential community into areas of heavier vegetation has resulted in homes existing in close proximity to dense natural foliage; these homes are often completely surrounded by highly combustible or tall vegetation, increasing the potential that wildland fires could impact them.

As part of the development of the Marin Community Wildfire Protection Plan (CWPP), an updated vegetation map layer was created using the most recent vegetation information available from a variety of state and local data sources.

Vegetation distribution in the Marin County OA is characterized by approximately 20 different types of vegetation which have been classified into 15 fire behavior fuel models.

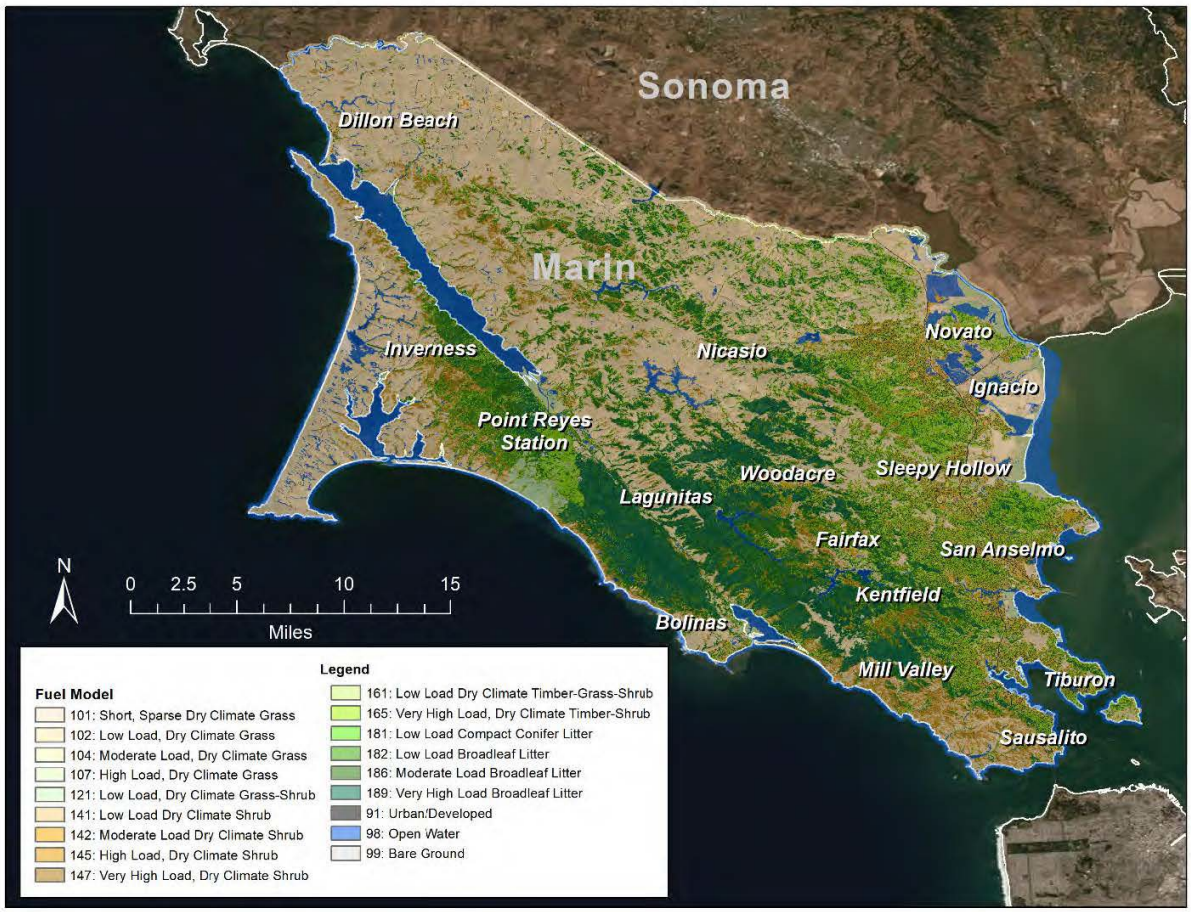

Figure 43: Fuel Model Map for the Marin County OA
Source: Marin CWPP, 11/27/23

Insect infestations and plant diseases, such as California oak mortality syndrome (sudden oak death), are increasing and threaten to change the structure and overall health of native plant communities in Marin County. Sudden oak death has no known cure and is the biggest concern; this syndrome is caused by the fungus-like Phytophthora ramorum, which has led to widespread mortality of several tree species in California since the mid-1990s; the tanoak (Lithocarpus densiflorus) in particular appears to have little or no resistance to the disease. Sudden oak death has resulted in stands of essentially dead trees with very low fuel moistures.

Studies examining the impacts of sudden oak death on fire behavior indicate that while predicted surface fire behavior in sudden oak death stands seems to conform to a common fuel model already in use for hardwood stands, the very low moisture content of dead tanoak leaves may lead to crown ignitions more often during fires of “normal” intensity.

Two other plant diseases prevalent in the Marin County OA are pitch canker (which affects conifers such as Bishop pine and other pine species) and madrone twig dieback (which affects Pacific madrones). Pitch canker is caused by the fungus Fusarium circinatum (F. subglutinans, F. sp. pini), which enters the tree through wounds caused by insects. While some trees do recover, most infected trees are eventually killed by the fungus. Management of this disease largely focuses on containment to reduce the fungus spreading to other trees. Pitch canker is a particular issue in the NPS lands of Pt. Reyes National Seashore, where many acres of young Bishop Pines that were seeded on the Inverness Ridge by the Mount Vision Fire of 1995 have been infected.

These dead and dying trees have created large swaths of land with dense and dry fuel loads. Madrone twig dieback is caused by the native fungus Botryosphaeria dothidea and appears to be getting worse throughout the county due to drought effects on Pacific madrones. Three additional threats to trees common to the Marin County OA include:

- Bark and ambrosia beetles (Monarthrum dentiger and monarthrum scutellare), which target oak and tanoak trees. Sudden oak death may be exacerbating the effects of beetle infestations which prey on trees already weakened by this disease.
- Root rot, caused by oak root fungus (Armillaria mellea), is primarily associated with oaks and other hardwoods but also attacks conifers. These fungal infestations cause canopy thinning and branch dieback and can kill mature trees. As with the beetle infestations, sudden oak death may be exacerbating the effects of root rot fungus in the county forests.
- Velvet-top fungus (Phaeolus schweinitzii) is a root rot fungus affecting Douglas-fir and other conifers, with the infection typically occurring through a wound.

Topography characterizes the land surface features of an area in terms of elevation, aspect, and slope. Aspect is the compass direction that a slope faces, which can have a strong influence on surface temperature, and more importantly on fuel moistures. Both elevation and aspect play an important role in the type of vegetation present, the length of the growing season, and the amount of sunlight absorbed by vegetation. Generally, southern aspects receive more solar radiation than northern aspects; the result is that soil and vegetation on southern aspects is warmer and dryer than soil and vegetation on northern aspects. Slope is a measure of land steepness and can significantly influence fire behavior as fire tends to spread

more rapidly on steeper slopes. For example, as slope increases from 20 – 40%, flame heights can double and rates of fire spread can increase fourfold; from 40 – 60%, flame heights can become three times higher and rates of spread can increase eightfold.

The Marin County OA is topographically diverse, with rolling hills, valleys and ridges that trend from northwest to southeast. Elevation throughout the county varies considerably, with Mt. Tamalpais' peak resting at 2,574 feet above sea level and many communities at or near sea level. Correspondingly, there is considerable diversity in slope percentages. The San Geronimo Valley slopes run from level (in the valley itself) to near 70%. Mt. Barnabe has slopes that run from 20 to 70%, and Throckmorton ridge has slopes that range in steepness from 40 – 100%. These slope changes can make fighting fires extremely difficult.

In the WUI where natural fuels and structure fuels are intermixed, fire behavior is complex and difficult to predict. Research based on modeling, observations, and case studies in the WUI indicates that structure ignitability during wildland fires depends largely on the characteristics and building materials of the home and its immediate surroundings.

The dispersion of burning embers from wildfires is the most likely cause of home ignitions. When embers land near or on a structure, they can ignite near-by vegetation or accumulated debris on the roof or in the gutter. Embers can also enter the structure through openings such as an open window or vent and could ignite the interior of the structure or debris in the attic.

Wildfire can further ignite structures through direct flame contact and/or radiant heat. For this reason, it is important that structures and property in the WUI are less prone to ignition by ember dispersion, direct flame contact, and radiant heat.

Public Safety Power Shutoff (PSPS) Events

As a result of the 2017 Northern California Wildfires, the 2018 Camp Fire in Butte County and other wildfires caused by power line infrastructure, Pacific Gas & Electric (PG&E) began initiating Public Safety Power Shutoff (PSPS) events in their service areas (including Marin County) to help prevent the start of future wildfires. PG&E will initiate a PSPS if conditions indicate potentially dangerous weather conditions in fire-prone areas due to strong winds, low humidity, and dry vegetation. During these events, PG&E will proactively turn off power in high fire risk areas to reduce the threat of wildfires. The most likely electric lines to be considered for a public safety power outage will be those that pass through areas that have been designated by the California Public Utilities Commission (CPUC) High Fire-Threat District at elevated (Tier 2) or extreme risk (Tier 3) for wildfire. Customers outside of these areas could have their power shut off, though, if their community relies upon a line that passes through a high fire-threat area or an area experiencing severe weather. PG&E will consider numerous factors and analyze historical data to help predict the likelihood of a wildfire occurring, and closely monitoring weather watch alerts from the National Weather Service (NWS). These factors generally include, but are not limited to:

- A Red Flag Warning declared by the National Weather Service
- Low humidity levels, generally 20 percent and below
- Forecasted sustained winds generally above 25 mph and wind gusts in excess of approximately 45 mph, depending on location and site-specific conditions such as temperature, terrain and local climate
- Condition of dry material on the ground and live vegetation (moisture content)

- On-the-ground, real-time observations from PG&E's Wildfire Safety Operations Center and field crews

Pacific Gas & Electric Company (PG&E) operates a total of 1,179 miles of overhead electricity transmission and distribution lines in the Marin County OA. Overhead electricity lines and poles can be damaged or downed under severe weather conditions, particularly severe wind conditions, which increases the potential for wildfire ignition. 52 percent of PG&E's overhead distribution lines and 41 percent of its overhead transmission lines are located in CPUC-identified High-Fire Threat Districts subject to elevated or extreme fire risk. PG&E is currently planning and implementing safety measures to prevent wildfires and reduce the impacts of Public Safety Power Shutoff (PSPS) events on communities in the Marin County OA and throughout California.

In October 2019 Marin County and the City of Belvedere experienced two PSPS events.

These measures include installing weather stations; installing high-definition cameras; installing sectionalizing devices on its overhead lines to separate the grid into smaller sections; hardening the system by installing stronger power poles, covering lines, and undergrounding lines in targeted areas; creating temporary microgrids to provide electricity during PSPS events; and enhancing existing vegetation management activities. From 2018 to July 2021, PG&E hardened three miles of overhead lines, installed 68 transmission and distribution sectionalizing devices, completed enhanced vegetation management on approximately 51 of overhead line miles, installed 28 weather stations, and installed 12 high-definition cameras in the Marin County OA. PG&E has also begun undergrounding several overhead transmission lines throughout California.

A wildfire in Belvedere would most likely occur in any of the open spaces throughout Belvedere. While there are not many open spaces in Belvedere, there are open patches of land in Belvedere's hillside areas and along the Tiburon Boulevard bike path where a brush fire could occur. These areas of Belvedere are primarily residential and consist of numerous winding streets and hillside homes that could be damaged or destroyed by wildfire. Only a very small fraction of Belvedere lies in an a high FHSZ. This area lies in the northwest corner of Belvedere along the Tiburon Boulevard bike path and consists of five residences that could be susceptible to a brush fire. A small area adjacent to this area along Lagoon Road and San Rafael Avenue lies in a moderate FHSZ with ten residences that could be susceptible to a brush fire. No other area of the Belvedere Lagoon, including the Belvedere Police Department, City Hall and Community Center building, lie in a FHSZ. Another moderate FHSZ lies in the southern area of Belvedere, and there are several dozen residences in this area that could be susceptible to a brush fire.

All of Belvedere could be impacted by a Public Safety Power Shutoff (PSPS) event and/or suffer poor air quality from smoke as a result of a wildfire in Marin County or the surrounding region. As open areas around Belvedere become drier due to climate change, the risk of a wildfire occurring and impacting the city will continue to increase. Brush fires in the city may increase over time as parks and other open spaces experience drier conditions.

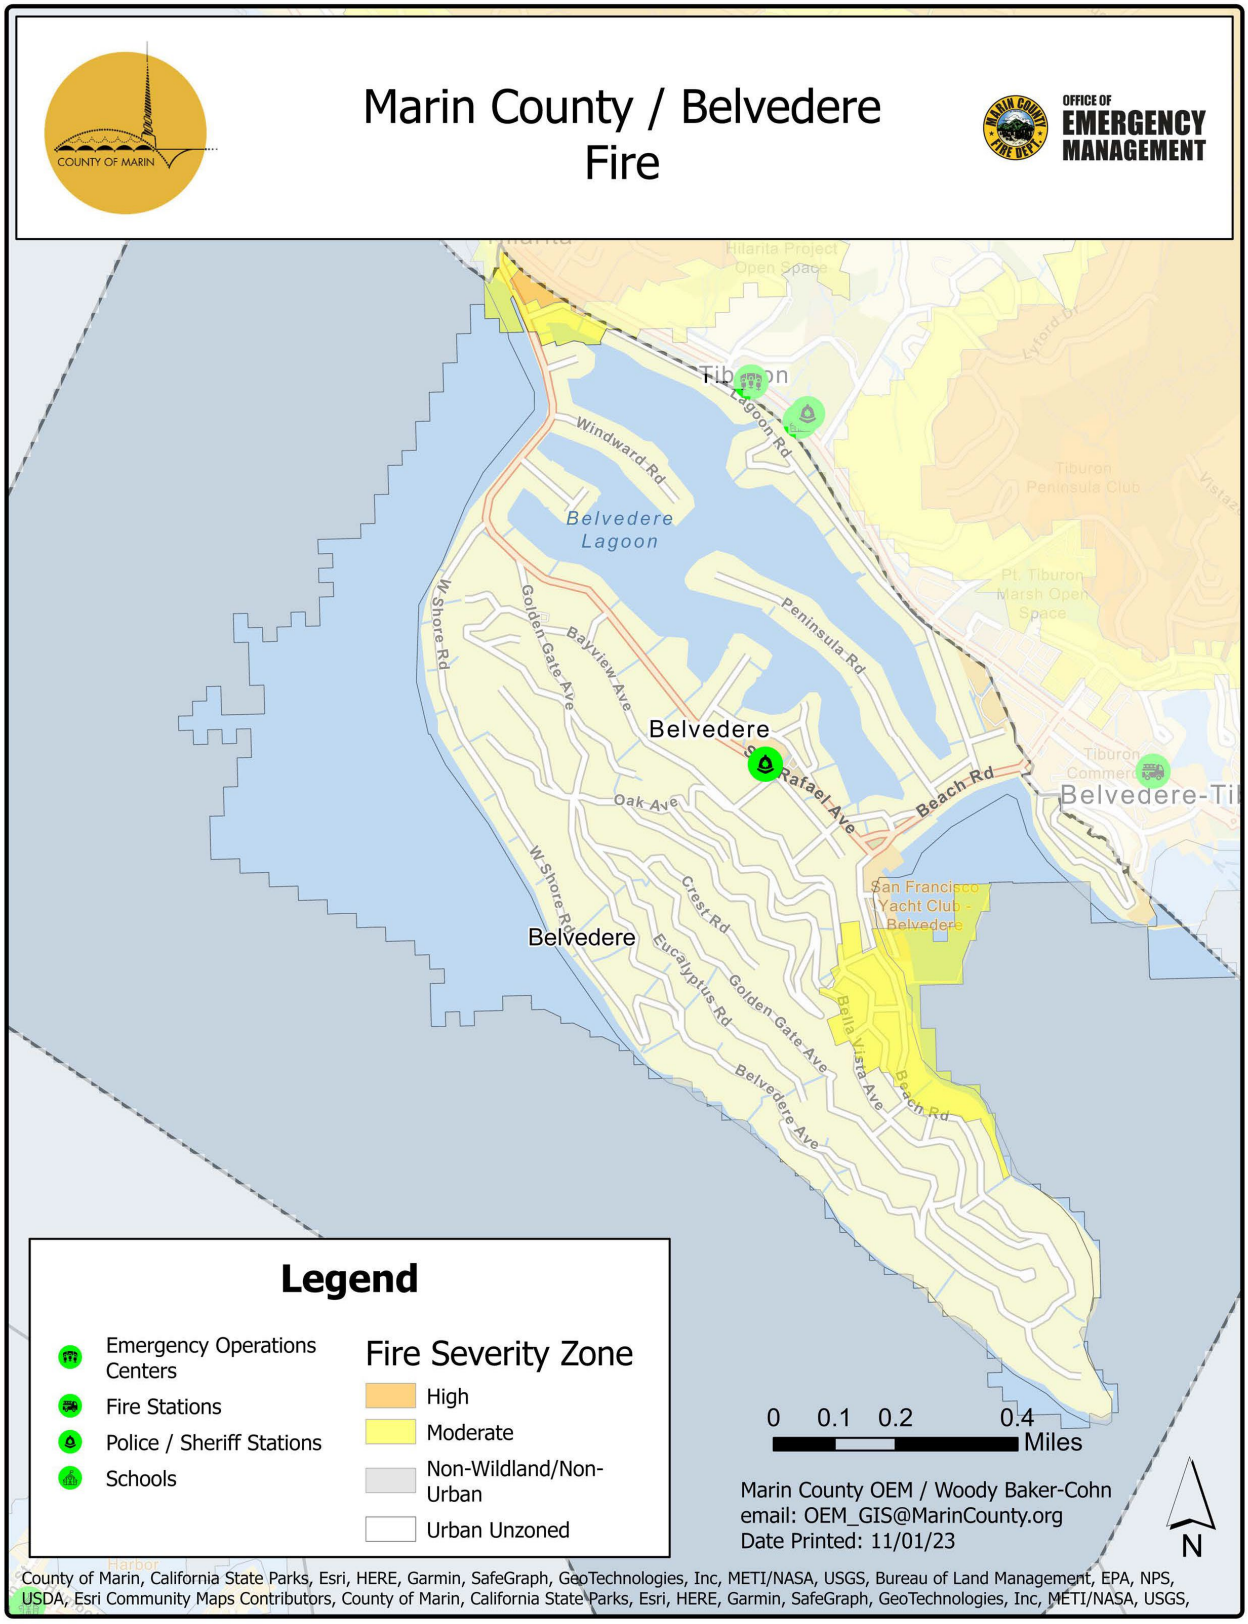

Figure 44: City of Belvedere Wildfire Critical Facilities and Infrastructure
Source: Marin County OEM

Belvedere has never experienced a significant wildfire of note.

Climate Change and Future Development Considerations

Climate change can lead to an increase in wildfire events. Climate change has been a key factor in increasing the risk and extent of wildfires in the western United States. Changes in climate create warmer, drier conditions. Increased drought, and a longer fire season are boosting these increases in wildfire risk.

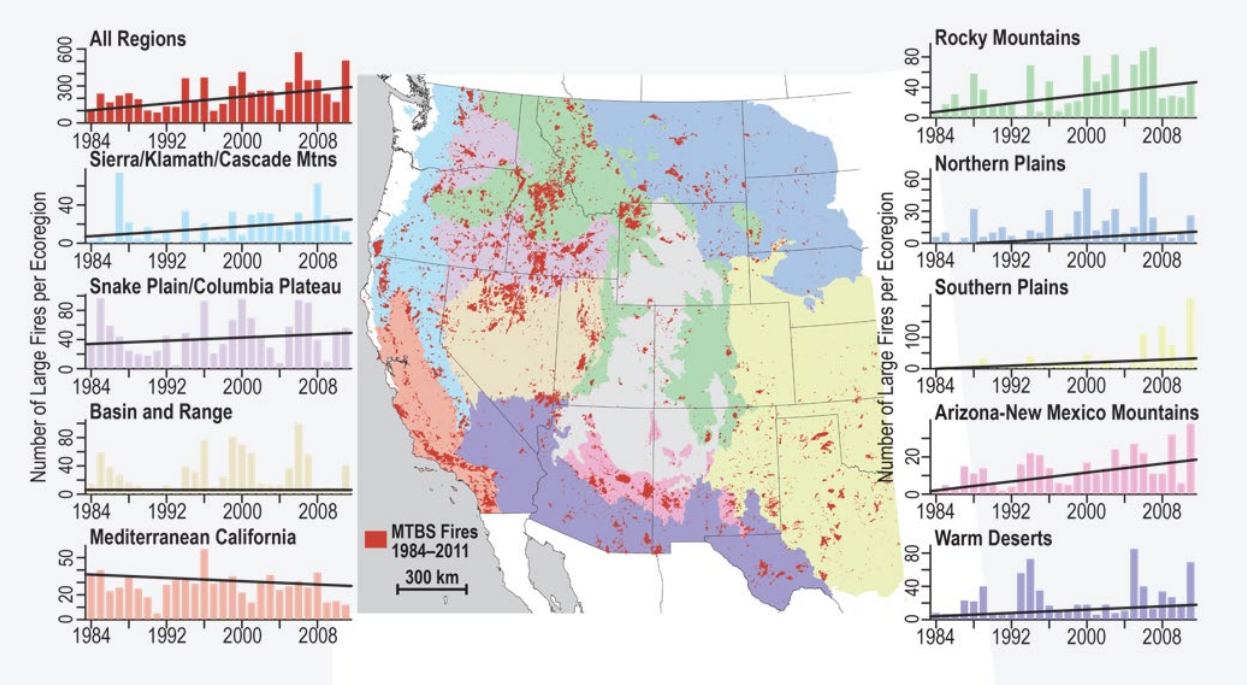

Figure 45: Trends in the Annual Number of Large Wildfires in the United States
Source: Fourth Climate Change Assessment, 01/04/23

As summer conditions in Northern California become hotter and drier due to climate change, the occurrence and severity of wildfires will only increase. The Marin County OA including Belvedere is particularly susceptible to these future impacts of climate change on wildfire, as the OA's climate has generally been wet enough historically to avoid major wildfires. Extreme heat events and high wind events could cause electrical systems to become overloaded and fail, sparking wildfires. An increase in wildfires as a result of climate change could lead to more significantly burned areas that could contribute to debris flows after a significant storm event, particularly in the open areas around Belvedere. Future development in the open areas around Belvedere will expose more people and property to the impacts of a potentially significant wildfire.

SECTION 3.0: MITIGATION STRATEGY

3.1 CHANGES IN DEVELOPMENT

The various Marin County Jurisdiction's General Plans guide growth and development across the County based on maintaining the County's small communities with their own unique character.

The City of Belvedere's lack of housing production overall has resulted in limited affordable housing opportunities at all income levels, and a lack of housing type choices has prevented low- and moderate-income households in the county and broader region from residing in the City. Belvedere is com-mitted to playing its part in meeting this growing demand for housing, and the Housing Element includes strategies to expand the development of housing as well as the availability of housing types at a more diverse range of price points and promote more equitable housing opportunities.

The Plan Bay Area 2050 Final Blueprint forecasts that the nine-county Bay Area will add 1.4 million new households between 2015 and 2050. For the eight-year time frame covered by the City of Belvedere Housing Element Update, the Department of Housing and Community Development has identified the region's housing need as 441,176 units. The total number of housing units assigned by HCD is separated into four income categories that cover housing types for all income levels. For the 2023-2031 period, Belvedere must identify sites sufficient to accommodate 160 new housing units with the following number of units designated as affordable to each income category: Extremely Low-Income (24), Very Low- income (25), Low-Income (28), Moderate-Income (23), and Above Moderate-Income (60).

The Mallard Pointe development project will increase the vulnerability to Flooding, Tsunami, Sea Level Rise, Earthquake, and Land Subsidence.

Table 19: City of Belvedere Future Growth Areas

Development	# of Units	# of Parcels	Project Date	Acres	Fire Severity Zone	Flood Zone
Mallard Pointe	40	3	Submitted 6/18/2021 Under Planning Review	2.8	No	AE
Total	**40**	**3**		**2.8**		

Table 19: City of Belvedere Future Growth Areas

Figure 46: Mallard Pointe Project Map
Source: City of Belvedere General Plan, 6th Cycle Housing Element Update, 2023

On June 18, 2021, a preliminary application was received for a proposed residential redevelopment submitted is a "SB 330 preliminary housing application" for a housing development on three parcels, currently developed with 22 residential units (duplexes).

The project proposal includes demolition of the existing residential units and construction of forty (40) new residential units, which include single-family dwellings, accessory dwelling units, duplexes and apartments. As submitted, the project would contain sixteen (16) single-family and duplex units, one (1) ADU, and twenty-three (23) apartments. Based on its SB 330 application, the project will include 36 market rate and 2 very low- and 2 moderate-income (deed-restricted) units. Five units will be one-bedroom apartments presumed to be affordable to moderate incomes. In accounting for existing units, the project represents a total net gain of eighteen (18) units.

The project submitted its application prior to the City's adoption of objective design and development standards (ODDS), so requirements of the R-2 zone apply. The project has requested a density bonus for waivers of development standards and a cost concession related to the allowable housing choices in the R-2 zone.

3.2 CAPABILITY ASSESSMENT

The overall priorities in the City of Belvedere have not changed since the 2018 MJHMP update. However, the strategies in which to support the overall City priorities have changed and are reflected in the sections below. There were many projects that were either ongoing day-to-day business activities or were response related that were completed or deleted from the 2018 MJHMP project list and not carried over to this plan update. Several actions were completed and new projects were added to coincide with the changes in priorities, progress in local mitigation efforts and changes in development.

Capabilities are the programs and polices currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. The capability assessment identifies the local planning mechanisms where information from the 2018 MJHMP is incorporated and where updated hazard mitigation information from this 2023 MJHMP will be incorporated once approved. The 2018 capability assessments have been successfully incorporated into the City of Belvedere General Plan to include the Public Safety Element, Land Use Element, and Housing Element and the 2023 capability assessments will also be incorporated into the General Plan and these Elements. The capability assessment is divided into four sections: regulatory, administrative and technical, fiscal, and outreach and partnerships.

3.2.1 Regulatory Capabilities

The legal and regulatory capabilities include existing ordinances and codes that affect the City's physical or built environment. Examples of legal and/or regulatory capabilities can include: a jurisdiction's building codes, zoning ordinances, subdivision ordnances, special purpose ordinances, growth management ordinances, site plan review, general plans, capital improvement plans, economic development plans, emergency response plans, and real estate disclosure plans. The table below lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place.

Table 20: Legal and Regulatory Capabilities

Plans	Yes/No Latest Update	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
General Plan/Master Plan	Y 2023	The City is completing the 6th cycle housing element update which is a component of the General Plan. Additionally we will start the process of updating our Safety Element.
Strategic Plan	N	
Capital Improvements Plan	Y 2022	The Capital Improvement Plan provides an annual 5-year forecast of capital infrastructure. It includes funding for a variety of hazard mitigation projects, including flood protection, fire-fuel reduction, hillside stability, and drainage.
Economic Development Plan	N	
Local Emergency Operations Plan	Y 2022	The plan addresses hazards and resources that can be used to mitigate disasters and emergencies. The plan can be used to implement mitigation actions.
Continuity of Operations Plan	N	
Flood Mitigation Plan (FMP)	N	
Engineering Studies for Streams	N	
Open Space Management Plan	N	
Regional Transportation Plan (RTP)	Y	The City participated in the Marin County Travel Safety

	2018	Plan – Systematic Safety Analysis.
Stormwater Management Plan/Program	Y 2022	The City partners with the Marin County Stormwater Pollution Prevention Program (MCSTOPPP) to manage the City's stormwater discharge permit.
Community Wildfire Protection Plan	Y 2020	The City, through TFPD, is a member of the Marin Community Wildfire Protection Plan
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Yes. Projects are reviewed for compliance with building code standards. Building permit applications are routed to various departments for review (Building, Planning, Fire, and Public Works) as necessary to ensure compliance with applicable codes and standards.
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	
Fire department ISO rating:	Y	The Central Marin Fire Department has an ISO rating of 2.
Site plan review requirements	Y	Yes. Projects are reviewed for compliance with development standards, including required setbacks. The majority of building permit applications submitted to the City are required to provide a site plan.
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Municipal Code	Y	Yes
Zoning ordinance	Y	Yes
Subdivision ordinance	Y	Yes
Floodplain ordinance	Y	Yes
Natural hazard specific ordinance (stormwater, steep slope, wildfire)		
Flood insurance rate maps	Y	Yes
Elevation Certificates	Y	Yes
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	Y	Yes

Table 20: City of Belvedere Legal and Regulatory Capabilities
Source: City of Belvedere

City of Belvedere General Plan or Master Plan

California Government Code 65300 requires that every City and County in the state have a General Plan. The City of Belvedere General Plan, adopted in May 22, 2023, was prepared over a one year period that included an extensive public review process. The General Plan is the most important policy and planning document in the City and is used by virtually every department. The General Plan is the City's statement of its vision for the future. The General Plan contains policies covering every aspect of the City: land use (how land can be developed), circulation, noise, air quality, housing, open space and conservation, and health and safety. The Housing, Land Use, and Safety Elements of the General Plan were updated in 2023.

City of Belvedere specific goals and policies related to mitigation of natural hazards are as follows:

Table 21: City of Belvedere General Plan

Goal/Policy/ Program	Explanation
Land Use Element	
Goal LU-2	Maintain the character of Belvedere Island with refinement of development standards.
Policy LU-2.5	Review opportunities to repair or mitigate environmental hazards such as pyrophytic plants and trees, sub-standard retaining walls and foundations, hazardous site access and obstructions, and roadway repair at time of development review.
Program LU-2.5.1	The Planning Commission shall consider amendments to the Zoning Ordinance and Architectural and Environmental Design Review Ordinance to mitigate or remove hazards at the time of development review that are related to fire protection, hillside stability, safe traffic and circulation, site line obstruction, and other issues that have been identified in the Environmental Hazards Element associated with private improvements.
Conservation and Open Space Element	
Goal REC-1	Support ongoing efforts to maintain Belvedere's public parks and open spaces. Belvedere's existing public spaces, including Community Park, Tom Price Park, Centennial Park, Belvedere Cove, Land Company Park, and the community's many lanes and paths, are appreciated and well-utilized by the community.
Policy REC-1.2	Support the ongoing maintenance of Belvedere's historic lanes and steps.
Program REC 1.2.1	Facilitate improvements to lanes that have fallen into disrepair or are no longer open. Consider the installation of low-impact lighting on some lanes to encourage their use and also to provide safer access down Belvedere Island in the event of necessary evacuation.
Public Safety	
Goal HAZ-1	Strive to protect the community from injury and damage resulting from injury and damage resulting from natural catastrophes and other hazard conditions
Policy HAZ1.1	Construction shall be located and designed to avoid or minimize the hazards from earthquake, erosion, landslides, floods, and fire.
Program HAZ-1.1.1	Institutionalize the Environmental Hazards policies through review for possible amendment of the grading, subdivision, zoning, building code, design review, and other sections of the Belvedere Municipal Code. Particular attention should be paid to the adequacy of building setbacks with respect to fire safety concerns.
Program HAZ	All new construction in the City shall ensure that it follows current seismic codes as set

Table 21: City of Belvedere General Plan	
Goal/Policy/ Program	**Explanation**
1.1.2	forth by the California Building Code (CBC).
Program HAZ 1.1.4	New construction must not compromise public infrastructure which is key to emergency access, egress, and flood prevention.
Policy HAZ 1.2	Require thorough field investigation of geologic hazards as a prerequisite to Design Review and construction approval and require site stabilization to minimize such risks.
Program HAZ-1.2.3	Investigate potential landslide hazards associated with specific project locations as part of Design Review for project applications.
Policy HAZ-1.3	Maintain adequate roadway clearances for emergency vehicles and evacuation and plan for safe pedestrian evacuation.
Policy HAZ 1.4	Ensure that the City is equipped for disaster, evacuation, and survival thereafter.
Policy HAZ-1.4.2	Ensure that risk to public lifeline utilities, such as those along Beach Road and San Rafael Avenue, be reduced by installing excess flow valves, bracing, flexible materials, flexible joints and connections, joint restraint, strengthening of support structures, or other means.

Table 21: City of Belvedere General Plan
Source: **City of Belvedere** General Plan

3.2.2 Administrative and Technical Capabilities

The administrative and technical capability identifies the City personnel responsible for activities related to mitigation and loss prevention. Many positions are full time and/or filled by the same person.

Table 22: Administrative and Technical Capabilities		
Administrative	Yes/No	Is coordination effective?
Planning Commission	Yes	Yes. The Planning Commission reviews planning applications for conformance with town policies, ordinances, and design standards.
Administrative Services	Yes	Yes. The Admin Services Department oversees finance and purchasing, budgets, risk management and human resources.
Hazard Mitigation Planning Committee	Yes	Yes, the City participates in the county-wide hazard mitigation planning process and team.
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Yes	Vegetation clearing and replanting work coordinated annually with city, fire department, utility agencies and residents.
Mutual aid agreements	No	
Technical	Yes/No	Has capability been used to assess/mitigate risk in the past?
Warning systems/services (Reverse 911, outdoor	Yes	Alert Marin Emergency Notification system sends text, phone and email notifications to residents or community

warning signals)		members that opt in to receive information
Hazard data and information	Yes	Regional and local GIS database of flood hazard
Grant writing	Yes	Department heads conduct grant writing with support of consultants when necessary.
Hazus analysis	No	
Staff/Personnel Resources	Yes/No FT/ PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y/FT	Yes
Floodplain Administrator	Y/FT	Yes
Emergency Manager	Y/PT	Yes
Community Planner	Y/FT	Yes
Civil Engineer	Y/FT	Yes
Engineer(s), project manager(s), technical staff, equipment operators, and maintenance and construction staff.	Y/FT and PT	Yes
GIS Coordinator	No	The City is a JPA member of Main Map for GIS.
Community Development Staff	Y/FT	Yes
Town Planning, Building, and Public Works Staff	Y/FT	Yes
Police Department Staff	Y/FT	Yes
Fire Protection District Staff	Y/FT	Yes
Community Development Staff	Y/FT	Yes

Table 22: City of Belvedere Administrative and Technical Capabilities
Source: **City of Belvedere**

3.2.3 FISCAL CAPABILITIES

The fiscal capability assessment shows specific financial and budgetary tools available to the jurisdictions such as community development block grants; capital improvements project funding; authority to levy taxes for specific purposes; fees for water, sewer, gas, or electric services; impact fees for homebuyers or developers for new development; ability to incur debt through general obligations bonds; and withholding spending in hazard-prone areas.

Table 23: Fiscal Capabilities

Financial	Yes/No	Has the funding resource been used in the past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Authority to levy taxes for specific purposes	Y	Yes, through voter-approved tax measures.
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Incur debt through private activities	N	
Community Development Block Grant	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Other federal funding programs	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
State funding programs	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.

Table 23: City of Belvedere Fiscal Capabilities
Source: **City of Belvedere**

3.2.4 COMMUNITY OUTREACH

The outreach and partnerships capability assessment shows outreach and public education programs available to the City of Belvedere and the City of Belvedere partnerships utilized to promote those programs.

Table 24: City of Belvedere Community Outreach		
Outreach and Partnerships	Yes/No	Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	The Belvedere Block Captains are trained to assist neighbors with preparedness and emergency response.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	The Get Ready disaster preparedness program teaches how to prepare for, respond to and recover from all kinds of disasters.
Natural disaster or safety related school programs	Yes	The Get Ready program was modified for 5th grade students and is called GR5. The 5th graders are taught about natural disasters as part of their curriculum and then the GR5 program teaches them how to prepare their family and home for any disaster. Homework given to the students takes the information into their home.
StormReady certification	Yes	
Firewise Communities certification	No	
Community Rating System	No	
Public-private partnership initiatives addressing disaster-related issues	Yes	The City of Belvedere works closely with the Belvedere Block Captains and residents, assisting with training and information.

3.2.5 PARTICIPATION IN THE NATIONAL FLOOD INSURANCE PROGRAM

Given the flood hazard in the planning area, an emphasis will be placed on continued compliance with the National Flood Insurance Program (NFIP). Detailed below is a description of City of Belvedere flood management program to ensure continued compliance with the NFIP.

City of Belvedere has participated in the Regular Phase of the NFIP since May 16, 1977. Since then, the City of Belvedere has administered floodplain management regulations that meet or exceed the minimum requirements of the NFIP. Under that arrangement, residents and businesses paid the same flood insurance premium rates as most other communities in the City

of Belvedere. The Community Rating System (CRS) was created in 1990. It is designed to recognize floodplain management activities that are above and beyond the NFIP's minimum requirements. City of Belvedere are not currently CRS participants.

In addition to the capabilities in the municipal code regarding floodplains, the City of Belvedere has additional capabilities. Table 25 shows the City of Belvedere participation in and continued compliance with the NFIP, as well as identify areas for improvement that could be potential mitigation actions.

Table 25: City of Belvedere NFIP Status

NFIP Topic	Comments
Insurance Summary	
How many NFIP policies are in the community? What is the total premium and coverage?	There are 200 active policies. The total premium is $340,778 and coverage is $75,270,000.
How many claims have been paid in the community? What is the total amount of paid claims? How many of the claims were for substantial damage?	There has been a total of 54 claims with $597,578.58 paid on those claims. There are # of substantial damage claims.
How many structures are exposed to flood risk within the community? *"flood risk" is defined as the 1% annual chance flood (100-year flood. Numbers are from overlay of FEMA SFHA and building stock data.	364
Describe any areas of flood risk with limited NFIP policy coverage	None
Staff Resources	
Is the Community Floodplain Administrator or NFIP Coordinator certified?	No
Is floodplain management an auxiliary function?	No, it is a primary function of plan review and inspection
Provide an explanation of NFIP administration services (e.g., permit review, GIS, education or outreach, inspections, engineering capability)	Plan review, inspections, engineering review, and public outreach and information.
What are the barriers to running an effective NFIP program in the community, if any?	Having the community understand these requirements/statutes are for public safety and wellbeing and buy into the process.
Compliance History	
Is the community in good standing with the NFIP?	Yes
Are there any outstanding compliance issues (i.e., current violations)?	No
When was the most recent Community Assistance Visit (CAV) or Community Assistance Contact (CAC)?	2019
Is a CAV or CAC scheduled or needed?	No

Regulation	
When did the community enter the NFIP?	05/02/1977
Are the FIRMs digital or paper?	Both
Do floodplain development regulations meet or exceed FEMA or State minimum requirements? If so, in what ways?	Floodplain regulations meet the standards of State and Federal regulations through the adoption of the California Building Codes and local Municipal Codes complying with these standards
Provide an explanation of the permitting process.	Applicant submits permit application and supplemental construction documents to the Building Dept. Should the proposed project be located within one of the local, designated Floodplains, the plan review is conducted through the Floodplain prism. The proposed project would then be reviewed for local Municipal Floodplain Code compliance, as well as State Building Code and Federal Code compliance. Once the project is deemed compliant with the applicable Codes, permit fees would be paid, and the building permit issued.
Community Rating System (CRS)	
Does the community participate in CRS?	No
What is the community's CRS Class Ranking?	N/A
What categories and activities provide CRS points and how can the class be improved?	N/A
Does the plan include CRS planning requirements	N/A

Table 25: City of Belvedere NFIP Status
Source: FEMA, City of Belvedere

NFIP Insurance Coverage Details

City of Belvedere joined the NFIP on May 2, 1977. The City of Belvedere does not participate in the Community Rating System. NFIP insurance data provided by DWR indicates that as of 2023 there were 200 policies in force in the City of Belvedere with $340,778 in premiums, resulting in $75,270,000 of insurance in force. There have been 54 closed paid losses totaling $597,578.58. None of the claims were considered substantial damage losses. There were no repetitive loss structures in the City. There were no severe repetitive loss properties in the City of Belvedere.

Repetitive Loss Properties

- Repetitive Loss (RL) Residential Structures: 0
- Repetitive Loss (RL) Non-Residential Structures: 0
- Severe Repetitive Loss (SRL) Residential Structures: 0
- Severe Repetitive Loss (SRL) Non-Residential Structures: 0

3.3 MITIGATION GOALS

44 CFR Requirement § 201.6(c)(3)(i) [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long - term vulnerabilities to the identified hazards.

The information developed from the risk assessment was used as the primary basis for developing mitigation goals and objectives. Mitigation goals are defined as general guidelines explaining what each jurisdiction wants to achieve in terms of hazard and loss prevention.

Hazard Risk Prioritization
↓
Mitigation Goals & Objectives
↓
Mitigation Project Identification
↓
Mitigation Project Implementation

Goal statements are typically long-range, policy-oriented statements representing jurisdiction-wide visions. Objectives are statements that detail how each jurisdiction's goals will be achieved, and typically define strategies or implementation steps to attain identified goals. Other important inputs to the development of jurisdiction-level goals and objectives include performing reviews of existing local plans, policy documents, and regulations for consistency and complementary goals, as well as soliciting input from the public.

The following represents overarching strategic goals associated with the identification and eventual implementation of appropriate and meaningful hazard mitigation efforts in relation to prioritized hazards and threats confronting Marin County. These goals form the basis for specific supporting process objectives and are shown from the highest priority, at the top of the list, to those of lesser importance.

The establishment of hazard mitigation goals represents both individual and collective strategies that have been mutually agreed upon by the Steering Committee and have changed with the 2023 MJHMP update. Objectives were added to Goals 2 and 5. Eventually, these goals have been adopted by Marin County and its participating jurisdictions as the guiding policy behind local hazard mitigation efforts, in conjunction with other associated principles.

Goals were defined for the purpose of this mitigation plan as broad-based public policy statements that:

- Represent basic desires of the community;
- Encompass all aspects of community, public and private;
- Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;
- Are future-oriented, in that they are achievable in the future; and
- Are time-independent, in that they are not scheduled events.

Goals are stated without regard to implementation. Implementation cost, schedule, and means are not considered. Goals are defined before considering how to accomplish them so that they are not dependent on the means of achievement. Goal statements form the basis for objectives

and actions that will be used as means to achieve the goals. Objectives define strategies to attain the goals and are more specific and measurable.

Goal 1: Minimize risk and vulnerability of the community to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, and environment in Marin County.

- Minimize economic and resource impacts and promote long-term viability and sustainability of resources throughout Marin County.
- Minimize impact to both existing and future development.
- Provide protection for public health.
- Prevent and reduce wildfire risk and related losses.

Goal 2: Provide protection for critical facilities, infrastructure, utilities, and services from hazard impacts.

- Incorporate defensible space and reduce hazard vulnerability.
- Develop redundancies in utilities and services.
- Enhance resilience through enhanced construction.

Goal 3: Improve public awareness, education, and preparedness for hazards that threaten our communities.

- Enhance public outreach and participation in the Alert Marin Emergency Notification System.
- Enhance public outreach, education, and preparedness program to include all hazards of concern.
- Increase public knowledge about the risk and vulnerability to identified hazards and their recommended responses to disaster events, including evacuation and sheltering options.
- Provide planning and coordination for "At-Risk" populations.
- Provide planning and coordination for companion animals, livestock, and other animal populations.
- Increase community awareness and participation in hazard mitigation projects and activities.

Goal 4: Increase communities' capabilities to be prepared for, respond to, and recover from a disaster event.

- Improve interagency (local, state, federal) emergency coordination, planning, training, and communication to ensure effective community preparedness, response and recovery.
- Enhance collaboration and coordination of disaster-related plans, exercises, and training with local, state, and federal agencies, neighboring communities, private partners, and volunteers.
- Enhance the use of shared resources/Develop a strong mutual aid support system.
- Create and maintain a fully functional, interoperable radio and communication system with all regional public safety partners.

Goal 5: Maintain FEMA Eligibility/Position the communities for grant funding.

- Review hazard events and ongoing hazard mitigation projects annually.
- Assess the need to pursue or adjust hazard mitigation projects after significant hazard events.

Goal 6: Reduce exposure to High Hazard Dams that pose an unacceptable risk to the public.

- Improve alert and warning systems to provide residents downstream of a High Hazard Dam to receive timely warning to evacuation when threatened by potential or imminent dam failure.
- Enhance overall community preparedness to respond and evacuate a potential or imminent dam failure.
- Increase public awareness of the risk posed by High Hazard Dams and the potential for relocation of housing outside a possible inundation zone.
- Prioritize High Hazard Dam Mitigation projects and programs.

3.4 Status of Previous Mitigation Actions

Table 26 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 26: Status of Previous Hazard Mitigation Actions

Action Number / Name	Completed	Ongoing	Not Started	Still Relevant	Included in Updated Action Plan
Lane Design & Engineering: Lanes are critical egress and evacuation routes for all types of hazard, disaster.		X			X
Lane Maintenance, Minor Repairs: Lanes are critical egress and evacuation routes for all types of hazard, disaster.		X			X
Park Lane Stairs: Upgrade of section of stairs on this lane, including new landing/seating area.		X			X
Hawthorne Lane Stairs: Upgrades to stairs and seating area in Centennial Park section of Hawthorne Lane.		X			X
Retaining Walls Evaluation: Failure of retaining walls along roads would result in blocked access in an emergency. Evaluation project is to identify any vulnerable walls .		X			X
Wooden Retaining Walls Repairs: Identify needed repairs on wooden retaining walls and make repairs.		X			X
Corrugated Metal Pipe Replacement: CMP pipes are critical drainage infrastructure, some of these are in poor condition and need repair/replacement.		X			X
Emergency Drainage Repairs: Fund to be used in case of emergency.		X			X
Levee evaluation – EIR completion: Completion of EIR process that was initiated as part of a potential levee/sea wall repair and		X			X

Table 26: Status of Previous Hazard Mitigation Actions					
Action Number / Name	**Completed**	**Ongoing**	**Not Started**	**Still Relevant**	**Included in Updated Action Plan**
upgrade project, which is currently on hold as no funding has been identified.					
Community Center Founder's Room Furniture Replacement: CC is a potential cooling center, project is planned to install suitable furniture for this purpose.		X			X
Vegetation/Fire Fuel Reduction: City properties with high amounts of dead, brushy and other fire prone vegetation to have work done to remove this material.		X			X

Table 26: Status of Previous Hazard Mitigation Actions
Source: City of Belvedere

3.5 HAZARD MITIGATION ACTIONS

The 2023 Marin County MJHMP and City of Belvedere Annex were revised to reflect progress in local mitigation efforts. Mitigation projects were selected for each hazard and for the City of Belvedere based off the hazard risk assessment. The projects are supported by the mitigation goals and objectives, and are ranked using the following criteria; approximate cost, timeframe of completion, whether the project requires City Council regulatory action, and an assumption as to whether or not the project would be subject to CEQA or NEPA requirements. Funding sources are identified for all projects. All projects consider new, future, and existing development. Project worksheets are used by the Planning Team and Marin County and City of Belvedere Steering Committee to describe criteria for each project.

Based on the hazard profiles, threat assessment, capabilities assessment, community survey results, discussions among the Planning Team members, and existing best practices, a set of potential mitigation actions was developed and then evaluated based on the following criteria:

- FEMA requires local governments to evaluate the monetary and non-monetary costs and benefits of potential mitigation actions. Although local governments are not required to assign specific dollar values to each action, they should identify the general size of costs and benefits.
- The Planning Team may elect to include measures with a high cost or low benefits, but such measures should be clearly beneficial to the community and an appropriate use of local resources.

In addition, FEMA directs local governments to consider the following questions as part of the financial analysis:

- What is the frequency and severity of the hazard type to be addressed by the action, and how vulnerable is the community to this hazard?
- What impacts of the hazard will the action reduce or avoid?
- What benefits will the action provide to the community?

The Planning Team also chose to review and revise the potential hazard mitigation actions with consideration for climate impact and social vulnerability. Projects and programs were assessed with consideration of these variables.

Prioritization

As part of the mitigation actions development and review, the Planning Team also prioritized the actions. The prioritization efforts looked at the risks and threats from each hazard; lifesaving, life safety, property protection and lastly environmental protection; financial costs and benefits; technical feasibility; consideration for climate impact, and social vulnerability, and community values. Planning Team members were asked to identify their priority actions using the following criteria.

Implementation priority ratings were assigned as follows:

- **High Priority** - An action that meets multiple objectives, is linked to a high risk hazard, has benefits that exceed costs, and has a potential source of funding. Action can begin within the short term (1 to 5 years).
- **Medium Priority** - An action that meets multiple objectives, is linked to a high or medium risk hazard, has benefits that exceed costs, and is eligible for funding though no funding has yet been secured for it. Action can begin within the short term (1 to 5 years) once funding is secured.
- **Low Priority** - An action that will mitigate the risk of a hazard, has benefits that do not exceed the costs or are difficult to quantify, has no secured source of funding, and is not eligible for any known grant funding. Action can be completed in the long term (1 to 10 years). Low-priority actions may be eligible for grant funding from programs that have not yet been identified.

Table 27 lists the Current Hazard Mitigation Actions for the City of Belvedere.

Table 27: City of Belvedere Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
B-1	Lane Design & Engineering: Lanes are critical egress and evacuation routes for all types of hazards or a disaster.	All Hazards/ 1, 2, 4, 5	Marin County and City of Belvedere	Existing	Cost TBD; State and/or Federal grants, existing budgets	1-5 years/ High	
B-2	Lane Maintenance, Minor Repairs: Lanes are critical egress and evacuation routes for all types of hazard, disaster.	All Hazards/ 1, 2, 4, 5	Marin County and City of Belvedere	Existing	Cost TBD; State and/or Federal grants, existing budgets	1-5 years/ High	
B-3	Park Lane Stairs Alternate Pedestrian Evacuation Route	All Hazards/ 1, 2, 4, 5	City of Belvedere	Existing	Cost TBD; State and/or Federal grants, existing budgets	1-5 years/ High	Upgrade of section of stairs on this lane, including new landing.
B-4	Hawthorne Lane Stairs Alternate Pedestrian Evacuation Route	All Hazards/ 1, 2, 4, 5	City of Belvedere	Existing	Cost TBD; State and/or Federal grants, existing budgets	1-5 years/ High	Upgrades to stairs and seating area in Centennial Park section of Hawthorne Lane.
B-5	Retaining Walls Evaluation Route	All Hazards/ 1, 2, 4, 5	City of Belvedere	Existing	Cost TBD; State and/or Federal grants, existing budgets	1-5 years/ High	Failure of retaining walls along roads would result in blocked access in an emergency. Evaluation project is to identify any vulnerable walls .
B-6	Corrugated Metal Pipe Replacement for flood control	Flooding; Sea Level Rise; Tsunami; Levee Failure/ 1, 2, 4, 5	City of Belvedere	Existing	Cost TBD: General Fund; FEMA BRIC	1-5 years/ High	CMP pipes are critical drainage infrastructure, some of these are in poor condition and need repair/replacement.
B-7	Emergency Drainage Repairs	Flooding; Sea Level Rise; Tsunami;	City of Belvedere	Existing	Cost TBD: General Fund; FEMA BRIC	1-5 years/ High	Fund to be used in case of emergency.

Table 27: City of Belvedere Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
		Levee Failure/ 1, 2, 4, 5					
B-8	Levee evaluation – EIR completion	Flooding; Sea Level Rise; Tsunami; Levee Failure/ 1, 2, 4, 5	City of Belvedere	Existing	Cost TBD: General Fund; FEMA BRIC	1-5 years/ High	Completion of EIR process that was initiated as part of a potential levee/sea wall repair and upgrade project, which is currently on hold as no funding has been identified.
B-9	Enhance Community facilities to support the socially vulnerable population during extreme weather events.	Severe Weather – Heat, All Hazards/ 1, 2, 4, 5	City of Belvedere, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1 - 2 years/ High	Community Center Founder's Room
B-10	Vegetation Management around at risk PG&E power lines and electrical line undergrounding projects by PG&E.	Wildfire, Drought, Severe Weather – Heat & Wind 1, 2, 4, 5,	City of Belvedere, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	Removing fire prone vegetation around power poles or under grounding lines reduces the risk of wind causing wildfire to vegetation dried by drought or heat.
B-11	Shoreline adaptation project to protect against flooding, sea level rise and earthquake; strengthen existing levees and raise vulnerable above-ground critical infrastructure out of the flood zone.	Flooding; Sea Level Rise; Tsunami, Debris Flow/ 1, 2, 4, 5	City of Belvedere	Existing	Cost TBD: General Fund; FEMA BRIC	1-5 years/ High	Seismic Upgrade Component EIR Completed and Certified
B-12	Earthquake natural gas valves are required in new construction or during substantial remodel work.	Earthquake/ 1, 2, 4, 5	City of Belvedere	New (2023)	Cost TBD: HMGP, BRIC, CDAA	2 -5 Years/ High	

Table 27: City of Belvedere Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
B-13	Increase height and retrofit existing levees in town	Levee Failure/ 1, 2, 4, 5	City of Belvedere	New (2023)	Cost TBD: HMGP, FMA, BRIC, CDAA Grants	5-20 Years/ High	
B-14	Enhance and promote community and individual emergency preparedness.	All Hazards/ 1, 2, 3, 4, 5	City of Belvedere; Tiburon Fire Protection District	Existing	Cost TBD: General Fund	1 - 2 years/ High	Focus on signing residents up for Alert Marin and establish a personal evacuation kit and plan.
B-15	Update Safety Element of the General Plan.	All Hazards/ 1, 2, 4, 5	City of Belvedere	Existing	Cost TBD: General Fund	1-2 years High	City Adopted. Awaiting certification from State of California
B-16	Review and adopt current California Building codes for seismic, flood, fire and other disaster. Adopt and Enforce Building Codes	All Hazards/ 1, 2, 4, 5	City of Belvedere	Existing	Cost TBD: General Fund	3 - 5 years/ Medium	The City continues to review and adopt current California Building codes.
B-17	Vegetation Management Plan to include the removal of exotic, invasive, and hazardous species.	Wildfire, Severe Weather-Wind, Drought, Debris Flow/ 1, 2, 4, 5	City of Belvedere; Tiburon Fire Protection District	Existing	Cost TBD: HMGP, CDAA, Wildfire Protection Grants.	1 - 5 years/ High	Reduces the chance of a wildland fire igniting the structure(s). Supports environmental restoration by using native plant resistant to debris flow, drought, and wind.
B-18	Updating or enhancing flood control pump stations, storm force mains, and gravity storm lines around city. This will also include maintaining and dredging existing flood control open channels, canals, and lagoons.	Flooding, Sea Level Rise, Levee, Tsunami/ 1, 2, 4, 5	City of Belvedere; Belvedere Lagoon Property Owners Association	Existing	Cost TBD: HMGP, FMA, CDAA, General Fund.	1 -5 years/ High	Stormwater Pumping Stations in the Lagoon Upgraded for Capacity, Reliability and Redundancy

Table 27: City of Belvedere Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
B-19	Marin Emergency Radio Authority (MERA) Upgrades.	All Hazards/ 1, 2, 4, 5	Marin County and City of Belvedere	Existing	Cost TBD; State and/or Federal grants, existing budgets	1-5 years/ High	City as Participant

Table 27: City of Belvedere Current Hazard Mitigation Actions

3.6 Progress in Local Mitigation Efforts

This plan has been created as a "living" document with input from the population and professionals within the City of Belvedere. Based on the planning meetings and the progress monitored by the steering committee members several mitigation actions were accomplished since the last planning cycle. Table 26 provides a brief description of the progress made in the local mitigation efforts and the plan for those mitigation actions that were not completed or are ongoing.

The planning team for the City of Belvedere identified and prioritized the mitigation actions as detailed in Table 27, based on the risk assessment and in accordance with the process outline in Section 3, Mitigation Strategy, of the base plan. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. General processes and information on plan implementation and maintenance of this LHMP by all participating jurisdictions is included in Section 4.0: Plan Review, Evaluation, and Implementation.

3.7 Plan Integration

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning, capital facilities planning, emergency management, hazard specific planning, and that relevant information from those sources is also used in hazard mitigation. This section identifies where such integration is already in place from the 2018 MJHMP, and where the 2023 MJHMP will be used for further integration.

The planning team for the City of Belvedere will maintain this plan and will serve as a lead staff for grant project applications on City projects selected for application under the Hazard Mitigation Assistance grant programs.

An important implementation mechanism that is highly effective and low-cost is incorporation of the hazard mitigation plan recommendations and their underlying principles into City plans and mechanisms. Where possible the City of Belvedere will use existing plans and/or programs to implement hazard mitigation actions. Mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and development. As described in this plan's capability assessment, the City of Belvedere already implements policies and programs to reduce losses to life and property from hazards. This plan builds upon the momentum developed through previous and related planning efforts and mitigation programs and recommends implementing actions, where possible, through these other program mechanisms. These existing mechanisms include Integration opportunities for the 2023 Marin County MJHMP:

City General Plan - Integrates hazard mitigation through the consideration of hazards most likely to impact the City. These hazards are considered in the Safety Element, Housing Element and Open Space Element.

City Emergency Operations Plans – Integrates hazard mitigation through the consideration of the City's planned response to hazards most likely to impact the City.

County, City and Town Ordinances - Integrates hazard mitigation through the consideration of plans and policies outlined in the capability assessments in the jurisdictional annexes.

Flood/Storm Water Management/Master Plans - Integrates hazard mitigation through the consideration of strategies to reduce flood risk and storm water management for the protection of life and property.

Community Wildfire Protection Plan - Integrates hazard mitigation through the consideration of strategies to reduce fire hazard and the risk of catastrophic wildfires in the WUI, while promoting the protection and enhancement of the county's economic assets and ecological resources.

The successful implementation of this mitigation strategy will require review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. A few examples of incorporation of the MJHMP into existing planning mechanisms include:

1. As recommended by Assembly Bill 2140, each community should adopt (by reference or incorporation) this MJHMP into the Safety Element of their General Plans. Evidence of adoption (by formal, certified resolution) shall be provided to CalOES and FEMA
2. Integration of flood actions identified in this mitigation strategy with the actions and implementation priorities established in existing Flood Management Programs
3. Using the risk assessment information to update the hazards section in the County, City and City Emergency Operations Plans

Efforts should continuously be made to monitor the progress of mitigation actions implemented through these other planning mechanisms and, where appropriate, their priority actions should be incorporated into updates of this hazard mitigation plan.

3.8 FUTURE DEVELOPMENT TRENDS

Belvedere residents are more affluent than the regional population as a whole. In Belvedere, 72.7 percent of households make more than 100 percent of the Area Median Income (AMI), compared to 8.5 percent making less than 30 percent of AMI, which is considered extremely low-income. Many households with multiple wage earners, including food service workers, full-time students, teachers, farmworkers and healthcare professionals, can fall into lower AMI categories due to relatively stagnant wages in many industries.

The number of residents who own their homes compared to those who rent can help identify the level of housing insecurity (i.e., ability for individuals to stay in their homes) in a city and region. Generally, renters may be displaced more quickly if prices increase. In Belvedere, there are a total of 895 households (2019 American Community Survey estimate), and the majority of households own their homes rather than rent: 76.3 percent versus 23.7 percent. By comparison, 36.3 percent of households in Marin County are renters, while 44.0 percent of Bay Area households rent their homes.

In recent years, most housing produced in the region and across the state consisted of single-family homes and larger multi-unit buildings. However, some households are increasingly interested in "missing middle housing," including duplexes, triplexes, townhomes, cottage clusters and accessory dwelling units. These housing types may open up more options across incomes and tenure, from young households seeking more affordable homeownership options

to seniors looking to downsize and age-in-place. Zoning districts in Belvedere, including R-2 and R-3, offer some flexibility for new construction. Some in the community have suggested that new single-family uses could be prohibited in these zones.

Availability of a variety of housing types is important in order to meet the needs of a community today and in the future. In 2020 Belvedere's mix of housing types was as follows:

- 84.0 percent of homes were single-family detached;
- 4.8 percent were single-family attached;
- 7.7 percent were small multifamily (2-4 units);
- 3.5 percent were medium or large multifamily (5+ units); and
- There were no mobile homes in Belvedere.

The Mallard Pointe development project will increase the vulnerability to Flooding, Tsunami, Sea Level Rise, Earthquake, and Land Subsidence.

SECTION 4.0: PLAN REVIEW, EVALUATION, AND IMPLEMENTATION

The strategies presented are deemed appropriate and effective by recommendation of the City of Belvedere.

4.1 PLAN ADOPTION

Upon submission to the California Office of Emergency Services (CalOES) for review, and subsequent approval by the Federal Emergency Management Agency (FEMA), the Marin County MJHMP will be presented to local government for formal adoption. As appropriate, the adopted plan and accompanying City of Belvedere Community Profile will then be incorporated into local general plans for integration into organizational policy.

4.2 PLAN MONITORING

The process of hazard mitigation does not end with the completion, approval, and adoption of the Marin County OA MJHMP. During the five-year lifespan the Marin County and City of Belvedere plan, the County, cities, towns and special districts, along with community-based organizations will ensure that the mitigation goals and strategies identified are exercised and monitored under a collaborative and cooperative umbrella, and that the document itself is properly maintained.

The Marin County Office of Emergency Management, as lead coordinating agency for hazard mitigation planning within the Marin County OA, leads the Marin Operational Area Hazard Mitigation Working Group that meets quarterly to review and manage the plan, projects, and programs. The City of Belvedere is a participating member of the Marin Operational Area Hazard Mitigation Working Group. The City of Belvedere Public Works Director will monitor and update the City of Belvedere Annex to the Marin County OA MJHMP.

The review will identify changing community priorities, updated or new planning documents and the progress or status of the mitigation actions as detailed in the mitigation strategy. Additional questions to complete the review will be considered as follows:

- Do the goals address current and expected conditions?
- Are the goals and objectives consistent with changes in the local, state, and federal policy?
- Status updates on all mitigation actions?
- Have the hazards or risks changed?
- Are current resources appropriate for implementing the MJHMP?
- Have the outcomes occurred as expected?
- Is the County and jurisdictions or districts participating in the plan implementation process as expected?

The Working Group is a subgroup of the Marin Disaster and Citizens Corps Council. During the five-year update cycle, the Marin Operational Area Hazard Mitigation Working Group will have quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. Further, Marin OEM will host an annual one-day mitigation summit to increase engagement and enhance collaboration on the plan and projects. The summit will also have the

goal to educate stakeholders on innovative approaches to mitigation, trends, and new plan requirements. Marin OEM, as the host, will seek subject matter experts, state and federal officials, and representatives from within the Marin OA to speak to mitigation and planning. The knowledge gathered and the coordination facilitated during the summit will be used to update the base plan and annexes.

Marin OEM has the capacity to lead the Working Group and Multi-Jurisdictional Planning with one coordinator assigned with direct maintenance of the plan, a department analyst assigned to support the coordinator with project and grant tracking, and a community preparedness coordinator assigned with conducting regular public outreach on the plan and education on mitigation. Community feedback and integration will continue through outreach events and OEM website, where residents and visitors are invited to provide feedback through a survey, available in English or Spanish.

Specific plan maintenance activities by the Marin County Office of Emergency Management and its participating jurisdictions/special districts may include:

- Hold quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions.
- Annual Hazard Mitigation Summit
- Holding public meetings after the first quarter and third quarter update meetings.
- Maintaining the Marin County OEM Hazard Mitigation Website, which provides the public with the ability to access identified hazard impact maps, location address search capability, and a listing of hazard mitigation actions.
- Monitoring of the Marin County and all participating jurisdiction mitigation project activities and dissemination of status reports.
- Generation of reports relative to plan status, project management, and revision updates to executive leadership.
  Preparations for the plan's future revision and updating.

4.3 Plan Evaluation

Upon approval and adoption by the City of Belvedere, the prioritized mitigation strategies will be further developed for funding and implementation by the lead agencies. The plan describes the potential sources of hazard mitigation funding, and general procedures to obtain that funding.

The mitigation strategies represented and adopted within this plan are recommendations only and must be approved and funded in order to be implemented as official mitigation solutions. Ultimately, it is the responsibility of jurisdictional and agency officials within the Marin County to undertake project implementation based upon identified mitigation strategies, funding availability, and local need when it arises. The Marin County Office of Emergency Management will meet with the Marin Operational Area Hazard Mitigation Working Group, including the City of Belvedere, to evaluate the plan after each update meeting.

4.4 Plan Update

The City of Belvedere Public Works Director will monitor and update the City of Belvedere Annex to the Marin County OA MJHMP. During the five-year update cycle, the City of Belvedere and the Marin County Office of Emergency Management will hold quarterly update meetings with the Marin Operational Area Hazard Mitigation Working Group and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. The Marin

County Office of Emergency Management and all participating jurisdictions and special districts will continue to hold public meetings after the first quarter and third quarter update meetings annually and will continue to invite public participation in the update process via updated public surveys.

Bolinas Community Public Utility District

Marin County Multi-Jurisdictional Hazard Mitigation Plan 2023

This page is intentionally blank.

ACKNOWLEDGEMENTS

The Bolinas Community Public Utility District would like to thank those collaborators and partners who participated in the planning and development of this document.

The official Marin County hazard mitigation Steering Committee provided the oversight and dedication to this project that was required, and without their commitment, this project would not be possible.

As with any working plan, this document represents planning strategies and guidance as understood as of the date of this plan's release. This plan identifies natural hazards and risks and identifies the hazard mitigation strategy to reduce vulnerability and make the Bolinas Community Public Utility District more disaster resistant and sustainable.

This page is intentionally blank.

1.0 INTRODUCTION

1.1 INTRODUCTION

The Bolinas Community Public Utility District Profile has been prepared in conjunction with the Marin County Multi-Jurisdictional Hazard Mitigation Plan (MJHMP), establishing an inter-jurisdictional process for the development and implementation of effective hazard mitigation strategies in association with identified hazards that pose real or potential threats to the Bolinas Community Public Utility District (PUD).

1.2 PLANNING PROCESS

The majority of Marin County consists of unincorporated, sparsely populated rural and protected lands. Most of the 262,000 county population is consolidated into the Eastern portion of the county. The Marin County MJHMP Steering Committee and broader Planning Team approached the development of the Marin County MJHMP and the associated jurisdictional and district profiles from a coordinated and collaborative planning and public engagement unity of effort.

The Steering Committee felt a unified effort, led by the County Office of Emergency Management (OEM), would be the most effective approach for this planning process. This approach allowed the small jurisdictions and special districts with limited staffing and resources to take advantage of the combined efforts of the County and other jurisdictions to reach a broader segment of each of their own populations and do so in a way to ensure greater equity and inclusion of the public in this planning process. Extensive and coordinated public outreach was done involving all participating jurisdictions and special districts with an eye towards equity, inclusion, openness, accessibility, and ensuring they meet the population where they live, work, or recreate to provide the public convenience of access and ease of participation in this planning process.

Marin County is very different from most California counties in that the populated portion of the County where the jurisdictions and special district's planning areas are located has the same climate, similar topography, and are exposed to many of the same hazards. Only three jurisdictions, Larkspur, Ross, and San Anselmo, are not coastal jurisdictions and are not impacted by Tsunami or Sea Level Rise.

This unity of effort approach allowed the Steering Committee to establish a more robust Planning Team representing local, countywide, regional, state, and federal stakeholders servicing the Marin County planning area. These stakeholders were in a unique position to provide informed and specific information and recommendations on hazard mitigation goals and actions, as well as population needs and social vulnerability for each of the jurisdictional and district planning areas. This united effort allowed the members of the Planning Team to attend fewer meetings than they would have been required to attend if they were required to attend separate meetings for each participating jurisdiction and special district. The reduced number of meetings allowed the Planning Team the opportunity and time to provide more detailed and thoughtful contributions to the planning effort.

In addition to providing representation on the coordinated Marin County Multi-Jurisdictional Hazard Mitigation Plan Steering Committee, the Bolinas Community Public Utility District involved additional internal planning team members to support the broader planning process. The Bolinas Community Public Utility District jurisdictional representatives for the coordinated

Marin County Multi-Jurisdictional Hazard Mitigation Plans Steering Committee and the Planning Team Members are represented below.

1.2.1 Steering Committee Members (District Representatives)

Primary Point of Contact
Jennifer Blackman, General Manager
Telephone: 415-868-1224
e-mail Address: Jblackman@bcpud.org

Alternate Point of Contact
Stephen Marcotte, Assistant Fire Chief
Telephone: 415-868-1566
e-mail Address: smarcotte@bolinasfire.org

This annex was developed by the primary point of contact with assistance from the members of the local mitigation planning team listed in Table 1.

This 2023 Marin County Operational Area (OA) MJHMP is a comprehensive update of the 2018 Marin County OA MJHMP. The planning area and participating jurisdictions and organizations were defined to consist of unincorporated Marin County, eleven incorporated jurisdictions, and five special districts, including the Bolinas Community Public Utility District. All participating jurisdictions and special districts are within the geographical boundary of Marin County and have jurisdictional authority within this planning area.

The Steering Committee led the planning process based on the contribution and input from the whole community stakeholders who identified the community's concerns, values, and priorities. The Steering Committee met and reviewed the mitigation recommendations and strategies identified within this plan. Each participating local jurisdiction and special district established a mechanism for the development and implementation of jurisdictional mitigation projects, as identified within this plan and associated locally specific supporting documents. As deemed necessary and appropriate, participating jurisdictions and special districts will organize local mitigation groups to facilitate and administer internal activities.

The Steering Committee assisted with the planning process in the following ways:

- Attending and participating in the Steering Committee meetings.
- Identifying potential mitigation actions.
- Updating the status of mitigation actions from the 2018 Marin County OA MJHMP.
- Collecting and providing other requested data (as available).
- Making decisions on plan process and content.
- Reviewing and providing comments on plan drafts; including annexes.
- Informing the public, local officials, and other interested stakeholders about the planning process and providing opportunity for them to be involved and provide comment.
- Coordinating, and participating in the public input process.
- Coordinating the formal adoption of the plan by the governing boards.

1.2.2 Steering Committee Planning Process

The Steering Committee met monthly to develop the plan. Email notifications were sent out to each Steering Committee member to solicit their participation in the Steering Committee meetings. The meetings were conducted using a Zoom platform videoconferencing. Meeting attendees signed in using the chat feature to record their attendance.

The Steering Committee agreed to make and pass plan-based general policy recommendations by a vote of a simple majority of those members present. The Steering Committee will also seek input on future hazard mitigation programs and strategies from the mitigation planning team by focusing on the following:

- Identify new hazard mitigation strategies to be pursued on a state and regional basis and review the progress and implementation of those programs already identified.
- Review the progress of the Hazard Mitigation program and bring forth community input on new strategies.
- Coordinate with and support the efforts of the Marin County OEM to promote and identify resources and grant money for implementation of recommended hazard mitigation Strategies within local jurisdictions and participating public agencies.

During the planning process, the Steering Committee communicated through videoconferencing, face-to-face meetings, email, telephone conversations, and through the County website. The County website included information for all stakeholders on the MJHMP update process. Hannah Tarling of the Marin County OEM and Preparative Consulting established a Microsoft 365 SharePoint folder which allowed the Steering Committee members and Marin OEM and Preparative Consulting to share planning documents and provide a format for the planning partners to submit completed documents and access other planning related documents and forms. Draft documents were also posted on this platform and the Marin County OEM website so that the Steering Committee members and the public could easily access and review them.

1.2.3 Coordination with Stakeholders and Agencies

Opportunities for involvement in the planning process must be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other private and nonprofit interests (44 CFR, Section 201.6(b)(2)).

Early in the planning process, the Marin County and Bolinas Community PUD Steering Committee reached out to the following Local and Regional Agencies involved in hazard mitigation activities to invite them to participate in this planning process as a member of the Planning Team. These individuals work with Marin County and the Bolinas Community PUD communities and could provide subject matter expertise and relevant information to the planning process regarding the community history, hazard risk, vulnerability, and impact, mitigations efforts, community needs, demographics, and social vulnerability, economic concerns, ecology, and other community services and needs.

The Marin County and Bolinas Community PUD Steering also determined that data collection, risk assessment analyses, mitigation strategy development, and plan approval would be greatly enhanced by inviting other local, state and federal agencies and organizations to participate in the process. Based on their involvement in hazard mitigation planning, their landowner status in the County, the Bolinas Community PUD and/or their interest as a neighboring jurisdiction, representatives from the following groups were invited to participate on the Planning Team:

Eighty-five planning partners participated in this update, as listed in Table1.

Table 28: 2023 MJHMP Planning Team Members

Several opportunities were provided for the groups listed above to participate in the local planning process. At the beginning of the planning process, invitations were extended to these groups to actively participate on the Planning Team. Participants from these groups assisted in the process by attending several videoconferencing meetings where hazard vulnerability and risk were discussed along with hazard mitigation strategies and actions. Planning Team members provided data and other applicable information directly as requested in meetings, emails, telephone calls, videoconferencing, worksheets, or through data contained on their websites or as maintained by their offices. This information was used to develop hazard vulnerability and risk profiles along with mitigation actions.

These key agencies, organizations, and advisory groups received meeting announcements, agendas, and minutes by e-mail throughout the plan update process. They supported the effort by attending meetings or providing feedback on issues. All the agencies were provided with an opportunity to comment on this plan update and were provided with a copy of the plan to review and offer edits and revisions. They were also provided access to the Marin County OEM hazard mitigation plan website to review all planning documents and hazard mapping tools.

Each was sent an e-mail message informing them that draft portions of the plan were available for review. In addition, the complete draft plan was sent to the California Governor's Office of Emergency Services (Cal OES) and FEMA Region IX for a pre-adoption review to ensure program compliance.

In addition, through the public meetings conducted at the beginning of the planning process, members of the planning team, the public, and other key stakeholders were invited to participate in the planning process through public outreach activities.

Further as part of the public outreach process, all planning areas engaged in public outreach and education by providing information on their website or though press releases directing the public to the main Marin County OEM website that provided coordinated and detailed public information of the planning process and how the public could participate. All planning areas were invited to attend the public meetings and to review and comment on the plan prior to submittal to Cal OES and FEMA. Additional public outreach action is detailed in the 1.2.4 PUBLIC ENGAGEMENT section of this annex.

The following planning meetings were held with the planning team:

Table 2: Bolinas Community Public Utility District & Marin County MJHMP Planning Meetings

1.2.4 Public Engagement

Early discussions with the Marin County OEM established the initial plan for public engagement to ensure a meaningful and inclusive public process with a focus on equity and accessible to the whole community. The Public Outreach efforts mirrored the Planning Team approach with a unified effort, led by the County OEM, involving all participating jurisdictions and special districts. Public outreach for this plan update began at the beginning of the plan development process with a detailed press release informing the community of the purpose of the hazard mitigation planning process for the Marin County planning area and to invite the public to participate in the process.

Public involvement activities for this plan update were conducted by the County and all participating jurisdictions and special districts and included press releases; website postings; a community survey; stakeholder and public meetings; and the collection of public and stakeholder comments on the draft plan which was posted on the County website. Information provided to the public included an overview of the mitigation status and successes resulting from implementation of the 2018 plan as well as information on the processes, new risk assessment data, and proposed mitigation strategies for the plan update.

Equity and Whole Community Approach

Early discussions with the Marin County OEM established the initial plan for public engagement to ensure a meaningful and inclusive public process with a focus on equity and accessible to the whole community. The Public Outreach efforts mirrored the Planning Team approach with a unified effort, led by the County OEM, involving all participating jurisdictions and special districts. Public outreach for this plan update began at the beginning of the plan development process with a detailed press release informing the community of the purpose of the hazard mitigation planning process for the Marin County OA planning area and to invite the public to participate in the process.

Public involvement activities for this plan update were conducted by the County and all participating jurisdictions and special districts and included press releases; website postings; a community survey; stakeholder and public meetings; and the collection of public and stakeholder comments on the draft plan which was posted on the County website. Information provided to the public included an overview of the mitigation status and successes resulting from implementation of the 2018 plan as well as information on the processes, new risk assessment data, and proposed mitigation strategies for the plan update.

Equity and Whole Community Approach

The Marin County OEM and the Steering Committee prioritized equity and engagement of the whole community in the development of the Marin County OA MJHMP by establishing a framework with key actions for each step of the planning process. Elements of the equity approach included:

Engaging hard-to-reach populations

This effort was to ensure the greatest equity and access to the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." The Town Hall meetings were conducted at different familiar locations within the county where people could easily access them and were conducted on both a weekday and weekend, and in the evening and during the daytime. The meetings were offered in-person with a virtual broadcast using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. After the meeting, Marin County OEM uploaded the recorded meeting to their website to allow the public on demand access to the meeting.

Translation and Interpretation Services

The survey and outreach materials were provided in both English and Spanish to improve accessibility among populations with limited English proficiency. The website uses Google Translate for accessibility in multiple languages. Interpretation services were offered for both town hall meetings. Each town hall meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

Three stakeholder and public meetings were held, two at the beginning of the plan development process and one prior to finalizing the updated plan. Where appropriate, stakeholder and public comments and recommendations were incorporated into the final plan, including the sections that address mitigation goals and strategies. Specifically, public comments were obtained during the plan development process and prior to plan finalization.

All press releases and website postings are on file with the Marin County OEM. Public meetings were advertised in a variety of ways to maximize outreach efforts to both targeted groups and to the public at large. Advertisement mechanisms for these meetings and for involvement in the overall MJHMP development process include:

- Development and publishing of an MJHMP public outreach article
- Providing press releases to local newspapers and radio stations
- Posting meeting announcements on the local County MJHMP website
- Email to established email lists
- Personal phone calls

The public outreach activities were conducted with participation from and on behalf of all jurisdictions participating in this plan.

The Steering Committee has made the commitment to periodically bring this plan before the public through public meetings and community posting so that citizens may make input as strategies and implementation actions change. Public meetings will continue to be held twice a year after the first and third MJHMP meetings. Public meetings will continue to be stand-alone meetings but may also follow a council meeting or other official government meeting. The public will continue to be invited to public meetings via social media messaging, newspaper invitations, and through the website for each jurisdiction participating in the plan. Each jurisdiction is responsible for assuring that their citizenry is informed when deemed appropriate by the Steering Committee.

WEBSITE

At the beginning of the plan update process, Marin County OEM established a hazard mitigation website https://emergency.marincounty.org/pages/lhmp on behalf of all the planning areas to ensure consistent messaging and information, to keep the public posted on plan development milestones, and to solicit relevant input. The website also provided information on signing up for Alert Marin, provided detailed information about the hazard mitigation process and plan development, provided a URL and QR code link to the survey in both English and Spanish, and provided information about upcoming town hall meetings. (See Figure 1)

The site's address was publicized in all press releases, surveys and public town hall meetings. Each planning partner also established a link on their own agency website. Information on the plan development process, the Steering Committee, a link to the Hazard Mitigation survey, and drafts of the plan were made available to the public on the site. Marin County intends to keep a website active after the plan's completion to keep the public informed about successful mitigation projects and future plan updates.

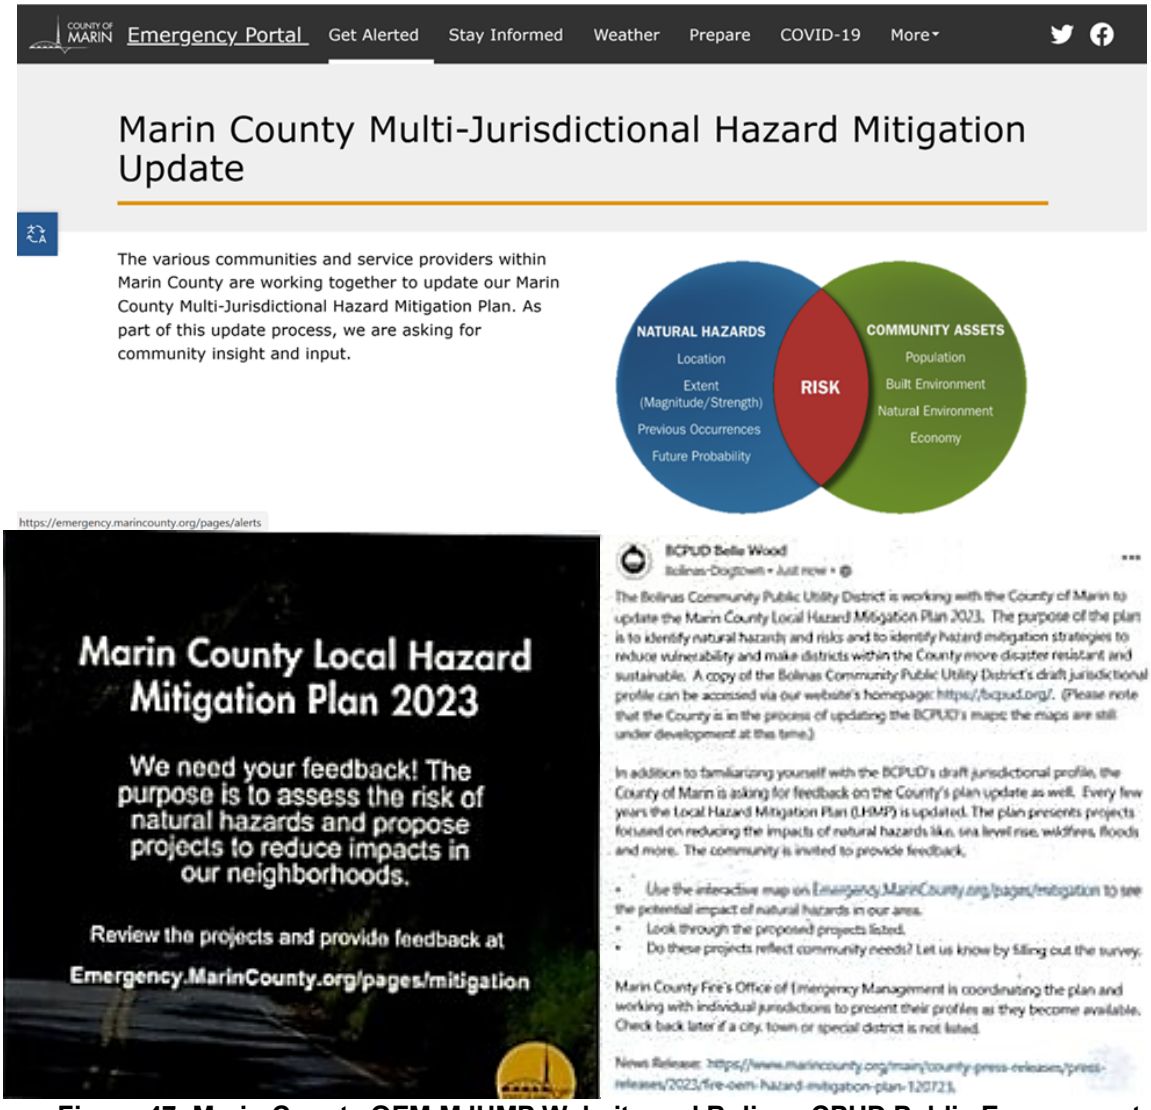

Figure 47: Marin County OEM MJHMP Website and Bolinas CPUD Public Engagement

PUBLIC MEETINGS

Two separate Marin County MJHMP Public Town Hall Meeting were conducted at different locations within the County, on different days of the week and during different times of the day. This effort was to ensure the greatest equity and access by the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." Each Town Hall Meeting included, live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

The first Town Hall Meeting was conducted on Thursday, April 13, 2023, from 6:00 pm to 7:30 pm, at the Marin County Board of Supervisors Chambers, Marin County Civic Center, 3501 Civic Center Drive, Room #330 San Rafael, CA 94903. The in-person meeting was also broadcast virtually using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. Each of the jurisdictions participating in the MJHMP released a Press Release on their respective websites announcing the Public Town Hall Meeting and providing the date, time, and URL link to the Zoom Meeting for the public to log in and attend the Zoom Meeting. Marin County OEM also posted a notice for the Public Town Hall Meeting on their Facebook account. At the conclusion of the presentation, a question and answer session was held to answer questions from the attendees.

The second Town Hall Meeting was conducted on Saturday, April 29, 2023, from 10:00 am to 11:30 am, at the Marin County Health and Wellness Center, 3240 Kerner Ave. Rooms #109 and #110 San Rafael, CA. 94903. The meeting followed the same format as the first and hosted the same access level of equity and accessibility.

The Marin County MJHMP Public Town Hall Meeting was recorded and downloaded from Zoom and made available to all of the jurisdictions and districts to place on their websites and local Access TV for the public to view.

Meeting participants were also invited to complete the Hazard Mitigation Survey and were provide the URL link to the Survey Monkey website to complete the survey.

Figure 48: Marin County OEM MJHMP Public Town Hall Meeting

SOCIAL MEDIA

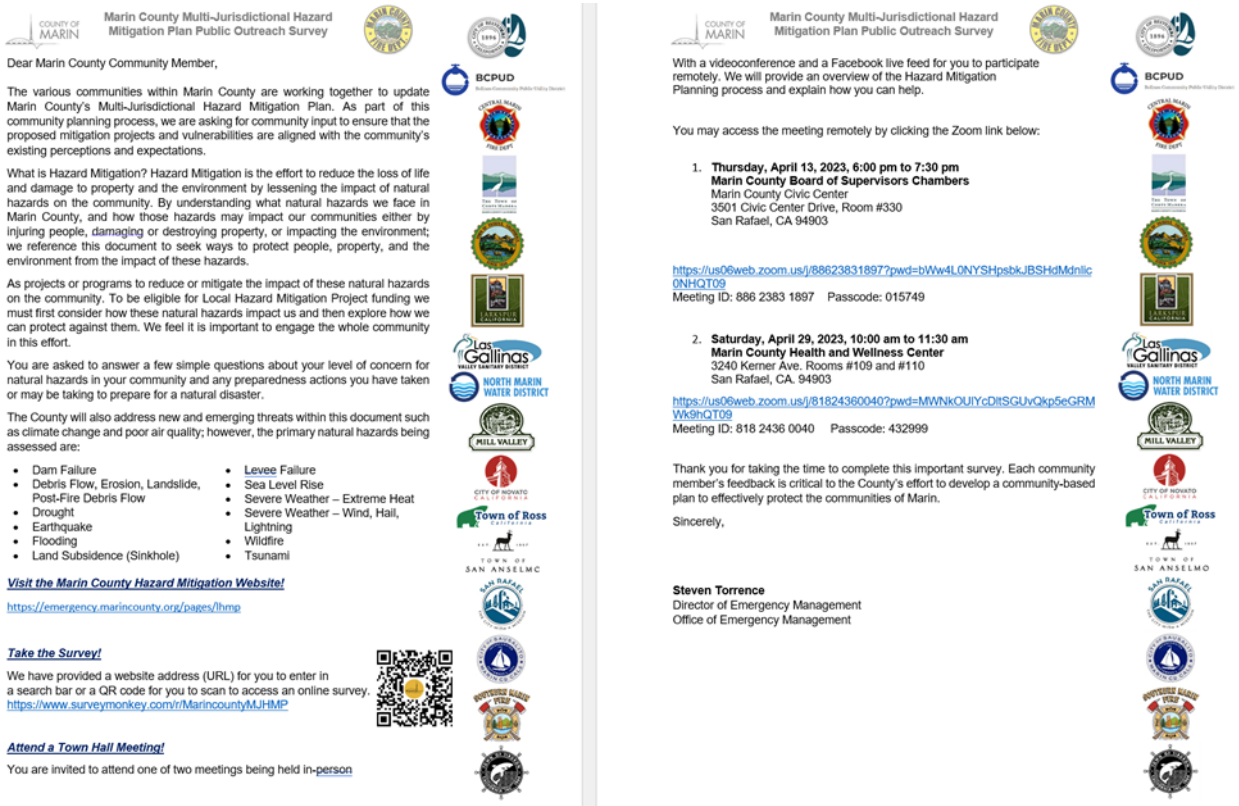
Marin County and its participating jurisdictions utilized several forms of social media to reach residents and customers. Information about the Hazard Mitigation Planning process was communicated to the public via Facebook, Twitter, and local access TV. Residents and customers were invited to complete the Hazard Mitigation Plan survey which was accessible via an attached URL or QR Code and provide feedback on potential hazard mitigation projects or programs.

The results of the survey were provided to each of the planning partners and used to support the jurisdictional annex process. Each planning partner was able to use the survey results to help identify actions as follows:

- Gauge the public's perception of risk and identify what citizens are concerned about.
- Identify the best ways to communicate with the public.
- Determine the level of public support for different mitigation strategies.
- Understand the public's willingness to invest in hazard mitigation.

PRESS RELEASES

Press releases were distributed over the course of the plan's development as key milestones were achieved and prior to each Marin County MJHMP Public Town Hall Meeting. All press releases were made available to the community in both English and Spanish.



Marin County Multi-Jurisdictional Hazard Mitigation Plan Public Outreach Survey

Dear Marin County Community Member,

The various communities within Marin County are working together to update Marin County's Multi-Jurisdictional Hazard Mitigation Plan. As part of this community planning process, we are asking for community input to ensure that the proposed mitigation projects and vulnerabilities are aligned with the community's existing perceptions and expectations.

What is Hazard Mitigation? Hazard Mitigation is the effort to reduce the loss of life and damage to property and the environment by lessening the impact of natural hazards on the community. By understanding what natural hazards we face in Marin County, and how those hazards may impact our communities either by injuring people, damaging or destroying property, or impacting the environment; we reference this document to seek ways to protect people, property, and the environment from the impact of these hazards.

As projects or programs to reduce or mitigate the impact of these natural hazards on the community. To be eligible for Local Hazard Mitigation Project funding we must first consider how these natural hazards impact us and then explore how we can protect against them. We feel it is important to engage the whole community in this effort.

You are asked to answer a few simple questions about your level of concern for natural hazards in your community and any preparedness actions you have taken or may be taking to prepare for a natural disaster.

The County will also address new and emerging threats within this document such as climate change and poor air quality; however, the primary natural hazards being assessed are:

- Dam Failure
- Debris Flow, Erosion, Landslide, Post-Fire Debris Flow
- Drought
- Earthquake
- Flooding
- Land Subsidence (Sinkhole)
- Levee Failure
- Sea Level Rise
- Severe Weather – Extreme Heat
- Severe Weather – Wind, Hail, Lightning
- Wildfire
- Tsunami

Meeting ID: 818 2436 0040 Passcode: 432999

Thank you for taking the time to complete this important survey. Each community member's feedback is critical to the County's effort to develop a community-based plan to effectively protect the communities of Marin.

Sincerely,

Steven Torrence
Director of Emergency Management
Office of Emergency Management

Figure 49: Hazard Mitigation Plan Public Outreach Press Release

SURVEY

A hazard mitigation plan survey (see Figure 4) was developed by the Steering Committee and made available to the public in both English and Spanish. The survey was used to gauge household preparedness for natural hazards and the level of knowledge of tools and techniques that assist in reducing risk and loss from natural hazards. This survey was designed to help identify areas vulnerable to one or more natural hazards. The answers to its ten questions helped guide the Steering Committee in defining our hazards, and selecting goals, objectives, and mitigation strategies. The survey was available on the hazard mitigation plan website, advertised in press releases, and at town hall meetings. Finally, the survey and the process of public input was advertised throughout the course of the planning process. The survey was available to the public on March 13, 2023, and closed on June 12, 2023. At the conclusion of the planning process over 293 surveys were completed by the public.

Public Comments Considered by the Planning Team

The Planning Team used the following information gathered from the Public Outreach Survey to inform decisions regarding hazard mitigation strategies, actions, and priorities.

- Climate Change, Wildfire, and Drought were the top hazards of concern for the public.
- Text messages, mail, and the County website were the preferred methods for receiving hazard mitigation information.
- 48% of respondents expressed that they were “Very Much” concerned and 31% were “Moderately” concerned that a natural disaster could impact their home or place of residence.
- 85% of respondents own their own home.
- 99% of respondents have access to the internet.

Figure 50: Hazard Mitigation Plan Survey

PUBLIC COMMENT ON THE PLAN

To solicit public feedback on the draft plan, Marin OEM engaged in a multi-faceted approach intended to reach as many Marin residents as possible, including members of the community who are under-served and under-represented. All members of the community had the opportunity to provide initial comments on the plan during a two-week period from Wednesday, December 4, 2023, to Wednesday, December 18, 2023. Although the initial comment period was listed as two weeks, the public could submit comments indefinitely via the County's website to support the County's continuous improvement efforts. The base plan, as well as city, town and special district annexes, were available for download on emergency.marincounty.org (include photos). The website additionally asked for feedback in a survey in English and Spanish (include photos), the survey was designed to establish where that person lives or works, their top hazards of concern, elicit feedback on the plan and offer a place for them to share projects to reduce risk in their community. The survey collected responses from the community in English and in Spanish.

The website and survey were shared through traditional and social media (photos) The Marin Independent Journal (Marin IJ) used the press release to write an article. Social media accounts were updated four times with an initial ask, two reminders, and a closing announcement. The Marin OEM Public Information Officer coordinated with the Marin County Public Information Officers (MAPIO) working group to distribute information to partner jurisdictions (city, town, and special districts) to share this information on their social media sites and with the communities in the area.

To reach those who may not be engaged digitally, the planning team worked with Marin County Community Response Teams, (CRTs are a collaboration of non-profit organizations supporting underrepresented communities in four zones) to conduct outreach with half-sheet flyers in English and Spanish to share in the 4 CRT zones (southern Marin, north Marin, west Marin, San Rafael). These half sheets were also shared county-wide at libraries, including in areas not covered by CRTs, like at the Fairfax library. CRTs are designed to reach Marin's

traditionally underserved and underrepresented communities, so by conducting outreach through this method, we were able to inform residents who may not have been engaged otherwise, including residents in Marin City, West Marin, and the Canal District of San Rafael.

After December 18, 2023, the various participating jurisdiction and district profiles remained on the Marin County OEM website for public comments. The Bolinas Community PUD had an additional 14-day comment period for the Bolinas Community PUD Profile where their profile was posted on the District website for final public comment from January 29 – February 5, 2024.

The 14-day public comment period gave the public an opportunity to comment on the draft plan update prior to the plan's submittal to Cal OES. Comments received on the draft plan are available upon request. All comments were reviewed by the planning team and incorporated into the draft plan as appropriate.

Public Comments Considered by the Planning Team

The Marin County OEM posted the draft Hazard Mitigation Plan and hazard mitigation actions on their website and solicited public comments on the content. The Bolinas Community PUD posted social media alerts directing the community to the Marin County OEM website to review the draft plans. The Planning Team gathered public comments and information on the Marin County OEM website regarding proposed and current Hazard Mitigation Actions. The Planning Team used the comments and suggestions to inform decisions regarding hazard mitigation strategies, actions, and priorities. Most comments included ideas for hazard mitigation projects and comments on the effectiveness of current mitigation projects. These comments were used to revise the proposed hazard mitigation actions which resulted in the final list of hazard mitigation actions listed in 3.5 Hazard Mitigation Actions.

1.3 Overview and History

The Bolinas Community Public Utility District ("BCPUD") was formed in 1967 pursuant to a resolution of the Marin County Board of Supervisors which consolidated two previously existing districts: the Bolinas Beach Public Utility District (formed in 1927 to serve the Big Mesa) and the Bolinas Public Utility District (formed in 1935 to serve the Little Mesa and downtown areas).

As a public utility district, the BCPUD's governance authority is codified in the California Public Utilities Act of 1913, which empowers the district to provide a range of municipal services. The district is governed by a five-member Board of Directors, who are elected by registered voters (or appointed in-lieu of a contested election) to staggered four-year terms, and managed by a General Manager who supervises of staff of four shift operators and one administrative assistant. At present, the BCPUD directly or indirectly provides water, sewer, solid waste, drainage, and parks and recreation services within its boundaries.

1.4 Service Area

The BCPUD is located in unincorporated western Marin County, immediately to the south of the Point Reyes National Seashore and to the west of the Golden Gate National Recreation Area.

The BCPUD has a jurisdictional boundary of approximately 2.6 square miles and covers 1,649 acres of unincorporated Marin County, as depicted in the map below. Approximately one-fifth of that acreage (350 acres) is part of the Point Reyes National Seashore. In total there are 1,168 legal parcels encompassed within BCPUD's boundary.

Figure 51: Map of the Bolinas Community Public Utility District
Source: Marin County OEM

Figure 6 on the next page illustrates the Bolinas Community Public Utility District service area in Salmon and the jurisdictional boundaries of the Cities and Towns within Marin County.

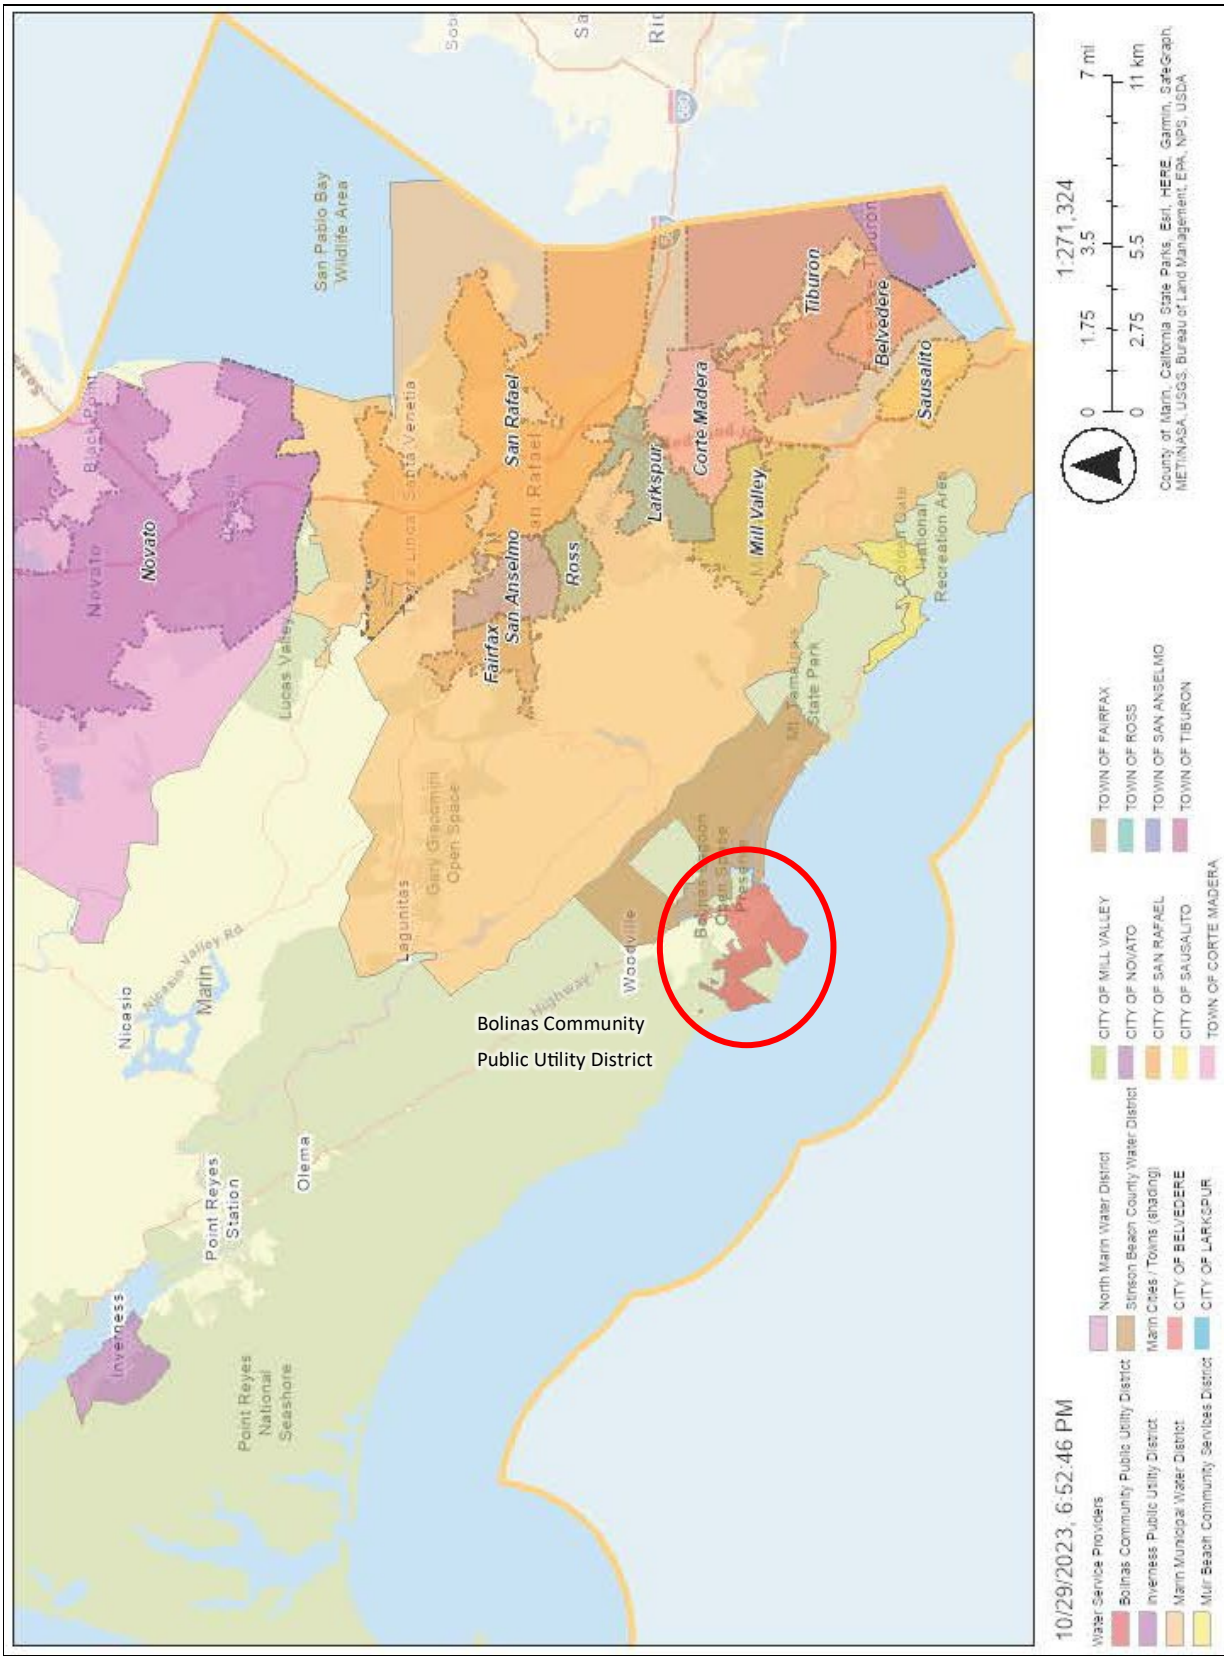

Figure 52: Map of the Bolinas Community Public Utility District and Jurisdictions
Source: Marin County OEM

Water Service

The BCPUD provides potable water services through its own supply, transmission, treatment, storage, and distribution facilities to 587 homes and businesses in the community of Bolinas. The BCPUD serves a population of approximately 1,500 full-time residents and an additional 1,000 seasonal or part time residents. All water diverted by BCPUD from its surface water sources receives treatment via inline coagulation and low-pressure microfiltration at its Woodrat Water Treatment Plant, constructed in 1995.

The majority of the BCPUD's distribution infrastructure was constructed prior to World War II by its two predecessor agencies, the Bolinas Beach Public Utility District and the Bolinas Public Utility District. The distribution system is comprised of approximately 19 miles of water mains which are gravity-fed from the District's two treated water storage tanks, the West Tank and the East Tank, which store a combined volume of 860,000 gallons of treated water.

The District's water is obtained from surface sources – the Arroyo Hondo Creek and two small emergency reservoirs supplied by unnamed streams -- contained within a 2 square mile watershed area of the Point Reyes National Seashore. In combination with the District's permitted diversions, these sources provide the BCPUD with an estimated maximum available annual yield of 167 acre-feet of water. Due to the limited nature of the BCPUD's surface water supplies, the BCPUD Board of Directors in 1971 declared a water shortage emergency and enacted a moratorium on new connections to the water system which remains in effect today. Water conservation is a way of life in Bolinas, with most households using less than 100 gallons of water per day

In 2021, the BCPUD received approval from the State Water Resources Control Board ("SWRCB") to add two existing groundwater wells as emergency sources to its water system to provide some resilience for the district in times of drought. The district applied to the California Department of Water Resources ("DWR") Small Communities Drought Relief Program for grant funding to install the treatment facilities and infrastructure needed to connect the wells to the district's distribution system. The DWR approved the funding in September 2022 and a funding agreement was finalized in September 2023. The BCPUD currently is in the process of applying for coastal permits to install the new facilities.

Wastewater Service

The BCPUD is the successor agency to the Marin County Sanitary District #3, organized in 1908. The District's sewer service area encompasses approximately three square miles with a collection system of pipelines stretching approximately three linear miles and consisting of pipes ranging in size from two inches to six inches. The collection system was constructed in two phases prior to and immediately after World War I and serves 162 connections (residential and business) in the downtown area of the community of Bolinas, as well as one additional connection on the Bolinas Mesa.

In 1975, responding to an order from the State of California to cease and desist disposing of the system's effluent in the channel of the Bolinas Lagoon, the BCPUD constructed a pump station, force main and treatment facility. The treatment facility is an integrated pond system which uses no chemicals in the treatment process, relying instead on a biological process of methane fermentation, with aeration and recirculation for odor control, and with ultimate disposal through pond evaporation and spray disposal on 45 acres of grasslands.

In 1990, the BCPUD completed an infiltration and inflow ("I&I") correction project to eliminate unwanted storm runoff and seawater intrusion into the collection system. While the project reduced I&I by 70%, the district continues to experience capacity problems in years when rainfall exceeds 50 inches. As a result, the district has continued a moratorium on new service connections enacted in 1985 as a requirement for state funding.

The BCPUD's sewer system is regulated by the Regional Water Quality Control Board for the San Francisco Bay Region ("Regional Board"). Since 1988, the district's sewer treatment facility has been subject to Waste Discharge Order 88-100. In 2021, Regional Board staff notified the district this permit is outdated and the Regional Board intends to transition to district's treatment facility to either the statewide General Order for Small Domestic Wastewater Treatment Systems (SWRCB Order WQ 2014-0153-DWQ) or an updated facility-specific permit. Among other things, the district will be required to upgrade its treatment facility in order to meet the requirements of the updated permit.

Drainage Service

The majority of residences within the District's jurisdictional boundaries are located on the Big Mesa and served by on-site wastewater treatment systems (septic systems). In the early 1990's the BCPUD hired Todd Engineering to prepare a set of drainage improvement maps with the objective of providing a high-level integrated approach to improving drainage on the Big Mesa by lowering the water table and improving septic system functioning via a series of projects to be executed by residents (or groups of residents) and their contractors over time. BCPUD provides project consultation services to District residents who are interested in implementing surface drainage projects on the Big Mesa. The District also provides culverts for project implementation "at cost" for those that are eligible.

Parks and Recreation

BCPUD does not have direct involvement in day-to-day parks and recreation activities within the District's jurisdictional boundaries. While the district owns the property on which Mesa Park (12-acres) is located and which has been improved with a parking lot, soccer field, baseball field, basketball court, playground and skate park, the land and the activities programmed there are managed by the Fire House Community Park Agency ("FHCPA"). FHCPA is a joint powers authority (JPA) whose member agencies include BCPUD and the Bolinas-Stinson Union School District. The JPA was created on January 21, 1985, with the stated intention of providing recreational opportunities to the taxpayers and residents of the area and to the students of the school and their families. FHCPA is a separate special district and receives no direct funding from BCPUD but rather receives revenue by way of Measure A funds and ad valorem property taxes.

Solid Waste Disposal Services

BCPUD provides residential and commercial properties within the District with weekly solid waste disposal, recycling and organic waste collection services pursuant to a franchise agreement with Recology Sonoma Marin.

1.5 ADMINISTRATION

The BCPUD has a five-member board that is elected to staggered four-year terms. All directors are required to be registered voters within the District's jurisdictional boundaries. The Board of Directors meets regularly on the 3rd Wednesday of each month at 7:30 p.m. at the BCPUD's Administrative Building located at 270 Elm Road in Bolinas, and holds special meetings as needed. The Board has a President, a Vice-President and three directors; the district's General Manager serves as Secretary to the Board. The Board also has several standing committees including Finance, Legal, Personnel, and Operations. Full time employees include the General Manager, Administrative Assistant, Chief Operator and three Shift Operators; the addition of an Assistant General Manager position is planned for 2024. The Board of Directors appoints the General Manager, who serves on an at-will basis, to oversee all District activities and implement the policies established by the Board of Directors. The Board provides policy direction to the General Manager on matters within the authority of the Board by majority vote of the Board members present during duly convened public meetings.

1.6 WEATHER AND CLIMATE

The Bolinas Community Public Utility District sits within an elevation range of 36 - 170 feet above sea level. The summers are long, comfortable, arid, and mostly clear and the winters are short, cold, wet, and partly cloudy. Over the course of the year, the temperature typically varies from 42°F to 77°F and is rarely below 41°F or above 78°F. The difference in precipitation between the driest month and the wettest month is 8 inches. The BCPUD records and average annual rainfall of 32 inches. The month which sees the most rainfall is December. The driest month of the year is July.

1.7 Social Vulnerability and Risk

The California Governor's Office of Emergency Services (Cal OES) has initiated the "Prepare California" grant program focused on building community resilience amongst vulnerable individuals living in the areas of the state most susceptible to natural disasters. The Prepare California Initiative is aimed at reducing long-term risks from natural disasters by investing in local capacity building and mitigation projects designed to protect communities.

Prepare California leverages funds approved in Governor Gavin Newsom's 2021-22 State Budget and is designed to unlock federal matching funds for community mitigation projects that vulnerable communities would otherwise be unable to access. This program is intended for communities that are the most socially vulnerable and at the highest risk for future natural hazard events. The state identified communities by prioritizing California census tracts according to their estimated hazard exposures and social vulnerability.

The National Risk Index is a dataset and online tool to help illustrate the United States communities most at risk for 18 natural hazards: Avalanche, Coastal Flooding, Cold Wave, Drought, Earthquake, Hail, Heat Wave, Hurricane, Ice Storm, Landslide, Lightning, Riverine Flooding, Strong Wind, Tornado, Tsunami, Volcanic Activity, Wildfire, and Winter Weather.

For purposes of this plan the following National Risk Index (NRI) hazards are profiled in support of eight of the twelve Marin County MJHMP Hazards. NRI data was not available for Dam Failure, Land Subsidence, Levee Failure, or Sea Level Rise.

Table 3: NRI Hazards and Marin County MJHMP Hazards	
NRI Hazards	Marin County MJHMP Hazards
Earthquake	Earthquake
Riverine Flooding	Flooding
Coastal Flooding	Flooding
Wildfire	Wildfire
Landslide	Debris Flow
Drought	Drought
Heat Wave	Severe Weather -Extreme Heat
Tsunami	Tsunami
Strong Wind	Severe Weather – Wind, Tornado

Table 30: NRI Hazards and Marin County MJHMP Hazards
Source: FEMA National Risk Index 2023

The National Risk Index leverages available source data for Expected Annual Loss due to these 18 hazard types, Social Vulnerability, and Community Resilience to develop a baseline relative risk measurement for each United States county and Census tract. These measurements are calculated using average past conditions, but they cannot be used to predict future outcomes for

a community. The National Risk Index is intended to fill gaps in available data and analyses to better inform federal, state, local, tribal, and territorial decision makers as they develop risk reduction strategies.

Calculating the Risk Index

Risk Index scores are calculated using an equation that combines scores for Expected Annual Loss due to natural hazards, Social Vulnerability and Community Resilience:

Risk Index = Expected Annual Loss × Social Vulnerability ÷ Community Resilience

Hazard Type Risk Index

Hazard type Risk Index scores are calculated using data for only a single hazard type, and reflect a community's Expected Annual Loss value, community risk factors, and the adjustment factor used to calculate the risk value.

The following Tables and Figures illustrates the NRI Hazard Type Risk Index and the Social Vulnerability Map for the Bolinas Community Public Utility District for the various Census Tracts within its service area.

Table 4: NRI Hazard Type Risk Index Census Tract 1321.00

Hazard Type	EAL Value	Social Vulnerability	Community Resilience	CRF	Risk Value	Score
Earthquake	$1,334,090	Very Low	Very High	0.79	$1,051,384	91.6
Riverine Flooding	$296,155	Very Low	Very High	0.79	$233,397	92.5
Landslide	$25,977	Very Low	Very High	0.79	$20,472	98.3
Coastal Flooding	$19,189	Very Low	Very High	0.79	$15,122	91.1
Wildfire	$11,259	Very Low	Very High	0.79	$8,873	83.3
Tsunami	$4,427	Very Low	Very High	0.79	$3,489	98.3
Tornado	$2,307	Very Low	Very High	0.79	$1,818	4.4
Drought	$1,339	Very Low	Very High	0.79	$1,055	84.1
Heat Wave	$316	Very Low	Very High	0.79	$249	16.9
Strong Wind	$122	Very Low	Very High	0.79	$96	4.5

Social Vulnerability in Marin County and the Bolinas Community Public Utility District

Most socially vulnerable residents in Marin County reside in parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and the unincorporated areas of Marin City and Santa Venetia. This aligns with what the County knows about Marin residents. However, discrepancy lies in the western, more rural area of the County. West Marin is comprised of seven villages, including Bolinas[4], and other populated areas, that are distanced from the centralized resources in the eastern part of the county. At three local elementary schools in West Marin (2022-2023 school year), including Bolinas, students eligible for free and reduced lunch program are, 62%, 41%, and 52%, a reflection of the financial capacity of local families. West Marin is home to many farms that may employ and house underrecognized workers that may not have taken part in a census survey, what the SVI is calculated from. In the fourth quarter of FY 2021/22 the bus routes traveling to West Marin (Rural Routes) were the only service category to have increased in ridership since pre-COVID (increase 0.1%; Marin Transit, 2022) showing the reliance of West Marin residents on public transportation; however, this data continues to adjust based upon the increase in alternate methods of mass transportation. Considering this, the County of Marin acknowledges that unique social factors in West Marin require different approaches than other parts of the County.

Looking to the community resilience index (CRI) results, the data is only calculated at the county-level and compared across the nation. As a whole, Marin County is considered to have a "very high" ability to prepare for anticipated natural hazards, adapt to changing conditions, and

[4] Bolinas is categorized as a "low income community" by California Air Resources Board's Community Investments: https://www.arb.ca.gov/cc/capandtrade/auctionproceeds/communityinvestments.htm

withstand and recover rapidly from disruptions when compared to the rest of the U.S. Unfortunately, this metric does not give us the distinct experiences of the diverse communities across Marin.

When the Estimated Annual Loss Index, Social Vulnerability Index, and Community Resilience Index are aggregated as one, final results of the National Risk Index show Marin County as a whole to have "Relatively High" risk, this is due to the financial implications a disaster may have on the county. When broken out by census tract, five tracts are in the highest category ("Very High Risk"), this matches generally with the same tracts that are ranked in as higher social vulnerability; parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and unincorporated areas of Santa Venetia.

Customers within the Bolinas Community Public Utility District service area reside within census tracts that have a Social Vulnerability Index of "Very Low". However, BCPUD residents have only one way in and out of their community (Olema-Bolinas Road) and this road floods frequently, making it unsafe to cross and rendering the residents unable to access their workplaces, groceries or medical resources. The Bolinas Community Public Utility District's scope of service to this community is limited to the water, sewer, solid waste, drainage, and parks and recreation services it provides within its jurisdictional boundaries. The district's influence may be realized during an emergency by ensuring the continued delivery of water, sewer, and solid waste services which are considered a community lifeline. The district may also work with these impacted customers to provide fee relief through local, state, and or federal programs where appropriate. The majority of socially vulnerable population services are provided through the county, state, and federal government or other non-governmental or volunteer agencies or organizations.

1.8 CRITICAL FACILITIES

The following list of facilities has been determined to be critical to the ability of the Bolinas Community Public Utility District to fulfill the requirements of its mission during an emergency:

Table 5: Bolinas Community Public Utility District Critical Facilities

	Category	Name	Address	Fire Severity Zone	Flood Zone
7.	**Dams**	Woodrat 1 Reservoir	400 Mesa Road, Bolinas	Moderate	None
8.	**Dams**	Woodrat 2 Reservoir	450 Mesa Road, Bolinas	Moderate	None
	Critical Infrastructure				
9.	**Water/Wastewater Facilities**	Administrative Building	270 Elm Road, Bolinas	Moderate	None
10.	**Water Facilities**	Corporation Yard and Shop Buildings	270 Elm Road, Bolinas	Moderate	None
11.	**Water Facilities**	Woodrat Water Treatment Plant	400 Mesa Road, Bolinas	Moderate	None
12.	**Water Facilities**	West Tank (potable water storage)	390 Mesa Road, Bolinas	Moderate	None

13.	**Water Facilities**	East Tank (potable water storage)	390 Mesa Road, Bolinas	Moderate	None
14.	**Water Facilities**	Booster Pump Station	390 Mesa Road, Bolinas	Moderate	None
15.	**Water Facilities**	Water distribution system (serves residents with potable water)	BCPUD jurisdictional boundary	Moderate	None
16.	**Water Facilities**	Water transmission system (conveys raw water to treatment plant)	Arroyo Hondo watershed, Point Reyes National Seashore	Moderate	None
17.	**Water Facilities**	Upper Impoundment (fixed concrete structure)	Arroyo Hondo Creek, Point Reyes National Seashore	Moderate	None
18.	**Water Facilities**	Lower Impoundment (radial gate structure)	Arroyo Hondo Creek, Point Reyes National Seashore	Moderate	None
19.	**Water Facilities**	Pump house (conveys water from Woodrat 2 reservoir to treatment plant)	510 Mesa Road, Bolinas	Moderate	None
20.	**Wastewater Facilities**	Laboratory	101 Mesa Road, Bolinas	Moderate	None
21.	**Wastewater Facilities**	Wharf Road Sewer Lift Station	51 Wharf Road, Bolinas	Moderate	None
22.	**Wastewater Facilities**	Force Main	Wharf Road, Olema-Bolinas Road to Treatment Ponds at 101 Mesa Road, Bolinas	Moderate	None
23.	**Wastewater Facilities**	Wastewater Treatment Ponds Facility (integrated ponds/levees, disposal fields, seepage ponds and groundwater wells)	101 Mesa Road, Bolinas	Moderate	None
24.	**Wastewater Facilities**	Wastewater Irrigation Pump Station	101 Mesa Road, Bolinas	Moderate	None
25.	**Wastewater Facilities**	Wastewater collection system (serves customers on sanitary sewer system)	BCPUD jurisdictional boundary	Moderate	None
26.	**Electrical Power Facilities**	Solar PV System	400 Mesa Road (water treatment plant)	Moderate	None
27.	**Electrical Power Facilities**	Solar PV System	101 Mesa Road, Bolinas (wastewater treatment plant)	Moderate	None

2.0 HAZARD IDENTIFICATION AND RISK ASSESSMENT

The Bolinas Community Public Utility District identified hazards that affect the District and developed natural hazard profiles based upon the countywide risk assessment, past events and their impacts. Figure 10 shows the top hazards that the Jurisdiction is at risk from according to the hazard mitigation Steering Committee.

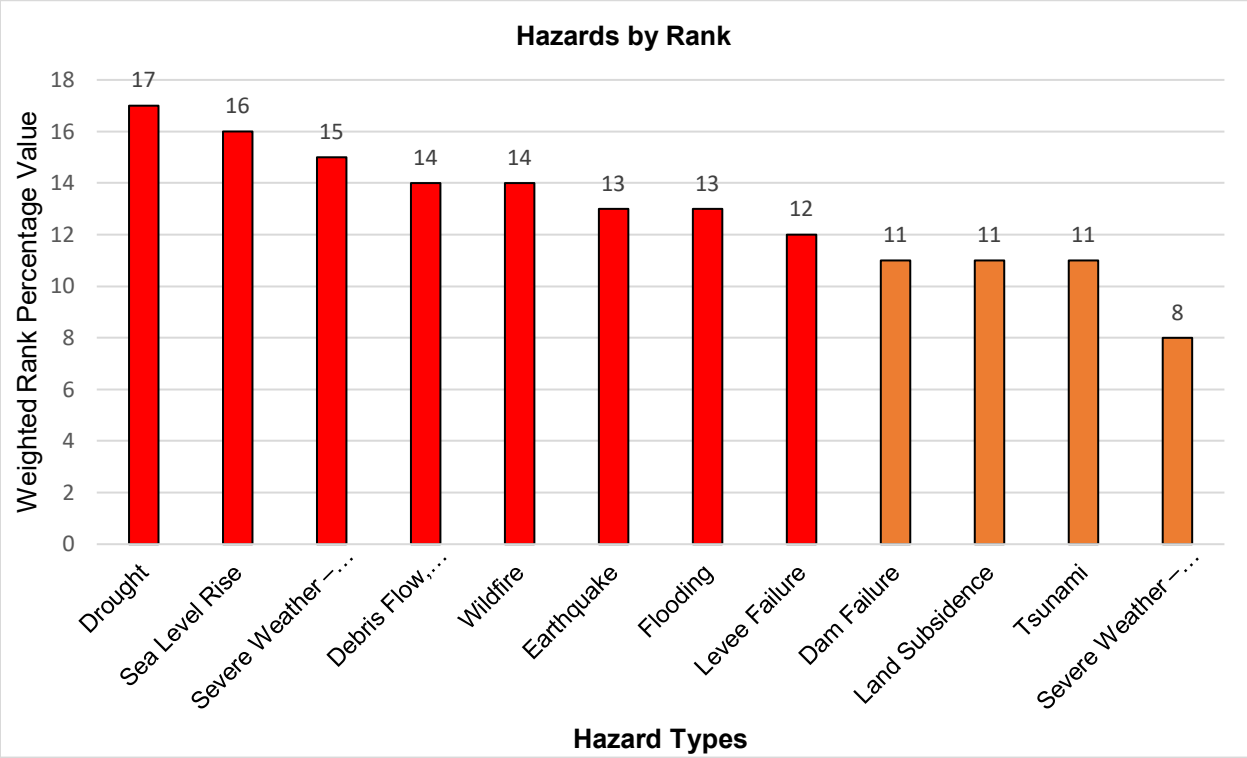

Figure 56: BCPUD Risk Assessment – Planning Team Top Hazards

Figure 11: Risk Rank Categorization	
Risk Level	Risk Numerical Score
High Risk	**12 - 18**
Serious Risk	**8 - 11**
Moderate Risk	**4 - 7**
Low Risk	**1 - 3**

Figure 57: Hazard Risk Categorization

Each Marin County MJHMP participating jurisdiction and special district reviewed and approved the Top Hazards identified by the Planning Team. Each participating jurisdiction and special district then completed a more complex assessment tool to further develop their hazard assessment and prioritization.

The planning process used the available FEMA tools to evaluate all the possible threats faced. The primary tool selected was the Hazard Assessment and Prioritization Tool. This matrix allowed the participating jurisdiction or special district to assess their own level of vulnerability and

mitigation capability. Each participating Jurisdiction and special district assessed the top hazards for:

- Probability/ Likelihood of Future Events
- Geographic Extent
- Magnitude/ Severity
- Climate Change Influence
- Significance

Probability/ Likelihood of Future Events

- **Unlikely:** Occurs in intervals greater than 100 years - Less than 1% probability of occurrence in the next year or a recurrence interval greater than 100 years.
- **Occasional:** Occurring every 11 to 100 years - 1-10% probability of occurrence in the next year or a recurrence interval of 11 to 100 years.
- **Likely:** Occurring every 1 to 10 years - 10-90% probability of occurrence in the next year or recurrence interval of 1 to 10 years.
- **Highly Likely:** Occurring almost every year - 90-100% probability of occurrence in the next year or a recurrence interval of less than 1 year.

Geographic Extent

- **Negligible:** Less than 10% of the planning area
- **Limited:** 10-25% of the planning area
- **Significant:** 25-75% of planning area
- **Extensive:** 75-100% of planning area

Magnitude/ Severity

- **Weak:** Limited classification on scientific scale, slow speed of onset or short duration of event, resulting in little to no damage.
- **Moderate:** Moderate classification on scientific scale, moderate speed of onset or moderate duration of event, resulting in some damage and loss of services for days.
- **Severe:** Severe classification on scientific scale, fast speed of onset or long duration of event, resulting in devastating damage and loss of services for weeks or months.
- **Extreme:** Extreme classification on scientific scale, immediate onset or extended duration of event, resulting in catastrophic damage and uninhabitable conditions.

Table 6: Select Hazards Magnitude and Severity Scale

Hazard	Scale/Index	Weak	Moderate	Severe	Extreme
Drought	Palmer Drought Severity Index	+1.99 to -1.99	-2.00 to -2.99	-3.00 to -3.99	-4.00 and below
Earthquake	Modified Mercalli	I to IV	V to VII	VIII	IX to XII
	Richter Magnitude	2,3	4,5	6	7,8
Tornado	Fujita Tornado Damage Scale	FO	F1, F2	F3	F4, F5

Table 33: Select Hazards Magnitude/ Severity Scale or Index

Climate Change Influence

- **Low:** Minimal potential impact
- **Medium:** Moderate potential impact
- **High:** Widespread potential impact

Significance

- **Low:** Minimal potential impact - Two or more criteria fall in lower classifications, or the event has a minimal impact on the planning area. This rating is sometimes used for hazards with a minimal or unknown record of occurrences or for hazards with minimal mitigation potential.
- **Medium:** Moderate potential impact - The criteria fall mostly in the middle ranges of classifications and the event's impacts on the planning area are noticeable but not devastating. This rating is sometimes used for hazards with a high extent rating but very low probability rating.
- **High:** Widespread potential impact - The criteria consistently fall in the high classifications and the event is likely/highly likely to occur with.

2.1 Climate Change

The County of Marin and associated jurisdictions profiled jointly recognize that the earth's climate is forcibly being augmented due to humans' reliance on fossil fuels and non-natural resources which pose negative impacts on the earth's climate. Reliance on fossil fuels and non-natural products results in the climate shifting to include unseasonable temperatures, more frequent and intense storms, prolonged heat and cold events, and a greater reliance on technological advancements to maintain the wellbeing of community members and balance of the environment. The forced adaptation to climatic shifts is necessary for the County and jurisdictions to understand and include with these assessments.

Locally to Marin, drought and rain events have already had devastating impacts to critical infrastructure, agriculture, and water resources; and globally, unseasonable temperatures have been identified as the cause for enhanced wildfires, severe droughts, ice sheets and glaciers disappearing, and persons emigrating from their countries due to a lack of sustainable, local resources. Melting land ice contributes additional water to the oceans and as ocean temperatures rise the water expands, both of which contribute to increase rates of sea level rise. Marin is bordered on the west by the Pacific Ocean and on the east by San Francisco Bay, making it particularly vulnerable to flooding and erosion caused by sea level rise.

The cause of current climate change is largely human activity, burning fossil fuels, natural gas, oil, and coal. Burning these materials releases greenhouse gases into Earth's atmosphere. Greenhouse gases trap heat from the sun's rays inside the atmosphere causing Earth's average temperature to rise. This rise in the planet's temperature was formerly called, "global warming", but climate change has shown to include both intense heat and cold shifts. The warming of the planet impacts local and regional climates. Throughout Earth's history, climate has continually changed; however, when occurring naturally, this is a slower process that has taken place over hundreds and thousands of years. The human influenced climate change that is happening now is occurring at an abnormally faster rate with devastating results.

GLOBAL OBSERVED AND PROJECTED IMPACTS AND RISKS
Source: Intergovernmental Panel on Climate Change, Headline Statements from the Summary for Policymakers, 2022

- Human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability.
- Global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans.
- Beyond 2040 and depending on the level of global warming, climate change will lead to numerous risks to natural and human systems.
- The magnitude and rate of climate change and associated risks depend strongly on near-term mitigation and adaptation actions, and projected adverse impacts and related losses and damages escalate with every increment of global warming.
- Multiple climate hazards will occur simultaneously, and multiple climatic and non-climatic risks will interact, resulting in compounding overall risk and risks cascading across sectors and regions.

FUTURE TRENDS/ IMPACTS
Source: Study Confirms Climate Models are Getting Future Warming Projections Right – Climate Change: Vital Signs of the Planet (nasa.gov)

Global Warming

- If global warming transiently exceeds 1.5°C in the coming decades or later, then many human and natural systems will face additional severe risks.
- An estimated 60% of today's methane emissions are the result of human activities. The largest sources of methane are agriculture, fossil fuels, and decomposition of landfill waste.
- The concentration of methane in the atmosphere has more than doubled over the past 200 years. Scientists estimate that this increase is responsible for 20 to 30% of climate warming since the Industrial Revolution (which began in 1750).
- According to the most recent National Climate Assessment, droughts in the Southwest and heat waves (periods of abnormally hot weather lasting days to weeks) are projected to become more intense, and cold waves less intense and less frequent.
- The last eight years have been the hottest years on record for the globe.

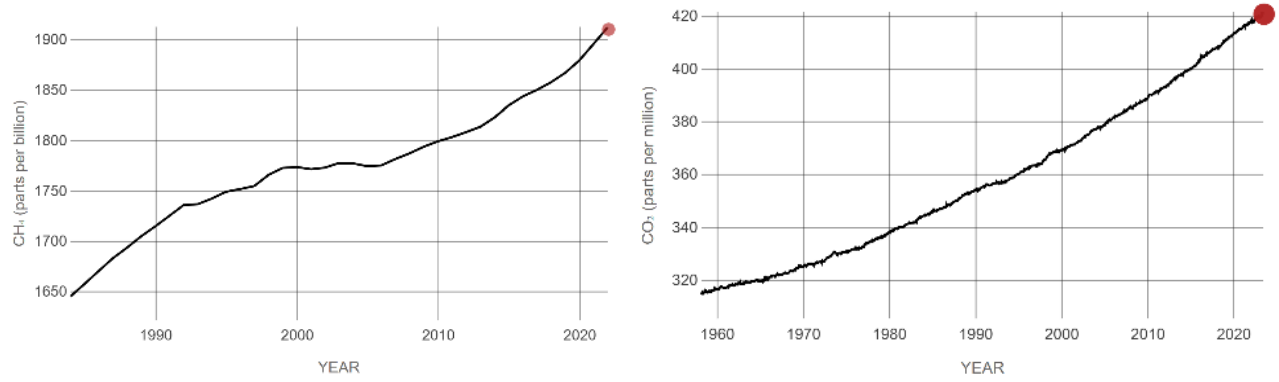

Figure 58: NASA Global Temperature Change CO2 Gas
Source: NASA Global Climate Change, 2022

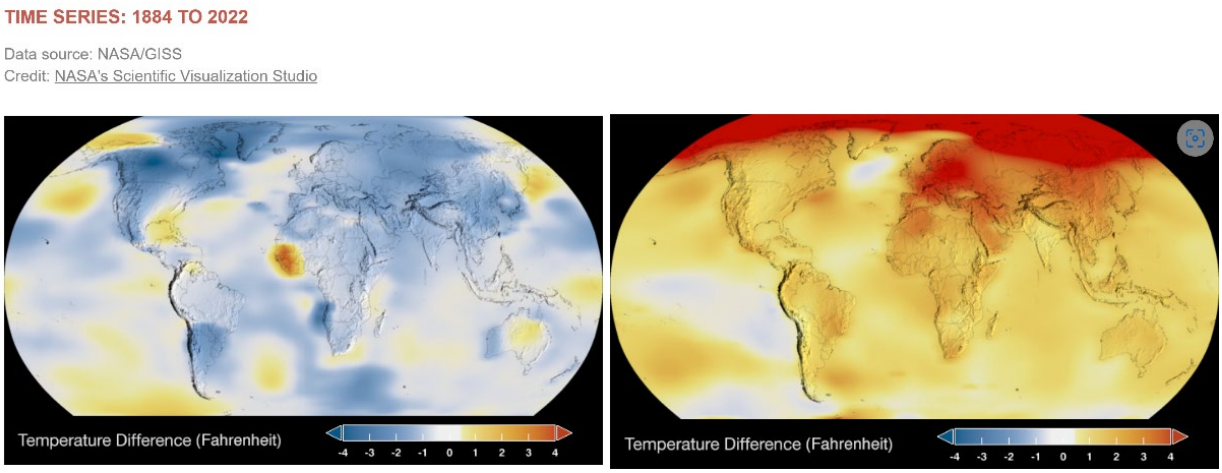

Figure 59: NASA Global Temperature Change 1884 to 2022
Source: NASA Global Climate Change, 2022

Drought

- A NASA-led study in 2022 concluded that the 22-year-long megadrought in southwestern US was the driest the territory had experienced in at least 1,200 years and was expected to persist through at least 2022.

Sea Level Rise

- Global sea levels are rising as a result of human-caused global warming, with recent rates being unprecedented over the past 2,500-plus years.

- U.S. Sea Level Likely to Rise 1 to 6.6 Feet by 2100.
- Global sea level has risen about 8 inches (0.2 meters) since reliable record-keeping began in 1880. By 2100, scientists project that it will rise at least another foot (0.3 meters), but possibly as high as 6.6 feet (2 meters) in a high-emissions scenario.
- Sea ice cover in the Arctic Ocean is expected to continue decreasing, and the Arctic Ocean will very likely become essentially ice-free in late summer if current projections hold. This change is expected to occur before mid-century.
- An indicator of changes in the Arctic sea ice minimum over time. Arctic sea ice extent both affects and is affected by global climate change.

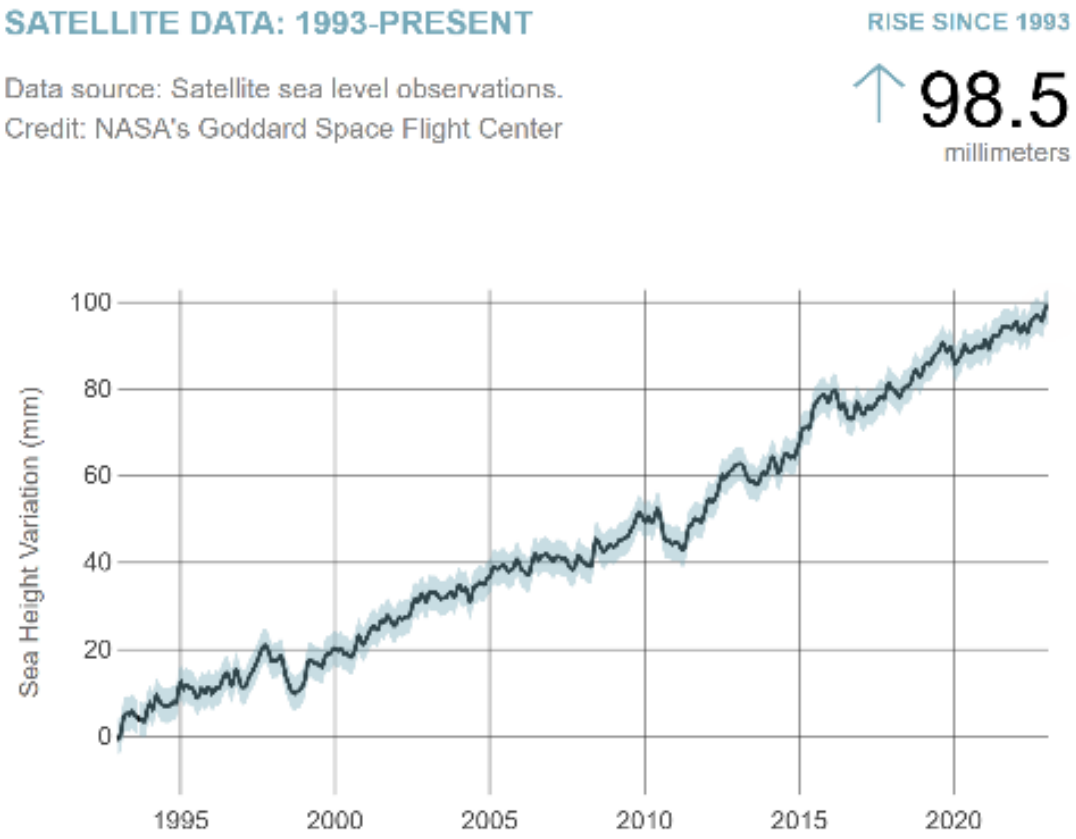

Figure 60: NASA Global Temperature Change Sea Level
Source: NASA Global Climate Change, 2022

Wildfire

- Warming temperatures have extended and intensified wildfire season in the West, where long-term drought in the region has heightened the risk of fires.
- Scientists estimate that human-caused climate change has already doubled the area of forest burned in recent decades. By around 2050, the amount of land consumed by wildfires in Western states is projected to further increase by two to six times.
- Even in traditionally rainy regions like the Southeast, wildfires are projected to increase by about 30%.

Flooding (Precipitation)

- Climate change is having an uneven effect on precipitation (rain and snow) in the United States, with some locations experiencing increased precipitation and flooding, while others suffer from drought.
- On average, more winter and spring precipitation is projected for the northern United States, and less for the Southwest, over this century.
- Projections of future climate over the U.S. suggest that the recent trend toward increased heavy precipitation events will continue. This means that while it may rain less frequently in some regions (such as the Southwest), when it does rain, heavy downpours will be more common.

Extreme Cold

- The length of the frost-free season, and the corresponding growing season, has been increasing since the 1980s, with the largest increases occurring in the western United States.

According to the California Natural Resource Agency (CNRA), climate change is already affecting California and is projected to continue to do so well into the foreseeable future. Current and projected changes include increased temperatures, sea level rise, a reduced winter snowpack, altered precipitation patterns, and more frequent storm events. Over the long term, reducing greenhouse gases can help make these changes less severe, but the changes cannot be avoided entirely. Unavoidable climate impacts result in a variety of secondary consequences including detrimental impacts on human health and safety, economic continuity, ecosystem integrity and provision of basic services. Climate change is being profiled in the 2023 Marin County Hazard Mitigation Plan as a standalone hazard while addressing each of the other natural hazards. Marin County is considering climate change issues when identifying future mitigation actions.

California is experiencing a climate crisis that is increasingly taking a toll on the health and well-being of its people and on its unique and diverse ecosystems. Every Californian has suffered from the effects of record high temperatures, dry winters, prolonged drought, and proliferating wildfires in recent years. California's biodiversity is threatened as alterations to habitat conditions brought about by a changing climate are occurring at a pace that could overwhelm the ability of plant and animal species to adapt.

Indicators of Climate Change in California
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

- Since 1895, annual average air temperatures in California have increased by about 2.5 degrees Fahrenheit (°F). Warming occurred at a faster rate beginning in the 1980s.
- Recent years have been especially warm: Eight of the ten warmest years on record occurred between 2012 and 2022; 2014 was the warmest year on record.
- Of all the Western states, California endured the hottest temperatures for the longest time, driving the average statewide temperature to the second warmest over the past 128 years.

- Extreme heat ranks among the deadliest of all climate-driven hazards in California, with physical, social, political, and economic factors effecting the capacity of individuals, workers, and communities to adapt, and with the most severe impacts often on communities who experience the greatest social and health inequities.
- Glaciers have essentially disappeared from the Trinity Alps in Northern California
- In 2020, wildfire smoke plumes were present in each county for at least 46 days.
- The 2022 fire season saw more fires than the previous fire season along with continued extreme drought and heat conditions.
- The drought, begun in 2019, was the third statewide drought declared in California since 2000.
- This drought has been marked by extreme swings; the state received record-breaking amounts of precipitation in October and December 2021 that were offset by the driest January, February, and March 2022 dating back more than 100 years. The year 2023 opened with California simultaneously managing both drought and flood emergencies.
- A series of storms in late December 2022 and early January 2023 broke rural levees, disrupted power, flooded roads, downed trees, and eroded coastal land.
- Sea level rise accelerates coastal erosion, worsens coastal flooding during large storms and peak tidal events, and impacts important infrastructure positioned along our state's 1,100-mile coast.
- The western drought which impacted all of California and the western United States was nearly lifted due to unseasonably heavy rains in late 2022 and early 2023.

The graph below shows the relative change, in millimeters, in sea levels at Crescent City (1933-2020), San Francisco (1900-2020), and La Jolla (1925-2020).

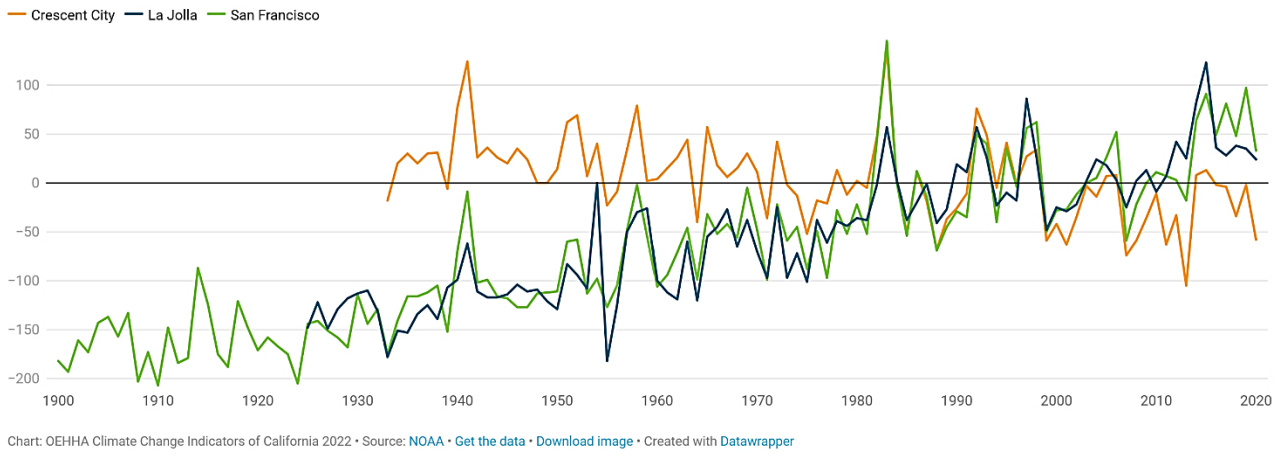

Figure 61: Annual Mean Sea Level Trends
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

Climate Change in the Marin County Operational Area

Climate change is already having significant impacts across California. Temperatures are warming, heat waves are more frequent, and precipitation has become increasingly variable. Climate change will continue to alter Marin County OA ecosystems as a result of rising temperatures, changes in precipitation, and sea level rise, which will increase the severity and occurrence of natural hazards across the Marin County OA well into the future. Coastal cooling processes that keep temperatures down, such as fog, will continue to decrease. Rising temperatures will exacerbate drought conditions and raise the potential for significant wildfires and associated smoke as vegetation becomes drier and tree mortality increases. Forested woodlands that play a major role in carbon reduction will gradually transition into chaparral and shrublands. There will be more extreme storms and weather events, including expanded heat waves and increased rain events with changes in precipitation. Significant rain events will lead to an increase in flooding and the potential for severe landslides. Shoreline communities will become inundated with sea level rise and high tide events. Marshlands and wetlands that act as natural storm barriers will disappear as they transition into open water.

Notable impacts from climate change that are already evident in the Marin County OA and surrounding region as identified in a 2020 Marin County Civil Grand Jury Report include:

- From 1895-2018, the average temperature in Marin County increased by 2.3 degrees Fahrenheit.
- Over the past century, sea level rise in the San Francisco Bay Area rose by eight inches and has accelerated rapidly since 2011.
- The threat of wildfires in 2019 was so severe that Pacific Gas and Electric shut off electric power to the County for multiple days

Climate change will continue to affect homes, businesses, infrastructure, utilities, transportation systems and agriculture across the Marin County OA. The risk to socially vulnerable populations will increase as they feel the immediate impacts of climate change more significantly and are less able to adapt to climate changes and recover from its impacts.

The Marin County OA has adopted numerous planning initiatives and mitigation measures to help combat the effects of climate change across the OA. The Marin Climate Energy Partnership (MCEP), which is a partnership program of Marin County jurisdictions, the County, and Marin County regional agencies, adapted a model Climate Action Plan (CAP) that is intended to support countywide implementation efforts and is currently being used to update additional climate action plans for other jurisdictions in Marin County. The CAP supports the Climate Action Plan for the unincorporated County, which was completed in 2020. The MCEP also collects data and report on progress in meeting each County jurisdictions' individual greenhouse gas emission targets. In June 2023, the County published the Greenhouse Gas Inventory for Unincorporated Community Emissions for the Year 2021. Marin County OA jurisdictions have already met their greenhouse reduction goals for 2020 and are about halfway to meeting the statewide goal to reduce emissions 40% below 1990 levels by the year 2030. Marin County also formed a Sea Level Marin Adaptation Response Team in 2018 and had a Sea Level Rise Vulnerability Assessment and associated Adaptation Report completed for the County and each of its jurisdictions in 2017 as part of their Bay Waterfront Adaptation and Vulnerability Evaluation. Additional Marin County OA climate change mitigation initiatives

include Marin Clean Energy, Electrify Marin, the Marin Solar Project, the Marin Energy Watch Partnership, Resilient Neighborhoods, and Drawdown: Marin.

2.2 HAZARDS

Of the hazards profiled in the Marin County MJHMP, those noted in the table are specific for the Bolinas Community Public Utility District as per the planning team.

Table 7: Bolinas Community PUD Hazard Risk Assessment

Hazard	Probability/ Likelihood of Future Events	Geographic Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Dam Failure	Unlikely	Limited	Extreme	High	Medium	**11.00**
Debris Flow	Highly Likely	Limited	Moderate	High	High	**14.00**
Drought	Highly Likely	Extensive	Severe	High	High	**17.00**
Earthquake	Likely	Extensive	Extreme	None	High	**13.00**
Flooding	Likely	Significant	Moderate	High	Medium	**13.00**
Land Subsidence (Sinkhole)	Likely	Limited	Moderate	Medium	Medium	**11.00**
Levee Failure	Unlikely	Limited	Extreme	High	Medium	**12.00**

2.2.1 Dam Failure

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped and fail. Overtopping is the primary cause of earthen dam failure in the United States.

Dam failure is the uncontrolled release of impounded water from behind a dam. Flooding, earthquakes, blockages, landslides, lack of maintenance, improper operation, poor construction, vandalism, and terrorism can all cause a dam to fail. Dam failure causes downstream flooding that can affect life and property. Dam failures can result from any one or a combination of the following causes:

- Earthquake
- Inadequate spillway capacity resulting in excess overtopping flows
- Internal erosion caused by embankment or foundation leakage, or piping or rodent activity
- Improper design

- Improper maintenance
- Negligent operation
- Failure of upstream dams on the same waterway

Water released by a failed dam generates tremendous energy and can cause a flood that is catastrophic to life and property. A catastrophic dam failure could challenge local response capabilities and require evacuations to save lives. Impacts to life safety will depend on the warning time and the resources available to notify and evacuate the public. Major loss of life could result as well as potentially catastrophic effects to roads, bridges, and homes. Electric generating facilities and transmission lines could also be damaged and affect life support systems in communities outside the immediate hazard area. Associated water supply, water quality and health concerns could also be an issue. Factors that influence the potential severity of a full or partial dam failure are the amount of water impounded; the density, type, and value of development and infrastructure located downstream; and the speed of failure.

In general, there are three types of dams: concrete arch or hydraulic fill, earth and rockfill, and concrete gravity. Each type of dam has different failure characteristics. A concrete arch or hydraulic fill dam can fail almost instantaneously, where the flood wave builds up rapidly to a peak then gradually declines. An earth-rockfill dam fails gradually due to erosion of the breach, where a flood wave will build gradually to a peak and then decline until the reservoir is empty. A concrete gravity dam can fail instantaneously or gradually with a corresponding buildup and decline of the flood wave.

The California Department of Water Resources (DWR) Division of Safety of Dams (DSOD) has jurisdiction over impoundments that meet certain capacity and height criteria. Embankments that are less than six feet high and impoundments that can store less than 15 acre-feet are non-jurisdictional. Additionally, dams that are less than 25 feet high can impound up to 50 acre-feet without being jurisdictional. The Cal DWR DSOD assigns hazard ratings to large dams within the State. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in three categories that identify the potential hazard to life and property:

- **High hazard** indicates that a failure would most probably result in the loss of life
- **Significant hazard** indicates that a failure could result in appreciable property damage
- **Low hazard** indicates that failure would result in only minimal property damage and loss of life is unlikely

Since 1929, the state has supervised all non-federal dams in California to prevent failure for the purpose of safeguarding life and protecting property. Supervision is carried out through the state's Dam Safety Program under the jurisdiction of DWR. The legislation requiring state supervision was passed in response to the St. Francis Dam failure and concerns about the potential risks to the general populace from a number of water storage dams. The law requires:

- Examination and approval or repair of dams completed prior to August 14, 1929, the effective date of the statute.
- Approval of plans and specifications for and supervision of construction of new dams and the enlargement, alteration, repair, or removal of existing dams.
- Supervision of maintenance and operation of all dams under the state's jurisdiction.

The 1963 failure of the Baldwin Hills Dam in Southern California led the Legislature to amend the California Water Code to include within state jurisdiction both new and existing off-stream storage facilities.

Dams and reservoirs subject to state supervision are defined in California Water Code §6002 through §6004, with exemptions defined in §6004 and §6025. In administering the Dam Safety Program, DWR must comply with the provisions of the California Environmental Quality Act (CEQA). As such, all formal dam approval and revocation actions must be preceded by appropriate environmental documentation.

In 1972, Congress moved to reduce the hazards from the 28,000 non-federal dams in the country by passing Public Law 92-367, the National Dam Inspection Act. With the passage of this law, Congress authorized the U.S. Army Corps of Engineers (USACE) to inventory dams located in the United States. The action was spurred by two disastrous earthen dam failures during the year, in West Virginia and South Dakota, that caused a total of 300 deaths.

The Water Resources Development Act of 1986 (P.L 99-662) authorized USACE to maintain and periodically publish an updated National Inventory of Dams (NID). The Water Resources Development Act of 1996 (P.L. 104-303), Section 215, re-authorized periodic updates of the NID by USACE.

Figure 17 illustrates the Dam Failure risk to Marin County.

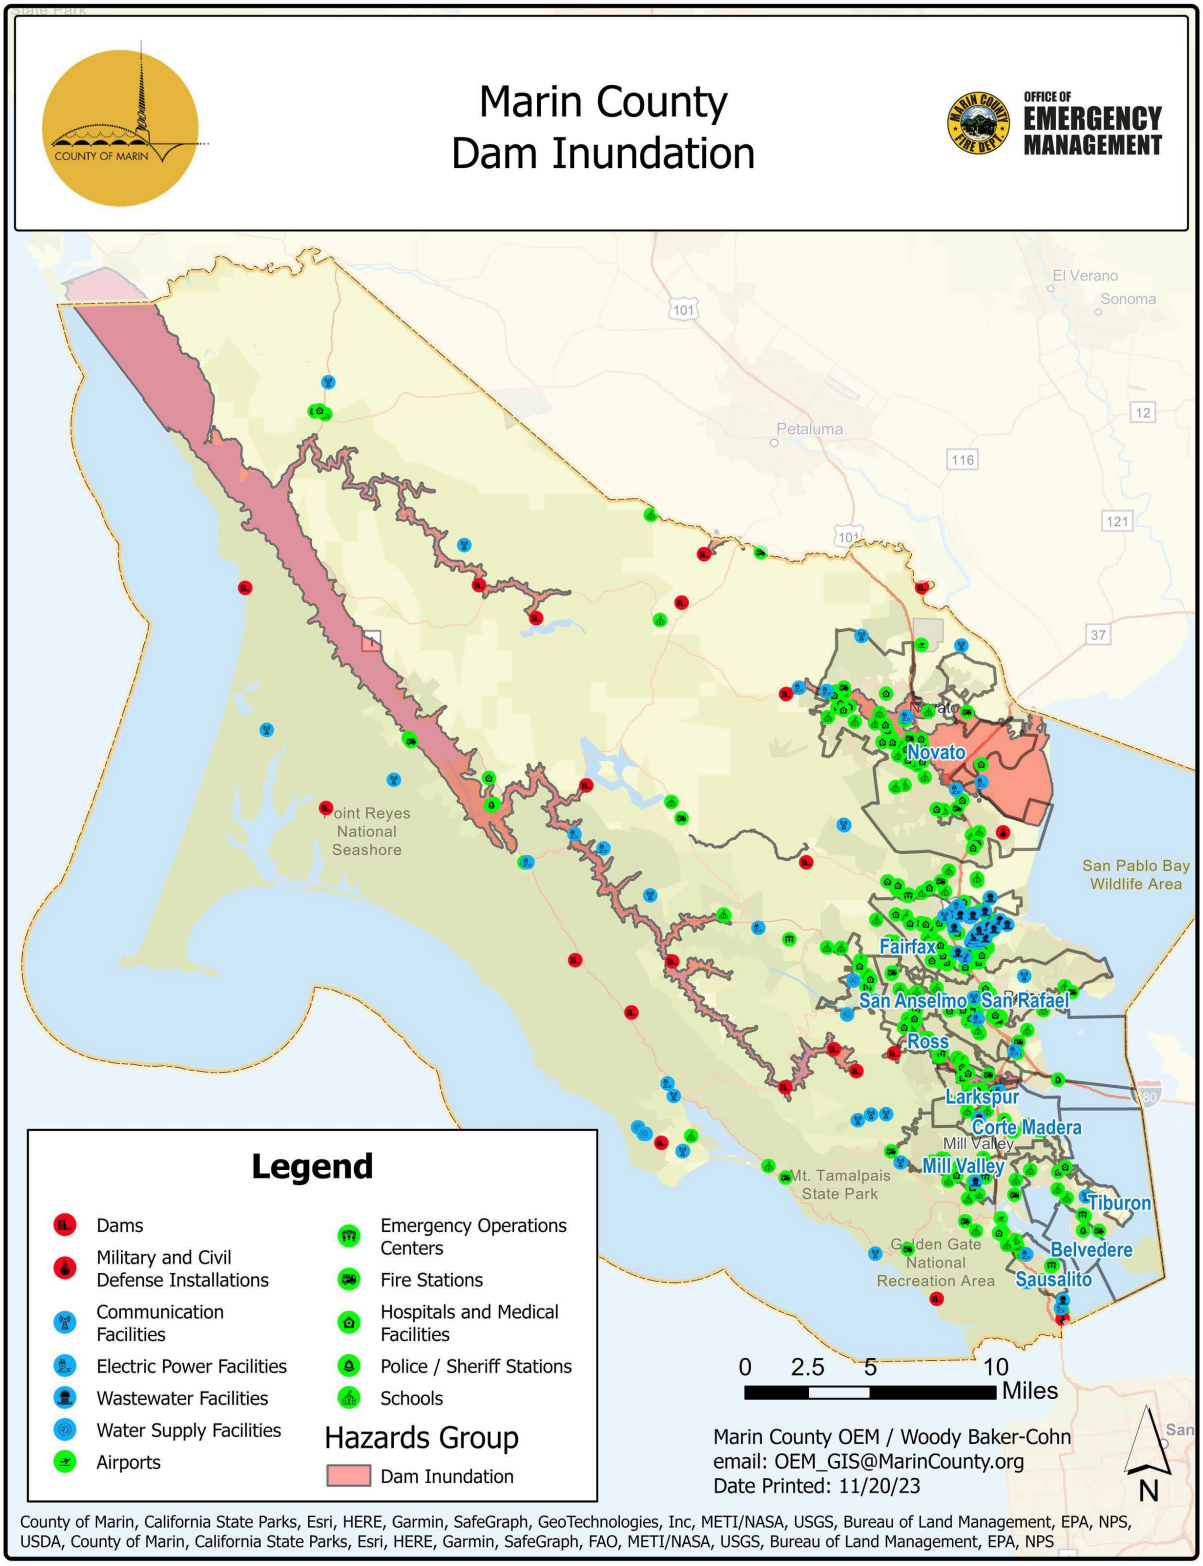

Figure 63: Marin County Dam Inundation Susceptibility to Critical Facilities
Source: Marin County OEM

The BCPUD is not within any classified dam inundation zones, though the district maintains small private dams or reservoirs. These facilities are not certified by the California Department of Water Resources, Division of Safety of Dams and are not known to pose potential downstream impacts to life and private property apart from one ranch home located downstream of the Woodrat 1 Reservoir.

The BPCUD maintains the Woodrat 1 Reservoir, which is directly behind the Woodrat Water Treatment Plant. The treatment plant is a small building with an adjacent solar array and may be at risk of damage should the reservoir flood control structure fail. The Woodrat Water Treatment Plant is the only water treatment plant in the district. If it were to be offline for any significant period of time or rendered inoperable, the district would be unable to provide treated drinking water to the community, posing a significant impact to public health and safety. The district does have two treated water storage tanks which hold a combined amount of water equal to approximately 800,000 gallons, or approximately two weeks of water (assuming significant conservation during this period), but the district has no other option to provide treated water from its surface water sources past that amount of time without operating the Woodrat Water Treatment Plant.

The image in Figure 18 shows the proximity of the Woodrat 1 Reservoir to the BCPUD Treatment Plant.

Figure 64: Woodrat 1 Reservoir and BCPUD Treatment Plant

Climate Change and Future Development Considerations

Most dams in the United States are aging and are at significant risk from increased storm events as a result of climate change. The average dam age in the United States is 60 years, and more than 8,000 dams in the United States including the Phoenix Lake Dam in the Marin County OA are over 90 years old. More than 200 U.S. dams have failed in bad weather since 2000. As the climate warms, rain events are predicted to become more intense. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in reservoirs across the Marin County OA, placing increased stress on its dams and increasing the potential for a dam failure. Currently only one ranch home is within the inundation area of the Woodrat 1 Reservoir Dam, however, future development within the inundation area has the potential for significant impacts to residents and infrastructure to increase. Future development in the unincorporated community of Bolinas could expose additional people and structures to risk of a dam failure and subsequent loss of the BCPUD's Woodrat Water Treatment Plant.

2.2.2 Debris Flows

For the purposes of the Marin County OA MJHMP, debris flows are classified as landslides (including rockslides) and mud flows.

A landside is the breaking away and gravity-driven downward movement of hill slope materials, which can travel at speeds ranging from fractions of an inch per year to tens of miles per hour depending on the slope steepness and water content of the rock/soil mass. Landslides range from the size of an automobile to a mile or more in length and width and, due to their sheer weight and speed, can cause serious damage and loss of life. The rate of a landslide is affected by the type and extent of vegetation, slope angle, degree of water saturation, strength of the rocks, and the mass and thickness of the deposit. Some of the natural causes of this instability are earthquakes, weak materials, stream and coastal erosion, and heavy rainfall. In addition, certain human activities tend to make the earth materials less stable and increase the chance of ground failure. These activities include extensive irrigation, poor drainage or groundwater withdrawal, removal of stabilizing vegetation and over-steepening of slopes by undercutting them or overloading them with artificial fill. These activities can cause slope failure, which normally produce landslides.

Landslide material types are often broadly categorized as either rock or soil, or a combination of the two for complex movements. Rock refers to hard or firm bedrock that was intact and in place prior to slope movement. Soil, either residual or transported material, means unconsolidated particles. The distinction between rock and soil is most often based on interpretation of geomorphic characteristics within landslide deposits but can also be inferred from geologic characteristics of the parent material described on maps or in the field. Landslide movements are also based on the geomorphic expression of the landslide deposit and source area, and are categorized as falls, topples, spreads, slides, or flows. Falls are masses of soil or rock that dislodge from steep slopes and free fall. Topples move by the forward pivoting of a mass around an axis below the displaced mass. Lateral spreads move by horizontal extension and shear or tensile fractures. Slides displace masses of material along one or more discrete planes and can either be rotational or transitional. Flows mobilize as a deforming, viscous mass without a discrete failure plane.

Natural conditions that contribute to landslide include the following:

- Degree of slope
- Water (heavy rain, river flows, or wave action)
- Unconsolidated soil or soft rock and sediments
- Lack of vegetation (no stabilizing root structure)
- Previous wildfires and other forest disturbances
- Earthquake

In addition, many human activities tend to make the earth materials less stable and, thus, increase the chance of ground movement. Human activities contribute to soil instability through grading of steep slopes or overloading them with artificial fill, by extensive irrigation, construction of impermeable surfaces, excessive groundwater withdrawal, and removal of stabilizing vegetation.

Another hazard related to landslide and erosion is the fall of a detached mass of rock from a cliff or down a very steep slope (rockfall). Weathering and decomposition of geological materials produce conditions favorable to rockfalls. Other causes include ice wedging, root growth, or ground shaking (earthquake). Destructive landslides and rockfalls usually occur very suddenly with little or no warning time and are short in duration.

Landslide susceptibly can be characterized by looking at both slope class and rock strength. Landslide susceptibility classes express the generalization that on very low slopes, landslide susceptibility is low even in weak rock, and that landslide susceptibility increases with slope and in weaker rocks. Very high landslide susceptibility includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks. Figure 19 shows landslide susceptibility classes.

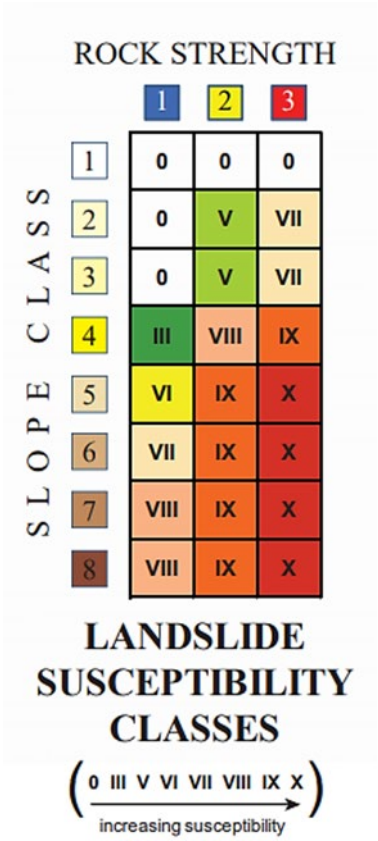

Figure 65: Landslide Susceptibility Classes
Source: USGS

A mud flow is a general term for a mass-movement landform and process characterized by a flowing mass of fine-grained earth material with a high degree of fluidity. Heavy rainfall, snowmelt, or high levels of groundwater flowing through cracked bedrock may trigger a movement of soil or sediments. Floods and debris flows may also occur when strong rains on hill or mountain slopes cause extensive erosion and/or what is known as "channel scour". Some broad mud flows are rather viscous and therefore slow; others begin very quickly and continue like an avalanche. Mud flows are composed of at least 50% silt and clay-sized materials and up to 30% water.

The point where a muddy material begins to flow depends on its grain size and the water content. Fine grainy material or soil has a smaller friction angle than a coarse sediment or a debris flow, but falling rock pieces can trigger a material flow, too. When a mud flow occurs it is given four named areas, the 'main scarp', in bigger mud flows the 'upper and lower shelves', and the 'toe'. See Figure 20 for the typical areas of a mud flow, with shelves (right) and without (left). The main scarp will be the original area of incidence, the toe is the last affected area(s). The upper and lower shelves are located wherever there is a large dip (due to mountain or natural drop) in the mud flow's path. A mud flow can have many shelves.

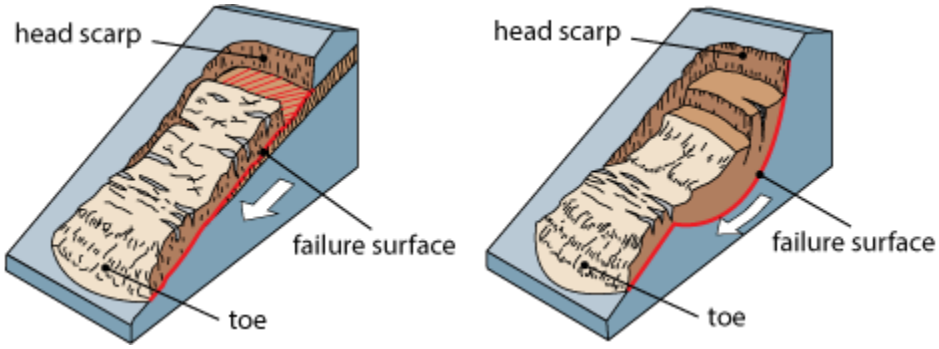

Figure 66: Mud Flow Areas
Source: Washington Department of Natural Resources

If large enough, mud flows can devastate villages and country-sides. Mud flows are common in mountain areas prone to wildfire, where they have destroyed many homes built on hillsides without sufficient support after fires destroy vegetation holding the land. The area most generally recognized as being at risk of a dangerous mud flow are:

- Areas where wildfires or human modification of the land have destroyed vegetation
- Areas where landslides have occurred before
- Steep slopes and areas at the bottom of slopes or canyons
- Slopes that have been altered for construction of buildings and roads
- Channels along streams and rivers
- Areas where surface runoff is directed

A landslide in the BCPUD would most likely occur in any of the open spaces throughout the District where the terrain is steeper and is more susceptible to movement of hill slope materials; in general, this characterizes the areas of the community on the edge of the coastal bluffs (i.e., the Little Mesa (downtown), the Francisco Mesa (downtown) and the Big Mesa). Landslides on the coastal bluffs directly threaten portions of the BCPUD's water distribution system and portions of its wastewater collection system, as well as critical egress roads. In 2004, the BCPUD relocated a critical pressurized water main off of Terrace Avenue at the intersection with Overlook on the Big Mesa due to its proximity to the coastal bluff. In 2011, there was a major landslide at this location that heavily damaged/closed Terrace Avenue, one of only two egress roads off of the Big Mesa. The County of Marin's Department of Public Works installed an extensive repair and reopened Terrace Avenue the following year. In 2013, the BCPUD relocated another critical pressurized water main off of Terrace Avenue near Surfer's Overlook due to its proximity to the coastal bluff; a gravity sewer collection main currently remains at this location. In addition, the BCPUD has relocated several other smaller water mains as and when it determined coastal bluff erosion threatened these facilities.

Additional BCPUD critical facilities are susceptible to landslides, including the Woodrat 1 Reservoir/dam, the Woodrat 2 Reservoir/dam, the Woodrat Water Treatment Plant, the Solar Arrays at the Woodrat Water Treatment Plant, the district's raw water transmission line from the Arroyo Hondo Creek to the Woodrat Water Treatment Plant, and the BCPUD's two impoundments on the Arroyo Hondo Creek, all of which lie in areas of non-coastal bluff related landslide susceptibility.

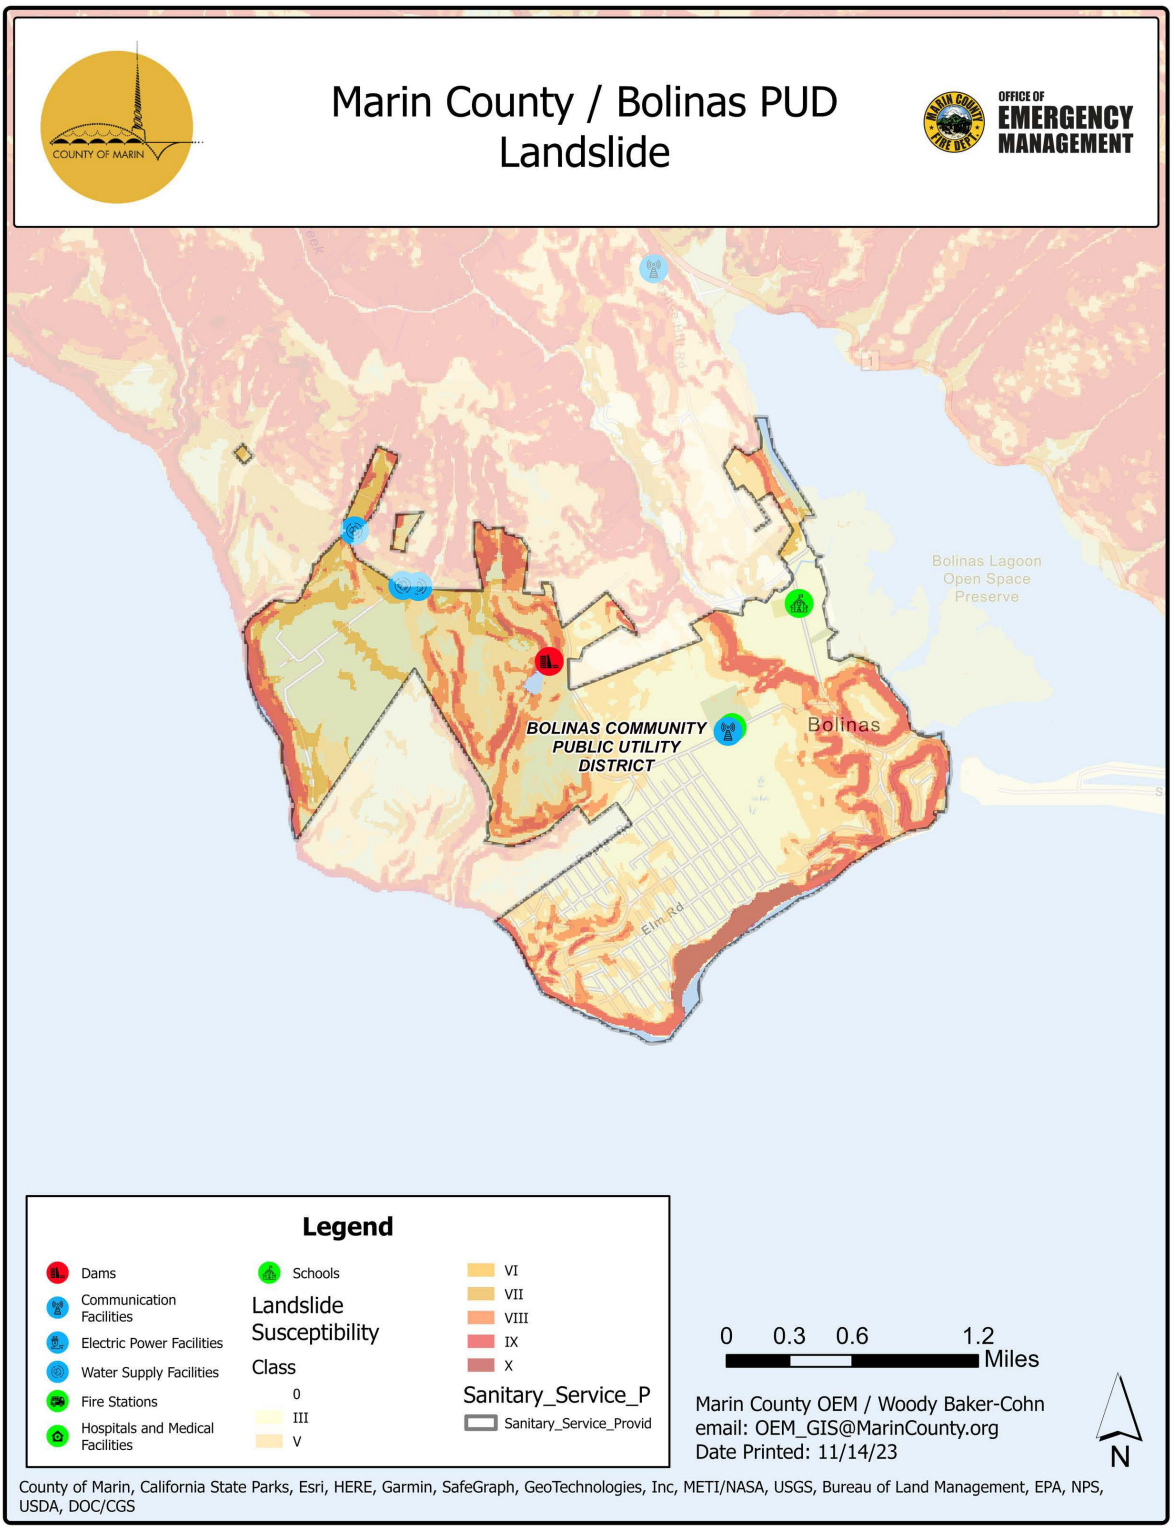

Figure 67: BCPUD Debris Flow Critical Facilities and Infrastructure
Source: Marin County OEM

A landslide having major impacts on any of the roads in the Bolinas area could affect the ability of District employees to reach District facilities or infrastructure. An earthquake has the

potential to cause landslides throughout this area. A wildfire and subsequent rain event in any of the open spaces could potentially contribute to debris flows within the District. There are several creeks that flow directly into the BCPUD's jurisdiction that could contribute to a debris flow, particularly from the mountainous areas in the western part of Marin County.

There have been no recorded debris flows in BCPUD since the last plan update.

Climate Change and Future Development Considerations

Extreme storm events and more frequent wildfires as a result of climate change have the potential to increase the amount and severity of landslides, including disastrous debris flows. Climate change is leading to more volatile precipitation patterns around the world with very dry stretches punctuated by storms that drop large amounts of rain in a short amount of time. Landslides in wetter regions of California, including the Marin County OA, move on average faster and farther downhill during rainy periods compared to drought years, according to a 2022 study by the American Geophysical Union (AGU)[5], showing the increased potential for landslides in the Marin County OA in rainy years. As development increases in the numerous canyons and around the many open spaces of the Marin County OA, the potential for significant impacts from a landslide and/or mudflow increases. Further development of the residential areas of the BCPUD that have a higher landslide susceptibility will expose more people and property to landslide risk. With increased wildfire potential as a result of climate change, more residents in the BCPUD's jurisdiction could be susceptible to post-fire debris flows. Future development should take into account the movement of mud and debris in waterways after a major rain event. Adequate space adjacent to susceptible waterways should be maintained free of development to allow for the passage of mud and debris, and catchment basins should be built in these areas to help capture any excess mud and debris.

2.2.3 DROUGHT

A drought is a deficiency in precipitation over an extended period, usually a season or more, resulting in a water shortage causing adverse impacts on vegetation, animals, and/or people. It is a normal recurrent feature of climate that occurs in virtually all climate zones, from very wet to very dry. Drought is a temporary aberration from normal climatic conditions and can thus vary significantly from one region to another. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Drought is a complex issue involving many factors—it occurs when a normal amount of moisture is not available to satisfy an area's usual water-consuming activities.

There are several types of drought which can often be defined regionally based on its effects:

- Meteorological drought is usually defined by a period of below average water supply, based on the degree of dryness (in comparison to normal or average) and the duration of the dry period. Drought onset generally occurs with a meteorological drought.

[5] Landslide Sensitivity and Response to Precipitation Changes in Wet and Dry Climates. https://agupubs.onlinelibrary.wiley.com/doi/10.1029/2022GL099499

- Agricultural drought occurs when there is an inadequate water supply to meet the needs of the state's crops and other agricultural operations such as livestock. Agricultural drought links various characteristics of meteorological (or hydrological) drought to agricultural impacts, focusing on precipitation shortages, soil water deficits, reduced ground water or reservoir levels needed for irrigation.
- Hydrological drought is defined as deficiencies in surface and subsurface water supplies. It is generally measured as stream flow, snowpack, and as lake, reservoir, and groundwater levels. Hydrological drought usually occurs following periods of extended precipitation shortfalls.

Socioeconomic drought occurs when a drought impacts health, well-being, and quality of life, or when a drought starts to have an adverse economic impact on a region.

Drought regularly occurs in all areas of the BCPUD and has a profound effect on the delivery of potable water service to the approximately 1,500 full-time residents and an additional 1,000 seasonal or part time residents served by the district. The BCPUD currently obtains its raw water exclusively from surface water sources -- the Arroyo Hondo Creek in the Point Reyes National Seashore and two small emergency reservoirs. Due to the limited nature of the BCPUD's surface water supplies, the BCPUD Board of Directors in 1971 declared a water shortage emergency and enacted a moratorium on new connections to the water system which remains in effect today. Drought quickly reduces the surface water flows in the BCPUD's primary water source, the Arroyo Hondo Creek, as well as the amount of water stored in the BCPUD's two emergency reservoirs, the Woodrat 1 and 2 Reservoirs, reducing the available supply potable water to customers and for fire suppression purposes, which also reduces revenue for the district which is used to operate the water delivery systems to these customers and renders the district more at risk in a wildfire. In 2009 and in 2021, in response to prolonged drought conditions, the BCPUD implemented mandatory conservation measures (i.e., rationing) to ensure the reliability of the water supply for public health, safety and fire suppression purposes.

Drought conditions throughout the district would also be felt in the mountainous areas just outside the District boundaries (in the Point Reyes National Seashore) where the risk of wildfire would increase and threaten BCPUD's facilities, particularly the Woodrat Water Treatment Plant. There have been two fires in the Point Reyes National Seashore in recent years: the Vision Fire in 1995 and the Woodward Fire in 2020. The wetland areas of the District, particularly the marshlands along the Bolinas Lagoon, could become drier during prolonged period of drought and experience marshland fires that could impact the District's critical facilities. Dry trees in public spaces adjacent to public roads, such as the eucalyptus grove to the east of the BCPUD's sewer treatment plant and in numerous other locations throughout the district, can become a safety hazard to the public due to falling limbs or tree failure.

Climate Change and Future Development Considerations

Climate change increases the odds of worsening drought. Warmer temperatures enhance evaporation, which reduces surface water and dries out soils and vegetation. This makes periods with low precipitation in the summer drier than they would be in cooler conditions. Climate also alters the timing of water availability as warmer winter temperatures cause less precipitation to fall. During droughts, communities in the Marin County OA including the BCPUD may have limited access to water for household use, including drinking, cooking, cleaning, and watering plants, as well as for agriculture, transportation, and power generation. Drought may

lead to higher water costs, rationing, or even the decimation of important water sources like wells in the Marin County OA. As more people move into the Marin County OA and the BCPUD, additional strain will be placed on the OA's water supply. Drought can affect livestock and crops in the Marin County OA, impacting its economy. Drought can increase the occurrence and severity of wildfires and tree mortality in the Marin County OA including in the open spaces in and around the BCPUD. Impacts to residents and infrastructure from wildfire as a result of drought will increase as more development occurs in the mountainous areas of the Marin County OA including the BCPUD where wildfires are more likely to occur. Drought also increases the amount of carbon dioxide in the atmosphere, including by decreasing land productivity, which reduces the amount of vegetation storing carbon dioxide. In addition, increases in drought-related wildfire and soil erosion can release carbon dioxide sequestered in trees and plants back into the atmosphere. This will only worsen climate change for the Marin County OA into the future. When considering future development, the Marin County OA including the BCPUD can help prepare for both future droughts and climate change by practicing and promoting water conservation and enhancing water efficiency throughout landscapes, city plans, and water infrastructure. The Marin County OA can also identify alternative water supplies, create drought emergency plans, and encourage farmers to plant drought-resistant crops.

2.2.4 EARTHQUAKE

Earthquakes are sudden rolling or shaking events caused by movement under the earth's surface. Earthquakes happen along cracks in the earth's surface, called fault lines, and can be felt over large areas, although they usually last less than one minute.

The amount of energy released during an earthquake is usually expressed as a magnitude and is currently measured by seismologists on the Moment Magnitude (Mw Scale). The Mw Scale was developed to succeed the previously used Richter Scale and is measured on a scale of zero to ten with increasing values reflecting increasing intensity.

The other commonly used measure of earthquake severity is intensity, which is an expression of the amount of shaking at any given location on the ground service. Intensity is most commonly measured on the Modified Mercalli Intensity (MMI) Scale (see Figure 22).

Intensity	Shaking	Description/Damage
I	Not felt	Not felt except by a very few under especially favorable conditions.
II	Weak	Felt only by a few persons at rest,especially on upper floors of buildings.
III	Weak	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Light	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Moderate	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Strong	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Very strong	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Severe	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Violent	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	Extreme	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.

Figure 68: Modified Mercalli Intensity Scale
Source: USGS

Figure 23 gives intensities (measured on the MMI scale) that are typically observed at locations near the epicenter or earthquakes of different magnitudes.

Richter Magnitude Scale	Typical Maximum Modified Mercalli Intensity Scale
1.0 – 2.9	I
3.0 – 3.9	II – III
4.0 – 4.9	IV – V
5.0 – 5.9	VI – VII
6.0 – 6.9	VII – IX
7.0 or higher	VIII or higher

Figure 69: Mercalli Scale vs. Magnitude
Source: USGS

The extent of ground shaking also depends in large part on how soft the underlying soil is. Soft soils amplify ground shaking (see Figure 24). This was observed during the 1989 Loma Prieta Earthquake when the most significant damages experienced in San Francisco were in the Marina District, which was built on fill.

Soil type A	Vs > 1500 m/sec	Includes unweathered intrusive igneous rock. Occurs infrequently in the bay area. We consider it with type B (both A and B are represented by the color blue on the map). Soil types A and B do not contribute greatly to shaking amplification.
Soil type B	1500 m/sec > Vs > 750 m/sec	Includes volcanics, most Mesozoic bedrock, and some Franciscan bedrock. (Mesozoic rocks are between 245 and 64 million years old. The Franciscan Complex is a Mesozoic unit that is common in the Bay Area.)
Soil Type C	750 m/sec > Vs > 350 m/sec	Includes some Quaternary (less than 1.8 million years old) sands, sandstones and mudstones, some Upper Tertiary (1.8 to 24 million years old) sandstones, mudstones and limestone, some Lower Tertiary (24 to 64 million years old) mudstones and sandstones, and Franciscan melange and serpentinite.
Soil Type D	350 m/sec > Vs > 200 m/sec	Includes some Quaternary muds, sands, gravels, silts and mud. Significant amplification of shaking by these soils is generally expected.
Soil Type E	200 m/sec > Vs	Includes water-saturated mud and artificial fill. The strongest amplification of shaking due is expected for this soil type.

Figure 70: Soil Types
Source: USGS

An earthquake fault is defined as “a fracture or fracture zone in the earth’s crust along which there has been displacement of the sides relative to one another.” For the purpose of planning there are two types of faults, active and inactive. Active faults have experienced displacement in historic time, suggesting that future displacement may be expected. Inactive faults show no evidence of movement in recent geologic time, suggesting that these faults are dormant.

Two types of fault movement represent possible hazards to structures in the immediate vicinity of the fault: fault creep and sudden fault displacement. Fault creep, a slow movement of one side of a fault relative to the other, can cause cracking and buckling of sidewalks and foundations even without perceptible ground shaking. Sudden fault displacement occurs during an earthquake event and may result in the collapse of buildings or other structures that are found along the fault zone when fault displacement exceeds an inch or two. The only protection against damage caused directly by fault displacement is to prohibit construction in the fault zone.

An earthquake could occur anywhere in and around BCPUD due to the number of active faults within and near Marin County, most notably the San Andreas and San Gregorio-Hosgri faults.

Earthquake Shake Intensity

The colors on Figures 25 and 26 represent the level of ground shaking intensity of a potential future earthquake. The result is expressed as the level of ground shaking (**expressed as a percentage of gravity**) that on average occurs every 500 years.

This map shows the expected relative intensity of ground shaking and damage in California from anticipated future earthquakes. The shaking potential is calculated as the level of ground motion that has a 2% chance of being exceeded in 50 years, which is the same as the level of ground-shaking with about a 2500 year average repeat time. The relatively long-period (1.0 second) earthquake shaking is shown here. Long period-shaking affects tall, relatively flexible buildings, but also correlates well with overall earthquake damage.

Earthquake Shaking Potential Maps for California depict expected intermediate period (1s or 1hz) ground motions with 2% exceedance probability in 50 years.

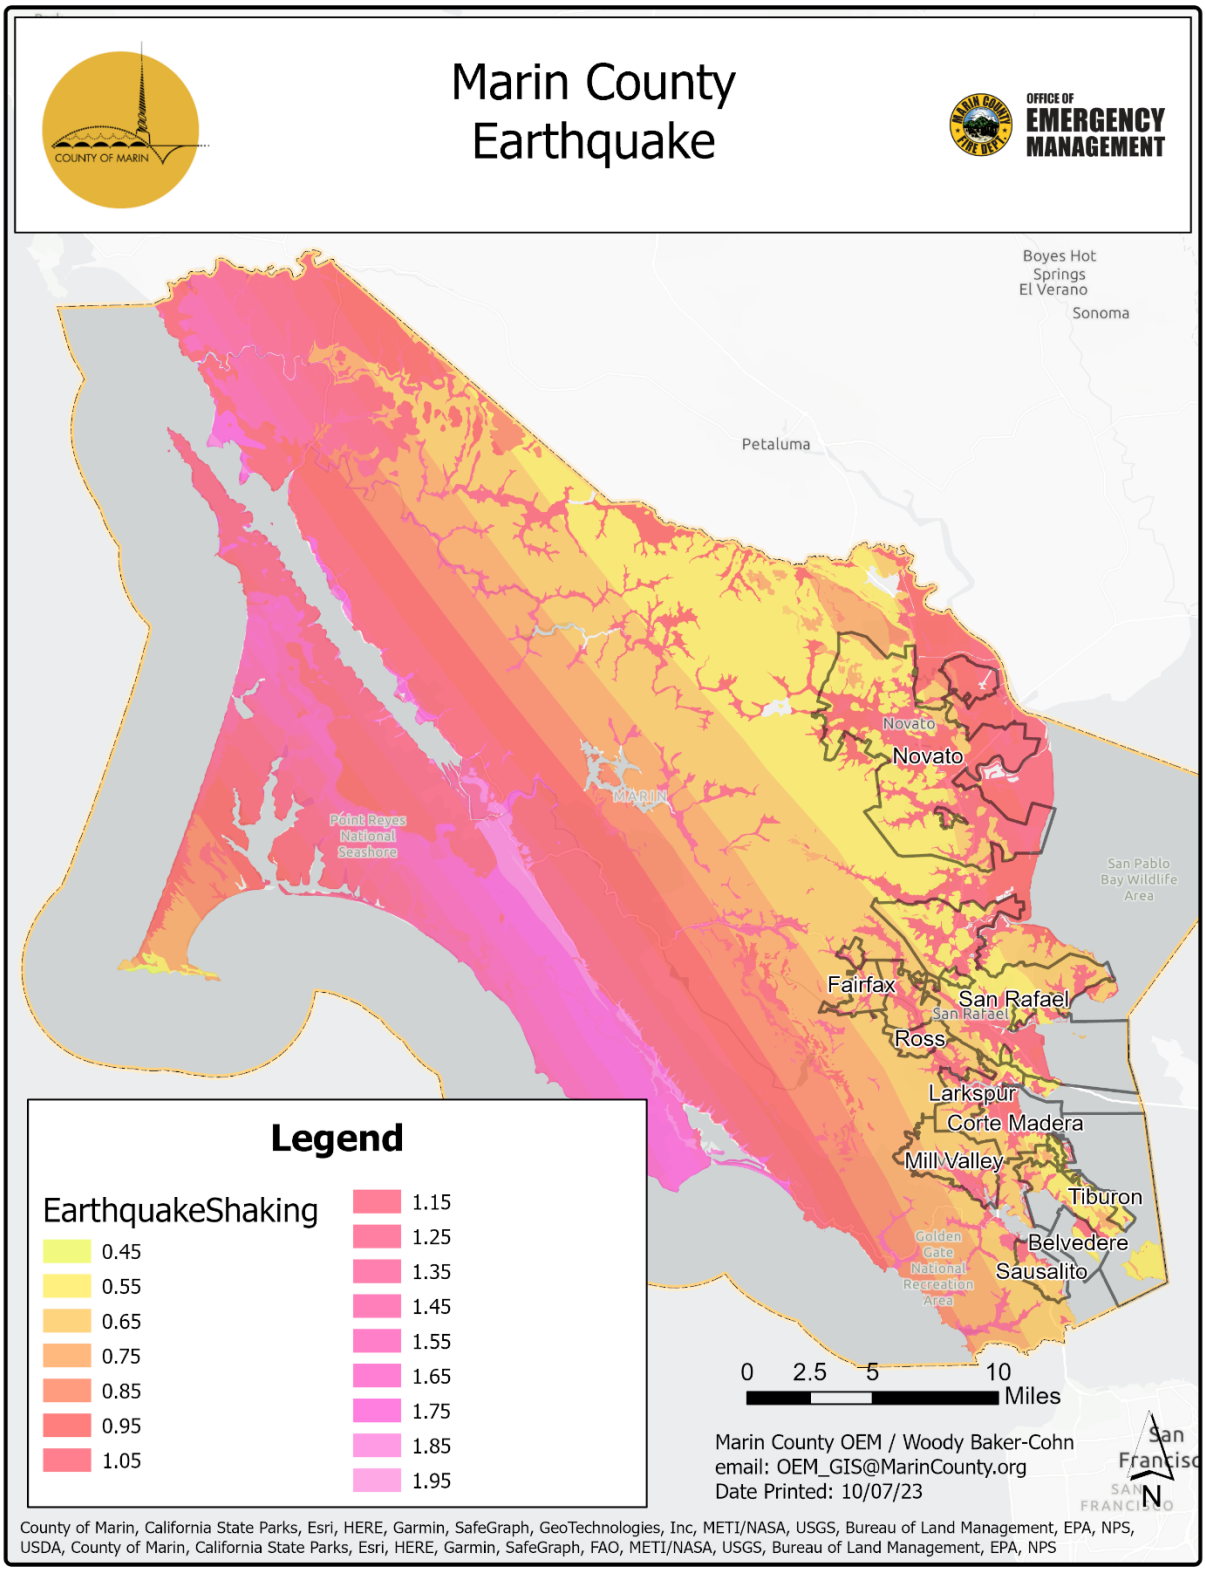

Figure 71: Marin County Earthquake Impact
Source: Marin County OEM

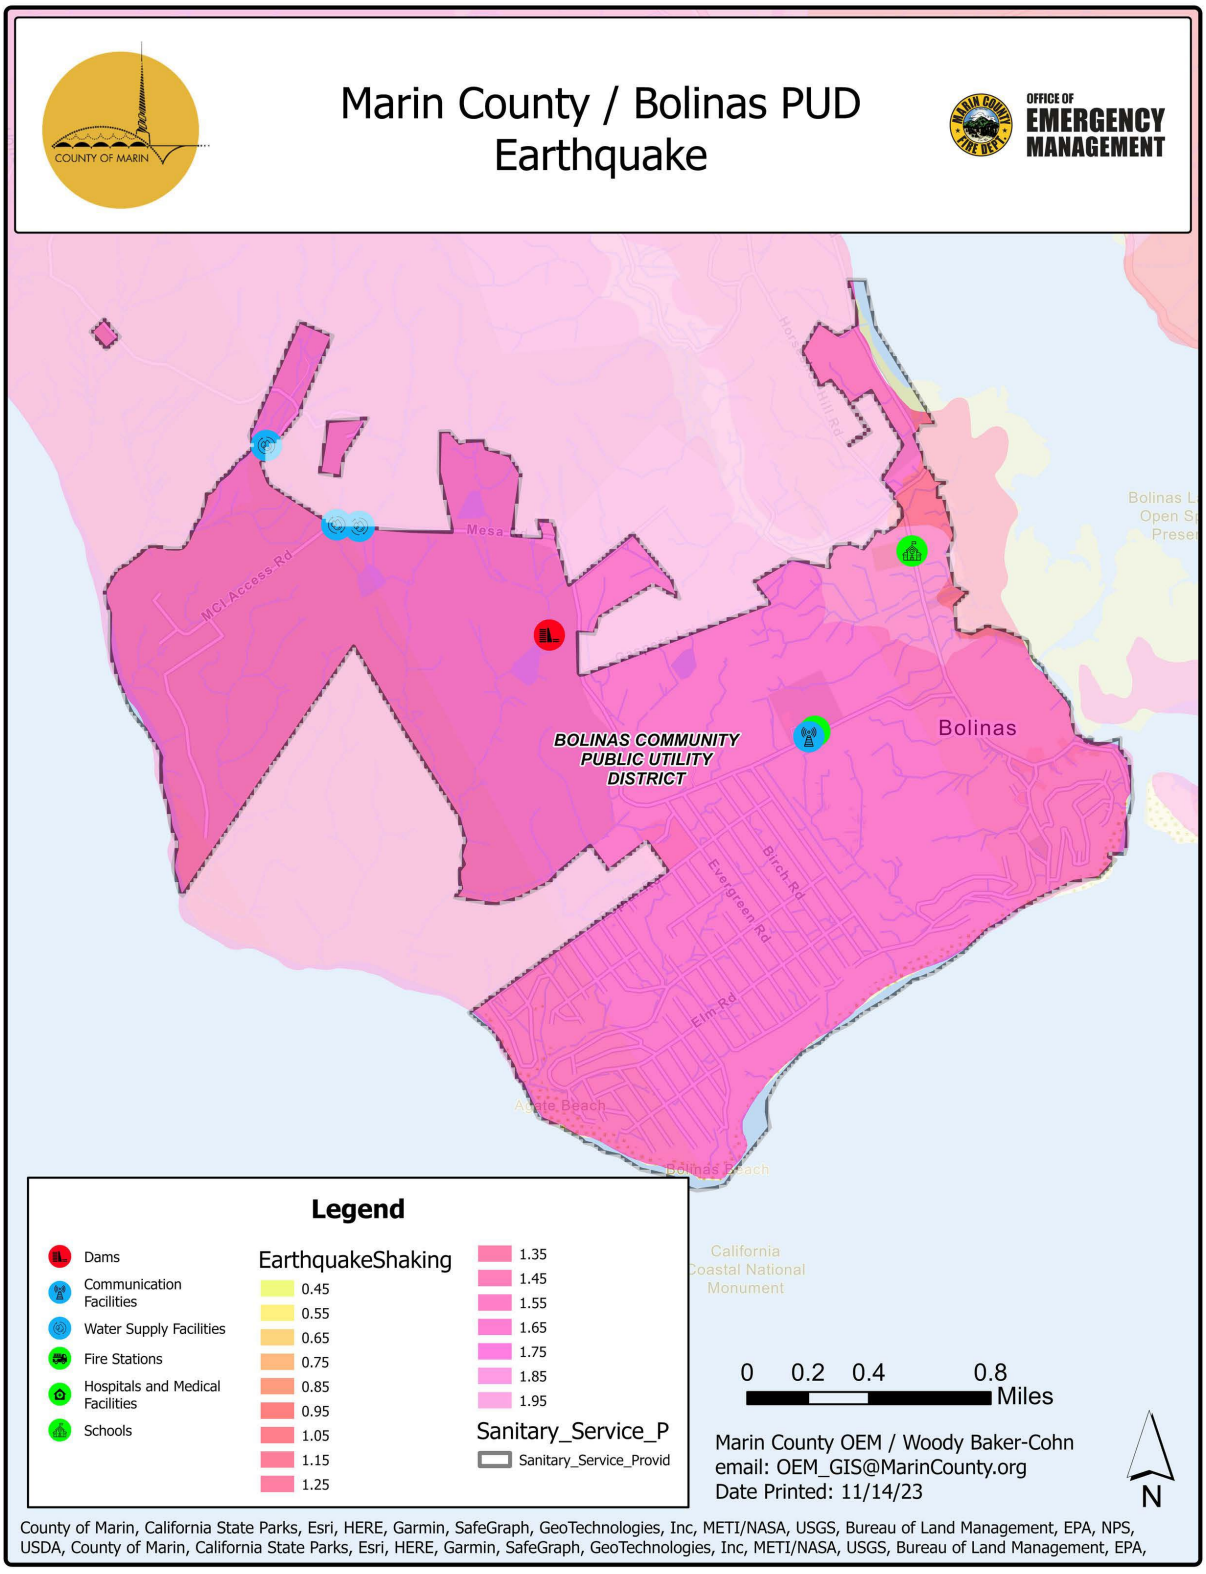

Figure 72: BCPUD Earthquake Critical Facilities and Infrastructure
Source: Marin County OEM

The BCPUD is located directly between the San Andreas and Hayward faults. A moderate to extreme earthquake originating from either of these major faults or any of the other faults in the region could have major impacts to the District. The Bolinas Peninsula in particular, including the District and the unincorporated community of Bolinas, has some of the highest earthquake shaking potential in the Marin County OA. There is increased risk of shaking and liquefaction in the District from an earthquake, particularly in the central and eastern lowland areas where superficial deposits and fill are more prevalent. All of the BCPUD critical facilities lie in these areas and have a high susceptibility to earthquake shaking. Vulnerable structures include District infrastructure and facilities that have not undergone major seismic retrofitting. Utility infrastructure throughout the District could be impacted by an earthquake, disrupting service to District customers.

Earthquakes could also cause landslides in the western areas of Bolinas with steeper terrain, causing damage to homes and roads as a result of shifting soils.

The BCPUD has not experienced a major earthquake. Marin County was sparsely populated at the time of the 1906 San Francisco Earthquake, and the effects across the County were relatively minimal. Likewise, the 1989 Loma Prieta Earthquake caused minimal impacts across Marin County as the epicenter of the quake was further south in Santa Cruz County. Smaller earthquakes with minimal to no impacts are routinely felt in the District.

Climate Change and Future Development Considerations

There is no direct link between climate change and seismic activity that could impact the Marin County OA including the BCPUD, so climate change is not expected to cause any changes to the frequency or intensity of seismic shaking. According to a 2018 study by the Institute of Physics (IOP)[6], climate change could result in "isostatic rebounds," or a sudden upward movement of the crust because of reduced downward weight caused by glaciers. As glaciers are known to melt when overall global temperatures increase, climate change could indirectly lead to an increase in seismicity in the Marin County OA including the BCPUD. Climate change could also impact earthquakes felt in the Marin County OA as droughts can further deteriorate existing fault lines and pumping groundwater can put further pressure on the earth's crust. Future development in the populated areas of Marin County OA where seismic shaking and subsidence are more prevalent could exacerbate the impacts of an earthquake. This includes the entire BCPUD, including the unincorporated community of Bolinas, where the risk of subsidence and subsequent earthquake shaking are higher. Future development in these areas could expose more people and infrastructure to earthquake shaking as a result of climate change.

2.2.5 FLOODING

Flooding is the rising and overflowing of a body of water onto normally dry land. Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. The area adjacent to a channel is the floodplain. Floodplains are illustrated on inundation maps, which show areas of potential flooding and water depths. In its common usage, the floodplain most often refers to that area that is inundated by the 100-year flood, the flood that has a one

[6] An Enhanced Seismic Activity Observed Due to Climate Change: Preliminary Results from Alaska. https://iopscience.iop.org/article/10.1088/1755-1315/167/1/012018

percent chance in any given year of being equaled or exceeded. The 100-year flood is the national minimum standard to which communities regulate their floodplains through the National Flood Insurance Program. The 200-year flood is one that has 0.5% chance of being equaled or exceeded each year. The 500-year flood is the flood that has a 0.2 percent chance of being equaled or exceeded in any given year. The potential for flooding can change and increase through various land use changes and changes to land surface, which result in a change to the floodplain. A change in environment can create localized flooding problems inside and outside of natural floodplains by altering or confining natural drainage channels. These changes are most often created by human activity such as construction of bridges or channels. In areas where flow contains high sediment load, such as Easkoot Creek in Stinson Beach (due to an active landslide upstream), or Pine Gulch Creek in Bolinas, the flow carrying capacity of the channel may be reduced dramatically during a single flood event. Coastal floodplains may also change over time as waves and currents alter the coastline (especially wetlands) and sea levels rise.

Flooding can occur in several ways:

Riverine flooding – Riverine flooding, defined as when a watercourse exceeds its "bank-full" capacity, generally occurs as a result of prolonged rainfall, or rainfall that is combined with snowmelt and/or already saturated soils from previous rain events. This type of flood occurs in river systems whose tributaries may drain large geographic areas and include one or more independent river basins. The onset and duration of riverine floods may vary from a few hours to many days and is often characterized by high peak flows combined with a large volume of runoff. Factors that directly affect the amount of flood runoff include precipitation amount, intensity and distribution, the amount of soil moisture, seasonal variation in vegetation, snow depth, and water-resistance of the surface due to urbanization. In the Marin County OA, riverine flooding can occur anytime from November through April and is largely caused by heavy and continued rains, sometimes combined with snowmelt, increased outflows from upstream dams, and heavy flow from tributary streams. These intense storms can overwhelm the local waterways as well as the integrity of flood control structures. Flooding is more severe when antecedent rainfall has resulted in saturated ground conditions. The warning time associated with slow rise riverine floods assists in life and property protection.

Flash flooding – Flash flooding describes localized floods of great volume and short duration. This type of flood usually results from a heavy rainfall on a relatively small drainage area. Precipitation of this sort usually occurs in the winter and spring. Flash floods often require immediate evacuation within the hour and thus early threat identification and warning is critical for saving lives.

Localized/Stormwater flooding – Localized flooding problems are often caused by flash flooding, severe weather, or an unusual amount of rainfall. Flooding from these intense weather events usually occurs in areas experiencing an increase in runoff from impervious surfaces associated with development and urbanization as well as inadequate storm drainage systems.

Tidal flooding – Tidal flooding develops when high tides exceed either the top of bank elevation of tidal sloughs and channels, or the crest of bay levees. An especially high tide event that occurs during alignment of the gravitational pull between the sun and the moon, causing tidal water levels to rise to higher-than normal levels. King tides are normal, predictable events

that occur semi-annually during winter months. Typically storms in which high tides coincide with peak stormwater flow are the most damaging in Marin County.

The area is also at risk to flooding resulting from levee failures and dam failures. Dam failure flooding is discussed separately in the Dam Failure Section of this document; levee failure flooding is discussed separately in the Levee Failure Section of this document. Regardless of the type of flood, the cause is often the result of severe weather and excessive rainfall, either in the flood area or upstream reach.

A weather pattern called the "Atmospheric River" contributes to the flooding potential of the area. An Atmospheric River brings warm air and rain to the West. A relatively common weather pattern brings southwest winds to the Pacific Northwest or California, along with warm, moist air. The moisture sometimes produces many days of heavy rain, which can cause soil saturation, extensive flooding and other impacts such as landslides. The warm air also can melt the snowpack in the mountains, which further aggravates the flooding potential. In the colder parts of the year, the warm air can be cooled enough to produce heavy, upslope snow as it rises into the higher elevations of the Sierra Nevada or Cascades. Forecasters and others on the West Coast often used to refer to this warm, moist air as the "Pineapple Express" because it comes from around Hawaii where pineapples are grown. A diagram of an atmospheric river event is shown in Figure 27.

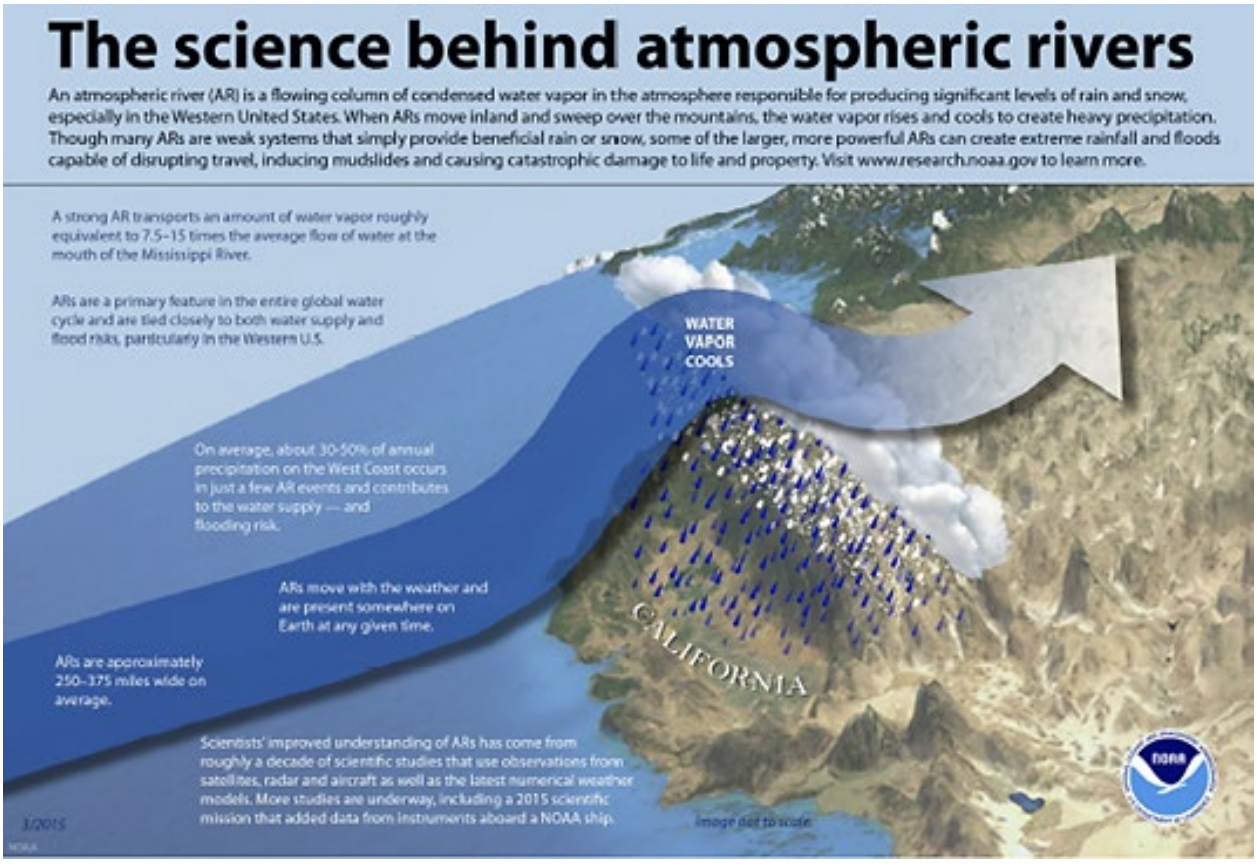

Figure 73: Diagram of an Atmospheric River Event
Source: NOAA

The Marin County OA is susceptible to various types of flood events. In coastal areas, flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Other types of flooding in Marin include isolated ponding and stormwater overflow. Isolated ponding is when pools form on the ground and can occur in any area that doesn't drain effectively – for example, in a natural depression in the landscape. Stormwater overflow is when storm drains back up. Stormwater drainage systems quickly convey rainwater through underground pipes to creeks and the Bay. When the storm drains are obstructed or broken or when the water bodies to which they lead to are already full, water backs up onto the streets. Although stormwater overflow and isolated ponding also occur throughout the County, the effects are typically not widespread or significantly damaging.

Flooding in the BCPUD generally results from a combination of high tides and storm runoff in low-lying areas. Downtown Bolinas and Olema-Bolinas Road (the only egress road out of town) also have flooded in the past during the period of high tides and storm runoff. Wharf Road and Brighton Avenue in downtown Bolinas follow former riverbeds that cut through the topography, so both streets are at the bottom of small valleys and Olema-Bolinas Road is in a mapped floodplain. These past floods have impacted the water and sewer systems.

The BCPUD does not have any critical facilities within a flood zone. However, the BCPUD maintains small private dams or reservoirs that, should they fail, could result in flooding and damage to their facilities, specifically, to the Woodrat Water Treatment Plant, the only source of potable water for the community. These dams or reservoir facilities are not certified by the California Department of Water Resources, Division of Safety of Dams and are not known to pose potential downstream impacts to life or private property.

The impact of king tides (which typically occur in November, December and January of each year) at the same time as high rainfall events - the combination of the two occurring at the same time specifically affects low-lying areas of Marin such as Bolinas near the coast and the Bay and have impacts on the BCPUD's sewer system.

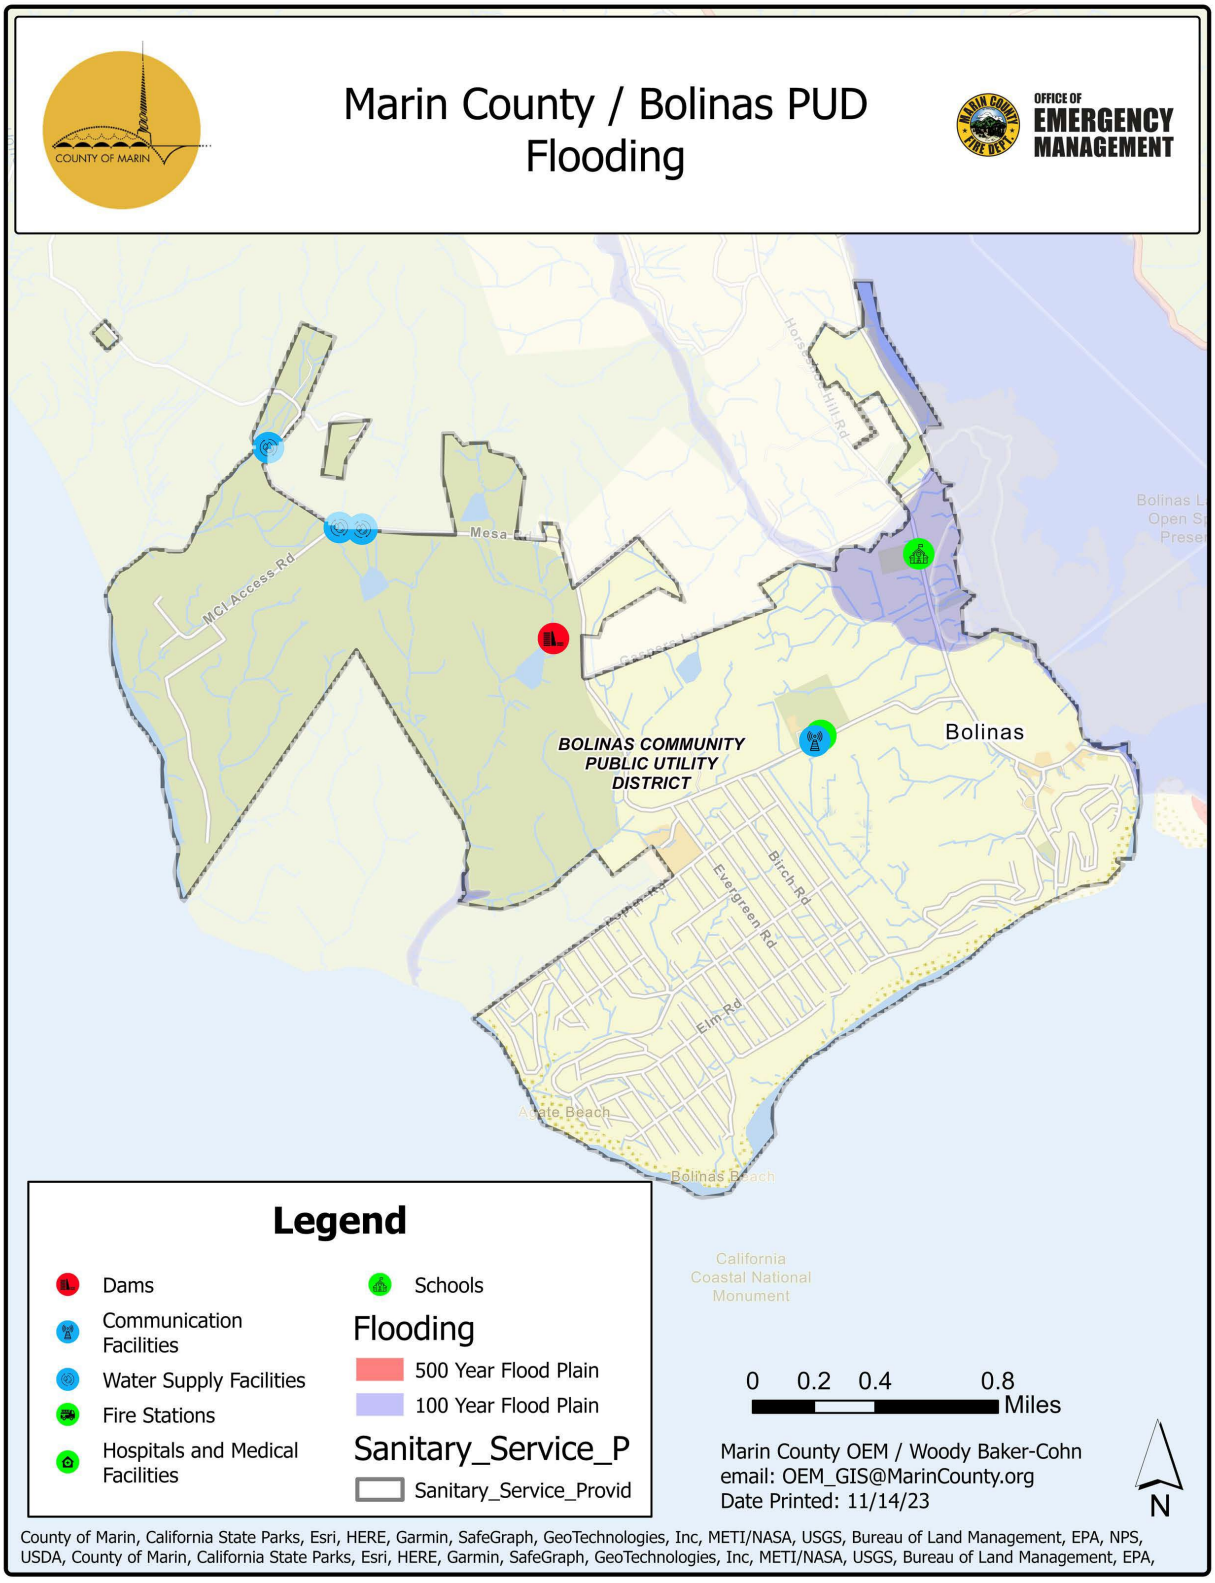

Figure 74: BCPUD Flooding Critical Facilities and Infrastructure
Source: Marin County OEM

Floodwaters can be deep enough to drown people and move fast enough to sweep people and vehicles away, lift buildings off foundations, and carry debris that smashes into buildings and other property. Flood waters can cause significant erosion which can lead to slope instability, severely damaging transportation and utility infrastructure by undermining foundations or washing away pavement. If water levels rise high enough to get inside buildings, flooding can cause extensive damage to personal property and the structure itself. Flood events that develop very quickly are especially dangerous because there may be little advance warning. Flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Tide elevations within the Bolinas Lagoon and Bolinas Bay have the potential to significantly impact the County's storm drain system in Bolinas, as well as the BCPUD's sewer system.

In Bolinas, Olema-Bolinas Road – the only egress road out of town -- has been closed due to flooding on numerous occasions, nearly always during a combination of heavy rains and King Tides, isolating the community for hours and rendering evacuation nearly impossible.

Climate Change and Future Development Considerations

Climate change is expected to affect California's precipitation patterns, which are likely to influence future flood events. A 2017 study[7] found that the number of very intense precipitation days in California is projected to more than double by the end of the century, increasing 117 percent, making it likely that flood events will become more frequent in the Marin County OA including the BCPUD. Climate change is expected to alter rainfall patterns in Northern California, including the Marin County OA. As the climate warms, rain events are predicted to become more intense. The Marin County OA including the BCPUD will likely experience more rain inundation events that lead to flooding and increase the potential threat of dam and levee failure, tree mortality, and other potential hazards. Sea level rise as a result of climate change will exacerbate the impacts of tidal flooding in the lowland areas of the Marin County OA including the shoreline areas of the BCPUD. Future development in these areas will expose more people and infrastructure to the effects of flooding. Development along creeks would expose more people, structures and infrastructure including major roads to creek flooding and storm surge from creeks as a result of climate change.

2.2.6 Land Subsidence/Sinkholes

Land subsidence is a gradual settling or sudden sinking of the Earth's surface owing to subsurface movement of earth materials. The principal causes are aquifer-system compaction, drainage of organic soils through groundwater pumping, underground mining, hydro-compaction, natural compaction, sinkholes, and thawing permafrost. More than 80 percent of the identified subsidence in the United States is a consequence of underground water exploitation. The increasing development of land and water resources threatens to exacerbate existing land-subsidence problems and initiate new ones.

Sinkholes can form in three primary ways. Dissolution sinkholes form when dissolution of the limestone or dolomite is most intensive where the water first contacts the rock surface. Aggressive dissolution also occurs where flow is focused in preexisting openings in the rock,

[7] Precipitation in a Warming World: Assessing Projected Hydro-Climate Changes in California and other Mediterranean Regaions. https://www.nature.com/articles/s41598-017-11285-y

such as along joints, fractures, and bedding planes, and in the zone of water-table fluctuation where groundwater is in contact with the atmosphere. See Figure 29 for a picture and description of how dissolution sinkholes form.

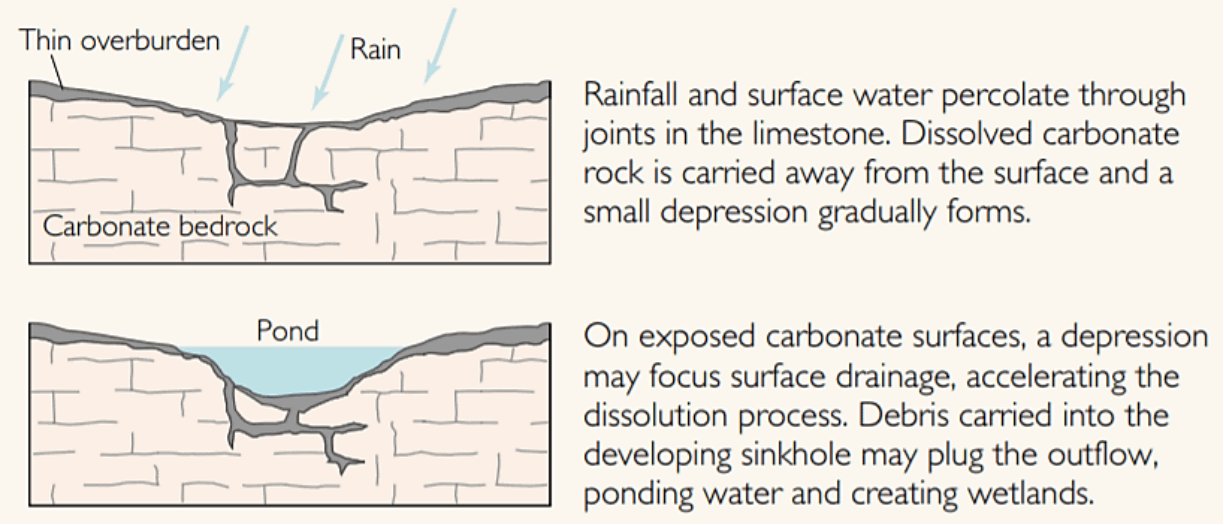

Figure 75: Dissolution Sinkhole Formation
Source: USGS

Cover-subsidence sinkholes tend to develop gradually where the covering sediments are permeable and contain sand. In areas where cover material is thicker, or sediments contain more clay, cover-subsidence sinkholes are relatively uncommon, are smaller, and may go undetected for long periods. See Figure 30 for a picture and description of how cover-subsidence sinkholes form.

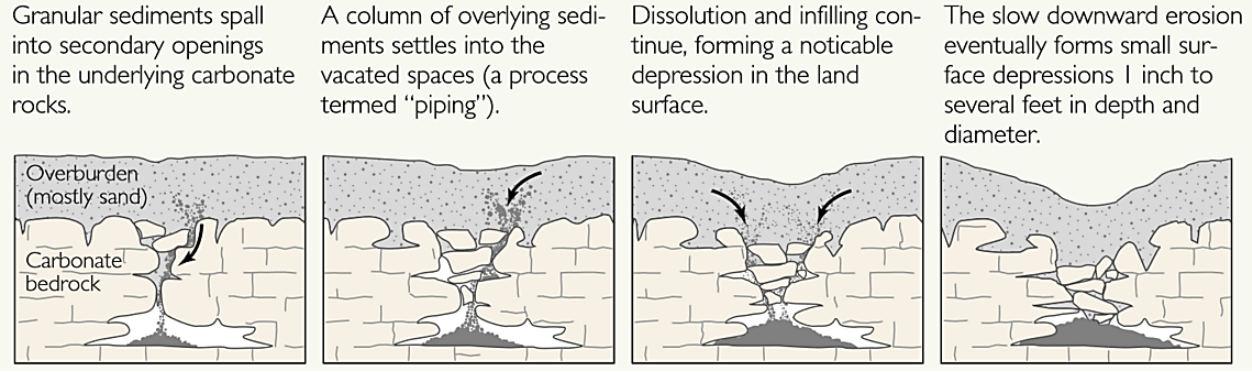

Figure 76: Cover-Subsidence Sinkhole Formation
Source: USGS

Cover-collapse sinkholes may develop abruptly over a period of hours and cause catastrophic damages. They occur where the covering sediments contain a significant amount of clay. Over time, surface drainage, erosion, and deposition of sediment transform the steep-walled sinkhole into a shallower bowl-shaped depression. See Figure 31 for a picture and description of how cover-collapse sinkholes form.

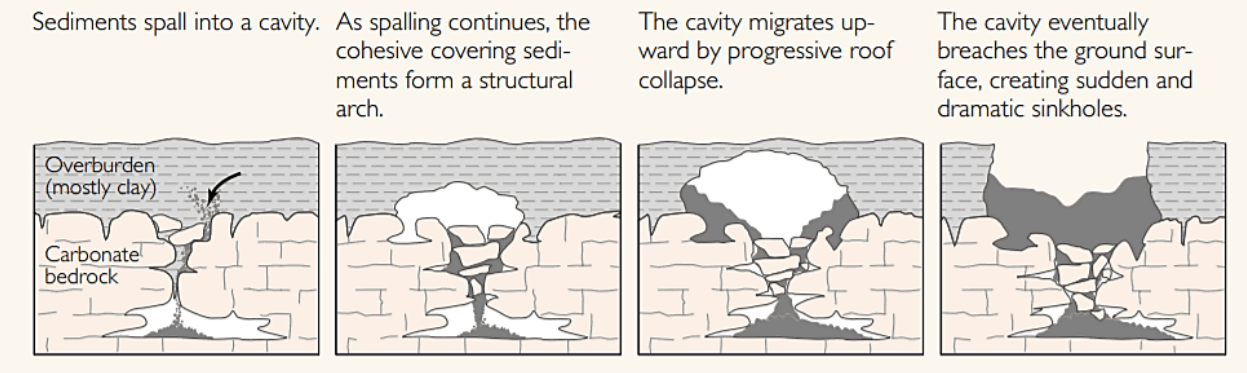

Figure 77: Cover-Collapse Sinkhole Formation
Source: USGS

New sinkholes have been correlated to land-use practices, especially from groundwater pumping and from construction and development practices that cause land subsidence. Sinkholes can also form when natural water-drainage patterns are changed and new water-diversion systems are developed. Some sinkholes form when the land surface is changed, such as when industrial and runoff-storage ponds are created. The substantial weight of the new material can trigger an underground collapse of supporting material, thus causing a sinkhole.

The overburden sediments that cover buried cavities in the aquifer systems are delicately balanced by groundwater fluid pressure. The water below ground helps to keep the surface soil in place. Groundwater pumping for urban water supply and for irrigation can produce new sinkholes in sinkhole-prone areas. If pumping results in a lowering of groundwater levels, then underground structural failure, and thus, sinkholes, can occur.

Land subsidence and sinkholes would most likely occur in the lowland areas of the BCPUD where superficial deposits and fill are more prevalent. Land subsidence could have numerous impacts for the BCPUD, including the settling of district facilities and infrastructure as well as the shifting of roadways that run through the District.

In recent years, numerous sinkholes have appeared under Wharf Road (a County-maintained road) in downtown Bolinas where the road is adjacent to the Bolinas Lagoon. These sinkholes appear to be related to wave scour undermining a County seawall that supports the road. These sinkholes and the shifting of Wharf Road threaten the BCPUD's water and sewer infrastructure in this area.

Climate Change and Future Development Considerations

Climate change could indirectly influence land subsidence as more severe and prolonged periods of drought may encourage more groundwater withdrawals. In coastal areas like the Marin County OA including the BCPUD, land subsidence leads to higher sea levels and increased flood risk. The rate of land subsidence could increase across the Marin County OA including the BCPUD as a result of climate change. The impacts of land subsidence on infrastructure, including roads and underground utilities, in the BCPUD as a result of climate change could increase with future development in the populated areas of the District, including the unincorporated community of Bolinas.

2.2.7 LEVEE FAILURE

Levee failure is the overtopping, breach or collapse of the levee. Levees can fail in the event of an earthquake, internal erosion, poor engineering/construction or landslides, but levees most commonly fail as a result of significant rainfall or very high tides. During a period of heavy rainfall, the water on the water-body side of the levee can build up and either flow over the top ("overtopping") or put pressure on the structure causing quickening seepage and subsequent erosion of the earth. The overflow of water washes away the top portion of the levee, creating deep grooves. Eventually the levee weakens, resulting in a breach or collapse of the levee wall and the release of uncontrollable amounts of water. Figure 32 shows a levee and the multiple ways it can fail.

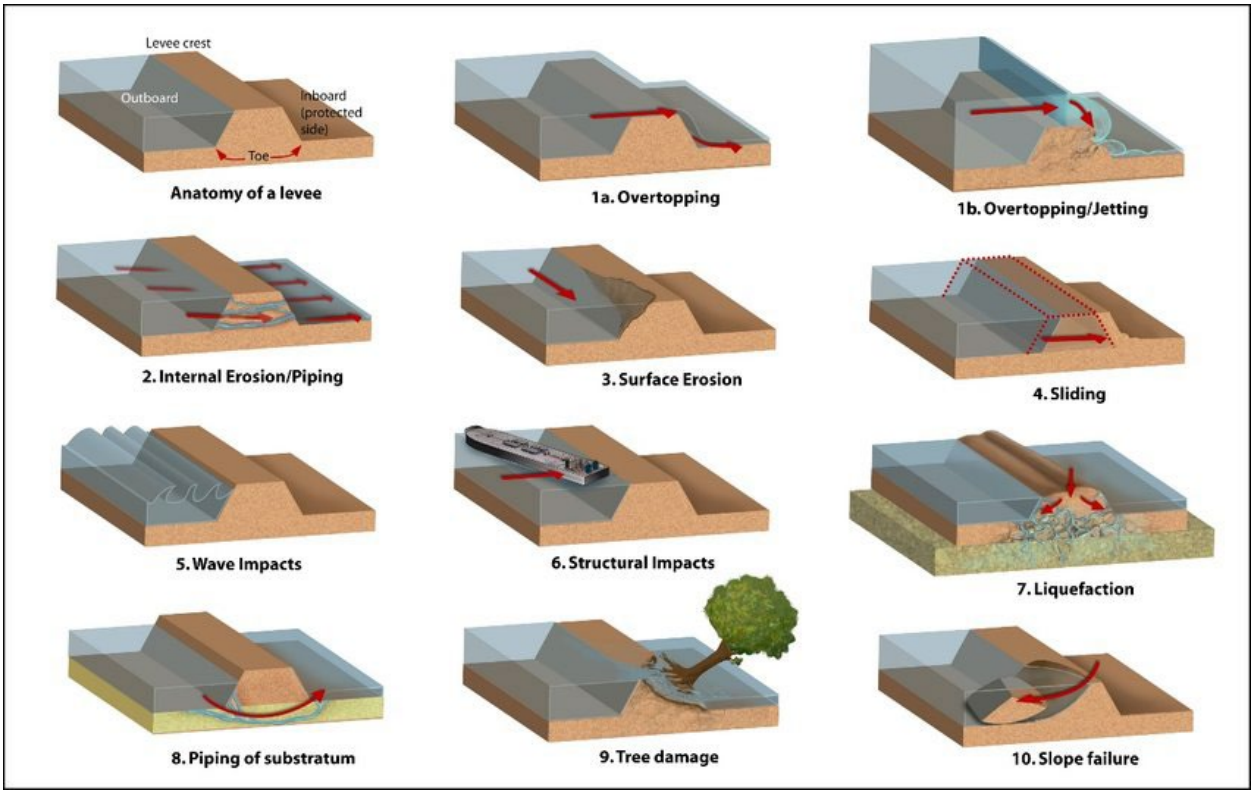

Figure 78: Levee Failure Mechanisms
Source: University of California

The BCPUD has levees in the form of four primary treatment ponds at its sewer treatment facility at 101 Mesa Road. The facility is an integrated pond system which uses no chemicals in the treatment process, relying instead on a biological process of methane fermentation, with aeration and recirculation for odor control. Following primary and secondary treatment, the effluent is spray-irrigated to land surrounding the treatment facility. Pursuant to the terms of the Waste Discharge Order 88-100 applicable to this facility, the BCPUD is not permitted to discharge from the ponds between November 15 and April 15 in any given year and must maintain two feet of freeboard in the ponds at all times. However, during years when the BCPUD receives 50-inches or more of rain, the BCPUD's levees are vulnerable to overtopping, which could cause flooding into the District, with property and critical infrastructure down

gradient of the treatment facility (including downtown unincorporated Bolinas) being most susceptible.

There has never been a failure of any of the BCPUD's levees.

Figure 79: Bolinas CPUD Primary Treatment Ponds Levees
Source: Bolinas Community PUD

Climate Change and Future Development Considerations

Climate change is expected to lead to an increase in the frequency and severity of major storm events, which can place added strain on levee systems. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in leveed areas across the Marin County OA including in the BCPUD, increasing the potential for a levee failure. As development increases in the populated areas of the BCPUD downstream of its levees, particularly in the unincorporated community of Bolinas, the potential for significant impacts to residents and infrastructure will only increase.

2.2.8 Sea Level Rise

Climate change is the distinct change in measures of weather patterns over a long period of time, ranging from decades to millions of years. More specifically, it may be a change in average weather conditions such as temperature, rainfall, snow, ocean and atmospheric circulation, or in the distribution of weather around the average. While the Earth's climate has cycled over its 4.5-billion-year age, these natural cycles have taken place gradually over millennia, and the Holocene, the most recent epoch in which human civilization developed, has been characterized by a highly stable climate until recently.

The Marin County OA MJHMP is concerned with human-induced climate change that has been rapidly warming the Earth at rates unprecedented in the last 1,000 years. Since industrialization began, the burning of fossil fuels (coal, oil, and natural gas) at escalating quantities has released vast amounts of carbon dioxide and other greenhouse gases responsible for trapping heat in the atmosphere, increasing the average temperature of the Earth. Secondary impacts include changes in precipitation patterns, the global water cycle, melting glaciers and ice caps, and rising sea levels. According to the Intergovernmental Panel on Climate Change (IPCC), climate change will "increase the likelihood of severe, pervasive and irreversible impacts for people and ecosystems" if unchecked.

Through changes to oceanic and atmospheric circulation cycles and increasing heat, climate change affects weather systems around the world. Climate change increases the likelihood and exacerbates the severity of extreme weather – more frequent or intense storms, floods, droughts, and heat waves. Consequences for human society include loss of life and injury, damaged infrastructure, long-term health effects, loss of agricultural crops, disrupted transport and freight, and more. Climate change is not a discrete event but a long-term hazard, the effects of which communities are already experiencing.

Climate change adaptation is a key priority of the State of California. The 2013 State of California Multi- Hazard Mitigation Plan stated that climate change is already affecting California. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Rising sea levels are considered a secondary effect of climate change due to warming ocean temperatures and melting glacial ice sheets into the ocean. The California coast has already seen a rise in sea level of four to eight inches over the 20th century due to climate change. Sea level rise impacts can be exacerbated during coastal storms, which often bring increased tidal elevations called "storm surge." The large waves associated with such storm surges can cause flooding in low-lying areas, erosion of coastal wetlands, saltwater contamination of drinking water, disruption of septic system operations, impacts on roads and bridges, and increased stress on levees. In addition, rising sea levels results in coastal erosion as shoreline sediment is re-deposited back into the ocean. Evidence shows that winter storms have increased in frequency and intensity since 1948 in the North Pacific, increasing regional wave heights and water levels during storm events.

According to the 2017 "Rising Seas in California, An Update on Sea-Level Rise Science" report Marin County may experience impacts from Sea Level Rise over defined periods of time, to include long-term changes (second half of this century and beyond), and short- to mid-term projections (within the next two or three decades).

All residents in the Marin County OA, including in the unincorporated area, are susceptible to climate change, with effects being more prevalent in those with pre-existing health conditions and the elderly. Communities most vulnerable to the impacts of sea level rise in unincorporated Marin County include Muir Beach, Stinson Beach, Bolinas, Inverness, Pt. Reyes Station, Marshall, and Dillon Beach.

The Marin Ocean Coast Sea Level Rise Vulnerability Assessment and Marin Shoreline Sea Level Rise Vulnerability Assessment estimate that by 2100 around 7,000 acres, 9,000 parcels, 10,000 buildings and 120 miles of roads throughout the Marin County OA will be exposed to sea level rise and 100-year storm events.

In their current conditions, the most vulnerable coastal Marin County OA infrastructure, in order of onset and flood depth, includes

Near term (ten years):

- Beaches, underground on-site wastewater treatment systems (OWTS), buildings, and streets in Stinson Beach west of Shoreline Highway
- Shoreline Highway between Stinson Beach and Bolinas, at Green Bridge over Lagunitas Creek in Pt. Reyes Station, the Walker Creek crossing in Marshall, and bridges on Middle Road and Valley Ford Lincoln School Road
- Beaches and beach front and downtown buildings and streets (where critical BCPUD water and sewer infrastructure is located) in Bolinas
- Septic systems, beaches, marshes, and buildings along the eastern and western shores of Tomales Bay
- The water distribution pipe underneath Shoreline Highway and Sir Francis Drake
- Boulevard serving many Inverness residents
- Intertidal rocky lands in Muir Beach and Duxbury Reef in Bolinas
- Fire service facilities and tsunami evacuation routes in Stinson Beach
- Blufftop buildings in Muir Beach, Bolinas, and Dillon Beach may be vulnerable to accelerated erosion

Medium Term (thirty years):

- Olema-Bolinas Road, which is the only road into Bolinas, and the Bolinas-Stinson Union School District's Bolinas campus, along with numerous public, non-profit and private (commercial and residential) properties
- Additional buildings and streets in downtown Bolinas, including the historic district and the College of Marin's Bolinas Field Station
- Bolinas Community Public Utility District's sewer lift station on Wharf Road
- Shoreline Highway in Pt. Reyes Station and East Shore, and Sir Francis Drake Blvd. in Inverness

Long Term (seventy years):

- Shoreline Highway along the East Shore
- Buildings in Inverness west of Sir Francis Drake Blvd
- Downtown Bolinas up to the intersection of Wharf Road and Brighton Avenue, including the markets, shops, library, community center, gas station, museum, and other valued places

Along the bay shoreline, in the near-term timeframe, tidal flooding at 10 inches of sea level rise could reach 5,000 acres, 1,300 parcels, and 700 buildings, potentially impacting tens of thousands of residents, employees, and visitors. With an additional 100-year storm surge, the previously impacted acres, parcels, and buildings could face tidal and storm surge flooding. An additional 3,000 acres, 2,500 parcels, and 3,800 buildings could anticipate storm surge flooding across the Marin County OA.

Beaches, estuaries, marshes, wetlands, and intertidal areas on the Marin County OA coast, including in the unincorporated area, are vulnerable to sea level rise and storms. Nearly all beaches except Dillon Beach and the federal portion of Stinson Beach, could be lost entirely in the long-term. Roughly 9,000 acres in the estuaries of Tomales Bay, Bolinas Lagoon, and Esteros Americano and San Antonio, 1,800 acres of wetlands and marshlands could be impacted to varying degrees across all of the scenarios in all of the communities. Sea level rise may push coastal habitats inland where possible, flooding tidal areas more frequently and new inland areas with saltwater. The North Central California Coast and Ocean Vulnerability Assessment identified the five most vulnerable species to sea level rise as the Western snowy plover, black oystercatcher, black rail, California mussel, and red abalone.

Much of the BCPUD is at a lower elevation than many of the coastal areas in Marin County. As such, the lowland areas in BCPUD are particularly vulnerable to sea level rise and could experience between one and six feet of inundation.

Critical facilities throughout the District can become damaged extensively with their foundations compromised over time. Of particular concern are those facilities that have not been elevated to projected sea level rise heights over the next century. Sea level rise in the District has the potential to exacerbate inland flooding when a significant rain or tidal event occurs, pushing water from local creeks over their banks and into areas were critical facilities lie. Sea level rise can also cause increased subsidence in the District, which may damage underground water and wastewater pipelines and disrupt services.

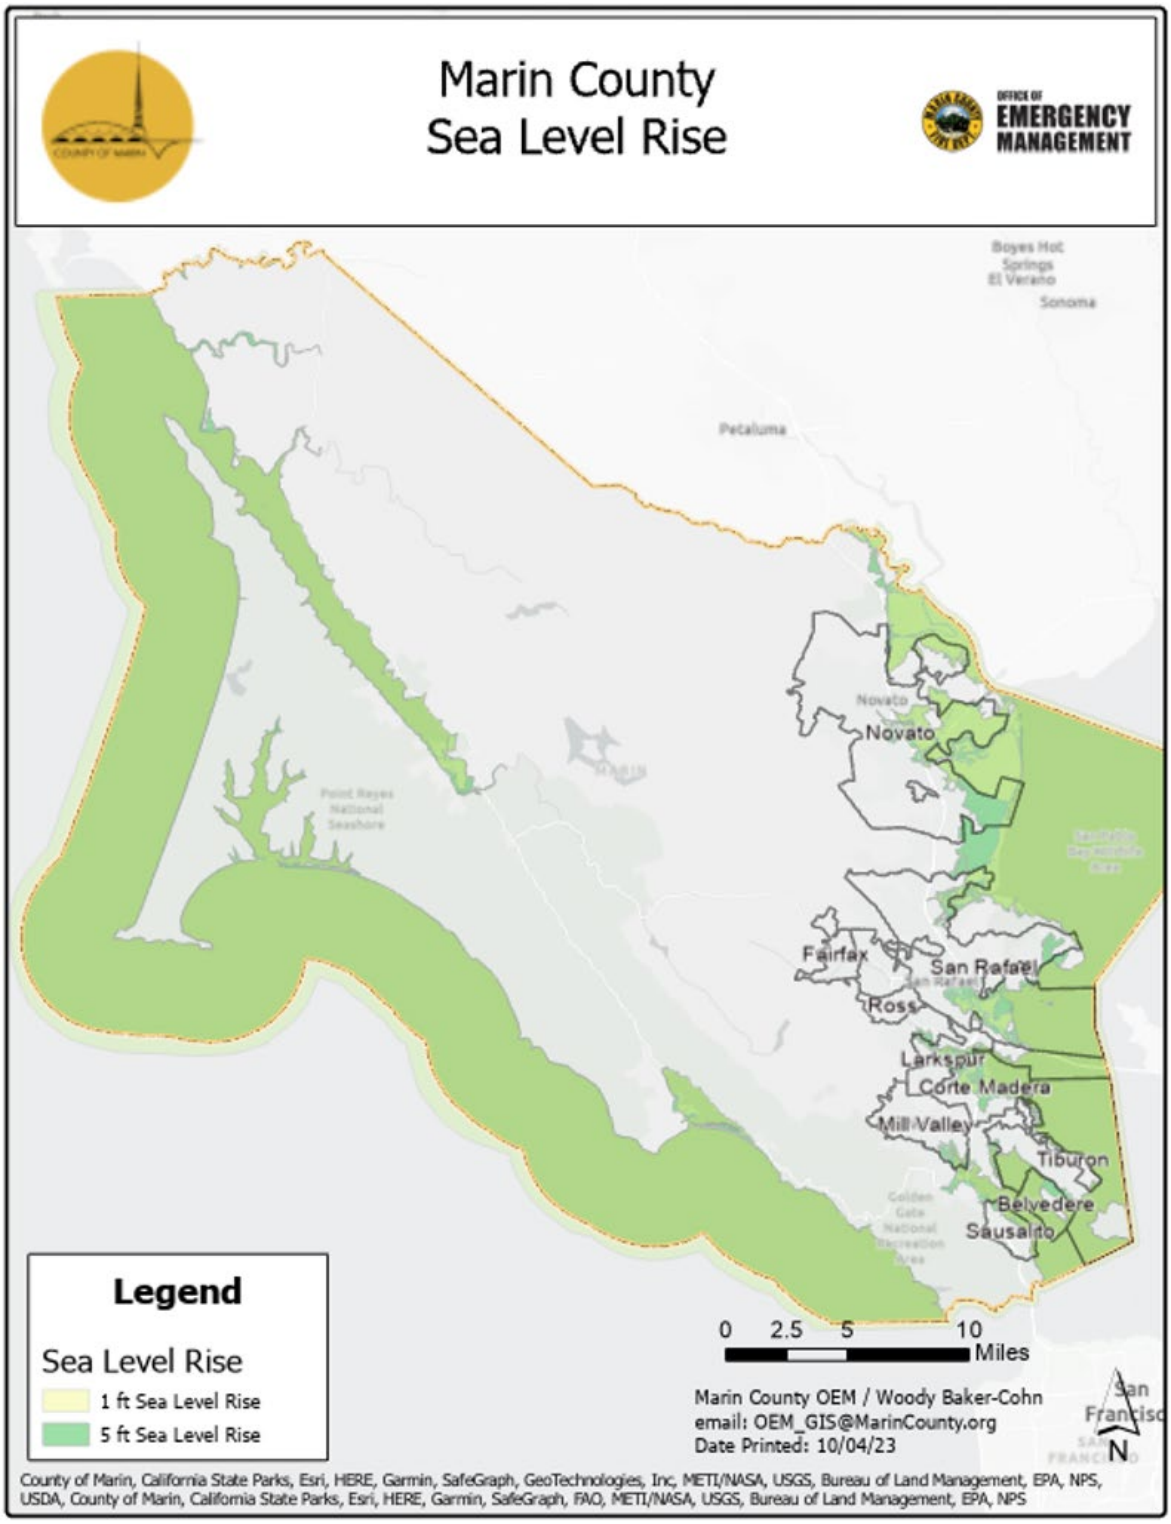

Figure 80: Marin County Sea Level Rise Impact
Source: Marin County OEM

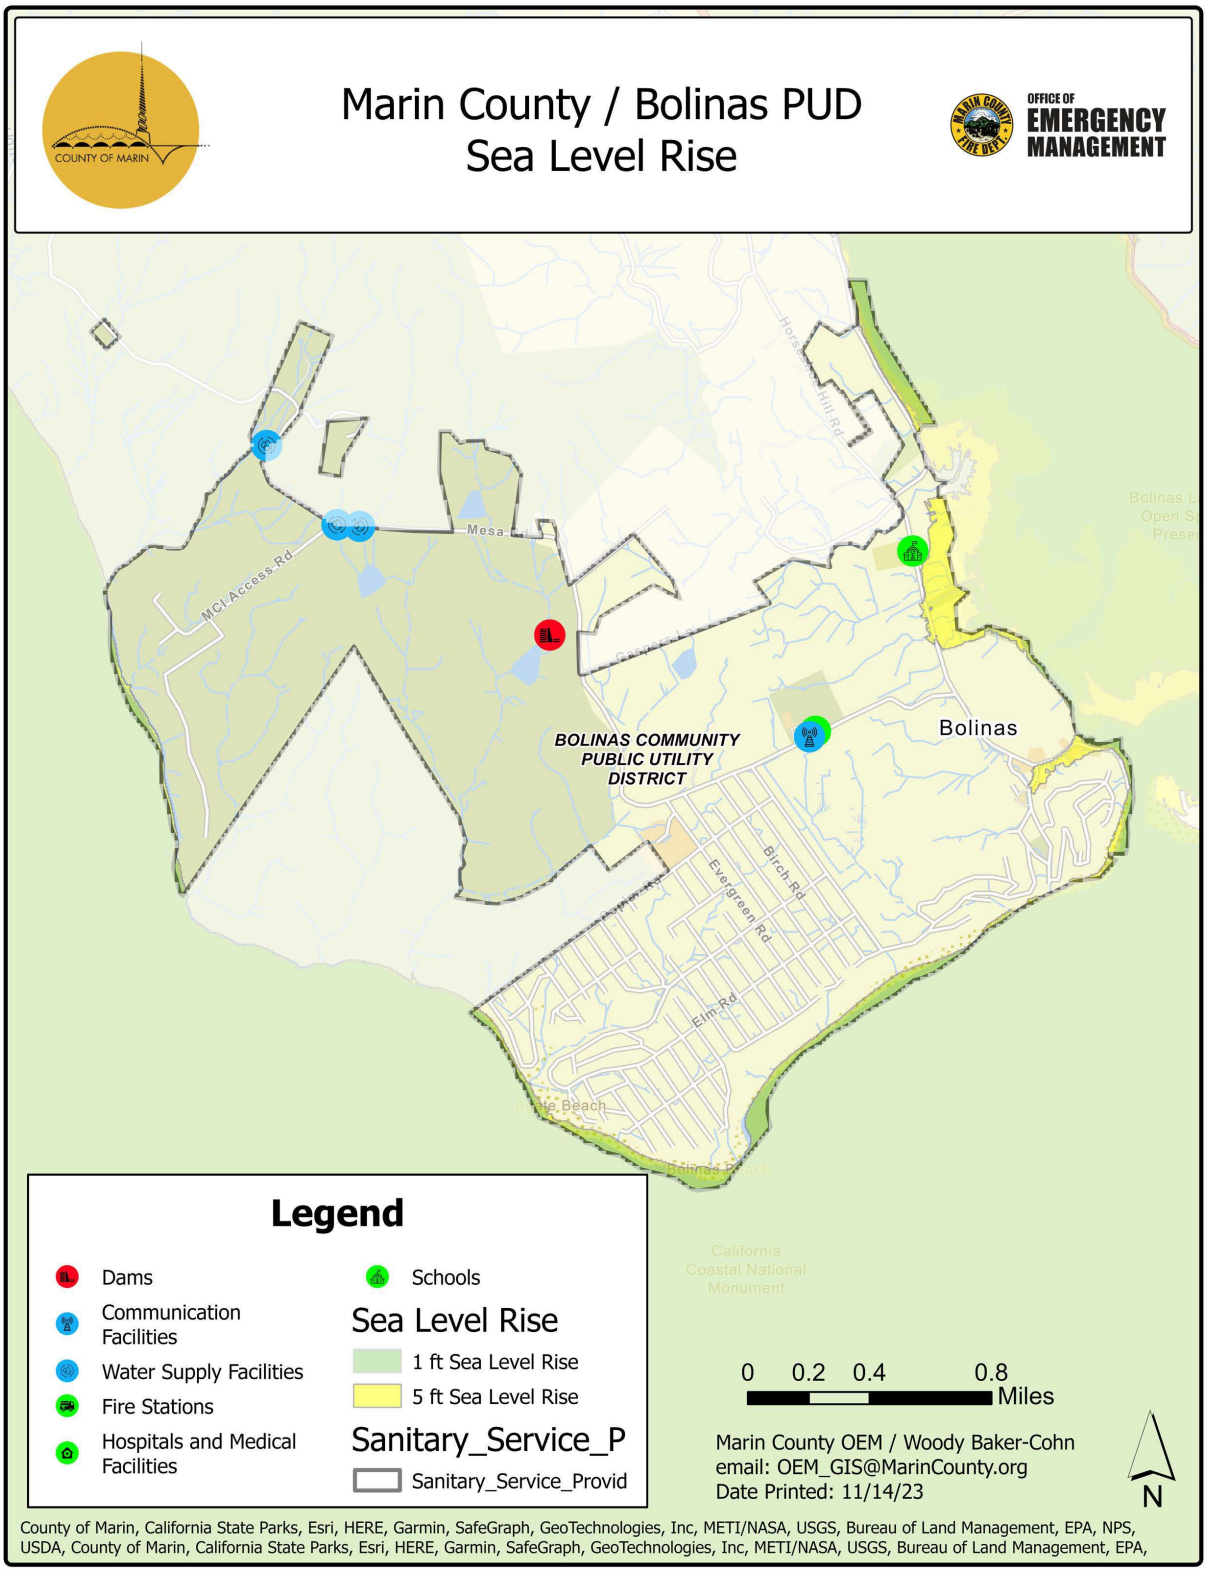

Figure 81: BCPUD Sea Level Rise Impact on Critical Facilities
Source: Marin County OEM

Climate Change and Future Development Considerations

The two major causes of global sea level rise are thermal expansion of warming oceans and the melting of land-based glaciers and polar ice caps. Climate change is affecting natural and built systems around the world, including the California coast. In the past century, average global temperature has increased about 1.4°F, and average global sea level has increased 7 to 8 inches. Sea level rise in the San Francisco Bay Area is projected to increase by eight inches MHW in 2050 and could reach 4.5 to eight feet by 2021 if greenhouse gas emissions aren't reduced.

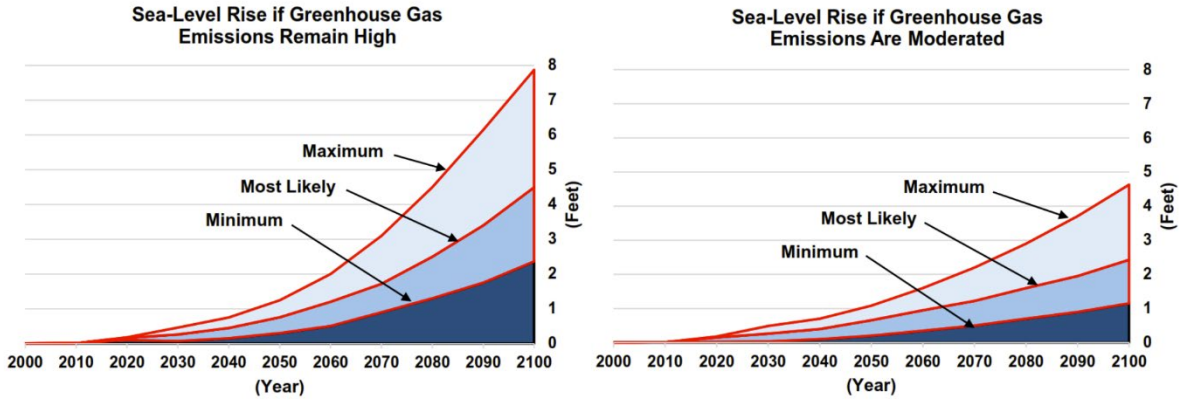

Figure 82: Projections of Sea Level Rise in the San Francisco Bay Area, 2000-2100
Source: 2019–2020 Marin County Civil Grand Jury, Climate Change: How Will Marin Adapt?

While the Marin County OA shoreline including around the BCPUD already experiences regular erosion, flooding, and significant storm events, sea level rise will exacerbate these natural processes, leading to significant social, environmental, and economic impacts. The third National Climate Assessment cites strong evidence that the cost of doing nothing exceeds the costs associated with adapting to sea level rise by 4 to 10 times. Sea level rise will continue to affect the Marin County OA including the BCPUD with increased tidal flooding and storm surge during severe weather events, and future development along the Marin County OA shoreline including around the BCPUD will only amplify these impacts. Sea level can also lead to increased land subsidence and the potential of levee failure. The impacts of a tsunami would also be magnified with rising seas. Future development in the coastal and lowland areas of the BCPUD, including in the unincorporated community of Bolinas, will put more people and property at risk from flooding as a result of sea level rise. Roads and utility infrastructure across the BCPUD will continue to become inundated.

2.2.9 SEVERE WEATHER – EXTREME HEAT

Extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. A heat wave is an extended period of extreme heat, often with high humidity. When relative humidity is factored in, the temperature can feel much hotter as reflected in the Heat Index (see Figure 37):

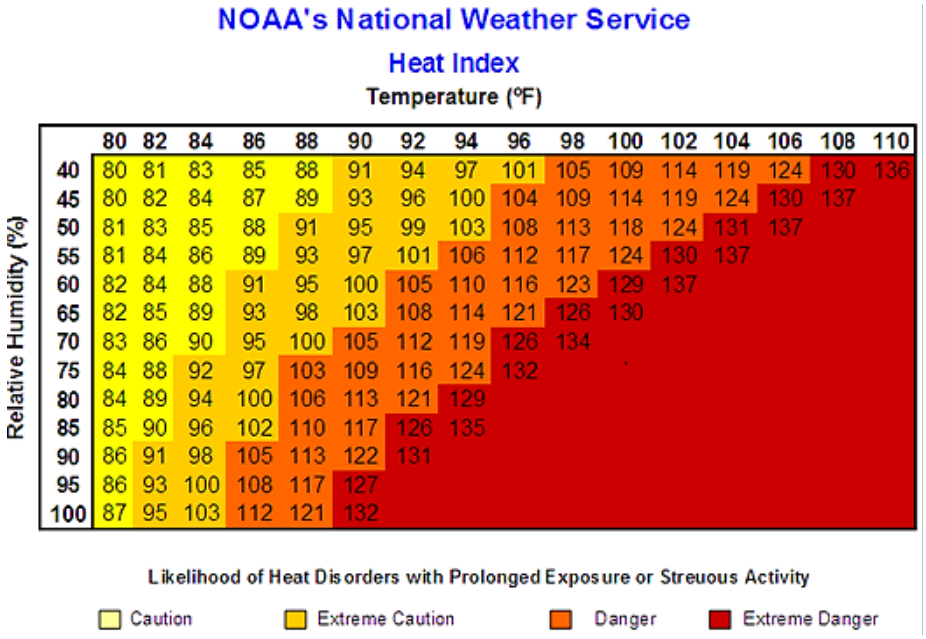

Figure 83: Heat Index
Source: NOAA

Heat kills by taxing the human body beyond its abilities. In a normal year, about 1,300 Americans succumb to the demands of summer heat. Heat is the leading weather-related cause of mortalities in the US. In 2006, California reported a high of 204 heat related deaths, with 98 reported in 2017 and 93 deaths reported in 2018.

Extreme heat can affect a range of key infrastructure from energy systems, water and wastewater treatment systems, the operation of government buildings, and public transit. While higher summer temperatures increase electricity demand for cooling, at the same time, it also can lower the ability of transmission lines to carry power, possibly leading to electricity reliability issues during heat waves. Increased temperatures also impact the efficiency of solar power infrastructure by increasing the surface temperature of solar panels, which reduces the voltage that panels can generate and thereby lowers efficiency. Although warmer winters will reduce the need for heating, modeling suggests that total U.S. energy use will increase in a warmer future. Extreme heat can also increase the risk of other types of disasters and exacerbate the urban heat island effect. Heat can exacerbate drought, and hot dry conditions can in turn create wildfire conditions. In cities, buildings, roads and infrastructure can be heated to 50 to 90 degrees hotter than the air while natural surfaces remain closer to air temperatures. The heat island effect is most intense during the day, but the slow release of heat from the infrastructure overnight (or an atmospheric heat island) can keep cities much hotter than surrounding areas. People who are required to work outside during extreme heat are especially vulnerable to the effects of extreme heat. In California, between 2000-2017, 15,996 workers experienced heat

related illness (Risk factors for occupational heat-related illness among California workers, 2000-2017 - PubMed (nih.gov).

Extreme heat has the potential to impact all areas of the BCPUD and would be felt more at lower elevations in the central and eastern areas of the District. Heat waves can cause power outages, which can impact the operability of the District's critical facilities and impede the delivery of services. Heat waves can also impact district employees who are exposed to high temperatures while working outside in the heat.

Climate Change and Future Development Considerations

The primary effect of climate change is warmer average temperatures. The annual average daily high temperatures in California are expected to rise by 2.7°F by 2040, 5.8°F by 2070, and 8.8°F by 2100 compared to observed and modeled historical conditions. At the current rate, annual average temperatures in the Marin County OA region and Bay Area will likely increase by approximately 4.4 degrees by 2050 and 7.2 degree by the end of the century unless significant efforts are made to reduce greenhouse emotions according to California's latest climate change assessment.

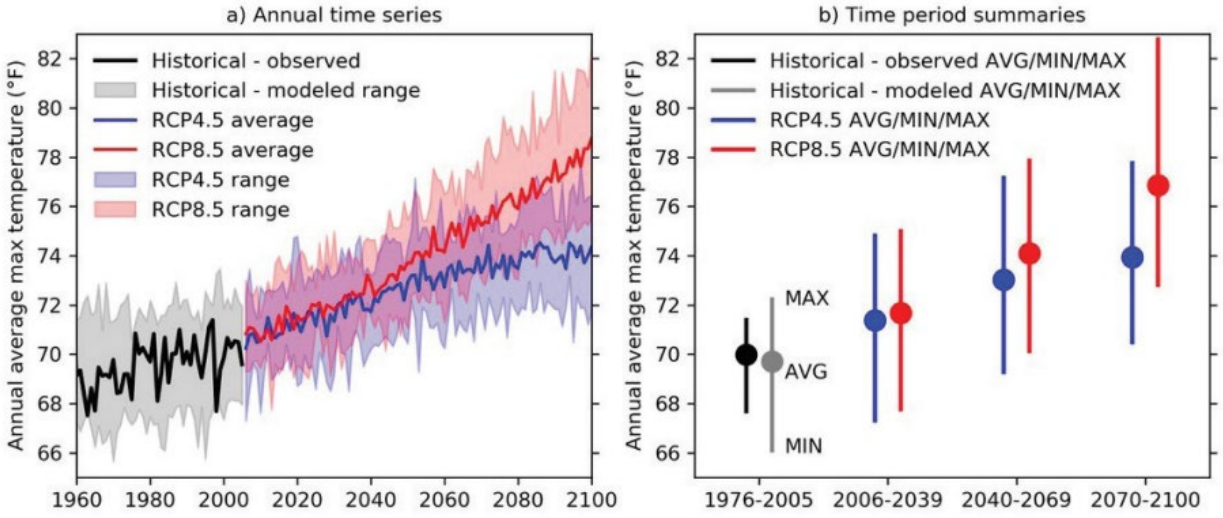

Figure 84: Annual Average Temperatures in the San Francisco Bay Area, 2000-2100
Source: California Climate Change Assessment (Fourth Edition)

As climate change accelerates in the 21st century, it is anticipated that extreme heat events will become more frequent and intense across the Marin County OA including in the BCPUD. There will be increased residential and business needs for cooling and addressing heat-related issues. These effects would primarily be felt in the lowland areas of the BCPUD where heat builds in developed areas, including in the unincorporated community of Bolinas. Heat waves also tax the energy grid. Future development in the Marin County OA including the BCPUD could exacerbate the impacts from heat related events, particularly in electricity provision and water delivery. Increased temperatures will also lead to an increase in the occurrence and severity of wildfires across the Marin County OA including the BCPUD as conditions become hotter and drier. These effects will primarily be felt in the upland and marshland areas of the District where hotter and drier conditions are more apt to lead to wildfires. Future development near the many open spaces around the BCPUD could expose more people and infrastructure to the threat of a major wildfire as a result of increasing temperatures.

2.2.10 SEVERE WEATHER – HIGH WIND & TORNADO

High Wind

High wind is defined as a one-minute average of surface winds 40 miles per hour or greater lasting for one hour or longer, or winds gusting to 58 miles per hour or greater regardless of duration that are either expected or observed over land. These winds may occur as part of a seasonal climate pattern or in relation to other severe weather events such as thunderstorms. The Beaufort scale is an empirical measure that relates wind speed to observed conditions on land and is a common measure of wind intensity (see Figure 39).

Windstorms in the Marin County OA are typically straight-line winds. Straight-line winds are generally any thunderstorm wind that is not associated with rotation (i.e., is not a tornado). It is these winds, which can exceed 100 mph, which represent the most common type of severe weather and are responsible for most wind damage related to thunderstorms.

Straight-line winds may exacerbate existing weather conditions by increasing the effect on temperature and decreasing visibility due to the movement of particulate matters through the air, as in dust and snow storms. The winds may also exacerbate fire conditions by drying out the ground cover, propelling fuel around the region, and increasing the ferocity of exiting fires. These winds may cause personal injury, damage crops, push automobiles off roads, damage roofs and structures, overturn mobile homes, tear roofs off of houses, topple trees, snap power lines, shatter windows, sandblast paint from cars, and cause secondary damage due to flying debris. Other associated hazards include utility outages, arcing power lines, debris blocking streets, dust storms, and an occasional structure fire. Due to the wildfire threat posed by trees falling or leaning on power lines as a result of high winds and other conditions, Pacific Gas and Electric began initiating PSPS events after the 2017 Northern California Wildfires and the 2018 Camp Fire (see wildfire profile) in order to prevent the start of wildfires. These PSPS events can have numerous impacts on residents who rely on electricity for cooling their homes, powering water pumps, keeping critical medical equipment operable and other needs.

Beaufort number	Description	Wind speed		Land conditions
		kts	km/h	
0	Calm	< 1	< 1	Calm. Smoke rises vertically.
1	Light air	1 – 2	1 – 5	Wind motion visible in smoke.
2	Light breeze	3 – 6	6 – 11	Wind felt on exposed skin. Leaves rustle.
3	Gentle breeze	7 – 10	12 – 19	Leaves and smaller twigs in constant motion.
4	Moderate breeze	11 – 15	20 – 28	Dust and loose paper raised. Small branches begin to move.
5	Fresh breeze	16 – 20	29 – 38	Branches of a moderate size move. Small trees begin to sway.
6	Strong breeze	21 – 26	39 – 49	Large branches in motion. Whistling heard in overhead wires. Umbrella use becomes difficult. Empty plastic garbage cans tip over.
7	High wind, Moderate gale, Near gale	27 – 33	50 – 61	Whole trees in motion. Effort needed to walk against the wind. Swaying of skyscrapers may be felt, especially by people on upper floors.
8	Gale, Fresh gale	34 – 40	62 – 74	Some twigs broken from trees. Cars veer on road. Progress on foot is seriously impeded.
9	Strong gale	41 – 47	75 – 88	Some branches break off trees, and some small trees blow over. Construction/temporary signs and barricades blow over. Damage to circus tents and canopies.
10	Storm, Whole gale	48 – 55	89 – 102	Trees are broken off or uprooted, saplings bent and deformed. Poorly attached asphalt shingles and shingles in poor condition peel off roofs.
11	Violent storm	56 – 63	103 – 117	Widespread vegetation damage. Many roofing surfaces are damaged; asphalt tiles that have curled up and/or fractured due to age may break away completely.
12	Hurricane	≥ 64	≥ 118	Very widespread damage to vegetation. Some windows may break; mobile homes and poorly constructed sheds and barns are damaged. Debris may be hurled about.

Figure 85: Beaufort Wind Scale
Source: NOAA

In the Marin County OA, storms with strong winds knock down trees and power lines nearly every year and continue to slowly erode vulnerable coastal areas and critical inland ponds (i.e. reservoirs/dams, berms/levees around stormwater detention ponds, wastewater treatment/storage ponds). Although the entire OA is affected by wind, coastal areas tend to be impacted more frequently by the strongest winds (9+ on the Beaufort scale) than inland areas. The Marin County OA's coastal areas have small resident populations but large visiting populations, such as Muir Beach, Stinson Beach, and Bolinas that can be impacted by strong winds. Beachgoers and boaters would be particularly impacted by wind hazards. Tourism is a key part of the economy in Marin County, particularly in coastal communities, and thus there are potentially significant economic impacts of wind events. Some communities, such as Oceana Marin and Olema, rely on water and wastewater infrastructure that has potential to be impacted by coastal erosion, wind driving up wave elevations, and erosion from waves forming due to

wind over treatment and storage ponds. Inland critical ponds are also impacted by wind-driven wave erosion such as dams on drinking water reservoirs, and levees/berms containing stormwater retention and detention ponds. Across the county powerlines are potentially impacted by wind, potentially affecting commercial, industrial, and residential areas, and most years downed trees lead to temporary road closures.

1/2023 – In unincorporated Bolinas, extreme high winds estimated at close to 100 mph knocked down numerous trees across Mesa Road, closing the road several times, causing power outages and, in one case, injury. These winds also toppled a tree across Terrace Avenue, closing that road at the same time one of the Mesa Road closures occurred, temporarily blocking both egress roads out of town.

Tornado

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes are the most powerful storms that exist, and damage paths can be in excess of one mile wide and 50 miles long. The Enhanced Fujita Scale (see Figure 40) is commonly used to rate the intensity of tornadoes in the United States based on the damages that they cause.

Enhanced Fujita Scale	
EF-0	65-85 mph winds
EF-1	86-110 mph winds
EF-2	111-135 mph winds
EF-3	136-165 mph winds
EF-4	166-200 mph winds
EF-5	>200 mph winds

Figure 86: Enhanced Fujita Scale
Source: NOAA

Tornadic waterspouts are tornadoes that form over water or move from land to water. They have the same characteristics as a land tornado. They are associated with severe thunderstorms, and are often accompanied by high winds and seas, large hail, and frequent dangerous lightning.

Figure 87: Waterspout Formation
Source: MarineInsights

All of the BCPUD is susceptible to storms and damage from wind and tornadoes, though the higher elevation areas throughout the District have increased susceptibility due to a greater number of trees. Lower elevations could be susceptible to a waterspout. Drought and/or heavy rainfall can increase the susceptibility of trees toppling over in a high wind event. Fallen trees could damage critical facilities and infrastructure and endanger the public. Power lines could be impacted by fallen trees and wind, causing power outages. Roadways could also become blocked by fallen trees, impacting public safety and affecting the delivery of services and access to critical facilities.

Climate Change and Future Development Considerations

It is anticipated that the atmospheric rivers that deliver storms to Northern California may intensify because of climate change. This increase in storm intensity may bring more intense winds and potential tornados to Northern California, including the Marin County OA and the BCPUD. Significant wind events and tornados can topple trees, particularly those that may be saturated, or drought stressed as a result of climate change. An increase in fallen trees in the BCPUD as a result of increased storms due to climate change can lead to an increase in power outages. Future development in any of the forested areas of the BCPUD with high tree cover including in the southern and western mountainous residential areas will increase the effects of severe wind events.

2.2.11 TSUNAMI

Tsunamis consist of waves generated by large disturbances of the sea floor, which are caused by volcanic eruptions, landslides or earthquakes. Shallow earthquakes along dip slip faults are more likely to be sources of tsunami than those along strike slip faults. The West Coast/Alaska Tsunami Warning Center (WC/ATWC) is responsible for tsunami warnings. Tsunamis are often incorrectly referred to as tidal waves. They are actually a series of waves that can travel at speeds averaging 450 (and up to 600) miles per hour with unusual wave heights. Tsunamis can reach the beach before warnings are issued.

A tsunami experienced by the BCPUD would most likely occur from an earthquake, the location of which would determine the amount of time that the tsunami waves would reach the District. A tsunami poses threat primarily to the coastal areas of the District.

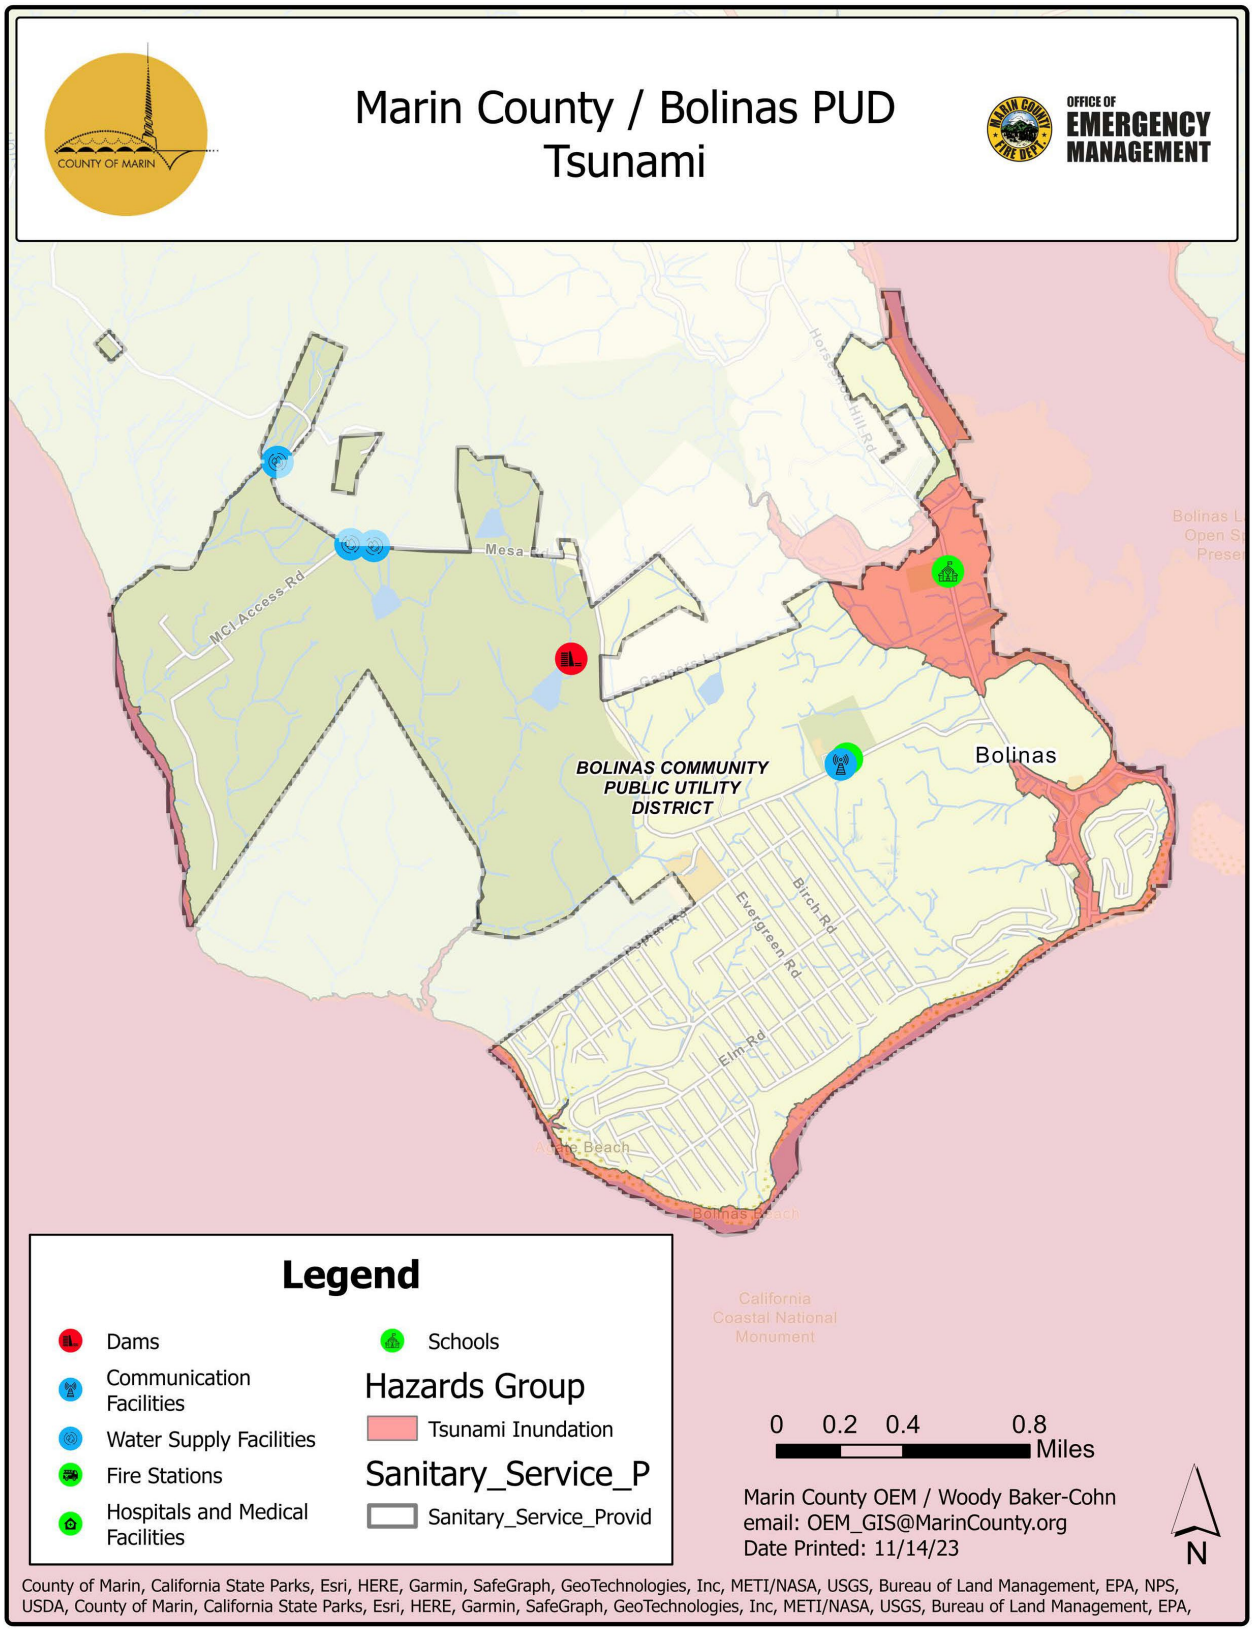

Figure 88: BCPUD Tsunami Critical Facilities and Infrastructure
Source: Marin County OEM

The BCPUD has never experienced a significant tsunami however, given its proximity to the San Francisco Bay, it is within a tsunami zone and could potentially experience the impacts of one, primarily in downtown Bolinas and along Olema-Bolinas Road.

Climate Change and Future Development Considerations

The biggest threat to tsunamis is sea level rise which is a direct result of climate change. Sea level rise can make tsunamis worse than they already are because higher sea levels allow for tsunamis to travel further inland and cause even more damage. Sea level rise results in more vulnerable coastlines which make coastal communities even more vulnerable to an incoming tsunami as the natural buffer to absorb the energy of an incoming tsunami will cease to exist. This is particularly true in the Marin County OA including the BCPUD, where a large segment of the developed population lies in an area vulnerable to sea level rise. Furthermore, it has been theorized that ocean warming, caused by climate change, can impact the tectonic plates that rest below large bodies of water. Ultimately, this can result in more geological activities and worse tsunamis. Climate change has also affected ocean patterns, which could eventually lead to tsunamis distributing themselves across the ocean and impacting areas that are currently not susceptible to a tsunami. Tsunamis as a result of climate change and associated sea level rise will exacerbate the impacts of flooding in the lowland areas of the Marin County OA including the BCPUD.

2.2.12 WILDFIRE

A wildfire is a fire that occurs in an area of combustible vegetation. The three conditions necessary for a wildfire to burn are fuel, heat, and oxygen. Fuel is any flammable material that can burn, including vegetation, structures, and cars. The more fuel that exists and the drier that fuel is, the more intense the fire can be. Wildfires can be started naturally through lightning or combustion or can be set by humans. There are many sources of human-caused wildfires including arson, power lines, a burning campfire, an idling vehicle, trains, and escaped controlled burns. On average, four out of five wildfires are started by humans. Uncontrolled wildfires fueled by wind and weather can burn acres of land and everything in their path in mere minutes and can reach speeds up to 15 miles per hour. On average, more than 100,000 wildfires burn 4 to 5 million acres of land in the United States every year. Although wildfires can occur in any state, they are most common in the Western states including California where heat, drought, and thunderstorms create perfect wildfire conditions.

Wildfires are of primary concern when they occur in the Wildland Urban Interface (WUI), which is defined as areas where homes are built near or among lands prone to wildfire. Even relatively small acreage fires may result in disastrous damages. Most structures in the WUI are not destroyed from direct flame impingement, but from embers carried by wind. The damages can be widely varying, but are primarily reported as damage to infrastructure, built environment, and injuries to people.

The pattern of increased damages is directly related to increased urban spread into historical forested areas that have wildfire as part of the natural ecosystem. Many WUI fire areas have long histories of wildland fires that burned only vegetation in the past. However, with new developments, a wildland fire following a historical pattern may now burn these newly developed areas. WUI fires can occur where there is a distinct boundary between the built and natural areas or where development or infrastructure has encroached or is intermixed in the natural area. WUI fires may include fires that occur in remote areas that have critical infrastructure

easements through them, including electrical transmission towers, railroads, water reservoirs, communications relay sites or other infrastructure assets.

Consequently, wildland fires that burn in natural settings with little or no development are part of a natural ecological cycle and may actually be beneficial to the landscape. Century old policies of fire exclusion and aggressive suppression have given way to better understanding of the importance fire plays in the natural cycle of certain forest types.

Warning times are usually adequate to ensure public safety, provided that evacuation recommendations and orders are heeded in a timely manner. While in most cases wildfires are contained within a week or two of outbreak, in certain cases, they have been known to burn for months, or until they are completely extinguished by fall rains.

Wildfire poses the greatest risk to human life and property in the Marin County OA's densely populated WUI, which holds an estimated 69,000 living units. Marin County is home to 23 communities listed on CAL FIRE's Communities at Risk list, with approximately 80% of the total land area in the county designated as having moderate to very high fire hazard severity ratings. The county has a long fire history with many large fires over the past decades, several of which have occurred in the WUI. To compound the issue, national fire suppression policies and practices have contributed to the continuous growth (and overgrowth) of vegetation resulting in dangerous fuel loads. The Community Wildfire Protection Plan (CWPP) provides a scientifically based assessment of wildfire threat in the WUI of the Marin County OA.

Fire protection in California is the responsibility of either the federal, state, or local government. On federally owned land, or federal responsibility areas (FRA), fire protection is provided by the federal government, and or in partnership with local agreements. In state responsibility areas (SRA), CAL FIRE typically provides fire protection. However, in some counties CAL FIRE contracts with county fire departments to provide protection of the SRA – this is the case in Marin County, where CAL FIRE contracts with MCFD. Local responsibility areas (LRA) include incorporated cities and cultivated agriculture lands, and fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

CAL FIRE contracts with MCFD to provide wildland fire protection and associated fire prevention activities for lands designated by the State Board of Forestry as SRA. Marin County is one of six counties in the state who contract with CAL FIRE to protect SRA. The MCFD is responsible for the protection of approximately 200,000 acres of SRA within the county and is the primary agency that handles wildland fires. MCFD also provides similar protection services to approximately 100,000 acres of FRA in the Golden Gate National Recreation Area (GGNRA), the Muir Woods National Monument, and the Point Reyes National Seashore.

Figure 43 indicates the federal responsibility areas, state responsibility areas and local responsibility areas in the Marin County OA.

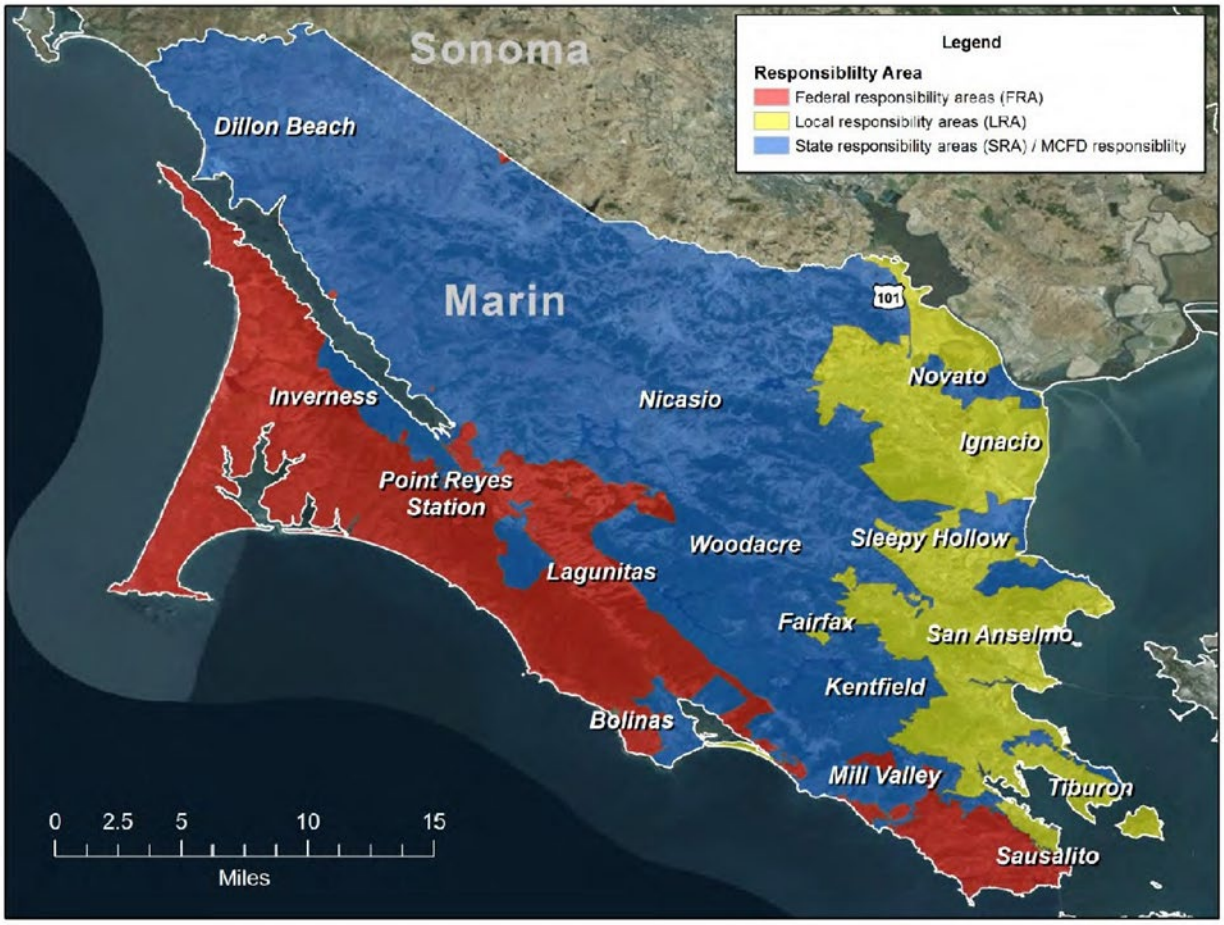

Figure 89: Federal, State and Local Responsibility Areas in the Marin County OA
Source: Marin Community Wildfire Protection Plan

The mix of weather, diverse vegetation and fuel characteristics, complex topography, and land use and development patterns in the Marin County OA are important contributors to the fire environment. The MCFD Woodacre ECC currently manages the data from four Remote Automated Weather Stations (RAWS) for predicting fire danger utilizing the National Fire Danger Rating System (NFDRS) during the fire season. The RAWS are located in Woodacre, Middle Peak, Barnabe, Big Rock and a new station will be coming online in Novato.

Marin County is bounded by the cool waters of the Pacific Ocean to the west, the San Francisco and Richardson Bays to the southeast, the San Pablo Bay to the east, and Sonoma County agricultural lands to the north. The combination of these large bodies of water, location in the mid-latitudes, and the persistent high pressure over the eastern Pacific Ocean results in several micro-climates. Weather in the OA consists of warm, dry summers and cool, wet winters. The climate in early fall and late spring is generally similar to the summer, and late fall is similar to winter. Spring is generally cool, but not as wet as winter. While these general weather conditions are fairly representative of the typical Marin County weather, complex topography, annual variability of weather patterns, and less frequent and transient weather patterns are important to fire conditions.

In the late spring through early fall, the combination of frequent and strong high-pressure systems (known as the Pacific High) over California combined with the cool waters of the ocean/bays results in persistent fog and low clouds along the coast (including over southern Marin County near the San Francisco Bay). The fog often penetrates into the inland valleys of northern and central Marin County, especially during overnight hours. At the coastline, mist from fog can keep the land surfaces modestly moist while inland land surfaces above the fog or inversion are often very dry.

The Pacific High that persists from late spring through early fall over the eastern Pacific, combined with a thermal low pressure over the Central Valley of California, results in an almost continuous sea breeze. These winds usher in cool and moist air and can be strong (15 to 25 mph), especially over the ridge tops and through northwest to southeast lying valleys, including San Geronimo/Ross, Hicks, and Lucas Valleys. These westerly winds are usually highest in the afternoon, decrease in the evening, and are light overnight before increasing again in the late morning/early afternoon.

Occasionally in the summer and more often in the fall, the Pacific High moves inland and centers over Oregon and Idaho, while low pressure moves from the Central Valley of California to southern California and Arizona. The resulting north-to-south pressure gradient can be strong enough to retard the typical sea breeze and can even result in winds blowing from the land to the ocean (offshore winds). As the offshore winds move air from the Great Basin to the coastal areas of California, the air descends and compresses, which greatly warms and dries the air. Under these “Diablo” wind conditions, temperatures in the Marin County OA can reach 100°F in the inland areas and even 80°F at the coast, and relative humidity can be very low. In addition, wind speeds can be high (20 to 40 mph) and gusty and are often much faster over the mountains and ridge tops such as Mt. Tamalpais, Loma Alta, and Mt. Burdell compared to low-lying areas. Wind speeds can be high over the ridges and mountains at all times of day under this “offshore” wind pattern and are often much slower or even calm at night in low-lying areas because nighttime cooling decouples the aloft winds from the surface winds. It is during these Diablo wind events that there is a high potential for large, wind-driven fires should there be an ignition. Historically, the largest and most destructive fires have occurred during these offshore (also known as Foehn) wind events including the Angel Island and the Vision fires.

A few times per year in the summer and early fall, monsoonal flow from Mexico brings in moist and unstable air over central and northern California, which can result in thunderstorms with or without precipitation. With the otherwise dry summer conditions, the lightning can ignite fires. These monsoonal flow patterns are usually only one to two-day events.

Beginning in late November and lasting through the end of March, the Pacific High moves south and weakens, allowing storms that originate in the Gulf of Alaska to move over California.

These storms bring precipitation and, at times, strong winds out of the south. Each storm usually results in one fourth inch to several inches of rain over a day or so. Near Mt. Tamalpais, rainfall amounts are enhanced by orographic lifting, resulting in higher rain amounts in the Kentfield and Fairfax areas compared to the rest of the county. Typically, after the first rain in November, the cool weather and occasional storm keeps the ground wet through late Spring. However, in some years, significant rain does not occur until later in the year (e.g., early-to-late December) and there can be several weeks without any storms and rain. During storms, temperatures are usually mild.

When there are no storms over California, a land-breeze typically forms (i.e., winds blowing from the Central Valley to the Pacific Ocean). These winds can reach 30 mph, and travel through the southeast to northwest lying valleys, over low-lying ridges such as the Marin Headlands, and through the Golden Gate. These winds are usually highest in the mid-morning hours and decrease in the afternoon as the Central Valley warms during the day. The winds are associated with cold and modestly moist air.

In late February/early March through late April, the Pacific High strengthens and moves north, and storms impacting the county become less frequent. During this time of year there is often a low-pressure area over the desert in southwest California. The combination of the Pacific High to the north and low-pressure to the southwest results in strong winds blowing from the northwest to the southeast. Like the sea breeze, these winds bring in cool, moist air and are usually highest in the afternoon hours. Because of winter and spring rains, the land is wet and there is little danger of wildland fire despite the strong winds and only occasional precipitation. There is often little coastal fog this time of year.

Vegetation, which is also known as fuel, plays a major role in fire behavior and potential fire hazards. A fuel's composition, including moisture level, chemical make-up, and density, determines its degree of flammability. Of these, fuel moisture level is the most important consideration. Generally, live trees contain a great deal of moisture while dead logs contain very little. The moisture content and distribution of fuels define how quickly a fire can spread and how intense or hot it may become. High moisture content will slow the burning process since heat from the fire must first eliminate moisture.

In addition to moisture, a fuel's chemical makeup determines how readily it will burn. Some plants, shrubs, and trees such as chamise and eucalyptus (both present in the Marin County OA) contain oils or resins that promote combustion, causing them to burn more easily, quickly, and intensely.

Finally, the density of a fuel influences its flammability; when fuels are close together but not too dense, they will ignite each other, causing the fuel to spread readily. However, if fuels are so close that air cannot circulate easily, the fuel will not burn freely.

The Marin County OA has extensive topographic diversity that supports a variety of vegetation types.

Environmental factors, such as temperature, precipitation, soil type, aspect, slope, and land use history, all help determine the existing vegetation at any given location. In the central and eastern parts of the county, north facing slopes are usually densely wooded from lower elevations to ridge peaks with a mixture of mostly hardwood tree species such as coast live oak, California bay, Pacific madrone, and other oak species. Marshlands are also present throughout the county; once ignited marsh fires can be difficult to contain and extinguish.

Grasslands with a mixture of native and nonnative annual and perennial plant species occur most often in the northern and western parts of the county due to a combination of soil type, lower rainfall, and a long history of ranching. The southern and western facing slopes tend to have a higher percentage of grasslands, which in turn have the potential to experience higher rates of fire spread. Grassland fires are dangerous even without extreme fire weather scenarios due to the rapid rate of fire spread; in some cases, fires spread so quickly that large areas can burn before response resources are able to arrive.

In the west portion of the county closer to the coast, where precipitation is higher and marine influence is greater, most areas are densely forested with conifer species (i.e., Bishop pine, Douglas-fir, and coast redwood) and associated hardwood species. Chaparral vegetation also occurs in parts of the county, especially on steeper south and west facing slopes. This mix of densely forested areas mixed with chaparral results in higher fuel loads and potentially higher fire intensity. Expansion of the residential community into areas of heavier vegetation has resulted in homes existing in close proximity to dense natural foliage; these homes are often completely surrounded by highly combustible or tall vegetation, increasing the potential that wildland fires could impact them.

As part of the development of the CWPP, an updated vegetation map layer was created using the most recent vegetation information available from a variety of state and local data sources.

Vegetation distribution in the Marin County OA is characterized by approximately 20 different types of vegetation which have been classified into 15 fire behavior fuel models.

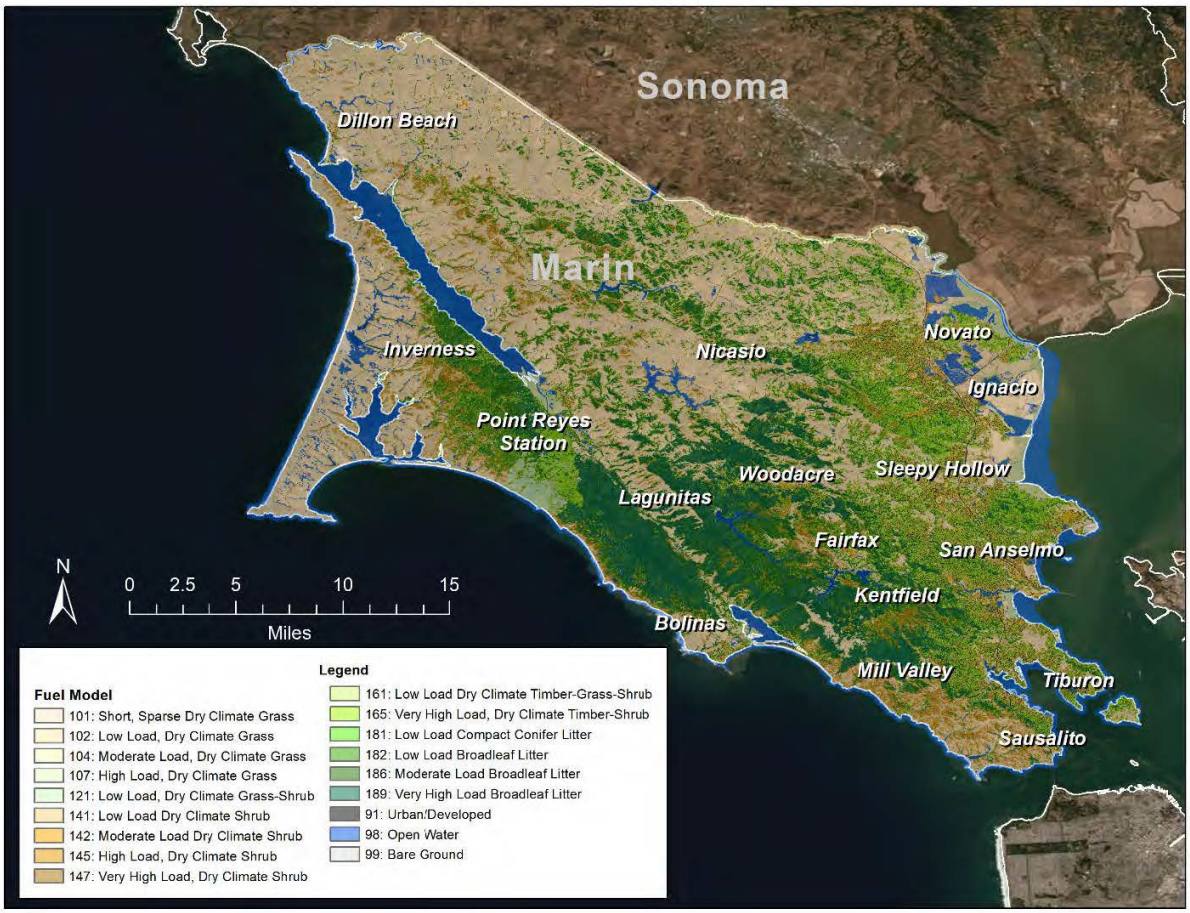

Figure 90: Fuel Model Map for the Marin County OA
Source: Unknown

Insect infestations and plant diseases, such as California oak mortality syndrome (sudden oak death), are increasing and threaten to change the structure and overall health of native plant communities in Marin County. Sudden oak death has no known cure and is the biggest concern; this syndrome is caused by the fungus-like Phytophthora ramorum, which has led to widespread

mortality of several tree species in California since the mid-1990s; the tanoak (Lithocarpus densiflorus) in particular appears to have little or no resistance to the disease. Sudden oak death has resulted in stands of essentially dead trees with very low fuel moistures.

Studies examining the impacts of sudden oak death on fire behavior indicate that while predicted surface fire behavior in sudden oak death stands seems to conform to a common fuel model already in use for hardwood stands, the very low moisture content of dead tanoak leaves may lead to crown ignitions more often during fires of “normal” intensity.

Two other plant diseases prevalent in the Marin County OA are pitch canker (which affects conifers such as Bishop pine and other pine species), and madrone twig dieback (which affects Pacific madrones). Pitch canker is caused by the fungus Fusarium circinatum (F. subglutinans, F. sp. pini), which enters the tree through wounds caused by insects. While some trees do recover, most infected trees are eventually killed by the fungus. Management of this disease largely focuses on containment to reduce the fungus spreading to other trees. Pitch canker is a particular issue in the NPS lands of Pt. Reyes National Seashore, where many acres of young Bishop Pines that were seeded on the Inverness Ridge by the Mount Vision Fire of 1995 have been infected.

These dead and dying trees have created large swaths of land with dense and dry fuel loads. Madrone twig dieback is caused by the native fungus Botryosphaeria dothidea and appears to be getting worse throughout the county due to drought effects on Pacific madrones. Three additional threats to trees common to the Marin County OA include:

- Bark and ambrosia beetles (Monarthrum dentiger and monarthrum scutellare), which target oak and tanoak trees. Sudden oak death may be exacerbating the effects of beetle infestations which prey on trees already weakened by this disease.
- Root rot, caused by oak root fungus (Armillaria mellea), is primarily associated with oaks and other hardwoods but also attacks conifers. These fungal infestations cause canopy thinning and branch dieback and can kill mature trees. As with the beetle infestations, sudden oak death may be exacerbating the effects of root rot fungus in the county forests.
- Velvet-top fungus (Phaeolus schweinitzii) is a root rot fungus affecting Douglas-fir and other conifers, with the infection typically occurring through a wound.

Topography characterizes the land surface features of an area in terms of elevation, aspect, and slope. Aspect is the compass direction that a slope faces, which can have a strong influence on surface temperature, and more importantly on fuel moistures. Both elevation and aspect play an important role in the type of vegetation present, the length of the growing season, and the amount of sunlight absorbed by vegetation. Generally, southern aspects receive more solar radiation than northern aspects; the result is that soil and vegetation on southern aspects is warmer and dryer than soil and vegetation on northern aspects. Slope is a measure of land steepness and can significantly influence fire behavior as fire tends to spread more rapidly on steeper slopes. For example, as slope increases from 20 – 40%, flame heights can double and rates of fire spread can increase fourfold; from 40 – 60%, flame heights can become three times higher and rates of spread can increase eightfold.

The Marin County OA is topographically diverse, with rolling hills, valleys and ridges that trend from northwest to southeast. Elevation throughout the county varies considerably, with Mt.

Tamalpais' peak resting at 2,574 feet above sea level and many communities at or near sea level. Correspondingly, there is considerable diversity in slope percentages. The San Geronimo Valley slopes run from level (in the valley itself) to near 70%. Mt. Barnabe has slopes that run from 20 to70%, and Throckmorton ridge has slopes that range in steepness from 40 – 100%. These slope changes can make fighting fires extremely difficult.

In the WUI where natural fuels and structure fuels are intermixed, fire behavior is complex and difficult to predict. Research based on modeling, observations, and case studies in the WUI indicates that structure ignitability during wildland fires depends largely on the characteristics and building materials of the home and its immediate surroundings.

The dispersion of burning embers from wildfires is the most likely cause of home ignitions. When embers land near or on a structure, they can ignite near-by vegetation or accumulated debris on the roof or in the gutter. Embers can also enter the structure through openings such as an open window or vent and could ignite the interior of the structure or debris in the attic.

Wildfire can further ignite structures through direct flame contact and/or radiant heat. For this reason, it is important that structures and property in the WUI are less prone to ignition by ember dispersion, direct flame contact, and radiant heat.

Public Safety Power Shutoff (PSPS) Events

As a result of the 2017 Northern California Wildfires, the 2018 Camp Fire in Butte County and other wildfires caused by power line infrastructure, Pacific Gas & Electric (PG&E) began initiating Public Safety Power Shutoff (PSPS) events in their service areas (including Marin County) to help prevent the start of future wildfires. PG&E will initiate a PSPS if conditions indicate potentially dangerous weather conditions in fire-prone areas due to strong winds, low humidity, and dry vegetation. During these events, PG&E will proactively turn off power in high fire risk areas to reduce the threat of wildfires. The most likely electric lines to be considered for a public safety power outage will be those that pass through areas that have been designated by the California Public Utilities Commission (CPUC) High Fire-Threat District at elevated (Tier 2) or extreme risk (Tier 3) for wildfire. Customers outside of these areas could have their power shut off, though, if their community relies upon a line that passes through a high fire-threat area or an area experiencing severe weather. PG&E will consider numerous factors and analyze historical data to help predict the likelihood of a wildfire occurring, and closely monitoring weather watch alerts from the National Weather Service (NWS). These factors generally include, but are not limited to:

- A Red Flag Warning declared by the National Weather Service
- Low humidity levels, generally 20 percent and below
- Forecasted sustained winds generally above 25 mph and wind gusts in excess of approximately 45 mph, depending on location and site-specific conditions such as temperature, terrain and local climate
- Condition of dry material on the ground and live vegetation (moisture content)
- On-the-ground, real-time observations from PG&E's Wildfire Safety Operations Center and field crews

Pacific Gas & Electric Company (PG&E) operates a total of 1,179 miles of overhead electricity transmission and distribution lines in the Marin County OA. Overhead electricity lines and poles

can be damaged or downed under severe weather conditions, particularly severe wind conditions, which increases the potential for wildfire ignition. 52 percent of PG&E's overhead distribution lines and 41 percent of its overhead transmission lines are located in CPUC-identified High-Fire Threat Districts subject to elevated or extreme fire risk. PG&E is currently planning and implementing safety measures to prevent wildfires and reduce the impacts of Public Safety Power Shutoff (PSPS) events on communities in the Marin County OA and throughout California.

These measures include installing weather stations; installing high-definition cameras; installing sectionalizing devices on its overhead lines to separate the grid into smaller sections; hardening the system by installing stronger power poles, covering lines, and undergrounding lines in targeted areas; creating temporary microgrids to provide electricity during PSPS events; and enhancing existing vegetation management activities. From 2018 to July 2021, PG&E hardened three miles of overhead lines, installed 68 transmission and distribution sectionalizing devices, completed enhanced vegetation management on approximately 51 of overhead line miles, installed 28 weather stations, and installed 12 high-definition cameras in the Marin County OA.

A wildfire in the BCPUD would most likely occur in the areas north of the District (i.e., in the Point Reyes National Seashore) where there is more forested terrain. With the exception of the BCPUD's raw water transmission pipeline and it two impoundment structures, there are no District critical facilities in these areas, although the BCPUD's jurisdictional boundaries are relatively small, so the critical facilities are nearby this forested terrain. District critical facilities, including the Woodrat 1 Reservoir/dam, the Woodrat 2 Reservoir/dam, the Woodrat Water Treatment Plant, and the BCPUD's treated water storage tanks and booster pump station are in a Moderate FHSZ and could be impacted by a brush fire in the vegetated areas of the District. All of the BCPUD could be impacted by a Public Safety Power Shutoff (PSPS) event and/or suffer poor air quality from smoke as a result of wildlfire anywhere in Marin County or the surrounding region. As wildland areas around the District become drier due to climate change and drought, the risk of a wildfire or brush fire occurring and impacting the District will continue to increase as open spaces experience drier conditions.

The BCPUD has never experienced a major wildfire or brush fire.

Climate Change and Future Development Considerations

Climate change can lead to an increase in wildfire events. Climate change has been a key factor in increasing the risk and extent of wildfires in the western United States. Changes in climate create warmer, drier conditions. Increased drought, and a longer fire season are boosting these increases in wildfire risk.

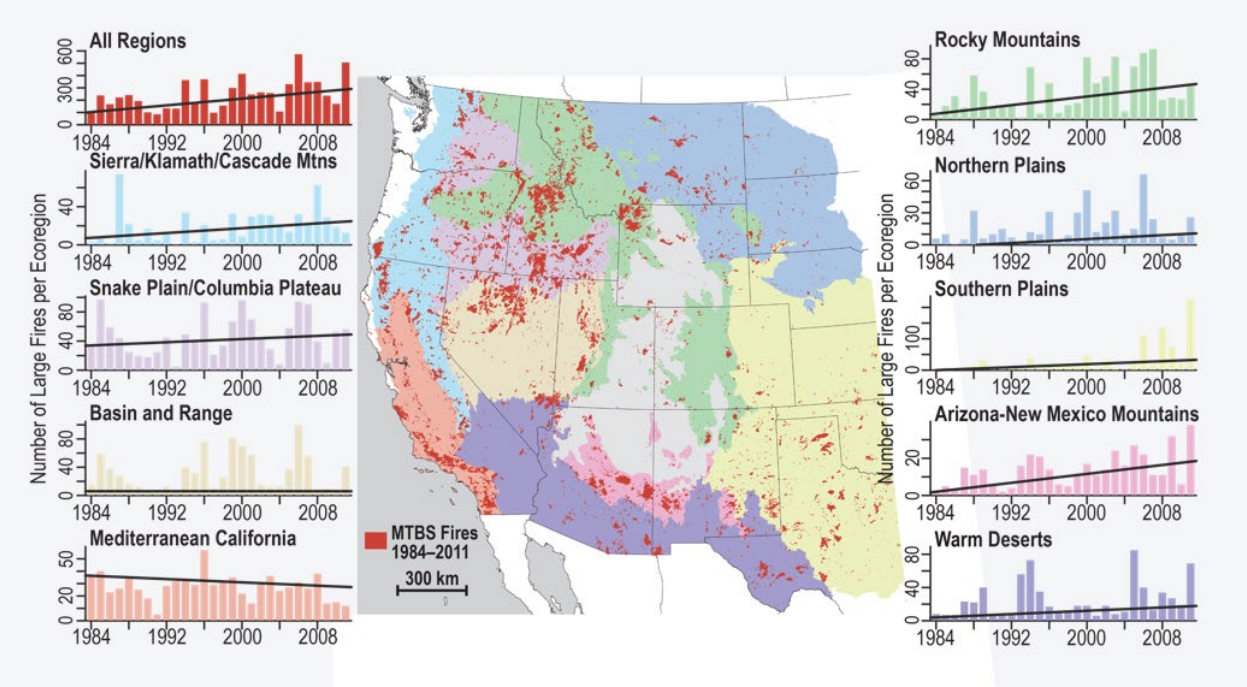

Figure 91: Trends in the Annual Number of Large Wildfires in the United States
Source: Fourth Climate Change Assessment, 01/04/23

As summer conditions in Northern California become hotter and drier due to climate change, the occurrence and severity of wildfires will only increase. The Marin County OA including the BCPUD is particularly susceptible to these future impacts of climate change on wildfire, as the OA's climate has generally been wet enough historically to avoid major wildfires. Extreme heat events and high wind events could cause electrical systems to become overloaded and fail, sparking wildfires. An increase in wildfires as a result of climate change could lead to more significantly burned areas that could contribute to debris flows after a significant storm event, particularly in the open space areas the BCPUD. Future development in the WUI throughout the Bolinas Community PUD will expose more people and property to the impacts of a potentially significant wildfire. The growing number of people in the BCPUD WUI can increase risk to life, property and public health as a result of a wildfire. Future development around the marshlands in the District would expose more people to the effects of brush fires as the marshlands dry out in the summer due to climate change.

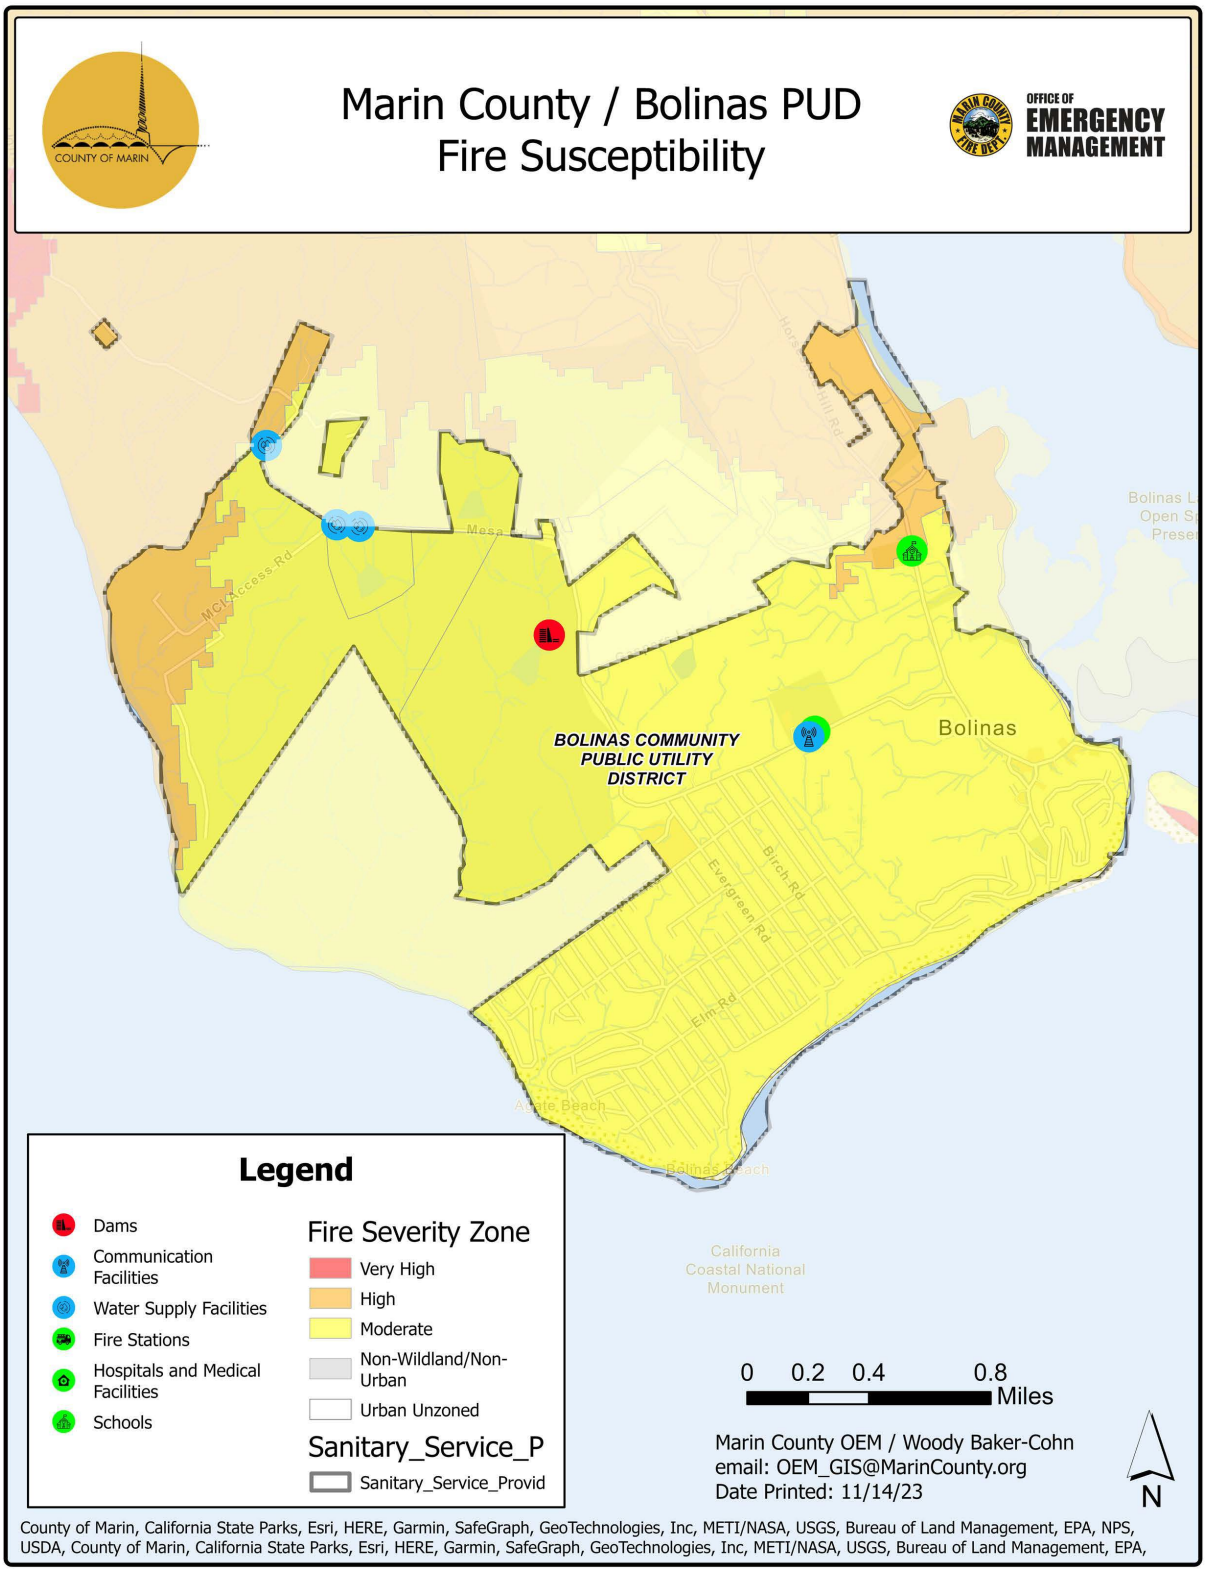

Figure 92: BCPUD Wildfire Critical Facilities and Infrastructure

3.0 MITIGATION STRATEGY

3.1 CHANGES IN DEVELOPMENT

There has been some development within the Bolinas Community Public Utility District over the last five years. However, the development has been in the form of numerous capital improvements to existing district facilities or within the facility footprint of the BCPUD. There has not been any increased risk to the District as a result of new development.

As a small special district in unincorporated Marin County, the BCPUD does not have jurisdiction over land use or planning in the community (that responsibility lies with the Marin County Community Development Agency). Significant development is not anticipated for Bolinas within the next 5 years given development constraints and the limited nature of the local water supply and consequent moratorium on new connections to the water system. The table below identifies projects planned for new district facilities or infrastructure in the next five years.

Future land use and growth management strategies in the Bolinas Community Public Utility District are consistent with priorities detailed in the 2023 Marin County MJHMP and aim to concentrate future development into and toward existing areas away from locations where natural characteristics may limit development (e.g., steep slopes or sensitive habitats), and to areas that have, or can readily be supplied with, adequate public facilities and services.

As detailed in the "Climate Change and Future Development Considerations" section of each hazard profile, development in BCPUD has occurred and will continue to occur throughout the District in areas prone to all of its identified hazards. Increased growth in these areas may increase the vulnerability of people and structures to these hazards.

Table 9: BCPUD Future Growth Areas						
Project Location	**# of Units**	**# of Parcels**	**Application Status**	**Acres**	**Fire Severity Zone**	**Flood Zone**
New Administrative Building – 270 Elm Road, Bolinas	1	1	3-5 years		Moderate	None
Wharf Well – new treatment facilities (31 Wharf Road, Bolinas)	N/A	1	Completion 12/31/24		Moderate	None
Resource Recovery Well – new treatment facilities (100 Mesa Road, Bolinas)	N/A	2	Completion 12/31/24		Moderate	None
Connect homes on Canyon Road to the BCPUD's sewer system.	N/A	6	2 years		Moderate	None

3.2 CAPABILITY ASSESSMENT

The Bolinas Community Public Utility District did not participate in the 2018 MJHMP update. However, the strategies to support the overall District priorities are reflected in the sections below. Several actions were added to coincide with the priorities, progress in local mitigation efforts and changes in development.

Capabilities are the programs and polices currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. The capability assessment identifies the local planning mechanisms where updated hazard mitigation information from this 2023 MJHMP will be incorporated once approved. The capability assessment is divided into four sections: regulatory, administrative and technical, fiscal, and outreach and partnerships.

3.2.1 REGULATORY CAPABILITIES

The legal and regulatory capabilities include existing ordinances and codes that affect the District's physical or built environment. Examples of legal and/or regulatory capabilities can include: a jurisdiction's building codes, zoning ordinances, subdivision ordnances, special purpose ordinances, growth management ordinances, site plan review, general plans, capital improvement plans, economic development plans, emergency response plans, and real estate disclosure plans. The table below lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place.

Opportunities for Enhancement

The 2023 Marin County OA MJHMP update provided the Bolinas Community PUD an opportunity to review and update the capabilities currently in place to mitigate hazards. This also provided an opportunity to identify where capabilities could be improved or enhanced. Specific opportunities could include:

- **Community Wildfire Protection Plan:** The District plans to take an active role in mitigation actions to enhance wildfire protection.
- **StormReady certification and Firewise Communities certification:** The District will consider participation in these programs.

Table 10: Legal and Regulatory Capabilities

Plans	Yes/No Latest Update	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive /Master Plan	Yes	Integrated Coastal Watershed Management Plan (July 2007) addresses water supply and reliability, water and wastewater treatment, and water conservation, among other things in the Tomales Bay and neighboring watersheds; it identifies hazards and watershed planning efforts; may be used to implement mitigation actions. Marin County LAFCO Countywide Water Service Study (March 2016) – independent assessment of public water service in Marin County over next 5 – 10 years, including

		but not limited to an evaluation of supply and demand Countywide and within service areas; may be used to implement mitigation actions. BCPUD Sewer System Management Plan (2023); identifies planned improvement projects, can be used to implement mitigation actions.
Strategic Plan	No	
Capital Improvements Plan	Yes	Hazards identified in the district's Five-Year CIP are funded based on priority via the district's annual budget process. Mitigation projects could be included in the CIP. The Board of Directors reviews and approves the CIP funding on an annual basis. If the Board approves CIP funding, the plan supports implementation of hazard mitigation actions and addresses resiliency/redundancy in general.
Economic Development Plan	No	N/A
Local Emergency Operations Plan	Yes	The district's plan addresses district-specific responses to hazards and various emergencies that may involve district facilities; the EOP does not identify specific projects to mitigate impacts of hazards.
Continuity of Operations Plan	Yes	The district's operations plan is designed to ensure continuity of operations for water and wastewater systems; the operations plan does not identify specific projects to mitigate impacts of hazards.
Flood Mitigation Plan (FMP)	No	N/A
Engineering Studies for Streams	Yes	The district has developed a base flow recession model for the Arroyo Hondo Creek; this model can be used to implement drought-related hazard mitigation actions.
Open Space Management Plan	No	N/A
Regional Transportation Plan (RTP)	No	N/A
Stormwater Management Plan/Program	No	N/A
Community Wildfire Protection Plan	Yes	Marin County Community Wildfire Protection Plan; identifies hazards, can be used to implement wildfire mitigation actions.
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Yes	Marin County Local Coastal Program and Marin County Collaboration: Sea-level Marin Adaptation Response Team (C-SMART); both programs identify hazards and can be used to implement mitigation actions.
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Yes	Yes, District adheres to city, county, state, & federal codes.
Building Code Effectiveness Grading Schedule (BCEGS) Score	Yes	Yes, District adheres to city, county, state, & federal codes.

Fire department ISO rating:	No	
Site plan review requirements	Yes	Yes, District participates San Rafael or Marin County plan reviews.
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
District Code	Yes	District ordinances and resolutions authorize, among other things, the collection of water and sewer service fees to fund all operations, capital improvements, debt service and mitigation projects. Adequately administered; no enforcement relating to hazard impacts.
Floodplain ordinance	Yes	Yes, District participates with Marin County.
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Yes	Yes, District participates with Marin County plan reviews.
Flood insurance rate maps	Yes	Yes, District participates Marin County plan reviews.
Elevation Certificates	Yes	Yes, District participates Marin County plan reviews.
Acquisition of land for open space and public recreation uses	No	
Erosion or sediment control program	Yes	Yes, District participates Marin County plan reviews.

Table 37: Bolinas Community Public Utility District Legal and Regulatory Capabilities
Source: Bolinas Community Public Utility District

Bolinas Community Public Utility District Comprehensive Plan or Master Plan

The BCPUD's jurisdictional boundaries are located entirely within unincorporated Marin County, which is required to have a General Plan or Master Plan per California Government Code Section 65300. Please see the Marin County General Plan for Details.

3.2.2 Administrative and Technical Capabilities

The administrative and technical capability identifies the District personnel responsible for activities related to mitigation and loss prevention. Many positions are full time and/or filled by the same person.

Table 11: Administrative and Technical Capabilities

Administrative	Yes/No	Is coordination effective?
Operations Department	Yes	The BCPUD's Operations staff have a variety of duties, principally related to the operation and maintenance of the BCPUD's critical infrastructure to ensure the safe and reliable provision of utility services within the district.

Administrative and Financial Services	Yes	The BCPUD's administrative and financial functions are performed by the General Manager and Administrative Assistant, subject to oversight by the Board of Directors; these positions work together closely to handle all administrative and financial responsibilities of the district.
Hazard Mitigation Planning	Yes	The BCPUD General Manager and Chief Operator (for Water and Wastewater) coordinate with the Operations Staff to evaluate, plan and implement the district's hazard mitigation projects.
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Yes	BCPUD operations staff conduct vegetation management (mowing, brush removal, tree pruning/thinning/removal) on district lands and easements to reduce wildfire risk and facilitate access; culvert clearing and road-side ditch maintenance to reduce flooding.
Mutual aid agreements	Yes	The BCPUD is a member of CalWARN and has a mutual aid agreement with the Bolinas Fire Protection District; informal mutual agreements are under discussion with neighboring water districts.
Technical	Yes/No	Has capability been used to assess/mitigate risk in the past?
Warning systems/services (Reverse 911, outdoor warning signals)	Yes	The BCPUD's water and wastewater treatment facilities have alarm systems to notify staff in the event of a mechanical or other emergency failure of critical facilities.
Grant writing	Yes	The BCPUD's General Manager administers grants from federal and state entities (such as FEMA, CalFire and the California Department of Water Resources) to conduct hazard mitigation activities such as fire fuel reduction projects on district lands (to reduce wildfire risk) and to connect existing groundwater wells to the district's water system (to reduce drought risk).
Staff/Personnel Resources	Yes/No FT/ PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Emergency Manager	Yes	The BCPUD's General Manager and Chief Operator serve this role and coordinate with other districts and/or Marin County as needed during emergencies; they are trained on hazard mitigation. The District plans to work with Marin OEM for EM training.
Civil Engineer	Yes	The district's consulting water and wastewater engineers assist the district in the enforcement of regulations, have training on hazard mitigation, and facilitate coordination with other agencies as needed.
Engineer(s), project manager(s), technical staff, equipment operators, and maintenance and construction staff.	Yes	The BCPUD does not have an in-house engineering department but rather contracts with outside consulting engineers; see response above re: the district's Operations Department. The district's General Manager and Chief Operator oversee the planning, permitting, design and construction management of the water and

		sewer facilities serving district customers.
Fire Protection District Staff	No	Fire protection in the district is the responsibility of the Bolinas Fire Protection District and Marin County Fire.

Table 38: Bolinas Community Public Utility District Administrative and Technical Capabilities
Source: **Bolinas Community Public Utility District**

3.2.3 Fiscal Capabilities

The fiscal capability assessment shows specific financial and budgetary tools available to the jurisdictions such as community development block grants; capital improvements project funding; authority to levy taxes for specific purposes; fees for water, sewer, gas, or electric services; impact fees for homebuyers or developers for new development; ability to incur debt through general obligations bonds; and withholding spending in hazard-prone areas.

Table 12: Fiscal Capabilities

Financial	Yes/No	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Yes	The Board of Directors reviews and approves CIP funding on an annual basis, which supports implementation of projects that often mitigate impacts from hazards, development, or address resiliency/redundancy in general.
Fees for water, sewer, gas, or electric services	Yes	The district has the authority to assess water and sewer service fees to fund operations, maintenance, capital improvement projects, debt service, staff salaries and benefits and various other expenses. When mitigation projects are identified in the CIP, service fee revenue can be adopted with the annual CIP budget to fund projects that have a mitigation component.
Impact fees for new development	No	
Storm water utility fee	Yes	The district has the authority to assess a septic/drainage service fee. This resource has been used to improve surface water drainage to improve septic system performance and can be used to fund future mitigation actions (property flooding).
Incur debt through general obligation bonds and/or special tax bonds	Yes	The BCPUD has incurred debt through general obligation and special tax bonds, as well as loans, to finance larger capital improvement projects, and these resources can be used to fund future mitigation actions.
Other federal funding programs	Yes	USDA Rural Development funding programs have been used by the BCPUD in the past for large capital improvement projects and other federal grant program funding and infrastructure awards could be used to fund hazard mitigation projects to address sea level rise, drought, wildfire, earthquake, and severe weather event

		hazards.
State funding programs	Yes	State grant program funding could be used to fund hazard mitigation projects, such as sea-level rise, wildfire prevention and drought contingency. California's Drinking Water State Revolving Fund, Clean Water State Revolving Fund, CalFIRE's Fire Prevention and the California Department of Water Resources' Small Communities Drought Relief Fund have been used by the BCPUD in the past for infrastructure upgrades and fire fuel reduction projects and can be used to fund future mitigation actions.

Table 39: Bolinas Community Public Utility District Fiscal Capabilities
Source: **Bolinas Community Public Utility District**

3.2.4 COMMUNITY OUTREACH

The outreach and partnerships capability assessment shows outreach and public education programs available to the Bolinas Community Public Utility District and the Bolinas Community Public Utility District partnerships utilized to promote those programs.

Table 13: Bolinas Community Public Utility District Community Outreach

Outreach and Partnerships	Yes/No	Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	Yes, the community of Bolinas has many local citizen groups and non-profit organizations dedicated to disaster and emergency preparedness, wildfire risk reduction, preservation of emergency access and egress, preservation of critical facilities and roads, as well as environmental protection. These groups and organizations have partnered with the BCPUD in the past (and several are doing so now) on hazard mitigation projects and would be very important partners in the implementation of future mitigation activities.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	The district is actively engaged with the community of Bolinas via the Board of Directors' regular monthly meetings, a quarterly newsletter, periodic special mailings, and social media on a variety of topics including, but not limited to, responsible water use, sewer system "dos and don'ts", solid waste disposal rules, and so forth. These platforms can be used to help implement future mitigation activities.
Public-private partnership initiatives addressing disaster-related issues	Yes	The district has participated in a public-private partnership to stabilize a critical access road where critical infrastructure (water and sewer mains) are located (Terrace Avenue) in Bolinas and this partnership has continued as the road is threatened by bluff erosion. The district also is working with of a local citizens' group to evaluate and address the wildfire and public safety risks

		posed by a eucalyptus grove on district lands. These and other public-private partnerships can be used to help implement future mitigation activities.

Table 40: Bolinas Community Public Utility District Community Outreach
Source: **Bolinas Community Public Utility District**

3.2.5 Participation in the National Flood Insurance Program

As a Special District the Bolinas Community Public Utility District does not participate in the national flood insurance program. The BCPUD does not have any facilities within a flood plain and does not have any repetitive loss and severe repetitive loss structures are defined as a structures covered under an NFIP flood insurance policy (44 CFR § 77.2(i)). None of the jurisdictions the BCPUD serves are incorporated. However, Marin County is a participant in the NFIP.

3.3 MITIGATION GOALS

44 CFR Requirement § 201.6(c)(3)(i) [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long - term vulnerabilities to the identified hazards.

The information developed from the risk assessment was used as the primary basis for developing mitigation goals and objectives. Mitigation goals are defined as general guidelines explaining what each jurisdiction wants to achieve in terms of hazard and loss prevention.

Hazard Risk Prioritization
↓
Mitigation Goals & Objectives
↓
Mitigation Project Identification
↓
Mitigation Project Implementation

Goal statements are typically long-range, policy-oriented statements representing jurisdiction-wide visions. Objectives are statements that detail how each jurisdiction's goals will be achieved, and typically define strategies or implementation steps to attain identified goals. Other important inputs to the development of jurisdiction-level goals and objectives include performing reviews of existing local plans, policy documents, and regulations for consistency and complementary goals, as well as soliciting input from the public.

The following represents overarching strategic goals associated with the identification and eventual implementation of appropriate and meaningful hazard mitigation efforts in relation to prioritized hazards and threats confronting Marin County. These goals form the basis for specific supporting process objectives and are shown from the highest priority, at the top of the list, to those of lesser importance.

The establishment of hazard mitigation goals represents both individual and collective strategies that have been mutually agreed upon by the Steering Committee and have changed with the 2023 MJHMP update. Objectives were added to Goals 2 and 5. Eventually, these goals have been adopted by Marin County and its participating jurisdictions as the guiding policy behind local hazard mitigation efforts, in conjunction with other associated principles.

Goals were defined for the purpose of this mitigation plan as broad-based public policy statements that:

- Represent basic desires of the community;
- Encompass all aspects of community, public and private;
- Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;
- Are future-oriented, in that they are achievable in the future; and
- Are time-independent, in that they are not scheduled events.

Goals are stated without regard to implementation. Implementation cost, schedule, and means are not considered. Goals are defined before considering how to accomplish them so that they are not dependent on the means of achievement. Goal statements form the basis for objectives

and actions that will be used as means to achieve the goals. Objectives define strategies to attain the goals and are more specific and measurable.

Goal 1: Minimize risk and vulnerability of the community to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, and environment in Marin County.

- Minimize economic and resource impacts and promote long-term viability and sustainability of resources throughout Marin County.
- Minimize impact to both existing and future development.
- Provide protection for public health.
- Prevent and reduce wildfire risk and related losses.

Goal 2: Provide protection for critical facilities, infrastructure, utilities, and services from hazard impacts.

- Incorporate defensible space and reduce hazard vulnerability.
- Develop redundancies in utilities and services.
- Enhance resilience through enhanced construction.

Goal 3: Improve public awareness, education, and preparedness for hazards that threaten our communities.

- Enhance public outreach and participation in the Alert Marin Emergency Notification System.
- Enhance public outreach, education, and preparedness program to include all hazards of concern.
- Increase public knowledge about the risk and vulnerability to identified hazards and their recommended responses to disaster events, including evacuation and sheltering options.
- Provide planning and coordination for "At-Risk" populations.
- Provide planning and coordination for companion animals, livestock, and other animal populations.
- Increase community awareness and participation in hazard mitigation projects and activities.

Goal 4: Increase communities' capabilities to be prepared for, respond to, and recover from a disaster event.

- Improve interagency (local, state, federal) emergency coordination, planning, training, and communication to ensure effective community preparedness, response and recovery.
- Enhance collaboration and coordination of disaster-related plans, exercises, and training with local, state, and federal agencies, neighboring communities, private partners, and volunteers.
- Enhance the use of shared resources/Develop a strong mutual aid support system.
- Create and maintain a fully functional, interoperable radio and communication system with all regional public safety partners.

Goal 5: Maintain FEMA Eligibility/Position the communities for grant funding.

- Review hazard events and ongoing hazard mitigation projects annually.
- Assess the need to pursue or adjust hazard mitigation projects after significant hazard events.

Goal 6: Reduce exposure to High Hazard Dams that pose an unacceptable risk to the public.

- Improve alert and warning systems to provide residents downstream of a High Hazard Dam to receive timely warning to evacuation when threatened by potential or imminent dam failure.
- Enhance overall community preparedness to respond and evacuate a potential or imminent dam failure.
- Increase public awareness of the risk posed by High Hazard Dams and the potential for relocation of housing outside a possible inundation zone.
- Prioritize High Hazard Dam Mitigation projects and programs.

3.4 Status of Previous Mitigation Actions

The Bolinas Community Public Utility District did not participate in the 2018 Marin County MJHMP and therefore, did not have any previous mitigation actions.

3.5 Hazard Mitigation Actions

The 2023 Marin County MJHMP was revised to reflect progress in local mitigation efforts. Mitigation projects were selected for each hazard and for the Bolinas Community Public Utility District based off the hazard risk assessment. The projects are supported by the mitigation goals and objectives, and are ranked using the following criteria; approximate cost, timeframe of completion, whether the project requires District Board of Directors regulatory action, and an assumption as to whether or not the project would be subject to CEQA or NEPA requirements. Funding sources are identified for all projects. All projects consider new, future, and existing development. Project worksheets are used by the Planning Team and Steering Committee to describe criteria for each project.

Based on the hazard profiles, threat assessment, capabilities assessment, community survey results, discussions among the Planning Team members, and existing best practices, a set of potential mitigation actions was developed and then evaluated based on the following criteria:

- FEMA requires local governments to evaluate the monetary and non-monetary costs and benefits of potential mitigation actions. Although local governments are not required to assign specific dollar values to each action, they should identify the general size of costs and benefits.
- The Planning Team may elect to include measures with a high cost or low benefits, but such measures should be clearly beneficial to the community and an appropriate use of local resources.

In addition, FEMA directs local governments to consider the following questions as part of the financial analysis:

- What is the frequency and severity of the hazard type to be addressed by the action, and how vulnerable is the community to this hazard?
- What impacts of the hazard will the action reduce or avoid?
- What benefits will the action provide to the community?

The Planning Team also chose to review and revise the potential hazard mitigation actions with consideration for climate impact and social vulnerability. Projects and programs were assessed with consideration of these variables.

Prioritization

As part of the mitigation actions development and review, the Planning Team also prioritized the actions. The prioritization efforts looked at the risks and threats from each hazard; lifesaving, life safety, property protection and lastly environmental protection; financial costs and benefits; technical feasibility; consideration for climate impact, and social vulnerability, and community values. Planning Team members were asked to identify their priority actions using the following criteria.

Implementation priority ratings were assigned as follows:

- **High Priority** - An action that meets multiple objectives, is linked to a high risk hazard, has benefits that exceed costs, and has a potential source of funding. Action can begin within the short term (1 to 5 years).
- **Medium Priority** - An action that meets multiple objectives, is linked to a high or medium risk hazard, has benefits that exceed costs, and is eligible for funding though no funding has yet been secured for it. Action can begin within the short term (1 to 5 years) once funding is secured.
- **Low Priority** - An action that will mitigate the risk of a hazard, has benefits that do not exceed the costs or are difficult to quantify, has no secured source of funding, and is not eligible for any known grant funding. Action can be completed in the long term (1 to 10 years). Low-priority actions may be eligible for grant funding from programs that have not yet been identified.

Table 14 lists the Current Hazard Mitigation Actions for the Bolinas Community Public Utility District.

Table 14: Bolinas Community Public Utility District Current Hazard Mitigation Actions

No.	Mitigation Actions	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
BC-1	Encourage participation in Alert Marin and other community alert & warning systems to ensure the public is aware of any potential emergencies or risk.	All Hazards/ 1, 2, 3, 4, 5	Bolinas Community Public Utility District / Marin County	New (2023)	Cost TBD: General Funds	1-2 years/ High	
BC-2	Emergency Operations Plan (EOP) Update	All Hazards 1, 2, 3, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost: TBD General Fund	1-2 years/ High	Update to existing EOP; in progress.
BC-3	Emergency Generator(s)	All Hazards 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1 - 5 years/ High	Ongoing – secure funding for installation of permanent generators at critical district facilities.
BC-4	Inspect Woodrat 1 and Woodrat 2 reservoir impoundments and install any recommended monitoring technology and/or improvements to structure(s) or spillway(s).	Dam Failure/ 1, 2, 4, 5, 6	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, [other grant sources)	1-2 years/ High	Reduces the risk of a dam failure that could destroy the district's water treatment plant (located below Woodrat 1) and/or these emergency stored water supplies.
BC-5	Relocate gravity sewer main off of Terrace Avenue at Surfer's Overlook	Debris Flow, Erosion, Landslide, Post-Fire Debris Flow/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	2 – 5 years/ High	Eliminates the risk of a sewer main failure/spill due to bluff erosion at this location (BCPUD relocated its high pressure water main off of this location in 2013).
BC-6	Repair County-owned seawall under Terrace Avenue at Surfer's Overlook to stabilize it and prevent land subsidence.	Debris Flow/ 1, 2, 4, 5	Bolinas Community Public Utility District; Marin County Department of Public Works	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1-2 years/ High	Reduces risk of failure of Terrace Avenue, a critical public egress road, and risk of sewer main failure/spill due to bluff erosion at this location.
BC-7	Retrofit or replace the existing concrete dam at the district's upper diversion point on the Arroyo Hondo Creek.	Debris Flow, Erosion, Landslide,	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	2 – 5 years/ Medium	Eliminates the potential for impoundment of erosion materials/debris behind this structure and the need for

		Post-Fire Debris Flow/ 1, 2, 4, 5					associated reservoir siltation removal projects.
BC-8	Inspect and install any necessary improvements to/replacement of the existing radial gate at the district's lower diversion point on the Arroyo Hondo Creek.	Drought/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1-2 years/ High	Eliminate leaks/water loss currently occurring when this diversion point is in use to improve drought resiliency.
BC-9	Engage consultant to evaluate feasibility of desalination, water recycling or additional groundwater sources as supplemental sources of water supply.	Drought/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	2 – 5 years/ High	Add resiliency to the district's water supply and prepare for climate change impacts to surface water sources.
BC-10	Seismic retrofit of the district's West Tank (potable water storage tank, 440,000 gallons)	Earthquake/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1-2 years/ High	Retrofit of critical water storage tank that is vulnerable to damage in an earthquake (BCPUD completed retrofit of East Tank in 2021) to ensure reliability of district's water supply.
BC-11	Replace existing district office building	Earthquake/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	2 – 5 years/ Medium	Building is 100+ years old and not built to current code; inspection confirms replacement needed; site assessment underway. Eliminate threat to public safety.
BC-12	Replace existing A/C water and/or sewer mains with C900	Earthquake/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	3 – 5 years/ Medium	Reduce possibility of catastrophic failure of critical facilities during earthquake.
BC-13	Engage engineers to evaluate the feasibility of a project to render the district's raw water transmission line less vulnerable to natural disasters, erosion, land subsidence and earthquakes.	Earthquake, Debris Flow, Drought, Severe Weather-Heat/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1-2 years/ High	Reduces the risk of loss of the district's primary raw water supply as a result of numerous different natural disasters.
BC-14	Conduct feasibility analysis and upgrade sewer treatment facility to perform during extreme rainfall (50 year+) events.	Flooding/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	2 – 5 years/ Medium	Enable the district to operate in compliance with its Waste Discharge Order and eliminate the possibility of discharging untreated wastewater.

BC-15	Convert Wharf Road Lift Station to a submersible pump station and install protective coating and associated improvement to wet well	Sea Level Rise/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost: $1 million: HMGP, BRIC, CDAA	1-2 years/ High	Adapt the facility in light of sea level rise
BC-16	Repair County-owned seawall under Wharf Road to stabilize it and prevent land subsidence.	Land Subsidence (Sinkhole)/ 1, 2, 4, 5	Bolinas Community Public Utility District, Marin County Department of Public Works	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1-2 years/ High	Eliminate recurrent sinkholes in Wharf Road and protect critical district infrastructure (water and sewer).
BC-17	Wharf Road Slip-line	Land Subsidence (Sinkhole)/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	3 – 5 years/ Medium	Slip line sewer to prevent raw sewage spills into the Bolinas Lagoon.
BC-18	Inspect sewage treatment and storage pond levees and install any recommended improvements.	Levee Failure/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	2 – 5 years/ High	Reduces risk of levee failure and catastrophic flooding
BC-19	Assess and remove trees (or portions thereof) on district properties that pose a threat to public safety during severe wind events.	Severe Weather – Wind, Tornado/ 1, 2, 4, 5	Bolinas Community Public Utility District	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1-2 years/ High	Reduce threat to public safety during extreme wind event storms in Bolinas.
BC-20	Consult with Fire authorities and licensed tree professionals and implement recommended projects to treat/remove trees on district property and replace them with safer vegetation.	Wildfire/ 1, 2, 4, 5	BCPUD, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Fire Safe Marin	1-2 years/ High	Reduces chance of wildland fire and supports environmental restoration.

Table 41: Bolinas Community Public Utility District Current Hazard Mitigation Actions

3.6 Progress in Local Mitigation Efforts

This plan has been created as a "living" document with input from the population and professionals within the Bolinas Community Public Utility District. The planning team for the Bolinas Community Public Utility District identified and prioritized the mitigation actions as detailed in Table 14, based on the risk assessment and in accordance with the process outline in Section 3, Mitigation Strategy, of the base plan. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. General processes and information on plan implementation and maintenance of this LHMP by all participating jurisdictions is included in Section 4.0: Plan Review, Evaluation, and Implementation.

3.7 Plan Integration

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as master planning, strategic planning, capital facilities planning, emergency management, hazard specific planning, and that relevant information from those sources is also used in hazard mitigation. This section identifies where the 2023 MJHMP will be used for further integration.

The planning team for the Bolinas Community Public Utility District will maintain this plan and will serve as a lead staff for grant project applications on District projects selected for application under the Hazard Mitigation Assistance grant programs.

Where possible the Bolinas Community Public Utility District will use existing plans and/or programs to implement hazard mitigation actions within the District and through the coordinated efforts with the County, the Bolinas Fire Protection District, and other state or local entities, as appropriate.

Mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and development. As described in this plan's capability assessment, the Bolinas Community Public Utility District already implements policies and programs to reduce losses to life and property from hazards. This plan builds upon the momentum developed through previous and related planning efforts and mitigation programs and recommends implementing actions, where possible, through these other program mechanisms. These existing mechanisms include Integration opportunities for the 2023 Marin County MJHMP:

District Master & Strategic Plans - Integrates hazard mitigation through the consideration of hazards most likely to impact the district.

District Emergency Operations Plans – Integrates hazard mitigation through the consideration of the Town's planned response to hazards most likely to impact the district.

Flood/Storm Water Management/Master Plans - Integrates hazard mitigation through the consideration of strategies to reduce flood risk and storm water management for the protection of life and property.

Community Wildfire Protection Plan - Integrates hazard mitigation through the consideration of strategies to reduce fire hazard and the risk of catastrophic wildfires in the WUI, while

promoting the protection and enhancement of the county's economic assets and ecological resources.

The successful implementation of this mitigation strategy will require review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. A few examples of incorporation of the MJHMP into existing planning mechanisms include:

4. As recommended by Assembly Bill 2140, each community should adopt (by reference or incorporation) this MJHMP into the Safety Element of their General Plans. Evidence of adoption (by formal, certified resolution) shall be provided to CalOES and FEMA
5. Integration of flood actions identified in this mitigation strategy with the actions and implementation priorities established in existing Flood Management Programs
6. Using the risk assessment information to update the hazards section in the County, City and Town Emergency Operations Plans

Efforts should continuously be made to monitor the progress of mitigation actions implemented through these other planning mechanisms and, where appropriate, their priority actions should be incorporated into updates of this hazard mitigation plan.

3.8 Future Development Trends

As a small special district in unincorporated Marin County, the BCPUD does not have jurisdiction over land use or planning in the community (that responsibility lies with the Marin County Community Development Agency). Significant development is not anticipated for Bolinas within the next 5 years given development constraints, the limited nature of the local water supply and consequent moratorium on new connections to the water system, as well as an ongoing moratorium on new connections to the sewer system.

As detailed in the "Climate Change and Future Development Considerations" section of each hazard profile, development in BCPUD has occurred and will continue to occur throughout the District in areas prone to all of its identified hazards. Increased growth in these areas may increase the vulnerability of people and structures to these hazards.

4.0 Plan Review, Evaluation, and Implementation

The strategies presented are deemed appropriate and effective by recommendation of the Bolinas Community Public Utility District.

4.1 Plan Adoption

Upon submission to the California Office of Emergency Services (CalOES) for review, and subsequent approval by the Federal Emergency Management Agency (FEMA), the Marin County MJHMP will be presented to local government for formal adoption. As appropriate, the adopted plan and accompanying Bolinas Community Public Utility District Community Profile will then be incorporated into local general plans for integration into organizational policy.

4.2 Plan Monitoring

The process of hazard mitigation does not end with the completion, approval, and adoption of the Marin County OA MJHMP. During the five-year lifespan the Marin County and Bolinas Community PUD plan, the County, cities, towns and special districts, along with community-based organizations will ensure that the mitigation goals and strategies identified are exercised and monitored under a collaborative and cooperative umbrella, and that the document itself is properly maintained.

The Marin County Office of Emergency Management, as lead coordinating agency for hazard mitigation planning within the Marin County OA, leads the Marin Operational Area Hazard Mitigation Working Group that meets quarterly to review and manage the plan, projects, and programs. The Bolinas Community PUD is a participating member of the Marin Operational Area Hazard Mitigation Working Group. The Bolinas Community PUD General Manager will monitor and update the Bolinas Community PUD Annex to the Marin County OA MJHMP.

The review will identify changing community priorities, updated or new planning documents and the progress or status of the mitigation actions as detailed in the mitigation strategy. Additional questions to complete the review will be considered as follows:

- Do the goals address current and expected conditions?
- Are the goals and objectives consistent with changes in the local, state, and federal policy?
- Status updates on all mitigation actions?
- Have the hazards or risks changed?
- Are current resources appropriate for implementing the MJHMP?
- Have the outcomes occurred as expected?
- Is the County and jurisdictions or districts participating in the plan implementation process as expected?

The Working Group is a subgroup of the Marin Disaster and Citizens Corps Council. During the five-year update cycle, the Marin Operational Area Hazard Mitigation Working Group will have quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. Further, Marin OEM will host an annual one-day mitigation summit to increase engagement and enhance collaboration on the plan and projects. The summit will also have the goal to educate stakeholders on innovative approaches to mitigation, trends, and new plan

requirements. Marin OEM, as the host, will seek subject matter experts, state and federal officials, and representatives from within the Marin OA to speak to mitigation and planning. The knowledge gathered and the coordination facilitated during the summit will be used to update the base plan and annexes.

Marin OEM has the capacity to lead the Working Group and Multi-Jurisdictional Planning with one coordinator assigned with direct maintenance of the plan, a department analyst assigned to support the coordinator with project and grant tracking, and a community preparedness coordinator assigned with conducting regular public outreach on the plan and education on mitigation. Community feedback and integration will continue through outreach events and OEM website, where residents and visitors are invited to provide feedback through a survey, available in English or Spanish.

Specific plan maintenance activities by the Marin County Office of Emergency Management and its participating jurisdictions/special districts may include:

- Hold quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions.
- Annual Hazard Mitigation Summit
- Holding public meetings after the first quarter and third quarter update meetings.
- Maintaining the Marin County OEM Hazard Mitigation Website, which provides the public with the ability to access identified hazard impact maps, location address search capability, and a listing of hazard mitigation actions.
- Monitoring of the Marin County and all participating jurisdiction mitigation project activities and dissemination of status reports.
- Generation of reports relative to plan status, project management, and revision updates to executive leadership.
  Preparations for the plan's future revision and updating.

4.3 Plan Evaluation

Upon approval and adoption by the Bolinas Community PUD, the prioritized mitigation strategies will be further developed for funding and implementation by the lead agencies. The plan describes the potential sources of hazard mitigation funding, and general procedures to obtain that funding.

The mitigation strategies represented and adopted within this plan are recommendations only and must be approved and funded in order to be implemented as official mitigation solutions. Ultimately, it is the responsibility of jurisdictional and agency officials within the Marin County to undertake project implementation based upon identified mitigation strategies, funding availability, and local need when it arises. The Marin County Office of Emergency Management will meet with the Marin Operational Area Hazard Mitigation Working Group, including the Bolinas Community PUD, to evaluate the plan after each update meeting.

4.4 Plan Update

The Bolinas Community PUD General Manager will monitor and update the Bolinas Community PUD Annex to the Marin County OA MJHMP. During the five-year update cycle, the Bolinas Community PUD and the Marin County Office of Emergency Management will hold quarterly update meetings with the Marin Operational Area Hazard Mitigation Working Group and local

stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. The Marin County Office of Emergency Management and all participating jurisdictions and special districts will continue to hold public meetings after the first quarter and third quarter update meetings annually and will continue to invite public participation in the update process via updated public surveys.

3. Town of Corte Madera and Sanitary District Number 2 Profile

THE TOWN OF CORTE MADERA
MARIN COUNTY CALIFORNIA

Marin County Multi-Jurisdictional Hazard Mitigation Plan 2023

This page is intentionally blank.

ACKNOWLEDGEMENTS

The Town of Corte Madera and Preparative Consulting would like to thank those collaborators and partners who participated in the planning and development of this document.

The official Marin County hazard mitigation Steering Committee provided the oversight and dedication to this project that was required, and without their commitment, this project would not be possible.

As with any working plan, this document represents planning strategies and guidance as understood as of the date of this plan's release. This plan identifies natural hazards and risks and identifies the hazard mitigation strategy to reduce vulnerability and make the communities of the Town of Corte Madera more disaster resistant and sustainable.

SECTION 1.0: INTRODUCTION

1.1 INTRODUCTION

The Town of Corte Madera, Community Profile has been prepared in conjunction with the Marin County Multi-Jurisdictional Hazard Mitigation Plan (MJHMP), establishing an inter-jurisdictional process for the development and implementation of effective hazard mitigation strategies in association with identified hazards that pose real or potential threats to the Town of Corte Madera.

1.2 PLANNING PROCESS

The majority of Marin County is unincorporated sparsely populated rural and protected lands. Most of the 262,000 county population is consolidated into the Eastern portion of the county. The Marin County MJHMP Steering Committee and broader Planning Team approached the development of the Marin County MJHMP and the associated jurisdictional and district profiles from a coordinated and collaborative planning and public engagement unity of effort.

The Marin County and Town of Corte Madera Steering Committee felt a unified effort, led by the County Office of Emergency Management (OEM), would be the most effective approach for this planning process. This approach allowed the small participating jurisdictions and districts with limited staffing and resources to take advantage of the combined efforts of the County, the Town of Corte Madera and the other participating planning areas to reach a broader segment of each of their own populations and do so in a way to ensure greater equity and inclusion of the public in this planning process. Extensive and coordinated public outreach was done involving the Town of Corte Madera and all participating jurisdictions and districts with an eye towards equity, inclusion, openness, accessibility, and ensuring they meet the population where they live, work, or recreate to provide the public convenience of access and ease of participation in this planning process.

Marin County is very different from most California Counties in that the populated portion of the County where the participating jurisdictions and district's planning areas are located has the same climate, similar topography, and are exposed to many of the same hazards. Only three jurisdictions, Larkspur, Ross, and San Anselmo, are not coastal jurisdictions and are not impacted by Tsunami or Sea Level Rise.

This unity of effort approach allowed the Marin County and Town of Corte Madera Steering Committee to establish a more robust Planning Team representing local Corte Madera, countywide, regional, state, and federal stakeholders servicing the Marin County and Town of Corte Madera planning area. These stakeholders were in a unique position to provide informed and specific information and recommendations on hazard mitigation goals and actions, as well as population needs and social vulnerability for each of the jurisdictional and district planning areas. This united effort allowed the planning team to attend fewer meetings than they would have been required to attend if they were required to attend separate meetings for each participating jurisdiction and district. The reduced number of meetings allowed the planning team the opportunity and time to provide more detailed and thoughtful contributions to the planning effort.

In addition to providing representation on the coordinated Marin County and Town of Corte Madera Multi-Jurisdictional Hazard Mitigation Plan Steering Committee, the Town of Corte Madera involved additional internal planning team members to support the broader planning process. The Town of Corte Madera jurisdictional representatives for the coordinated Marin

County Multi-Jurisdictional Hazard Mitigation Plans Steering Committee and the Planning Team Members are represented below.

1.2.1 Steering Committee Members (Jurisdictional Representatives)

Primary Point of Contact
RJ Suokko, Director of Public Works
Telephone: 415-927-5118
E-mail Address: rsuokko@tcmmail.org

Alternate Point of Contact
Chris Good, Senior Civil Engineer
Telephone: 415-927-5794
E-mail Address: cgood@tcmmail.org

This annex was developed by the primary point of contact with assistance from the members of the local mitigation planning team listed in Table 1 and Table 2.

Table 42: Local Hazard Mitigation Planning Team Members

This 2023 Marin County Operational Area (OA) MJHMP is a comprehensive update of the 2018 Marin County OA MJHMP. The planning area and participating jurisdictions and organizations were defined to consist of unincorporated Marin County, five special districts, and the eleven incorporated jurisdictions to include the Town of Corte Madera. All participating jurisdictions are within the geographical boundary of Marin County and have jurisdictional authority within this planning area.

The Marin County and Town of Corte Madera Steering Committee led the planning process based on the contribution and input from the whole community stakeholders who identified the community's concerns, values, and priorities. The Steering Committee met and reviewed the mitigation recommendations and strategies identified within this plan. Each participating local jurisdiction established a mechanism for the development and implementation of jurisdictional mitigation projects, as identified within this plan and associated locally specific supporting documents. As deemed necessary and appropriate, participating jurisdictions will organize local mitigation groups to facilitate and administer internal activities.

The Marin County and Town of Corte Madera Steering Committee assisted with the planning process in the following ways:

- Attending and participating in the Steering Committee meetings.
- Identification of potential mitigation actions.
- Updating the status of mitigation actions from the 2018 Marin County OA MJHMP.
- Collecting and providing other requested data (as available).
- Making decisions on plan process and content.
- Reviewing and providing comments on plan drafts; including annexes.
- Informing the public, local officials, and other interested stakeholders about the planning process and providing opportunity for them to be involved and provide comment.
- Coordinating, and participating in the public input process.
- Coordinating the formal adoption of the plan by the governing boards.

1.2.2 Steering Committee Planning Process

The Marin County and Town of Corte Madera Steering Committee met monthly to develop the plan. Email notifications were sent out to each Steering Committee member to solicit their participation in the Steering Committee meetings. The meetings were conducted using a Zoom platform videoconferencing. Meeting attendees signed in using the chat feature to record their attendance.

The Marin County and Town of Corte Madera Steering Committee agreed to make and pass plan-based general policy recommendations by a vote of a simple majority of those members present. The Steering Committee will also seek input on future hazard mitigation programs and strategies from the mitigation planning team by focusing on the following:

- Identify new hazard mitigation strategies to be pursued on a state and regional basis, and review the progress and implementation of those programs already identified.
- Review the progress of the Hazard Mitigation program and bring forth community input on new strategies.
- Coordinate with and support the efforts of the Marin County OEM to promote and identify resources and grant money for implementation of recommended hazard mitigation Strategies within local jurisdictions and participating public agencies.

During the planning process, the Marin County and Town of Corte Madera Steering Committee communicated through videoconferencing, face-to-face meetings, email, telephone conversations, and through the County and Town websites. The County and City website included information for all stakeholders on the MJHMP update process. Hannah Tarling of the Marin County Office of Emergency Management and Preparative Consulting established a Microsoft 365 SharePoint folder which allowed the Steering Committee members and Marin OEM and Preparative Consulting to share planning documents and provide a format for the planning partners to submit completed documents and access other planning related documents and forms. Draft documents were also posted on this platform and the Marin County OES website so that the Steering Committee members and the public could easily access and review them.

1.2.3 Coordination with Stakeholders and Agencies

Opportunities for involvement in the planning process must be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other private and nonprofit

interests (44 CFR, Section 201.6(b)(2)).

Early in the planning process, the Marin County and Town of Corte Madera Steering Committee reached out to the following Local and Regional Agencies involved in hazard mitigation activities to invite them to participate in this planning process as a member of the Planning Team. These individuals work with Marin County and the Town of Corte Madera communities and could provide subject matter expertise and relevant information to the planning process regarding the community history, hazard risk, vulnerability, and impact, mitigations efforts, community needs, demographics, and social vulnerability, economic concerns, ecology, and other community services and needs.

The Marin County and Town of Corte Madera Steering also determined that data collection, risk assessment analyses, mitigation strategy development, and plan approval would be greatly enhanced by inviting other local, state and federal agencies and organizations to participate in the process. Based on their involvement in hazard mitigation planning, their landowner status in the County, the Town of Corte Madera and/or their interest as a neighboring jurisdiction, representatives from the following groups were invited to participate on the Planning Team:

Eighty-five planning partners participated in this update, as listed in Table 2.

Table 43: 2023 MJHMP Planning Team Members

Several opportunities were provided for the groups listed above to participate in the Town of Corte Madera's planning process. At the beginning of the planning process, invitations were extended to these groups to actively participate on the Planning Team. Participants from these groups assisted in the process by attending several videoconferencing meetings where hazard vulnerability and risk were discussed along with hazard mitigation strategies and actions. Planning Team members provided data and other applicable information directly as requested in meetings, emails, telephone calls, videoconferencing, worksheets, or through data contained on their websites or as maintained by their offices. This information was used to develop hazard vulnerability and risk profiles along with mitigation actions.

These key agencies, organizations, and advisory groups received meeting announcements, agendas, and minutes by e-mail throughout the plan update process. They supported the effort by attending meetings or providing feedback on issues. All the agencies were provided with an opportunity to comment on this plan update and were provided with a copy of the plan to review and offer edits and revisions. They were also provided access to the Marin County OEM hazard mitigation plan website to review all planning documents and hazard mapping tools.

Each was sent an e-mail message informing them that draft portions of the plan were available for review. In addition, the complete draft plan was sent to the California Governor's Office of Emergency Services (Cal OES) and FEMA Region IX for a pre-adoption review to ensure program compliance.

In addition, through the public meetings conducted at the beginning of the planning process, members of the planning team, the public, and other key stakeholders were invited to participate in the planning process through public outreach activities.

Further as part of the public outreach process, all planning areas engaged in public outreach and education by providing information on their Town of Corte Madera website or though press releases directing the public to the main Marin County OEM website that provided coordinated and detailed public information of the planning process and how the public could participate. All planning areas were invited to attend the public meetings and to review and comment on the plan prior to submittal to Cal OES and FEMA. Additional public outreach action is detailed in the 1.2.4 PUBLIC ENGAGEMENT section of this annex.

The following planning meetings were held with the planning team:

1.2.4 PUBLIC ENGAGEMENT

Early discussions with the Marin County OEM established the initial plan for public engagement to ensure a meaningful and inclusive public process with a focus on equity and accessible to the whole community. The Public Outreach efforts mirrored the Planning Team approach with a unified effort, led by the County OEM and the Town of Corte Madera, involving all participating jurisdictions and districts. Public outreach for this plan update began at the beginning of the plan development process with a detailed press release from Marin County and the Town of Corte Madera informing the community of the purpose of the hazard mitigation planning process for the Marin County OA planning area and to invite the public to participate in the process.

Public involvement activities for this plan update were conducted by Marin County, the Town of Corte Madera, and all participating jurisdictions and districts and included press releases; website postings; a community survey; stakeholder and public meetings; and the collection of public and stakeholder comments on the draft plan which was posted on the Marin County and Town of Corte Madera website. Information provided to the public included an overview of the mitigation status and successes resulting from implementation of the 2018 plan as well as information on the processes, new risk assessment data, and proposed mitigation strategies for the plan update.

Equity and Whole Community Approach

The Marin County OEM and the Marin County and Town of Corte Madera Steering Committee prioritized equity and engagement of the whole community in the development of the Marin

County OA MJHMP by establishing a framework with key actions for each step of the planning process. Elements of the equity approach included:

Engaging hard-to-reach populations

This effort was to ensure the greatest equity and access to the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." The Town Hall meetings were conducted at different familiar locations within the county where people could easily access them and were conducted on both a weekday and weekend, and in the evening and during the daytime. The meetings were offered in-person with a virtual broadcast using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. After the meeting, Marin County OEM uploaded the recorded meeting to their website to allow the public on demand access to the meeting.

Translation and Interpretation Services

The survey and outreach materials were provided in both English and Spanish to improve accessibility among populations with limited English proficiency. The website uses Google Translate for accessibility in multiple languages. Interpretation services were offered for both town hall meetings. Each town hall meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

Three stakeholder and public meetings were held, two at the beginning of the plan development process and one prior to finalizing the updated plan. Where appropriate, stakeholder and public comments and recommendations were incorporated into the final plan, including the sections that address mitigation goals and strategies. Specifically, public comments were obtained during the plan development process and prior to plan finalization.

All press releases and website postings are on file with the Marin County OEM. Public meetings were advertised in a variety of ways to maximize outreach efforts to both targeted groups and to the public at large. Advertisement mechanisms for these meetings and for involvement in the overall MJHMP development process include:

- Development and publishing of an MJHMP public outreach article
- Providing press releases to local newspapers and radio stations
- Posting meeting announcements on the local County MJHMP website
- Email to established email lists
- Personal phone calls

The public outreach activities were conducted with participation from and on behalf of all jurisdictions participating in this plan.

The Marin County and Town of Corte Madera Steering Committee has made the commitment to periodically bring this plan before the public through public meetings and community posting so that citizens may make input as strategies and implementation actions change. Public meetings will continue to be held twice a year after the first and third MJHMP meetings. Public meetings will continue to be stand-alone meetings but may also follow a council meeting or other official government meeting. The public will continue to be invited to public meetings via social media messaging, newspaper invitations, and through the website for each jurisdiction participating in

the plan. Each jurisdiction is responsible for assuring that their citizenry is informed when deemed appropriate by the Steering Committee.

WEBSITE

At the beginning of the plan update process, Marin County OEM established a hazard mitigation website https://emergency.marincounty.org/pages/lhmp on behalf of all the planning areas to ensure consistent messaging and information, to keep the public posted on plan development milestones, and to solicit relevant input. The website also provided information on signing up for Alert Marin, provided detailed information about the hazard mitigation process and plan development, provided a URL and QR code link to the survey in both English and Spanish, and provided information about upcoming town hall meetings. (See Figure 1)

The site's address was publicized in all press releases, surveys and public town hall meetings. Each planning partner also established a link on their own agency website. Information on the plan development process, the Steering Committee, a link to the Hazard Mitigation survey, and drafts of the plan were made available to the public on the site. Marin County intends to keep a website active after the plan's completion to keep the public informed about successful mitigation projects and future plan updates.

Figure 93: Marin County OEM MJHMP and Town of Corte Madera Website

PUBLIC MEETINGS

Two separate Marin County MJHMP Public Town Hall Meeting were conducted at different locations within the County, on different days of the week and during different times of the day. This effort was to ensure the greatest equity and access by the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." Each Town Hall Meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom

videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

The first Town Hall Meeting was conducted on Thursday, April 13, 2023, from 6:00 pm to 7:30 pm, at the Marin County Board of Supervisors Chambers, Marin County Civic Center, 3501 Civic Center Drive, Room #330 San Rafael, CA 94903. The in-person meeting was also broadcast virtually using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. Each of the jurisdictions participating in the MJHMP released a Press Release on their respective websites announcing the Public Town Hall Meeting and providing the date, time, and URL link to the Zoom Meeting for the public to log in and attend the Zoom Meeting. Marin County OEM also posted a notice for the Public Town Hall Meeting on their Facebook account. At the conclusion of the presentation, a question and answer session was held to answer questions from the attendees.

The second Town Hall Meeting was conducted on Saturday, April 29, 2023, from 10:00 am to 11:30 am, at the Marin County Health and Wellness Center, 3240 Kerner Ave. Rooms #109 and #110 San Rafael, CA. 94903. The meeting followed the same format as the first and hosted the same access level of equity and accessibility.

The Marin County MJHMP Public Town Hall Meeting was recorded and downloaded from Zoom and made available to all of the jurisdictions and districts to place on their websites and local Access TV for the public to view.

Meeting participants were also invited to complete the Hazard Mitigation Survey and were provide the URL link to the Survey Monkey website to complete the survey.

Figure 94: Marin County OEM MJHMP Public Town Hall Meeting

SOCIAL MEDIA

Marin County and its participating jurisdictions utilized several forms of social media to reach residents and customers. Information about the Hazard Mitigation Planning process was communicated to the public via Facebook, Twitter, and local access TV. Residents and customers were invited to complete the Hazard Mitigation Plan survey which was accessible

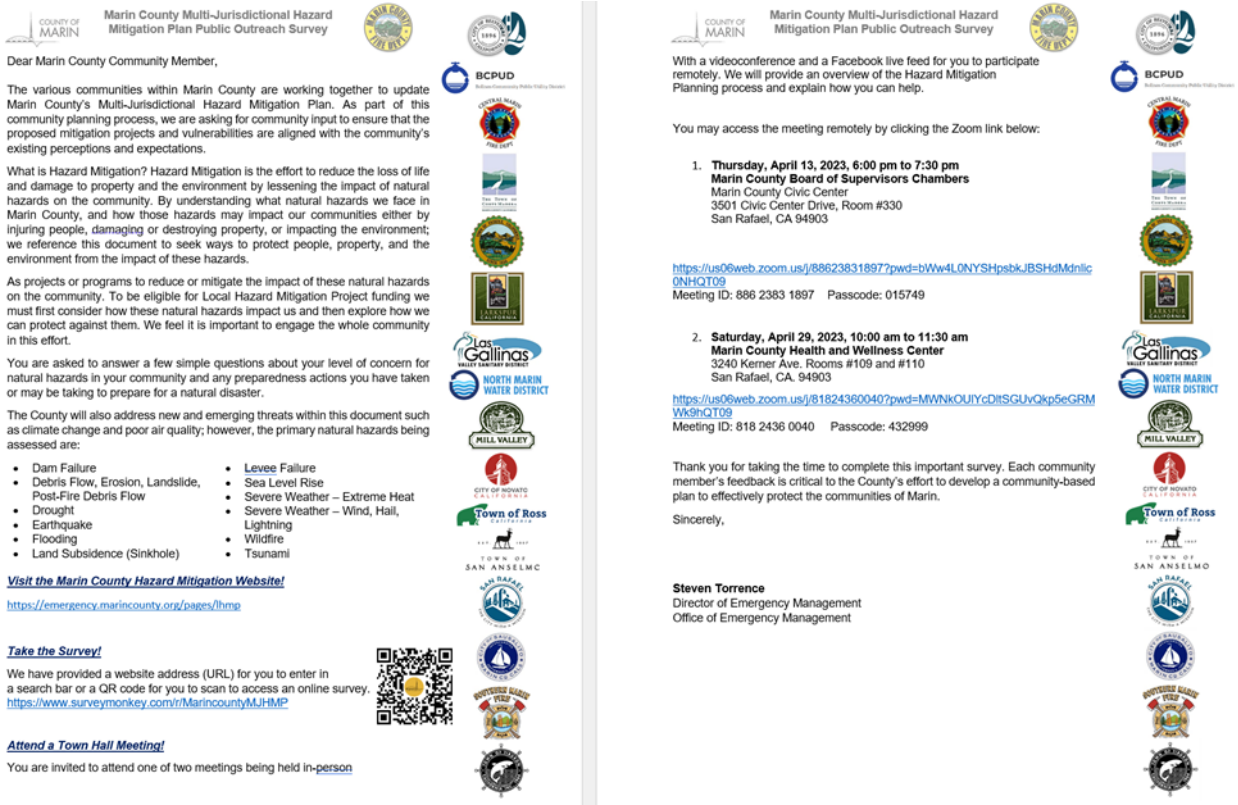
via an attached URL or QR Code and provide feedback on potential hazard mitigation projects or programs.

The results of the survey were provided to each of the planning partners and used to support the jurisdictional annex process. Each planning partner was able to use the survey results to help identify actions as follows:

- Gauge the public's perception of risk and identify what citizens are concerned about.
- Identify the best ways to communicate with the public.
- Determine the level of public support for different mitigation strategies.
- Understand the public's willingness to invest in hazard mitigation.

PRESS RELEASES

Press releases were distributed over the course of the plan's development as key milestones were achieved and prior to each Marin County MJHMP Public Town Hall Meeting. All press releases were made available to the community in both English and Spanish.



Marin County Multi-Jurisdictional Hazard Mitigation Plan Public Outreach Survey

Dear Marin County Community Member,

The various communities within Marin County are working together to update Marin County's Multi-Jurisdictional Hazard Mitigation Plan. As part of this community planning process, we are asking for community input to ensure that the proposed mitigation projects and vulnerabilities are aligned with the community's existing perceptions and expectations.

What is Hazard Mitigation? Hazard Mitigation is the effort to reduce the loss of life and damage to property and the environment by lessening the impact of natural hazards on the community. By understanding what natural hazards we face in Marin County, and how those hazards may impact our communities either by injuring people, damaging or destroying property, or impacting the environment; we reference this document to seek ways to protect people, property, and the environment from the impact of these hazards.

As projects or programs to reduce or mitigate the impact of these natural hazards on the community. To be eligible for Local Hazard Mitigation Project funding we must first consider how these natural hazards impact us and then explore how we can protect against them. We feel it is important to engage the whole community in this effort.

You are asked to answer a few simple questions about your level of concern for natural hazards in your community and any preparedness actions you have taken or may be taking to prepare for a natural disaster.

The County will also address new and emerging threats within this document such as climate change and poor air quality; however, the primary natural hazards being assessed are:

- Dam Failure
- Debris Flow, Erosion, Landslide, Post-Fire Debris Flow
- Drought
- Earthquake
- Flooding
- Land Subsidence (Sinkhole)
- Levee Failure
- Sea Level Rise
- Severe Weather – Extreme Heat
- Severe Weather – Wind, Hail, Lightning
- Wildfire
- Tsunami

Meeting ID: 818 2436 0040 Passcode: 432999

Thank you for taking the time to complete this important survey. Each community member's feedback is critical to the County's effort to develop a community-based plan to effectively protect the communities of Marin.

Sincerely,

Steven Torrence
Director of Emergency Management
Office of Emergency Management

Figure 95: Hazard Mitigation Plan Public Outreach Press Release

SURVEY

A hazard mitigation plan survey (see Figure 4) was developed by the Steering Committee and made available to the public in both English and Spanish. The survey was used to gauge household preparedness for natural hazards and the level of knowledge of tools and techniques that assist in reducing risk and loss from natural hazards. This survey was

designed to help identify areas vulnerable to one or more natural hazards. The answers to its ten questions helped guide the Steering Committee in defining our hazards, and selecting goals, objectives, and mitigation strategies. The survey was available on the hazard mitigation plan website, advertised in press releases, and at town hall meetings. Finally, the survey and the process of public input was advertised throughout the course of the planning process. The survey was available to the public on March 13, 2023, and closed on June 12, 2023. At the conclusion of the planning process 293 surveys were completed by the public.

Public Comments Considered by the Planning Team

The Planning Team used the following information gathered from the Public Outreach Survey to inform decisions regarding hazard mitigation strategies, actions, and priorities.

- Climate Change, Wildfire, and Drought were the top hazards of concern for the public.
- Text messages, mail, and the County website were the preferred methods for receiving hazard mitigation information.
- 48% of respondents expressed that they were “Very Much” concerned and 31% were “Moderately” concerned that a natural disaster could impact their home or place of residence.
- 85% of respondents own their own home.
- 99% of respondents have access to the internet.

Figure 96: Hazard Mitigation Plan Survey

PUBLIC COMMENT ON THE PLAN

To solicit public feedback on the draft plan, Marin OEM engaged in a multi-faceted approach intended to reach as many Marin residents as possible, including members of the community who are under-served and under-represented. All members of the community had the opportunity to provide initial comments on the plan during a two-week period from Wednesday, December 4, 2023, to Wednesday, December 18, 2023. Although the initial comment period was listed as two weeks, the public could submit comments indefinitely via the County's website to support the County's continuous improvement efforts. The base plan, as well as city, town and special district annexes, were available for download on emergency.marincounty.org (include photos). The website additionally asked for feedback in a survey in English and Spanish (include photos), the survey was designed to establish where that person lives or works, their top hazards of concern, elicit feedback on the plan and offer a place for them to share projects to reduce risk in their community. The survey collected responses from the community in English and in Spanish.

The website and survey were shared through traditional and social media (photos) The Marin Independent Journal (Marin IJ) used the press release to write an article (hopefully; include photos). Social media accounts were updated four times with an initial ask, two reminders, and a closing announcement. The Marin OEM Public Information Officer coordinated with the Marin County Public Information Officers (MAPIO) working group to distribute information to partner jurisdictions (city, town, and special districts) to share this information on their social media sites and with the communities in the area.

To reach those who may not be engaged digitally, the planning team worked with Marin County Community Response Teams, (CRTs are a collaboration of non-profit organizations supporting underrepresented communities in four zones) to conduct outreach with half-sheet flyers in English and Spanish to share in the 4 CRT zones (southern Marin, north Marin, west Marin, San Rafael). These half sheets were also shared county-wide at libraries, including in areas not covered by CRTs, like at the Fairfax library. CRTs are designed to reach Marin's

traditionally underserved and underrepresented communities, so by conducting outreach through this method, we were able to inform residents who may not have been engaged otherwise, including residents in Marin City, West Marin, and the Canal District of San Rafael.

The 14-day public comment period gave the public an opportunity to comment on the draft plan update prior to the plan's submittal to Cal OES. Comments received on the draft plan are available upon request. All comments were reviewed by the planning team and incorporated into the draft plan as appropriate.

Public Comments Considered by the Planning Team

The Marin County OEM posted the draft Hazard Mitigation Plan and hazard mitigation actions on their website and solicited public comments on the content. The Town of Corte Madera distributed press releases directing the community to the Marin County OEM website to review the draft plans. The Planning Team gathered public comments and information on the Marin County OEM website regarding proposed and current Hazard Mitigation Actions. The Planning Team used the comments and suggestions to inform decisions regarding hazard mitigation strategies, actions, and priorities. Most comments included ideas for hazard mitigation projects and comments on the effectiveness of current mitigation projects. These comments were used to revise the proposed hazard mitigation actions which resulted in the final list of hazard mitigation actions listed in 4.9 Hazard Mitigation Actions.

1.3 Overview and History

The Town of Corte Madera is named after Corte Madera del Presidio, an 1834 Mexican land grant of the area to Irish immigrant John Reed that also established several communities in Marin County. Spanish for "cut wood", Corte Madera provided redwood and oak timber for the growth of early San Francisco, including much of the construction at the Presidio. As the timber disappeared, Corte Madera became a farming and ranching community. Corte Madera continued to grow with the formation of the North Pacific Coast Railroad Company in 1872, and a railroad station was constructed by 1875 with freight and commuter service. Development of the town's harbor allowed for further trade of goods. The town grew around the railroad station with the development a town square and several neighborhoods. The Adams' Hotel and Tavern was the town's first commercial business when built in 1898 and it served as the town's first post office. The town was officially incorporated on June 10th, 1916. Further growth of the town occurred during World War II, when the Marinship Corporation built a shipyard in Sausalito and attracted thousands of ship workers to the area. The town currently has a total area of 3.2 square miles and is situated just south of the South Quentin Peninsula on San Francisco Bay. The terrain consists of hills and marshland where numerous creeks empty into San Francisco Bay.

The Town of Corte Madera had an estimated population of 10,222 in 2020, with 4,174 housing units in the town. The town has a total area of 4.406 square miles. The median income for a household in the town was $183,661 and the per capita income for the town was $95,257. Approximately 2.1 percent of families and 4.9 percent of the population were below the poverty line (2020 data, U.S. Census Bureau).

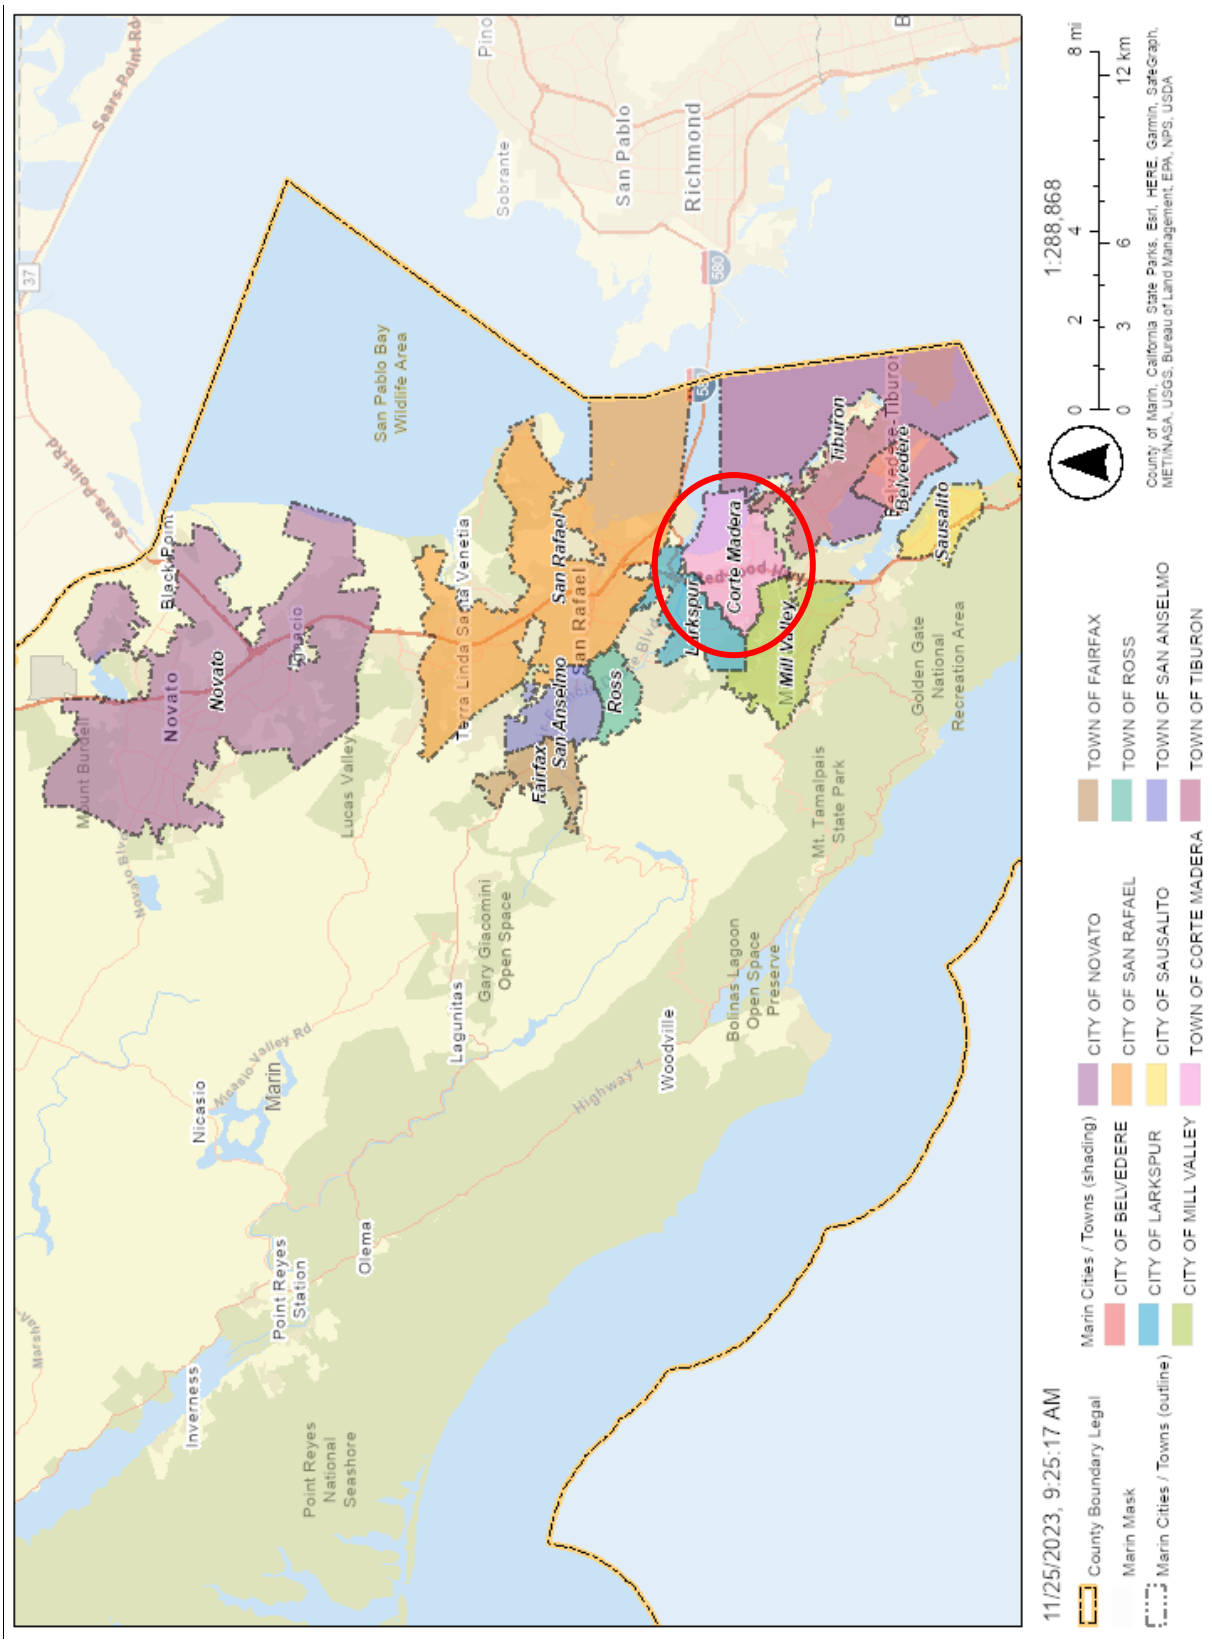

Figure 97: Map of Town of Corte Madera in Marin County
Source: Marin County OEM

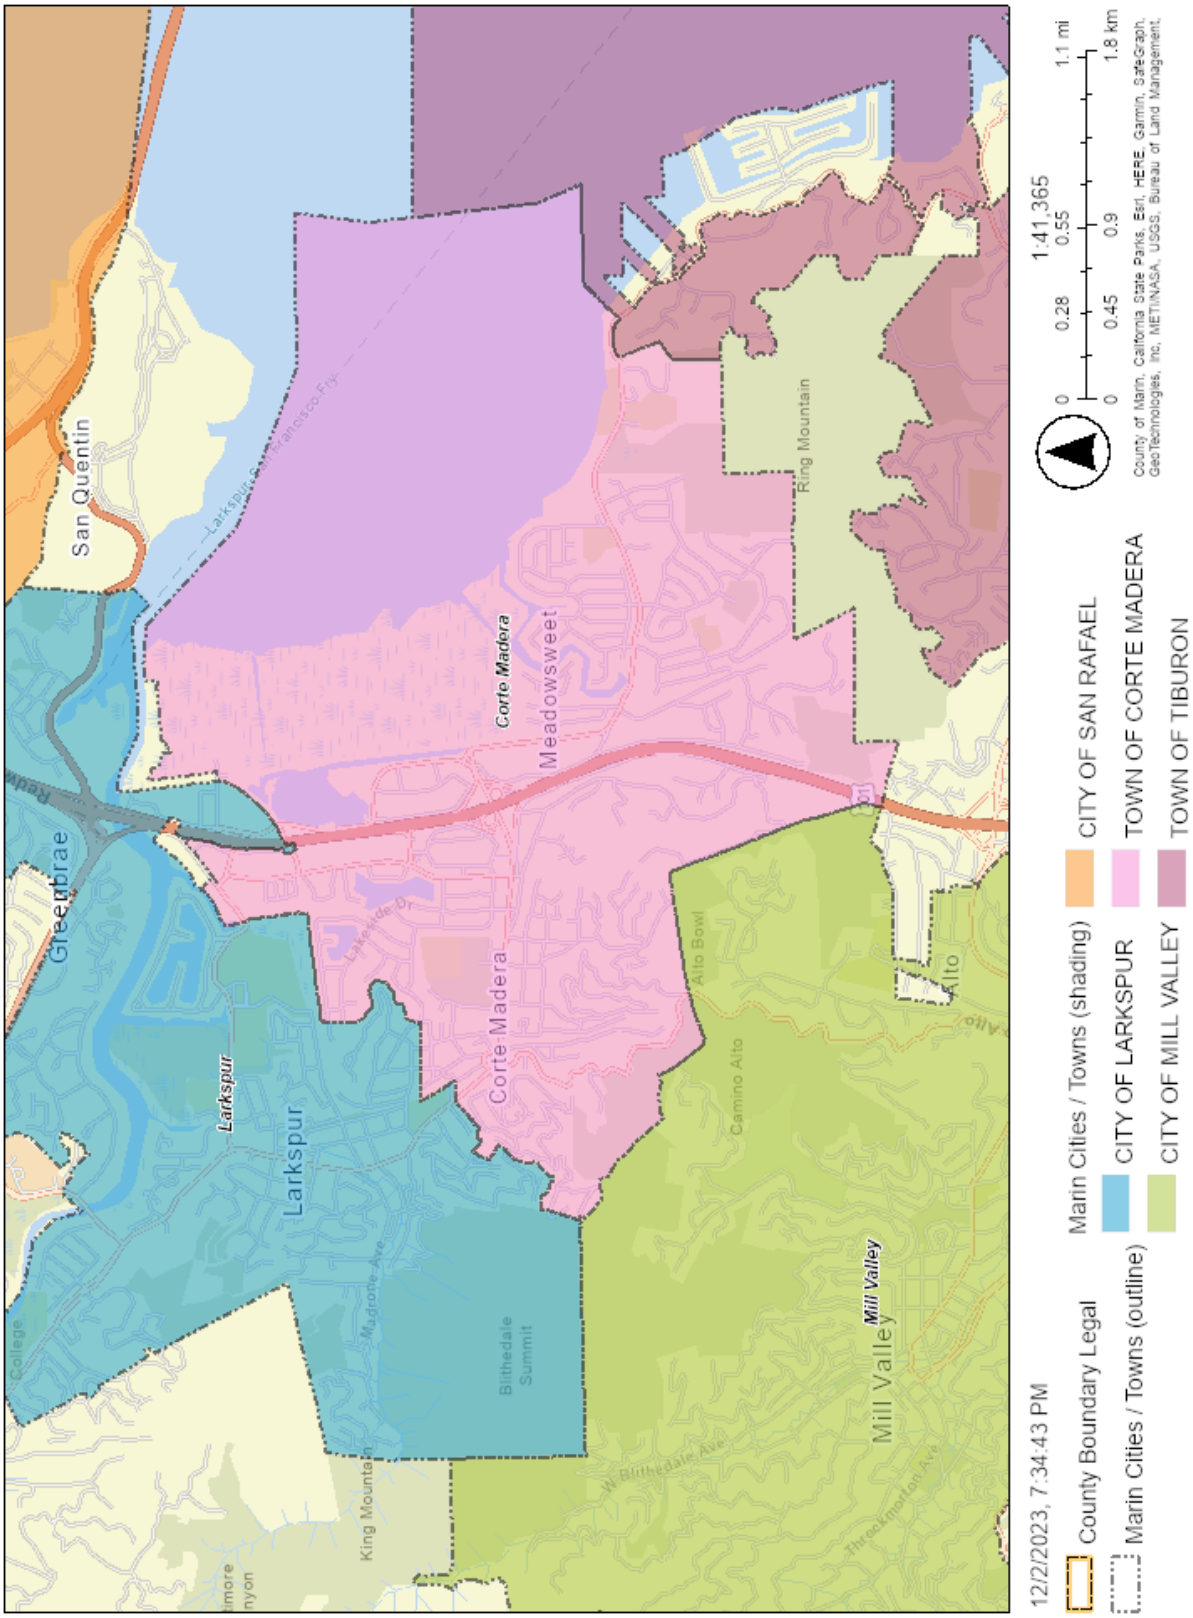

Figure 98: Map of the Town of Corte Madera
Source: Marin County OEM

1.4 GOVERNMENT

The Town of Corte Madera is governed by a five-person Town Council. The Town Council elects one of its members to serve as Mayor, the executive head of the town; and appoints a town Manager, the administrative head of the town. The town consists of 10 departments: the Administration, Community Development, Code Enforcement, Finance, Fire, Human Resources, Parks and Recreation, Police, Public Works, and Sanitary District No. 2.

The City Council assumes responsibility for the adoption of this plan; and the City Manager will oversee its implementation.

In 2018, the Towns of Corte Madera and Larkspur formed the Central Marin Fire Department, a Joint Powers Authority to provide fire protection.

In 1980 the town merged its police department with the of neighboring town of Larkspur to become the Twin Cities Police Authority, which subsequently merged in 2013 with the police department of San Anselmo to form the Central Marin Police Authority.

1.5 SANITARY DISTRICT NUMBER 2

Sanitary District No. 2 was incorporated on January 21, 1901, and was re-incorporated as a subsidiary district to the Town of Corte Madera (Town) on January 15, 1969. The District provides sewage collection services for the town, limited areas of the surrounding communities of Larkspur and Tiburon, and certain unincorporated land within Marin County. These services include the installation and maintenance of sanitary sewer pipelines and pump stations, regulation of sanitary sewer connections, and waste collection services within the boundary of the District.

Treatment of sanitary sewer flow is provided by the Central Marin Sanitation Agency (CMSA). Waste collection services are provided by Mill Valley Refuse.

The Corte Madera Town Council also serves as Board Members for Sanitary District No. 2. The Corte Madera Town Council/Board is the community's part-time legislative body consisting of five members including the Mayor, Vice Mayor and three Councilmembers (Town Council) and Board President, Board Vice-President and three Board Members (Sanitary District No. 2). They are elected at-large on a non-partisan basis for a four-year term. The terms are staggered so that a measure of continuity is maintained in the transitions from one Council to the next. Council members receive compensation in the amount of $300 per month, with the Mayor receiving $350 per month.

Citizen participation at Council/Sanitary District meetings is encouraged. Public Open Time for any item not on the current agenda is scheduled at the beginning of each meeting. Council meetings are normally held on the 1st and 3rd Tuesday of each month at 6:30 P.M. in the Town Hall Council Chambers (300 Tamalpais Drive). Sanitary District meetings are normally held on the 1st and 3rd Tuesday of each month at 6:45 P.M. or upon conclusion of the Corte Madera Town Council meeting, whichever is later, in the Town Hall Council Chambers (240 Tamal Vista Blvd., Ste. 108).

1.6 History and Administration of Sanitary District Number 2

The Sanitary District No. 2 came into existence by historical necessity because the town was not yet organized and therefore could not correct cesspools and raw sewage flows that were becoming commonplace at the beginning of the 20th century. The District was incorporated on January 21, 1901, approximately 15½ years prior to the Town's incorporation on June 10, 1916. Although legally separate, the Town and District operated in conjunction with each other including sharing equipment, office space, and meeting facilities.

Due to a change in the Municipal Organization Act, the Town was able to legally absorb the District. The District was re-incorporated as a subsidiary district to the Town on January 15, 1969. The Town Council became the Town Council/District Board of Directors. On April 1, 1969, the District ceased being an employer and its former employees were absorbed by the Town. Subsequently, the State Controller's Office requested that the merger be formalized with a Joint Powers Agreement. Town Resolution 1510 and District Resolution No. 9-73, both of which consummated the Joint Powers Agreement, were adopted by the Town Council/District Board of Directors on September 17, 1973.

Although the District is no longer independent, it does have a legal existence separate and apart from the Town. Currently, the boundaries of the Town and District are essentially contiguous, with three principal exceptions. Portions of the Tiburon Peninsula served by the District are either in the incorporated limits of the Town of Tiburon or in the unincorporated sphere of influence of the Town of Tiburon. That portion of Greenbrae to the east of Highway 101 and south of Corte Madera Creek served by the District is either in the incorporated limits of the City of Larkspur or in the unincorporated sphere of influence of the Town of Corte Madera. A residential area known as Palm Hill in the City of Larkspur features a boundary with the District that is dependent on gravity flow into the District. There are several smaller exceptions such as East Lucky Drive, which is in the unincorporated sphere of influence of the Town of Corte Madera.

The District is presented as a business-type activity and an enterprise fund under the category of proprietary fund types in the fund based financial statements.

The District is a member of the Central Marin Sanitation Agency (CMSA), established on October 15, 1979, which is a joint powers agency administered by its own board, separate from the Town Council/District Board of Directors. Financial information of this agency is not included in the accompanying basic financial statements except for the operating expenses included as sewage collection-pump station maintenance, the "FOG" (Fats, Oils, & Grease) source control program, and sewage treatment and disposal, which are expenses reimbursed by the District to CMSA. The District contracts under the Joint Powers Agreement with CMSA for CMSA personnel to provide all engineering, management, and operational services for the treatment and disposal of wastewater. By a separate contractual agreement, CMSA personnel provide for sewage collection pump station maintenance and the FOG source control program (inspection and enforcement) as part of the District's sewer system management plan as mandated by the State.

Town personnel provide all engineering, management and operational services to the wastewater collection system, exclusive of management and operational services for sewage collection pump station maintenance. In excess of 80% of the funding of CMSA's sewage

facilities were funded by Federal and State sources, with the remainder of the funding by the participants. The District provides one of the six members of the governing board of the CMSA. The operating agreement provides that members (including the District) are not obligated for the debts, liabilities, or obligations of the Agency. Pursuant to GASB Statements 14 and 39 regarding "The Financial Reporting Entity", the CMSA operating arrangement has been categorized as a "jointly governed organization."

1.5 Weather and Climate

The Town of Corte Madera lies 39 feet above sea level. In Corte Madera, the summers are long, comfortable, arid, and mostly clear and the winters are short, cold, wet, and partly cloudy. Over the course of the year, the temperature typically varies from 43°F to 73°F and is rarely below 36°F or above 84°F. The difference in precipitation between the driest month and the wettest month is 5 inches. The annual rainfall is 18 inches. The month of highest relative humidity is February (79.73 %). The month with the lowest relative humidity is June (69.32 %). The month which sees the most rainfall is January. The driest month of the year is July.

	January	February	March	April	May	June	July	August	September	October	November	December
Avg. Temperature °C (°F)	9.4 °C (48.9) °F	10.2 °C (50.3) °F	11.3 °C (52.4) °F	12.3 °C (54.1) °F	14 °C (57.2) °F	15.9 °C (60.7) °F	16.3 °C (61.3) °F	16.7 °C (62) °F	16.8 °C (62.3) °F	15.3 °C (59.6) °F	12.2 °C (53.9) °F	9.6 °C (49.4) °F

1.6 Demographics

The California Department of Finance shows an overall estimated decrease in the population of Marin County and the Town of Corte Madera since the last plan update in 2018. Of the total estimated 257,135 residents of Marin County in 2022 based on the 2020 U.S. Census Survey, 190,148 residents live in the incorporated county and 66,987 residents live in the unincorporated county.

The Town of Corte Madera had an estimated population of 10,104 in the 2018 plan. 2020 U.S. Census Survey estimated the Town's population at 10,222. However, revised estimates for 2022 estimated the population to decrease to 10,028 population.

Table 4: Town of Corte Madera Estimated Jurisdictional Population				
Jurisdiction	Population 2022 (Estimate)	Population 2020	Population 2018 (Estimate)	Percent Change 2018-2022
Marin County	257,135	262,321	262,179	-1.92%
Town of Corte Madera	10,028	10,222	10,104	-0.75%

Table 45: Town of Corte Madera Estimated Jurisdictional Population
Source: California Department of Finance

According to the U.S. Census, the population of The Town of Corte Madera is 10,222 as of 2020. Between 2018-2020, the City's growth rate increased at an average annual rate of 1.12%, lower than the historic twenty-year average growth rate of 3.2%. Table 5 shows the population growth comparison of the State of California, County of Marin and the Town of Corte Madera between 2010 - 2020.

Table 5: Population Change of The Town of Corte Madera				
Jurisdiction	Total Population		Change, 2010-2020	
	April 1, 2010	April 1, 2020	Number	Percent
California	37,253,956	39,538,223	2,284,267	6.1%

1.7 Social Vulnerability and Risk

The California Governor's Office of Emergency Services (Cal OES) has initiated the "Prepare California" grant program focused on building community resilience amongst vulnerable individuals living in the areas of the state most susceptible to natural disasters. The Prepare California Initiative is aimed at reducing long-term risks from natural disasters by investing in local capacity building and mitigation projects designed to protect communities.

Prepare California leverages funds approved in Governor Gavin Newsom's 2021-22 State Budget and is designed to unlock federal matching funds for community mitigation projects that vulnerable communities would otherwise be unable to access. This program is intended for communities that are the most socially vulnerable and at the highest risk for future natural hazard events. The state identified communities by prioritizing California census tracts according to their estimated hazard exposures and social vulnerability.

The National Risk Index is a dataset and online tool to help illustrate the United States communities most at risk for 18 natural hazards: Avalanche, Coastal Flooding, Cold Wave, Drought, Earthquake, Hail, Heat Wave, Hurricane, Ice Storm, Landslide, Lightning, Riverine Flooding, Strong Wind, Tornado, Tsunami, Volcanic Activity, Wildfire, and Winter Weather.

For purposes of this plan the following National Risk Index (NRI) hazards are profiled in support of eight of the twelve Marin County OA MJHMP Hazards. NRI data was not available for Dam Failure, Land Subsidence, Levee Failure, or Sea Level Rise.

Table 8: NRI Hazards and Marin County MJHMP Hazards	
NRI Hazards	Marin County MJHMP Hazards
Earthquake	Earthquake
Riverine Flooding	Flooding
Coastal Flooding	Flooding
Wildfire	Wildfire
Landslide	Debris Flow
Drought	Drought
Heat Wave	Severe Weather -Extreme Heat
Tsunami	Tsunami
Strong Wind	Severe Weather – Wind, Tornado

Table 49: NRI Hazards and Marin County MJHMP Hazards
Source: FEMA National Risk Index 2023

The National Risk Index leverages available source data for Expected Annual Loss due to these 18 hazard types, Social Vulnerability, and Community Resilience to develop a baseline relative risk measurement for each United States county and Census tract. These measurements are calculated using average past conditions, but they cannot be used to predict future outcomes for a community. The National Risk Index is intended to fill gaps in available data and analyses to better inform federal, state, local, tribal, and territorial decision makers as they develop risk reduction strategies.

Calculating the Risk Index

Risk Index scores are calculated using an equation that combines scores for Expected Annual Loss due to natural hazards, Social Vulnerability and Community Resilience:

Risk Index = Expected Annual Loss × Social Vulnerability ÷ Community Resilience

Hazard Type Risk Index

Hazard type Risk Index scores are calculated using data for only a single hazard type, and reflect a community's Expected Annual Loss value, community risk factors, and the adjustment factor used to calculate the risk value. Table 9 illustrates the NRI Hazard Type Risk Index for Corte Madera Census Tract 1212.00.

Table 9: NRI Hazard Type Risk Index for Corte Madera Census Tract 1212.00

Hazard Type	EAL Value	Social Vulnerability	Community Resilience	CRF	Risk Value	Score
Earthquake	$2,555,358	Relatively Moderate	Very High	1.13	$2,880,541	97.9
Riverine Flooding	$1,669,266	Relatively Moderate	Very High	1.13	$1,881,689	99.2
Coastal Flooding	$257,460	Relatively Moderate	Very High	1.13	$290,224	98.2
Heat Wave	$10,058	Relatively Moderate	Very High	1.13	$11,338	53.9
Landslide	$3,769	Relatively Moderate	Very High	1.13	$4,249	87.8
Wildfire	$1,679	Relatively Moderate	Very High	1.13	$1,893	73.6
Tsunami	$1,130	Relatively Moderate	Very High	1.13	$1,274	96.8
Lightning	$424	Relatively Moderate	Very High	1.13	$478	9.3
Strong Wind	$346	Relatively Moderate	Very High	1.13	$390	12.2
Hail	$32	Relatively Moderate	Very High	1.13	$36	6.7
Drought	$0	Relatively Moderate	Very High	1.13	$0	0

Figure 11 illustrates the Social Vulnerability Map for Corte Madera Census Tract 1211.00.

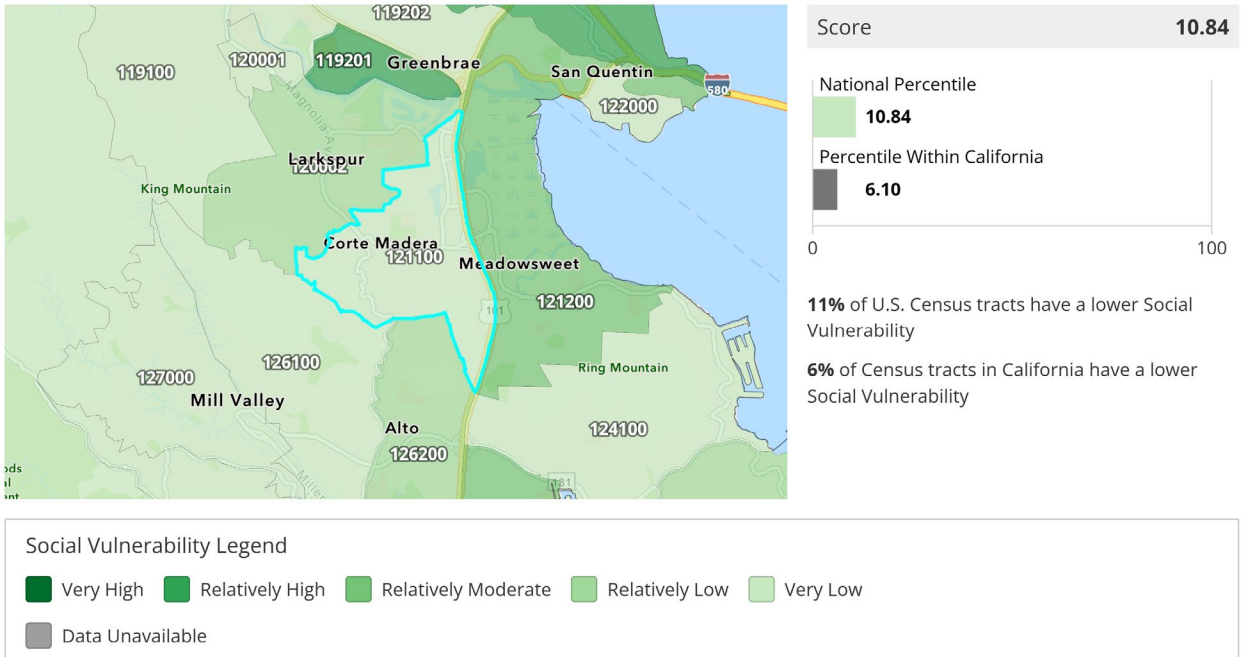

Figure 103: Town of Corte Madera Social Vulnerability Map Census Tract 1211.00
Source: FEMA National Risk Index 2023

Most socially vulnerable residents in Marin County reside in parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and the unincorporated areas of Marin City and Santa Venetia. This aligns with what the County knows about Marin residents. However, discrepancy lies in the western, more rural area of the county. West Marin is comprised of seven villages, and other populated areas, that are distanced from the centralized resources in the eastern part of the county. At three local elementary school in West Marin (2022-2023 school year), students eligible for free and reduced lunch program are, 62%, 41%, and 52%, a reflection of the financial capacity of local families. West Marin is home to many farms that may employ and house underrecognized workers that may not have taken part in a census survey, what the SVI is calculated from. In the fourth quarter of FY 2021/22 the bus routes traveling to West Marin (Rural Routes) were the only service category to have increased in ridership since pre-COVID (increase 0.1%; Marin Transit, 2022) showing the reliance of West Marin residents on public transportation; however, this data continues to adjust based upon the increase in alternate methods of mass transportation. Considering this, the County of Marin acknowledges that unique social factors in West Marin require different approaches than other parts of the County.

Looking to the community resilience index (CRI) results, the data is only calculated at the county-level and compared across the nation. As a whole, Marin County is considered to have a “very high” ability to prepare for anticipated natural hazards, adapt to changing conditions, and withstand and recover rapidly from disruptions when compared to the rest of the U.S. Unfortunately, this metric does not give us the distinct experiences of the diverse communities across Marin.

When the Estimated Annual Loss Index, Social Vulnerability Index, and Community Resilience Index are aggregated as one, final results of the National Risk Index show Marin County as a whole to have “Relatively High” risk, this is due to the financial implications a disaster may have on the county. When broken out by census tract, five tracts are in the highest category (“Very High Risk”), this matches generally with the same tracts that are ranked in as higher social vulnerability; parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and unincorporated areas of Santa Venetia.

However, Marin City is ranked as “Very Low” risk for the National Risk Index. Previous discussion highlighted why the Expected Annual Loss was low, but further discussion is required. As a County, we know Marin City should not be classified as “Very Low” on the NRI. Marin City residents, for example, only have one way in and out of their community and this road floods frequently, making it unsafe to cross and leave the community for work, school, and medical resources. Additionally, there is only one “grocery” store, a Target, in Marin City. Both of these elements contribute to the vulnerability of residents as they may be unable to leave or return home and have limited access to groceries, relying on a single store’s supply chain. At the local elementary school in Marin City, 47% of students are eligible for free and reduced-price meals (2022 – 2023 school year), a reflection of the financial capacity of local families. All this means, we can expect the social and built capacity of Marin City to be limited.

The median income for a household in the Town of Corte Madera was $183,661 and the per capita income for the Town was $95,257. Approximately 2.1 percent of families and 4.9 percent of the population were below the poverty line (2020 data, U.S. Census Bureau). This poverty line is higher than other communities within Marin County but is also significantly lower than some communities within the County of Marin. The two census tracts reflect both a Relatively Moderate and Very Low Social Vulnerability Index in the Town, which reflects the Towns SVI position within the County.

In Corte Madera, 59.1% of households make more than 100% of the Area Median Income (AMI)14, compared to 12.1% making less than 30% of AMI, which is considered extremely low-income. Regionally, more than half of all households make more than 100% AMI, while 15% make less than 30% AMI. In Marin County, 30% AMI is the equivalent to the annual income of $44,000 for a family of four. Many households with multiple wage earners – including food service workers, full-time students, teachers, farmworkers, and healthcare professionals – can fall into lower AMI categories due to relatively stagnant wages in many industries. (Housing Element for the Town of Corte Madera 2023-2031)

There are approximately 470 extremely low-income households in Corte Madera (12.1% of the total number of households), and approximately two-thirds of these households own their homes. In order to remain in their homes, extremely low-income owner households need programs to help reduce housing costs, while extremely low income renter households need programs to limit rent increases. (Housing Element for the Town of Corte Madera 2023-2031)

1.8 ECONOMY AND TAX BASE

Table 11 shows income by household in The Town of Corte Madera as of 2019.

Table 11: Household Income for The Town of Corte Madera as of 2019		
Household Income	Number	Percent
Total Households	1,842	-
Less than $10,000	90	4.9%
$10,000 to $14,999	195	10.6%
$15,000 to $24,999	228	12.4%
$25,000 to $34,999	164	8.9%

1.10 HISTORICAL PROPERTIES

The Town of Corte Madera does not have any registered historically significant homes, public buildings, or landmarks. To inventory these resources, the Marin County OA MJHMP Planning Team collected information from a number of sources:

- California Department of Parks and Recreation Office of Historic Preservation (OHP) OHP is responsible for the administration of federally and state mandated historic preservation programs to further the identification, evaluation, registration, and protection of California's irreplaceable archaeological and historical resources. OHP administers the National Register of Historic Places, the California Register of Historical Resources, California Historical Landmarks, and the California Points of Historical Interest programs.
- Town of Corte Madera Chamber of Commerce.
- Town of Corte Madera website.

As defined by the National Environmental Policy Act (NEPA), any property over 50 years of age is considered a potential historic resource and is potentially eligible for the National or California Register. Thus, in the event that the property is to be altered, or has been altered, as the result of a major federal action, the property must be evaluated under the guidelines set forth by NEPA. Structural mitigation projects are considered alterations for the purpose of this regulation. Similar regulations exist for buildings under the California Environmental Quality Act (CEQA)

SECTION 2.0: HAZARD IDENTIFICATION AND RISK ASSESSMENT

The Town of Corte Madera identified hazards that affect the city and developed natural hazard profiles based upon the countywide risk assessment, past events and their impacts. Figure 12 shows the top hazards that the Jurisdiction is at risk from according to the hazard mitigation Steering Committee.

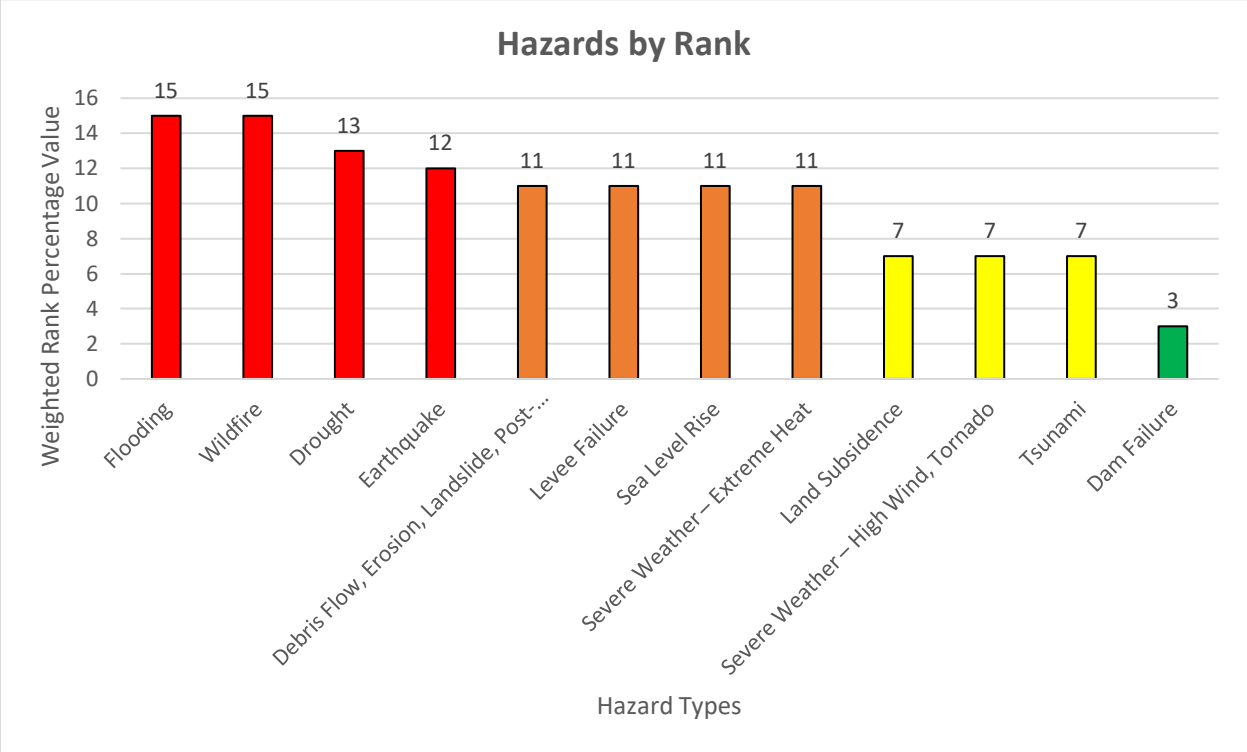

Figure 104: Town of Corte Madera Risk Assessment – Planning Team Top Hazards

Figure 13: Risk Rank Categorization	
Risk Level	**Risk Numerical Score**
High Risk	**12 - 16**
Serious Risk	**8 - 11**
Moderate Risk	**4 - 7**
Low Risk	**1 - 3**

Figure 105: Hazard Risk Categorization

Each Marin County MJHMP participating jurisdiction and organization reviewed and approved the Top Hazards identified by the Planning Team. Each participating jurisdiction and district then completed a more complex assessment tool to further develop their hazard assessment and prioritization.

The planning process used the available FEMA tools to evaluate all the possible threats faced. The primary tool selected was the Hazard Assessment and Prioritization Tool. This matrix allowed the participating jurisdiction or organization to assess their own level of vulnerability and

mitigation capability. Each participating Jurisdiction and organization assessed the top hazards for:

- Probability/ Likelihood of Future Events
- Geographic Extent
- Magnitude/ Severity
- Climate Change Influence
- Significance

Probability/ Likelihood of Future Events

- **Unlikely:** Occurs in intervals greater than 100 years - Less than 1% probability of occurrence in the next year or a recurrence interval greater than 100 years.
- **Occasional:** Occurring every 11 to 100 years - 1-10% probability of occurrence in the next year or a recurrence interval of 11 to 100 years.
- **Likely:** Occurring every 1 to 10 years - 10-90% probability of occurrence in the next year or recurrence interval of 1 to 10 years.
- **Highly Likely:** Occurring almost every year - 90-100% probability of occurrence in the next year or a recurrence interval of less than 1 year.

Geographic Extent

- **Negligible:** Less than 10% of the planning area
- **Limited:** 10-25% of the planning area
- **Significant:** 25-75% of planning area
- **Extensive:** 75-100% of planning area

Magnitude/ Severity

- **Weak:** Limited classification on scientific scale, slow speed of onset or short duration of event, resulting in little to no damage.
- **Moderate:** Moderate classification on scientific scale, moderate speed of onset or moderate duration of event, resulting in some damage and loss of services for days.
- **Severe:** Severe classification on scientific scale, fast speed of onset or long duration of event, resulting in devastating damage and loss of services for weeks or months.
- **Extreme:** Extreme classification on scientific scale, immediate onset or extended duration of event, resulting in catastrophic damage and uninhabitable conditions.

Table 14: Select Hazards Magnitude and Severity Scale

Hazard	Scale/Index	Weak	Moderate	Severe	Extreme
Drought	Palmer Drought Severity Index	+1.99 to -1.99	-2.00 to -2.99	-3.00 to -3.99	-4.00 and below
Earthquake	Modified Mercalli	I to IV	V to VII	VIII	IX to XII
	Richter Magnitude	2,3	4,5	6	7,8
Tornado	Fujita Tornado Damage Scale	FO	F1, F2	F3	F4, F5

Table 55: Select Hazards Magnitude/ Severity Scale or Index

Climate Change Influence

- **Low:** Minimal potential impact
- **Medium:** Moderate potential impact
- **High:** Widespread potential impact

Significance

- **Low:** Minimal potential impact - Two or more criteria fall in lower classifications, or the event has a minimal impact on the planning area. This rating is sometimes used for hazards with a minimal or unknown record of occurrences or for hazards with minimal mitigation potential.
- **Medium:** Moderate potential impact - The criteria fall mostly in the middle ranges of classifications and the event's impacts on the planning area are noticeable but not devastating. This rating is sometimes used for hazards with a high extent rating but very low probability rating.
- **High:** Widespread potential impact - The criteria consistently fall in the high classifications and the event is likely/highly likely to occur with.

2.1 CLIMATE CHANGE

The County of Marin and associated jurisdictions profiled jointly recognize that the earth's climate is forcibly being augmented due to humans' reliance on fossil fuels and non-natural resources which pose negative impacts on the earth's climate. Reliance on fossil fuels and non-natural products results in the climate shifting to include unseasonable temperatures, more frequent and intense storms, prolonged heat and cold events, and a greater reliance on technological advancements to maintain the wellbeing of community members and balance of the environment. The forced adaptation to climatic shifts is necessary for the County and jurisdictions to understand and include with these assessments.

Locally to Marin, drought and rain events have already had devastating impacts to critical infrastructure, agriculture, and water resources; and globally, unseasonable temperatures have been identified as the cause for enhanced wildfires, severe droughts, ice sheets and glaciers disappearing, and persons emigrating from their countries due to a lack of sustainable, local resources. Melting land ice contributes additional water to the oceans and as ocean temperatures rise the water expands, both of which contribute to increase rates of sea level rise. Marin is bordered on the west by the Pacific Ocean and on the east by San Francisco Bay, making it particularly vulnerable to flooding and erosion caused by sea level rise.

The cause of current climate change is largely human activity, burning fossil fuels, natural gas, oil, and coal. Burning these materials releases greenhouse gases into Earth's atmosphere. Greenhouse gases trap heat from the sun's rays inside the atmosphere causing Earth's average temperature to rise. This rise in the planet's temperature was formerly called, "global warming", but climate change has shown to include both intense heat and cold shifts. The warming of the planet impacts local and regional climates. Throughout Earth's history, climate has continually changed; however, when occurring naturally, this is a slower process that has taken place over hundreds and thousands of years. The human influenced climate change that is happening now is occurring at an abnormally faster rate with devastating results.

GLOBAL OBSERVED AND PROJECTED IMPACTS AND RISKS

Source: Intergovernmental Panel on Climate Change, Headline Statements from the Summary for Policymakers, 2022

- Human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability.
- Global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans.
- Beyond 2040 and depending on the level of global warming, climate change will lead to numerous risks to natural and human systems.
- The magnitude and rate of climate change and associated risks depend strongly on near-term mitigation and adaptation actions, and projected adverse impacts and related losses and damages escalate with every increment of global warming.
- Multiple climate hazards will occur simultaneously, and multiple climatic and non-climatic risks will interact, resulting in compounding overall risk and risks cascading across sectors and regions.

FUTURE TRENDS/ IMPACTS

Source: Study Confirms Climate Models are Getting Future Warming Projections Right – Climate Change: Vital Signs of the Planet (nasa.gov)

Global Warming

- If global warming transiently exceeds 1.5°C in the coming decades or later, then many human and natural systems will face additional severe risks.
- An estimated 60% of today's methane emissions are the result of human activities. The largest sources of methane are agriculture, fossil fuels, and decomposition of landfill waste.
- The concentration of methane in the atmosphere has more than doubled over the past 200 years. Scientists estimate that this increase is responsible for 20 to 30% of climate warming since the Industrial Revolution (which began in 1750).
- According to the most recent National Climate Assessment, droughts in the Southwest and heat waves (periods of abnormally hot weather lasting days to weeks) are projected to become more intense, and cold waves less intense and less frequent.
- The last eight years have been the hottest years on record for the globe.

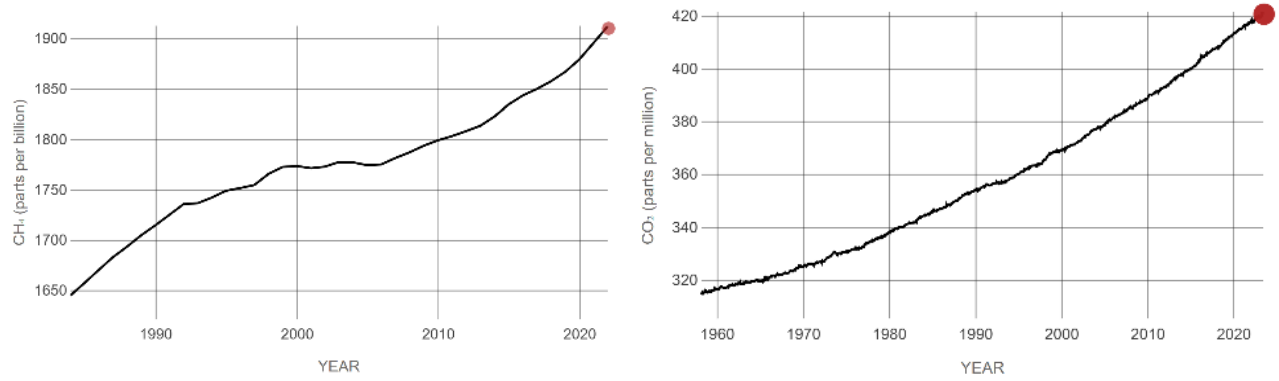

Figure 106: NASA Global Temperature Change CO2 Gas
Source: NASA Global Climate Change, 2022

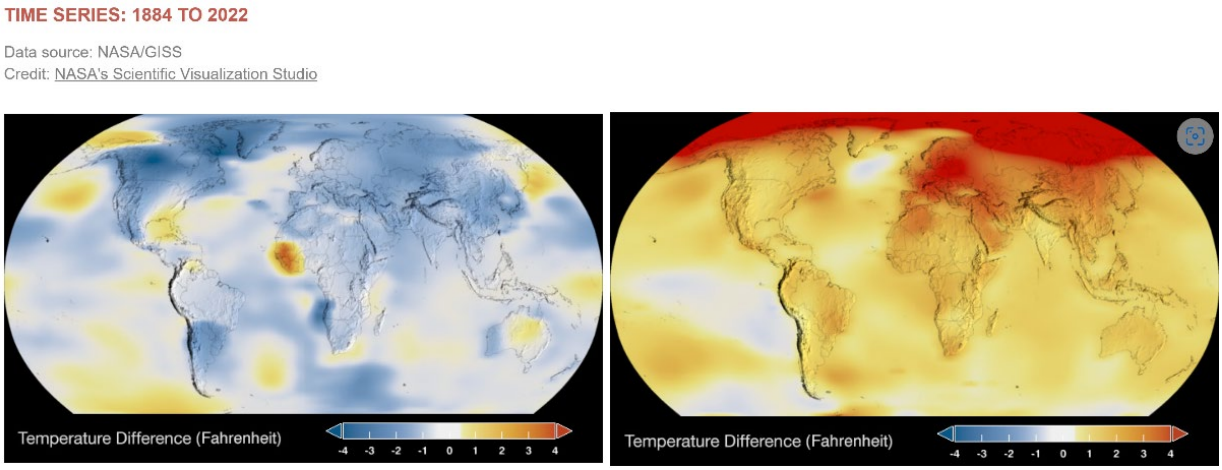

Figure 107: NASA Global Temperature Change 1884 to 2022
Source: NASA Global Climate Change, 2022

Drought

- A NASA-led study in 2022 concluded that the 22-year-long megadrought in southwestern US was the driest the territory had experienced in at least 1,200 years and was expected to persist through at least 2022.

Sea Level Rise

- Global sea levels are rising as a result of human-caused global warming, with recent rates being unprecedented over the past 2,500-plus years.

- U.S. Sea Level Likely to Rise 1 to 6.6 Feet by 2100.
- Global sea level has risen about 8 inches (0.2 meters) since reliable record-keeping began in 1880. By 2100, scientists project that it will rise at least another foot (0.3 meters), but possibly as high as 6.6 feet (2 meters) in a high-emissions scenario.
- Sea ice cover in the Arctic Ocean is expected to continue decreasing, and the Arctic Ocean will very likely become essentially ice-free in late summer if current projections hold. This change is expected to occur before mid-century.
- An indicator of changes in the Arctic sea ice minimum over time. Arctic sea ice extent both affects and is affected by global climate change.

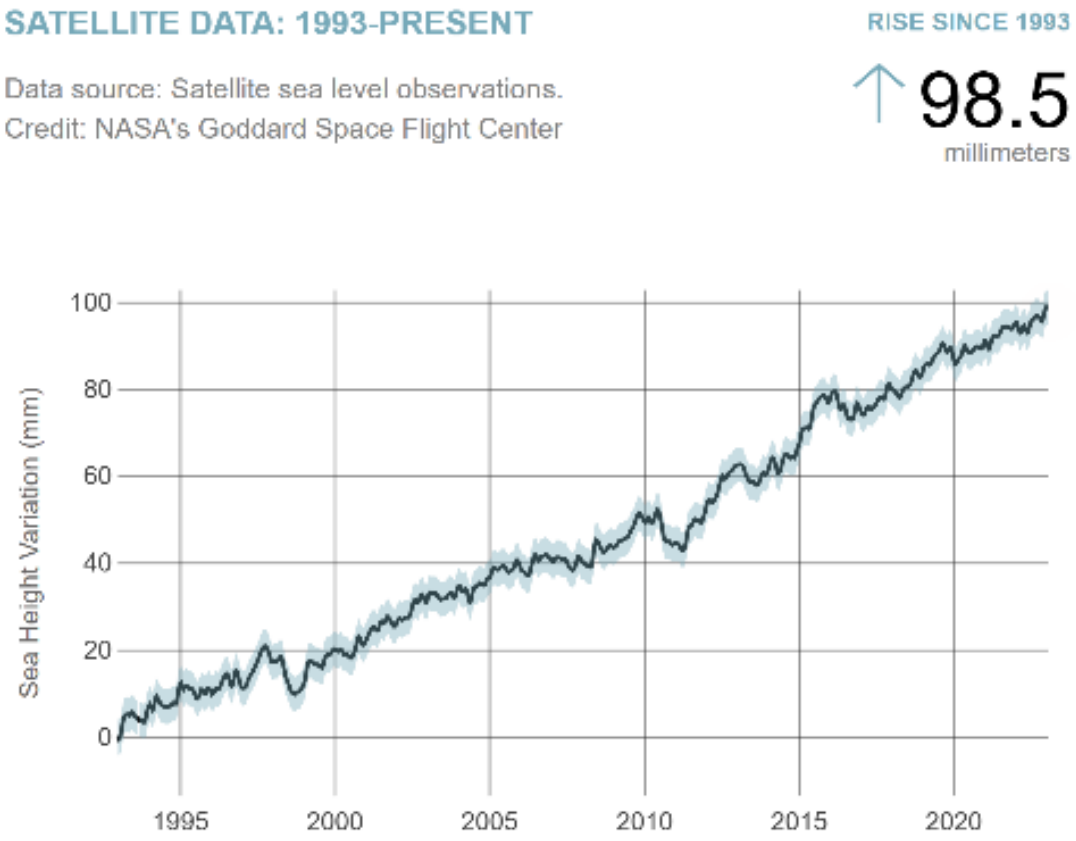

Figure 108: NASA Global Temperature Change Sea Level
Source: NASA Global Climate Change, 2022

Wildfire

- Warming temperatures have extended and intensified wildfire season in the West, where long-term drought in the region has heightened the risk of fires.
- Scientists estimate that human-caused climate change has already doubled the area of forest burned in recent decades. By around 2050, the amount of land consumed by wildfires in Western states is projected to further increase by two to six times.
- Even in traditionally rainy regions like the Southeast, wildfires are projected to increase by about 30%.

Flooding (Precipitation)

- Climate change is having an uneven effect on precipitation (rain and snow) in the United States, with some locations experiencing increased precipitation and flooding, while others suffer from drought.
- On average, more winter and spring precipitation is projected for the northern United States, and less for the Southwest, over this century.
- Projections of future climate over the U.S. suggest that the recent trend toward increased heavy precipitation events will continue. This means that while it may rain less frequently in some regions (such as the Southwest), when it does rain, heavy downpours will be more common.

Extreme Cold

- The length of the frost-free season, and the corresponding growing season, has been increasing since the 1980s, with the largest increases occurring in the western United States.

According to the California Natural Resource Agency (CNRA), climate change is already affecting California and is projected to continue to do so well into the foreseeable future. Current and projected changes include increased temperatures, sea level rise, a reduced winter snowpack, altered precipitation patterns, and more frequent storm events. Over the long term, reducing greenhouse gases can help make these changes less severe, but the changes cannot be avoided entirely. Unavoidable climate impacts result in a variety of secondary consequences including detrimental impacts on human health and safety, economic continuity, ecosystem integrity and provision of basic services. Climate change is being profiled in the 2023 Marin County OA MJHMP as a standalone hazard while addressing each of the other natural hazards. The Marin County OA is considering climate change issues when identifying future mitigation actions.

California is experiencing a climate crisis that is increasingly taking a toll on the health and well-being of its people and on its unique and diverse ecosystems. Every Californian has suffered from the effects of record high temperatures, dry winters, prolonged drought, and proliferating wildfires in recent years. California's biodiversity is threatened as alterations to habitat conditions brought about by a changing climate are occurring at a pace that could overwhelm the ability of plant and animal species to adapt.

Indicators of Climate Change in California

Source: 2022 Report: Indicators of Climate Change in California | OEHHA

- Since 1895, annual average air temperatures in California have increased by about 2.5 degrees Fahrenheit (°F). Warming occurred at a faster rate beginning in the 1980s.
- Recent years have been especially warm: Eight of the ten warmest years on record occurred between 2012 and 2022; 2014 was the warmest year on record.
- Of all the Western states, California endured the hottest temperatures for the longest time, driving the average statewide temperature to the second warmest over the past 128 years.

- Extreme heat ranks among the deadliest of all climate-driven hazards in California, with physical, social, political, and economic factors effecting the capacity of individuals, workers, and communities to adapt, and with the most severe impacts often on communities who experience the greatest social and health inequities.
- Glaciers have essentially disappeared from the Trinity Alps in Northern California
- In 2020, wildfire smoke plumes were present in each county for at least 46 days.
- The 2022 fire season saw more fires than the previous fire season along with continued extreme drought and heat conditions.
- The drought, begun in 2019, was the third statewide drought declared in California since 2000.
- This drought has been marked by extreme swings; the state received record-breaking amounts of precipitation in October and December 2021 that were offset by the driest January, February, and March 2022 dating back more than 100 years. The year 2023 opened with California simultaneously managing both drought and flood emergencies.
- A series of storms in late December 2022 and early January 2023 broke rural levees, disrupted power, flooded roads, downed trees, and eroded coastal land.
- Sea level rise accelerates coastal erosion, worsens coastal flooding during large storms and peak tidal events, and impacts important infrastructure positioned along our state's 1,100-mile coast.
- The western drought which impacted all of California and the western United States was nearly lifted due to unseasonably heavy rains in late 2022 and early 2023.

The graph below shows the relative change, in millimeters, in sea levels at Crescent City (1933-2020), San Francisco (1900-2020), and La Jolla (1925-2020).

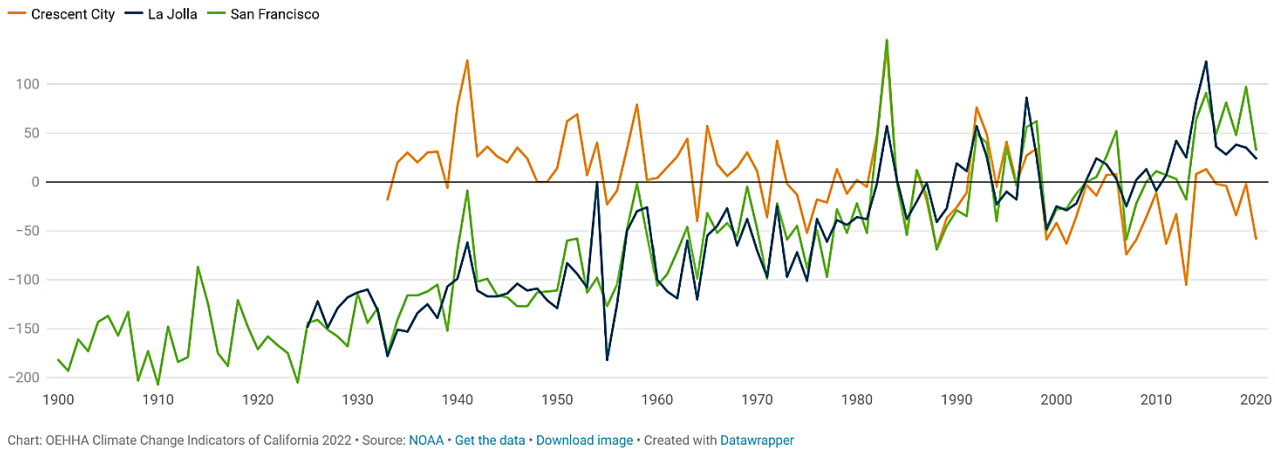

Figure 109: Annual Mean Sea Level Trends
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

Climate Change in the Marin County Operational Area

Climate change is already having significant impacts across California. Temperatures are warming, heat waves are more frequent, and precipitation has become increasingly variable. The annual average daily high temperatures in California are expected to rise by 2.7°F by 2040, 5.8°F by 2070, and 8.8°F by 2100 compared to observed and modeled historical conditions[8]. At the current rate, annual average temperatures in the San Francisco Bay Area will likely increase by approximately 4.4 degrees by 2050 and 7.2 degree by the end of the century unless significant efforts are made to reduce greenhouse emotions according to California's latest climate change assessment.

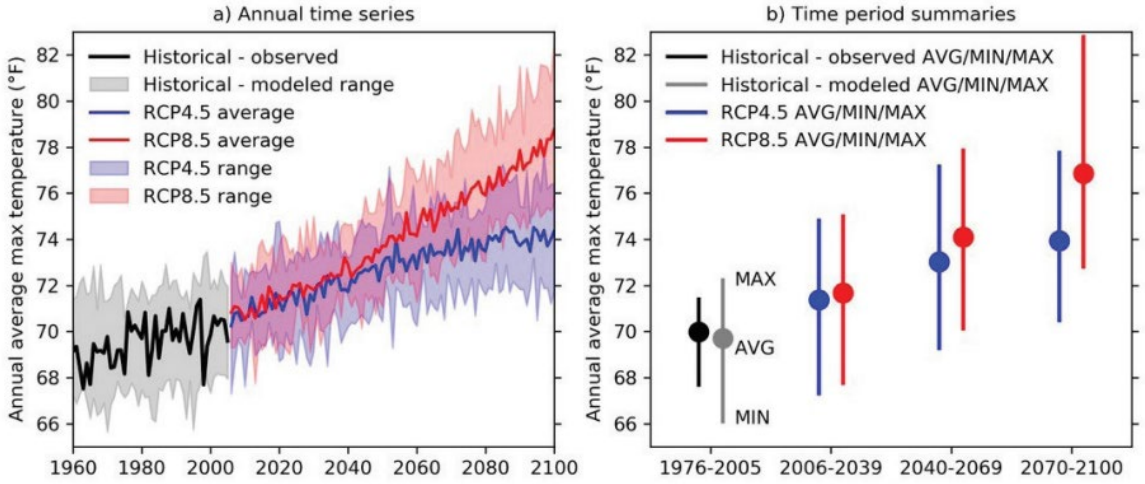

Figure 110: Annual Average Temperatures in the San Francisco Bay Area, 2000-2100
Source: California Climate Change Assessment (Fourth Edition)

Sea level rise in the San Francisco Bay Area is projected to increase by eight inches MHW in 2050 and could reach 4.5 to eight feet by 2021 if greenhouse gas emissions aren't reduced. Marin Shoreline Sea Level Rise Vulnerability Assessment: https://www.marincounty.org/-/media/files/departments/cd/planning/slr/baywave/vulnerability-assessment-final/final_allpages_bvbconsulting_reduced.pdf?la=en

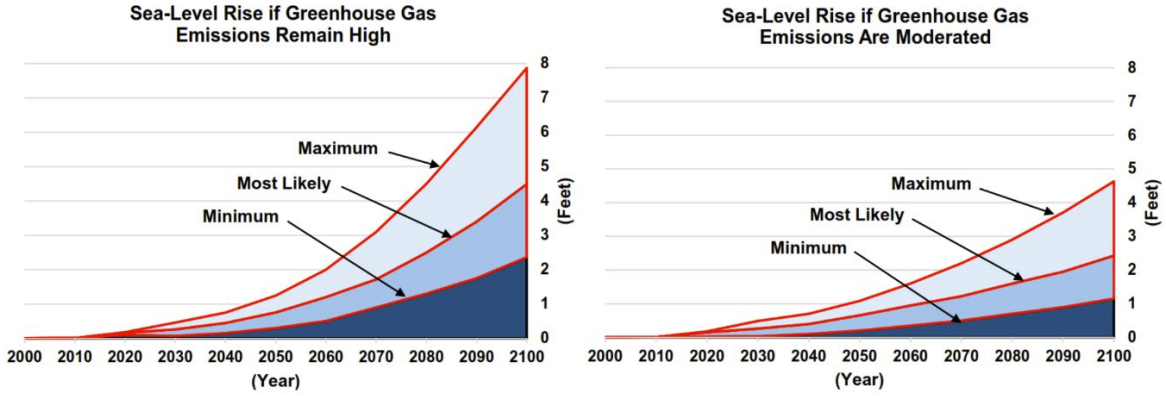

Figure 111: Projections of Sea Level Rise in the San Francisco Bay Area, 2000-2100
Source: 2019–2020 Marin County Civil Grand Jury, Climate Change:, How Will Marin Adapt?

[8] California Adaptation Planning Guide

Climate change will continue to alter Marin County OA ecosystems as a result of rising temperatures, changes in precipitation, and sea level rise, which will increase the severity and occurrence of natural hazards across the Marin County OA well into the future. Coastal cooling processes that keep temperatures down, such as fog, will continue to decrease. Rising temperatures will exacerbate drought conditions and raise the potential for significant wildfires and associated smoke as vegetation becomes drier and tree mortality increases. Forested woodlands that play a major role in carbon reduction will gradually transition into chaparral and shrublands. There will be more extreme storms and weather events, including expanded heat waves and increased rain events with changes in precipitation. Significant rain events will lead to an increase in flooding and the potential for severe landslides. Shoreline communities will become inundated with sea level rise and high tide events. Marshlands and wetlands that act as natural storm barriers will disappear as they transition into open water.

Notable impacts from climate change that are already evident in the Marin County OA and surrounding region as identified in a 2020 Marin County Civil Grand Jury Report include:

- From 1895-2018, the average temperature in Marin County increased by 2.3 degrees Fahrenheit.
- Over the past century, sea level rise in the San Francisco Bay Area rose by eight inches and has accelerated rapidly since 2011.
- The threat of wildfires in 2019 was so severe that Pacific Gas and Electric shut off electric power to the County for multiple days.

Climate change will continue to affect homes, businesses, infrastructure, utilities, transportation systems and agriculture across the Marin County OA. The risk to socially vulnerable populations will increase as they feel the immediate impacts of climate change more significantly and are less able to adapt to climate change and recover from its impacts.

The Marin County OA has adopted numerous planning initiatives and mitigation measures to help combat the effects of climate change across the OA. The Marin Climate Energy Partnership (MCEP), which is a partnership program of Marin County jurisdictions, the County, and Marin County regional agencies, adapted a model Climate Action Plan (CAP) that is intended to support countywide implementation efforts and is currently being used to update additional climate action plans for other jurisdictions in Marin County. The CAP supports the Climate Action Plan for the unincorporated County, which was completed in 2020. The MCEP also collects data and report on progress in meeting each County jurisdictions' individual greenhouse gas emission targets. In June 2023, the County published the Greenhouse Gas Inventory for Unincorporated Community Emissions for the Year 2021. Marin County OA jurisdictions have already met their greenhouse reduction goals for 2020 and are about halfway to meeting the statewide goal to reduce emissions 40% below 1990 levels by the year 2030. Marin County also formed a Sea Level Marin Adaptation Response Team in 2018 and had a Sea Level Rise Vulnerability Assessment and associated Adaptation Report completed for the County and each of its jurisdictions in 2017 as part of their Bay Waterfront Adaptation and Vulnerability Evaluation. Additional Marin County OA climate change mitigation initiatives include Marin Clean Energy, Electrify Marin, the Marin Solar Project, the Marin Energy Watch Partnership, Resilient Neighborhoods, and Drawdown: Marin.

2.2 HAZARDS

Of the hazards profiled in the Marin County MJHMP, those noted in the table are specific for the Town of Corte Madera as per the planning team.

Table 15: Town of Corte Madera Hazard Risk Assessment						
Hazard	Probability/ Likelihood of Future Events	Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Dam Failure	Unlikely	Negligible	Weak	None	None	**3.00**
Debris Flow	Likely	Limited	Severe	Low	Medium	**11.00**
Drought	Likely	Extensive	Weak	High	Medium	**13.00**

2.2.1 DAM FAILURE

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped and fail. Overtopping is the primary cause of earthen dam failure in the United States.

Dam failure is the uncontrolled release of impounded water from behind a dam. Flooding, earthquakes, blockages, landslides, lack of maintenance, improper operation, poor construction, vandalism, and terrorism can all cause a dam to fail. Dam failure causes downstream flooding that can affect life and property. Dam failures can result from any one or a combination of the following causes:

- Earthquake
- Inadequate spillway capacity resulting in excess overtopping flows
- Internal erosion caused by embankment or foundation leakage, or piping or rodent activity
- Improper design

- Improper maintenance
- Negligent operation
- Failure of upstream dams on the same waterway

Water released by a failed dam generates tremendous energy and can cause a flood that is catastrophic to life and property. A catastrophic dam failure could challenge local response capabilities and require evacuations to save lives. Impacts to life safety will depend on the warning time and the resources available to notify and evacuate the public. Major loss of life could result as well as potentially catastrophic effects to roads, bridges, and homes. Electric generating facilities and transmission lines could also be damaged and affect life support systems in communities outside the immediate hazard area. Associated water supply, water quality and health concerns could also be an issue. Factors that influence the potential severity of a full or partial dam failure are the amount of water impounded; the density, type, and value of development and infrastructure located downstream; and the speed of failure.

In general, there are three types of dams: concrete arch or hydraulic fill, earth and rockfill, and concrete gravity. Each type of dam has different failure characteristics. A concrete arch or hydraulic fill dam can fail almost instantaneously, where the flood wave builds up rapidly to a peak then gradually declines. An earth-rockfill dam fails gradually due to erosion of the breach, where a flood wave will build gradually to a peak and then decline until the reservoir is empty. A concrete gravity dam can fail instantaneously or gradually with a corresponding buildup and decline of the flood wave.

The California Department of Water Resources (DWR) Division of Safety of Dams (DSOD) has jurisdiction over impoundments that meet certain capacity and height criteria. Embankments that are less than six feet high and impoundments that can store less than 15 acre-feet are non-jurisdictional. Additionally, dams that are less than 25 feet high can impound up to 50 acre-feet without being jurisdictional. The Cal DWR DSOD assigns hazard ratings to large dams within the State. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in three categories that identify the potential hazard to life and property:

- **High hazard** indicates that a failure would most probably result in the loss of life
- **Significant hazard** indicates that a failure could result in appreciable property damage
- **Low hazard** indicates that failure would result in only minimal property damage and loss of life is unlikely

Since 1929, the state has supervised all non-federal dams in California to prevent failure for the purpose of safeguarding life and protecting property. Supervision is carried out through the state's Dam Safety Program under the jurisdiction of DWR. The legislation requiring state supervision was passed in response to the St. Francis Dam failure and concerns about the potential risks to the general populace from a number of water storage dams. The law requires:

- Examination and approval or repair of dams completed prior to August 14, 1929, the effective date of the statute.
- Approval of plans and specifications for and supervision of construction of new dams and the enlargement, alteration, repair, or removal of existing dams.
- Supervision of maintenance and operation of all dams under the state's jurisdiction.

The 1963 failure of the Baldwin Hills Dam in Southern California led the Legislature to amend the California Water Code to include within state jurisdiction both new and existing off-stream storage facilities.

Dams and reservoirs subject to state supervision are defined in California Water Code §6002 through §6004, with exemptions defined in §6004 and §6025. In administering the Dam Safety Program, DWR must comply with the provisions of the California Environmental Quality Act (CEQA). As such, all formal dam approval and revocation actions must be preceded by appropriate environmental documentation.

In 1972, Congress moved to reduce the hazards from the 28,000 non-federal dams in the country by passing Public Law 92-367, the National Dam Inspection Act. With the passage of this law, Congress authorized the U.S. Army Corps of Engineers (USACE) to inventory dams located in the United States. The action was spurred by two disastrous earthen dam failures during the year, in West Virginia and South Dakota, that caused a total of 300 deaths.

The Water Resources Development Act of 1986 (P.L 99-662) authorized USACE to maintain and periodically publish an updated National Inventory of Dams (NID). The Water Resources Development Act of 1996 (P.L. 104-303), Section 215, re-authorized periodic updates of the NID by USACE.

While there are no dams located within Corte Madera, the town could be impacted by a failure of the Phoenix Lake Dam in unincorporated Marin County. The dam has storage of 612-acre feet of water that could be released down Corte Madera Creek in the event of a full sunny-day dam failure. While most of the released water would be contained within Corte Madera Creek, numerous homes and marshland along the south side of the creek could become inundated with up to a foot of water approximately 40-45 minutes after the dam fails. Water from the dam may also be into marshland channels and the High Canal on the northern side of town but no further inundation of homes should occur.

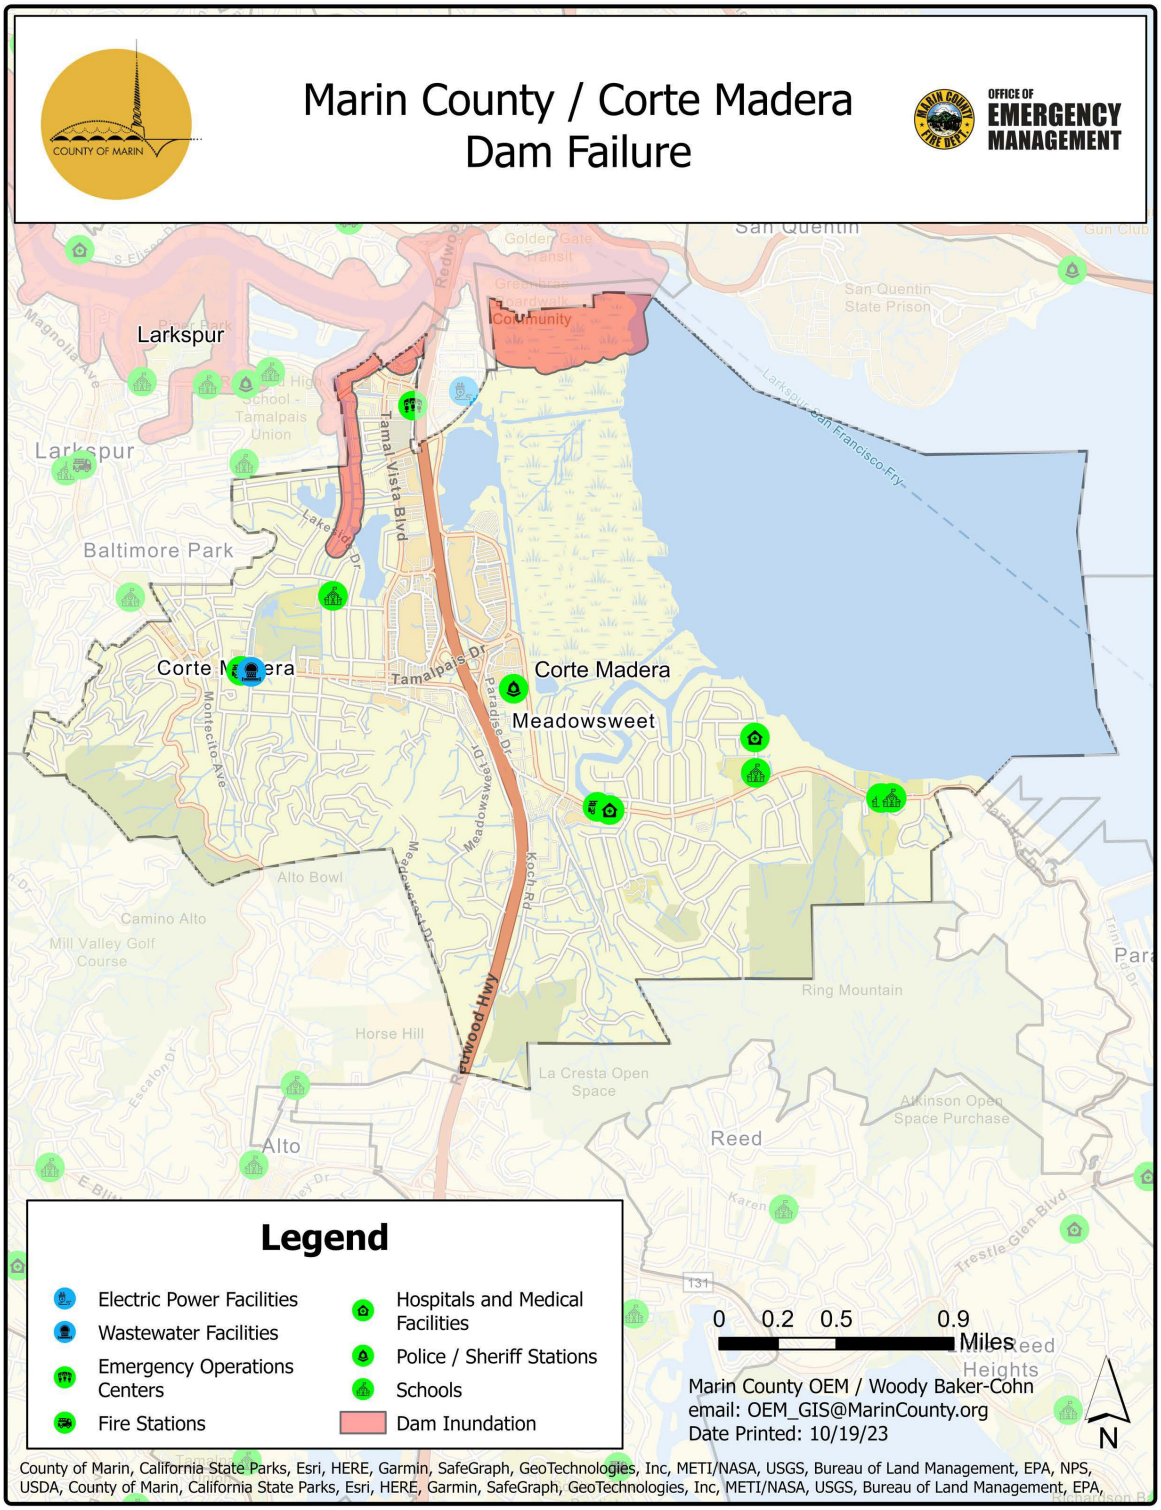

Figure 112: Town of Corte Madera Dam Inundation Critical Facilities and Infrastructure
Source: Marin County OEM

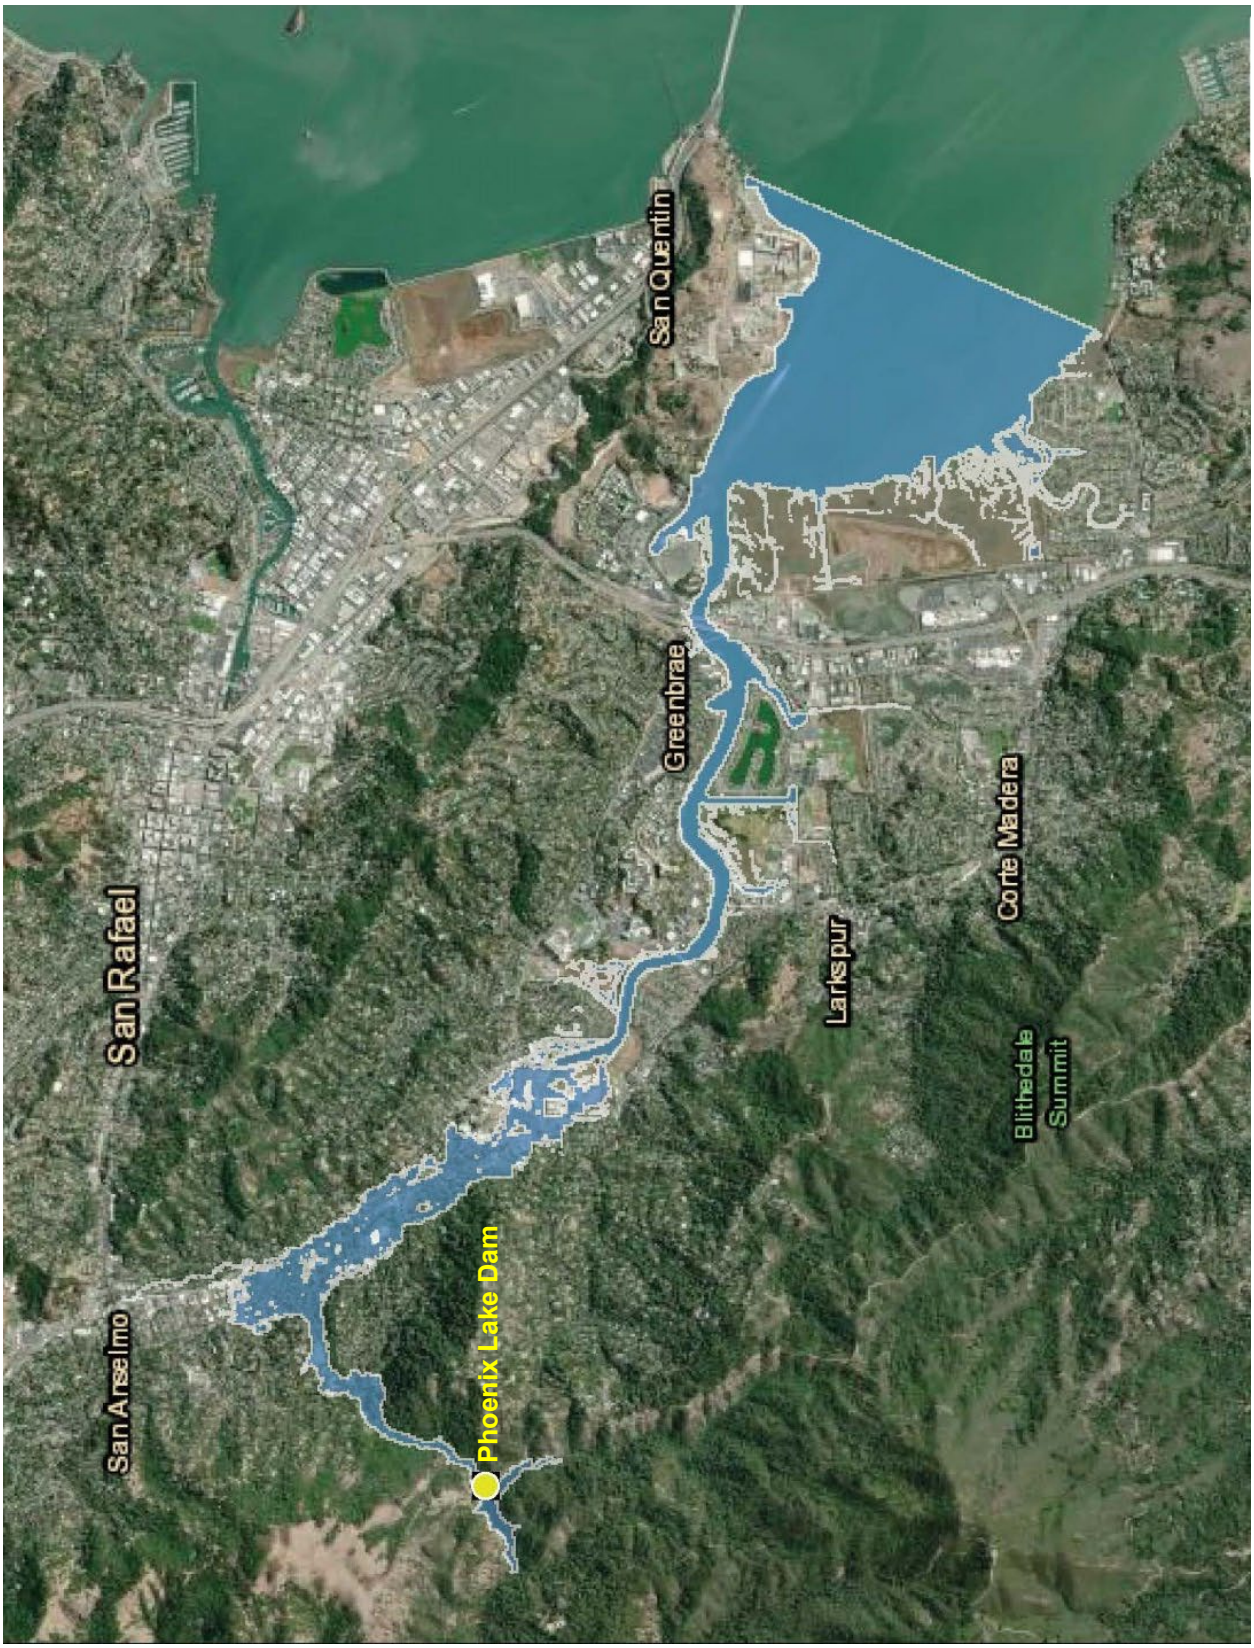

Figure 113: Town of Corte Madera Phoenix Lake Dam Inundation Impact
Source: California Department of Water Resources, DSOD, 11/27/23

There is no record of a failure of any regulated dam located in the Marin County OA. On December 29, 2022, Phoenix Lake hit capacity after recent rains and the dam saw some spillover with no impacts.

Climate Change and Future Development Considerations

Most dams in the United States are aging and are at significant risk from increased storm events as a result of climate change. The average dam age in the United States is 60 years, and more than 8,000 dams in the United States including the Phoenix Lake Dam are over 90 years old. More than 200 U.S. dams have failed in bad weather since 2000. As the climate warms, rain events are predicted to become more intense. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in reservoirs across the Marin County OA, placing increased stress on its dams and increasing the potential for a dam failure. As development increases in the populated areas of the Marin County OA downstream of its dams, particularly in the inundation area of the Phoenix Lake Dam, the potential for significant impacts to residents and infrastructure will only increase. This area includes part of the Corte Madera. Future development along the High Canal at the lower end of Corte Madera Creek could expose additional people and structures to risk of a dam failure.

2.2.2 Debris Flows

For the purposes of the Marin County OA MJHMP, debris flows are classified as landslides (including rockslides) and mud flows.

A landside is the breaking away and gravity-driven downward movement of hill slope materials, which can travel at speeds ranging from fractions of an inch per year to tens of miles per hour depending on the slope steepness and water content of the rock/soil mass. Landslides range from the size of an automobile to a mile or more in length and width and, due to their sheer weight and speed, can cause serious damage and loss of life. The rate of a landslide is affected by the type and extent of vegetation, slope angle, degree of water saturation, strength of the rocks, and the mass and thickness of the deposit. Some of the natural causes of this instability are earthquakes, weak materials, stream and coastal erosion, and heavy rainfall. In addition, certain human activities tend to make the earth materials less stable and increase the chance of ground failure. These activities include extensive irrigation, poor drainage or groundwater withdrawal, removal of stabilizing vegetation and over-steepening of slopes by undercutting them or overloading them with artificial fill. These activities can cause slope failure, which normally produce landslides.

Landslide material types are often broadly categorized as either rock or soil, or a combination of the two for complex movements. Rock refers to hard or firm bedrock that was intact and in place prior to slope movement. Soil, either residual or transported material, means unconsolidated particles. The distinction between rock and soil is most often based on interpretation of geomorphic characteristics within landslide deposits but can also be inferred from geologic characteristics of the parent material described on maps or in the field. Landslide movements are also based on the geomorphic expression of the landslide deposit and source area, and are categorized as falls, topples, spreads, slides, or flows. Falls are masses of soil or rock that dislodge from steep slopes and free fall. Topples move by the forward pivoting of a mass around an axis below the displaced mass. Lateral spreads move by horizontal extension and shear or tensile fractures. Slides displace masses of material along one or more discrete planes and can either be rotational or transitional. Flows mobilize as a deforming, viscous mass without a discrete failure plane.

Natural conditions that contribute to landslide include the following:

- Degree of slope
- Water (heavy rain, river flows, or wave action)
- Unconsolidated soil or soft rock and sediments
- Lack of vegetation (no stabilizing root structure)
- Previous wildfires and other forest disturbances
- Road building, excavation and grading
- Earthquake

In addition, many human activities tend to make the earth materials less stable and, thus, increase the chance of ground movement. Human activities contribute to soil instability through grading of steep slopes or overloading them with artificial fill, by extensive irrigation, construction of impermeable surfaces, excessive groundwater withdrawal, and removal of stabilizing vegetation.

Another hazard related to landslide and erosion is the fall of a detached mass of rock from a cliff or down a very steep slope (rockfall). Weathering and decomposition of geological materials produce conditions favorable to rockfalls. Other causes include ice wedging, root growth, or ground shaking (earthquake). Destructive landslides and rockfalls usually occur very suddenly with little or no warning time and are short in duration.

Landslide susceptibly can be characterized by looking at both slope class and rock strength. Landslide susceptibility classes express the generalization that on very low slopes, landslide susceptibility is low even in weak rock, and that landslide susceptibility increases with slope and in weaker rocks. Very high landslide susceptibility includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks. Figure 22 shows landslide susceptibility classes.

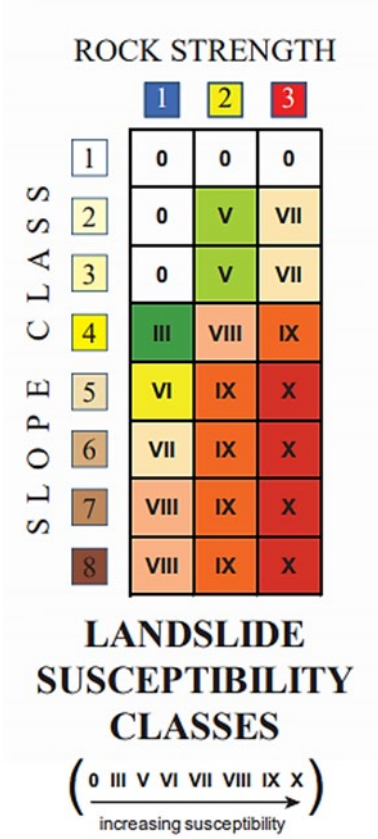

Figure 114: Landslide Susceptibility Classes
Source: USGS

A mud flow is a general term for a mass-movement landform and process characterized by a flowing mass of fine-grained earth material with a high degree of fluidity. Heavy rainfall, snowmelt, or high levels of groundwater flowing through cracked bedrock may trigger a movement of soil or sediments. Floods and debris flows may also occur when strong rains on hill or mountain slopes cause extensive erosion and/or what is known as "channel scour." Some broad mud flows are rather viscous and therefore slow; others begin very quickly and continue like an avalanche. Mud flows are composed of at least 50% silt and clay-sized materials and up to 30% water.

The point where a muddy material begins to flow depends on its grain size and the water content. Fine grainy material or soil has a smaller friction angle than a coarse sediment or a debris flow, but falling rock pieces can trigger a material flow, too. When a mud flow occurs it is given four named areas, the 'main scarp', in bigger mud flows the 'upper and lower shelves', and the 'toe'. See Figure 23 for the typical areas of a mud flow, with shelves (right) and without (left). The main scarp will be the original area of incidence, the toe is the last affected area(s). The upper and lower shelves are located wherever there is a large dip (due to mountain or natural drop) in the mud flow's path. A mud flow can have many shelves.

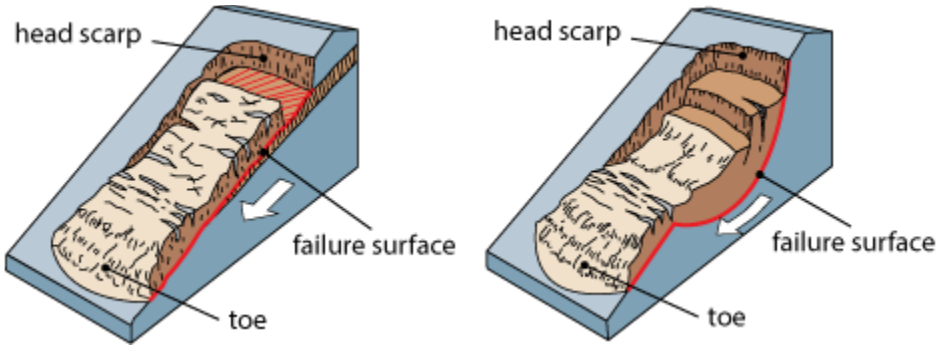

Figure 115: Mud Flow Areas
Source: Washington Department of Natural Resources

If large enough, mud flows can devastate villages and country-sides. Mud flows are common in mountain areas prone to wildfire, where they have destroyed many homes built on hillsides without sufficient support after fires destroy vegetation holding the land. The area most generally recognized as being at risk of a dangerous mud flow are:

- Areas where wildfires or human modification of the land have destroyed vegetation
- Areas where landslides have occurred before
- Steep slopes and areas at the bottom of slopes or canyons
- Slopes that have been altered for construction of buildings and roads
- Channels along streams and rivers
- Areas where surface runoff is directed

A landslide in Corte Madera would most likely occur on the southern side of the town where the terrain is steeper and is more susceptible to movement of hill slope materials. This area of Corte Madera is primarily residential and consists of numerous winding streets and hillside homes that could be damaged or destroyed by a landslide.

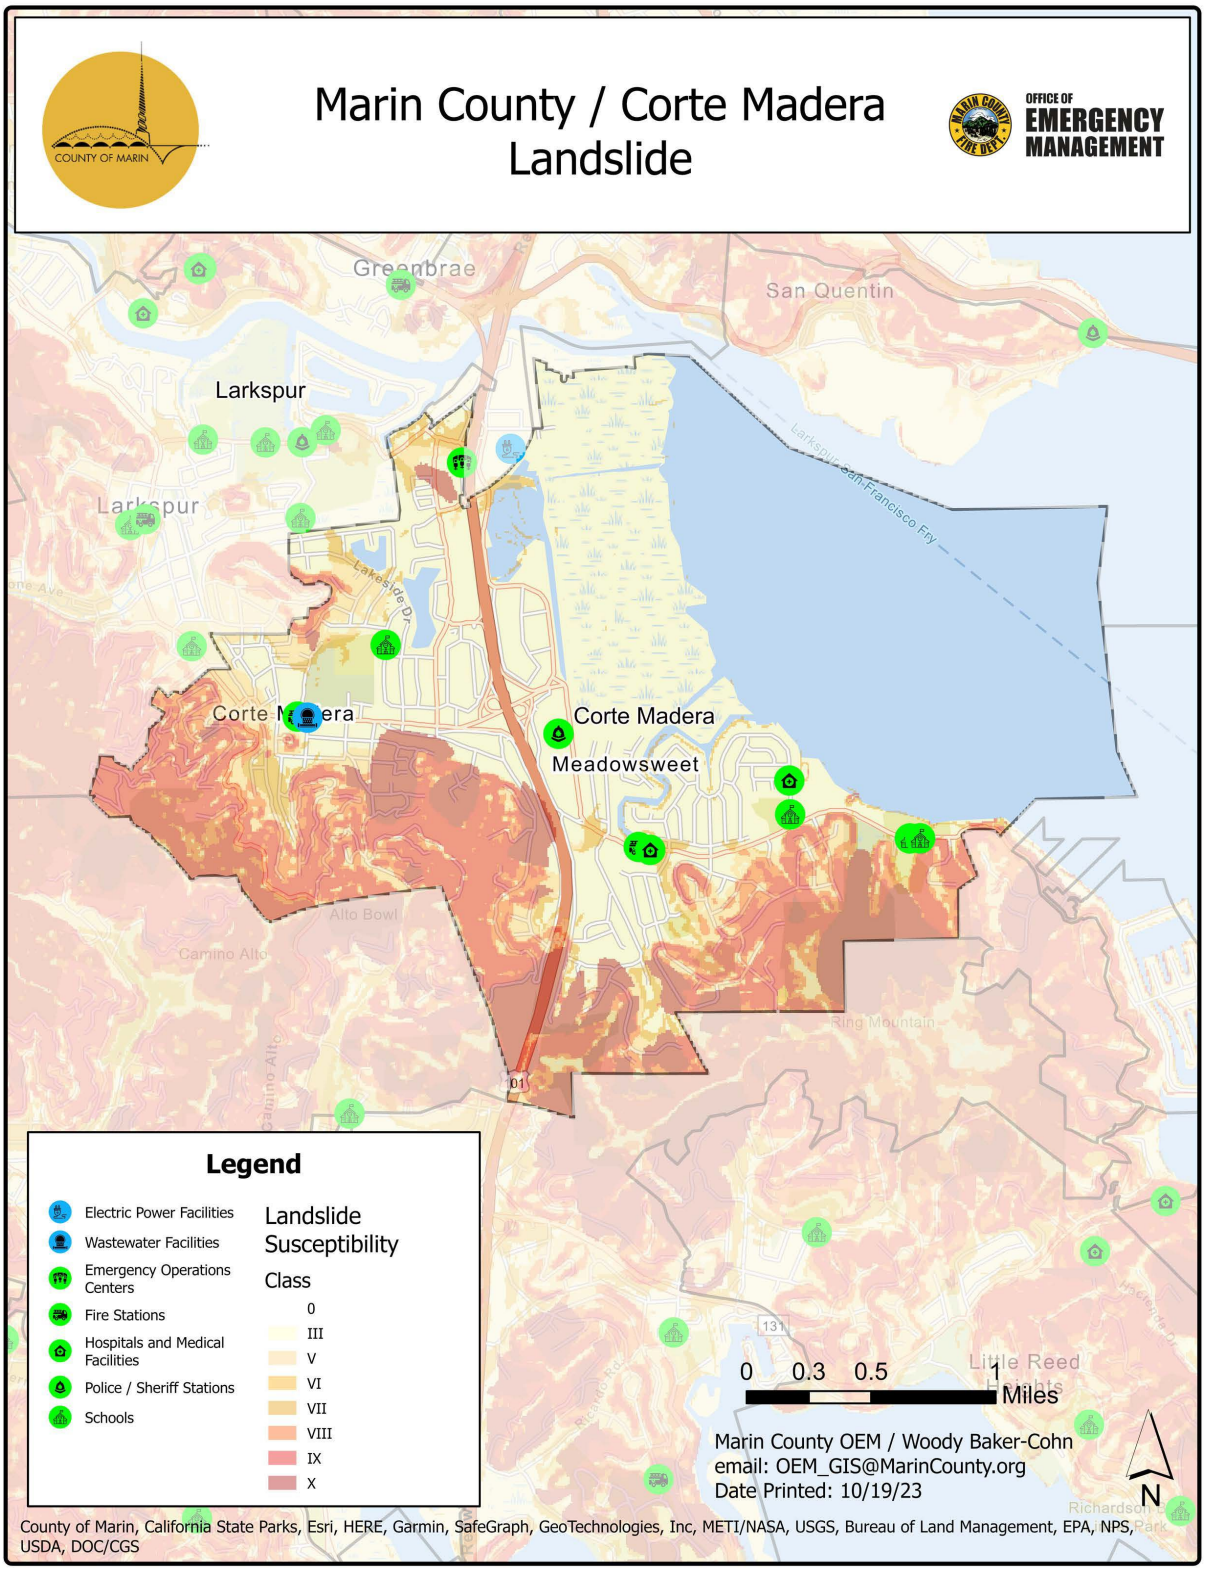

Figure 116: Town of Corte Madera Debris Flow Critical Facilities and Infrastructure
Source: Marin County OEM

A landslide having major impacts on any of the roads in this area could affect the ability of residents to reach their homes. An earthquake has the potential to cause landslides throughout this area. A wildfire and subsequent rain event in any of the open space to the south and west of Corte Madera, including in the Camino Alto Open Space Preserve, could potentially contribute to debris flows in Corte Madera. There are no creeks that flow directly into Corte Madera that could contribute to a debris flow, particularly from the mountainous areas in the western part of Marin County. However, there are several creeks originating from slopes of Mount Tamalpais including Larkspur Creek and Corte Madera Creek that flow into the City of Larkspur to the north of Corte Madera and could potentially experience a debris flow with mud and water that could impact the northern area of the town. There have been no recorded debris flows in Corte Madera.

Climate Change and Future Development Considerations

Extreme storm events and more frequent wildfires as a result of climate change have the potential to increase the amount and severity of landslides, including disastrous debris flows. Climate change is leading to more volatile precipitation patterns around the world with very dry stretches punctuated by storms that drop large amounts of rain in a short amount of time. Landslides in wetter regions of California, including the Marin County OA, move on average faster and farther downhill during rainy periods compared to drought years, according to a 2022 study by the American Geophysical Union (AGU)[9], showing the increased potential for landslides in the Marin County OA in rainy years. As development increases in the numerous canyons and around the many open spaces of the Marin County OA, the potential for significant impacts from a landslide and/or mudflow increases. Further development of the residential areas of southern Corte Madera that have a higher landslide susceptibility will expose more people and property to landslide risk. With increased wildfire potential as a result of climate change, more residents in southern and western Corte Madera could be susceptible to post-fire debris flows. Future development should take into account the movement of mud and debris in waterways after a major rain event. Adequate space adjacent to susceptible waterways should be maintained free of development to allow for the passage of mud and debris, and catchment basins should be built in these areas to help capture any excess mud and debris.

2.2.3 DROUGHT

A drought is a deficiency in precipitation over an extended period, usually a season or more, resulting in a water shortage causing adverse impacts on vegetation, animals, and/or people. It is a normal recurrent feature of climate that occurs in virtually all climate zones, from very wet to very dry. Drought is a temporary aberration from normal climatic conditions and can thus vary significantly from one region to another. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Drought is a complex issue involving many factors—it occurs when a normal amount of moisture is not available to satisfy an area's usual water-consuming activities.

There are several types of drought which can often be defined regionally based on its effects:

[9] Landslide Sensitivity and Response to Precipitation Changes in Wet and Dry Climates. https://agupubs.onlinelibrary.wiley.com/doi/10.1029/2022GL099499

- Meteorological drought is usually defined by a period of below average water supply, based on the degree of dryness (in comparison to normal or average) and the duration of the dry period. Drought onset generally occurs with a meteorological drought.
- Agricultural drought occurs when there is an inadequate water supply to meet the needs of the state's crops and other agricultural operations such as livestock. Agricultural drought links various characteristics of meteorological (or hydrological) drought to agricultural impacts, focusing on precipitation shortages, soil water deficits, reduced ground water or reservoir levels needed for irrigation.
- Hydrological drought is defined as deficiencies in surface and subsurface water supplies. It is generally measured as stream flow, snowpack, and as lake, reservoir, and groundwater levels. Hydrological drought usually occurs following periods of extended precipitation shortfalls.
- Socioeconomic drought occurs when a drought impacts health, well-being, and quality of life, or when a drought starts to have an adverse economic impact on a region.

Drought can occur in all areas of Corte Madera, though it's effects would be most felt in the mountainous areas where the risk of wildfire would increase. The wetland areas of Corte Madera, particularly the marshlands along San Francisco Bay, could become drier during prolonged period of drought and experience marshland fires that could impact local businesses and residences in the area. Dry trees in public spaces like Corte Madera's Town Park can become a safety hazard to the public due to falling limbs or the toppling of the tree itself.

Climate Change and Future Development Considerations

Climate change increases the odds of worsening drought. Warmer temperatures enhance evaporation, which reduces surface water and dries out soils and vegetation. This makes periods with low precipitation in the summer drier than they would be in cooler conditions. Climate also alters the timing of water availability as warmer winter temperatures cause less precipitation to fall. During droughts, communities in the Marin County OA including Corte Madera may have limited access to water for household use, including drinking, cooking, cleaning, and watering plants, as well as for agriculture, transportation, and power generation. Drought may lead to higher water costs, rationing, or even the decimation of important water sources like wells in the Marin County OA. As more people move into the Marin County OA and the Corte Madera, additional strain will be placed on the OA's water supply. Drought can affect livestock and crops in the Marin County OA, impacting its economy. Drought can increase the occurrence and severity of wildfires and tree mortality in the Marin County OA including in the open spaces in and around southern and western Corte Madera. Impacts to residents and infrastructure from wildfire as a result of drought will increase as more development occurs in the mountainous areas of the Marin County OA including Corte Madera where wildfires are more likely to occur. Drought also has the potential to dry out the marshlands along the shoreline of Corte Madera, increasing the chances of brush fires there. Future development in this area and in the mountainous areas of southern and western Corte Madera could expose people to drier summer conditions that could increase their vulnerability to wildfire. Drought also increases the amount of carbon dioxide in the atmosphere, including by decreasing land productivity, which reduces the amount of vegetation storing carbon dioxide. In addition, increases in drought-related wildfire and soil erosion can release carbon dioxide sequestered in trees and plants back into the atmosphere. This will only worsen climate change for the Marin

County OA into the future. When considering future development, the Marin County OA including Corte Madera can help prepare for both future droughts and climate change by practicing and promoting water conservation and enhancing water efficiency throughout landscapes, city plans, and water infrastructure. The Marin County OA can also identify alternative water supplies, create drought emergency plans, and encourage farmers to plant drought-resistant crops.

2.2.4 EARTHQUAKE

Earthquakes are sudden rolling or shaking events caused by movement under the earth's surface. Earthquakes happen along cracks in the earth's surface, called fault lines, and can be felt over large areas, although they usually last less than one minute.

The amount of energy released during an earthquake is usually expressed as a magnitude and is currently measured by seismologists on the Moment Magnitude (Mw Scale). The Mw Scale was developed to succeed the previously used Richter Scale and is measured on a scale of zero to ten with increasing values reflecting increasing intensity.

The other commonly used measure of earthquake severity is intensity, which is an expression of the amount of shaking at any given location on the ground service. Intensity is most commonly measured on the Modified Mercalli Intensity (MMI) Scale (see Figure 25).

Intensity	Shaking	Description/Damage
I	Not felt	Not felt except by a very few under especially favorable conditions.
II	Weak	Felt only by a few persons at rest,especially on upper floors of buildings.
III	Weak	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Light	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Moderate	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Strong	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Very strong	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Severe	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Violent	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	Extreme	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.

Figure 117: Modified Mercalli Intensity Scale
Source: USGS

Figure 26 gives intensities (measured on the MMI scale) that are typically observed at locations near the epicenter or earthquakes of different magnitudes.

Richter Magnitude Scale	Typical Maximum Modified Mercalli Intensity Scale
1.0 – 2.9	I
3.0 – 3.9	II – III
4.0 – 4.9	IV – V
5.0 – 5.9	VI – VII
6.0 – 6.9	VII – IX
7.0 or higher	VIII or higher

Figure 118: Mercalli Scale vs. Magnitude
Source: USGS

The extent of ground shaking also depends in large part on how soft the underlying soil is. Soft soils amplify ground shaking (see Figure 27). This was observed during the 1989 Loma Prieta Earthquake when the most significant damages experienced in San Francisco were in the Marina District, which was built on fill.

Soil type A	Vs > 1500 m/sec	Includes unweathered intrusive igneous rock. Occurs infrequently in the bay area. We consider it with type B (both A and B are represented by the color blue on the map). Soil types A and B do not contribute greatly to shaking amplification.
Soil type B	1500 m/sec > Vs > 750 m/sec	Includes volcanics, most Mesozoic bedrock, and some Franciscan bedrock. (Mesozoic rocks are between 245 and 64 million years old. The Franciscan Complex is a Mesozoic unit that is common in the Bay Area.)
Soil Type C	750 m/sec > Vs > 350 m/sec	Includes some Quaternary (less than 1.8 million years old) sands, sandstones and mudstones, some Upper Tertiary (1.8 to 24 million years old) sandstones, mudstones and limestone, some Lower Tertiary (24 to 64 million years old) mudstones and sandstones, and Franciscan melange and serpentinite.
Soil Type D	350 m/sec > Vs > 200 m/sec	Includes some Quaternary muds, sands, gravels, silts and mud. Significant amplification of shaking by these soils is generally expected.
Soil Type E	200 m/sec > Vs	Includes water-saturated mud and artificial fill. The strongest amplification of shaking due is expected for this soil type.

Figure 119: Soil Types
Source: USGS

An earthquake fault is defined as “a fracture or fracture zone in the earth’s crust along which there has been displacement of the sides relative to one another.” For the purpose of planning there are two types of faults, active and inactive. Active faults have experienced displacement in historic time, suggesting that future displacement may be expected. Inactive faults show no evidence of movement in recent geologic time, suggesting that these faults are dormant.

Two types of fault movement represent possible hazards to structures in the immediate vicinity of the fault: fault creep and sudden fault displacement. Fault creep, a slow movement of one side of a fault relative to the other, can cause cracking and buckling of sidewalks and foundations even without perceptible ground shaking. Sudden fault displacement occurs during an earthquake event and may result in the collapse of buildings or other structures that are found along the fault zone when fault displacement exceeds an inch or two. The only protection against damage caused directly by fault displacement is to prohibit construction in the fault zone.

An earthquake could occur anywhere in and around Corte Madera due to the number of active faults within and near Marin County.

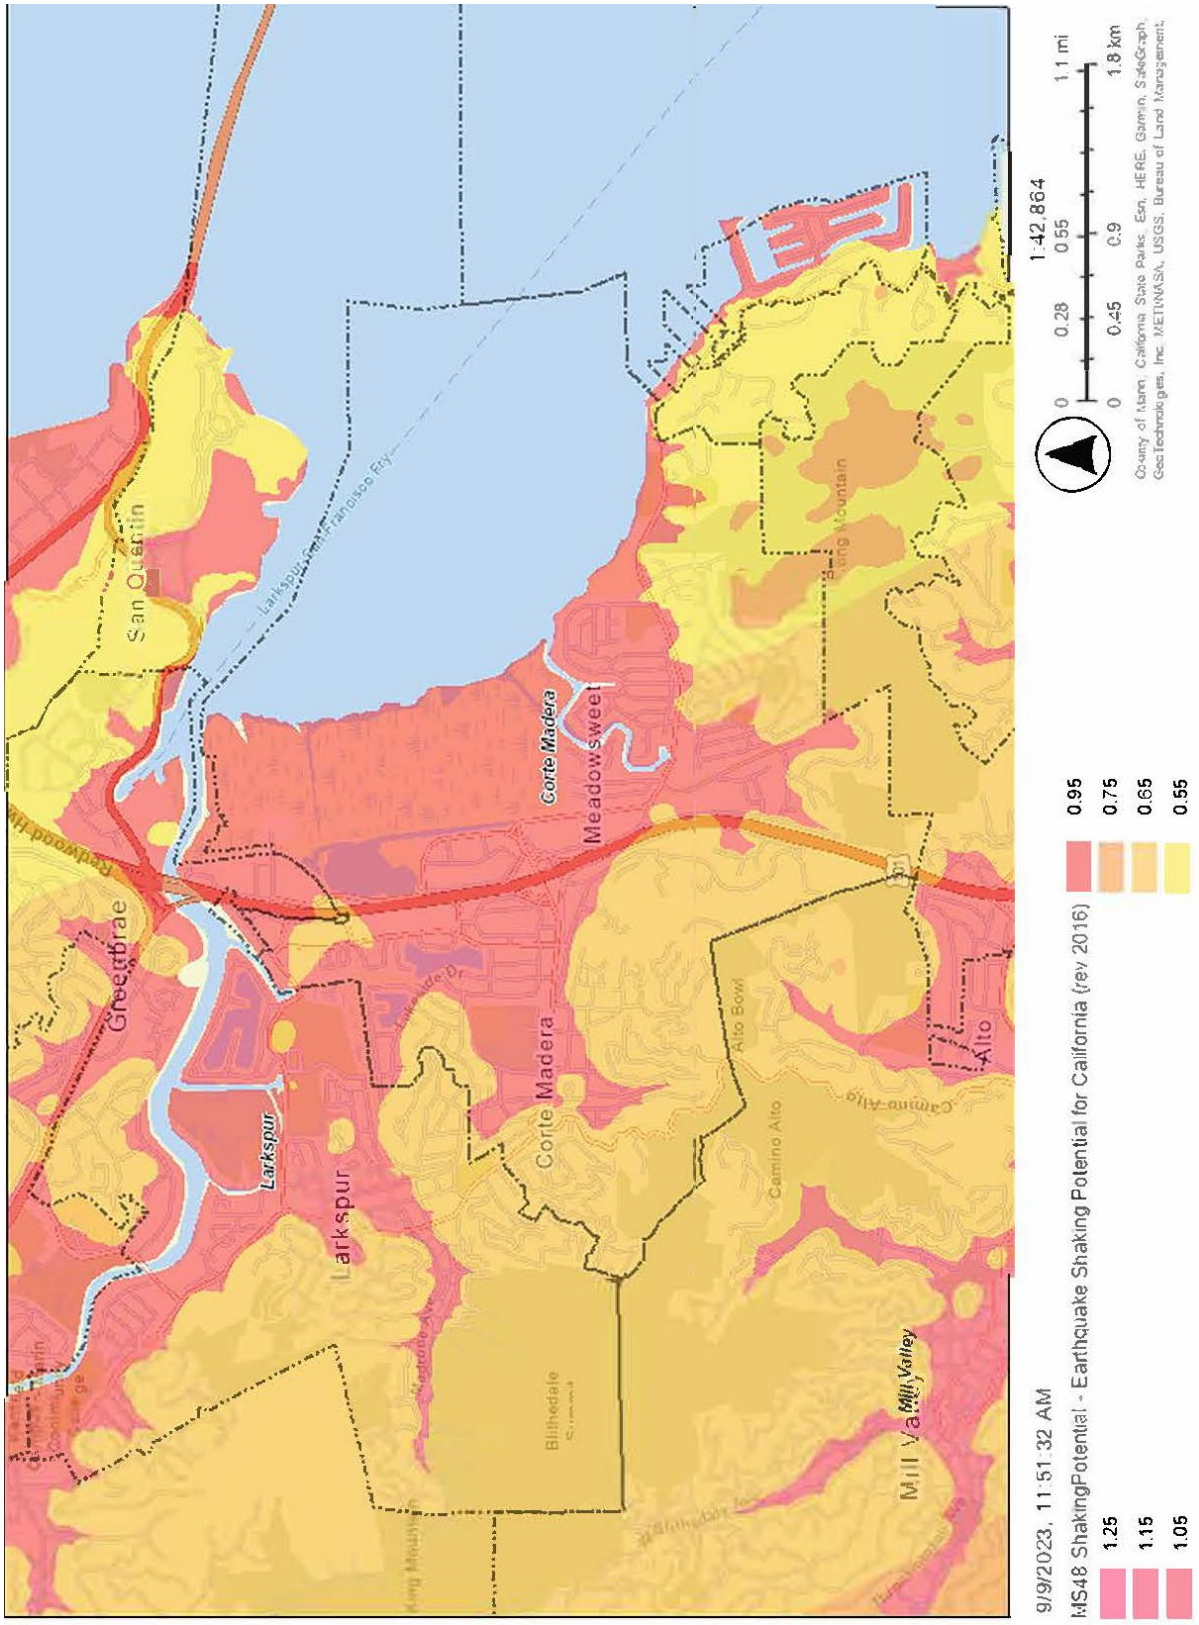

Figure 120: Town of Corte Madera Earthquake Impact
Source: Marin County OEM

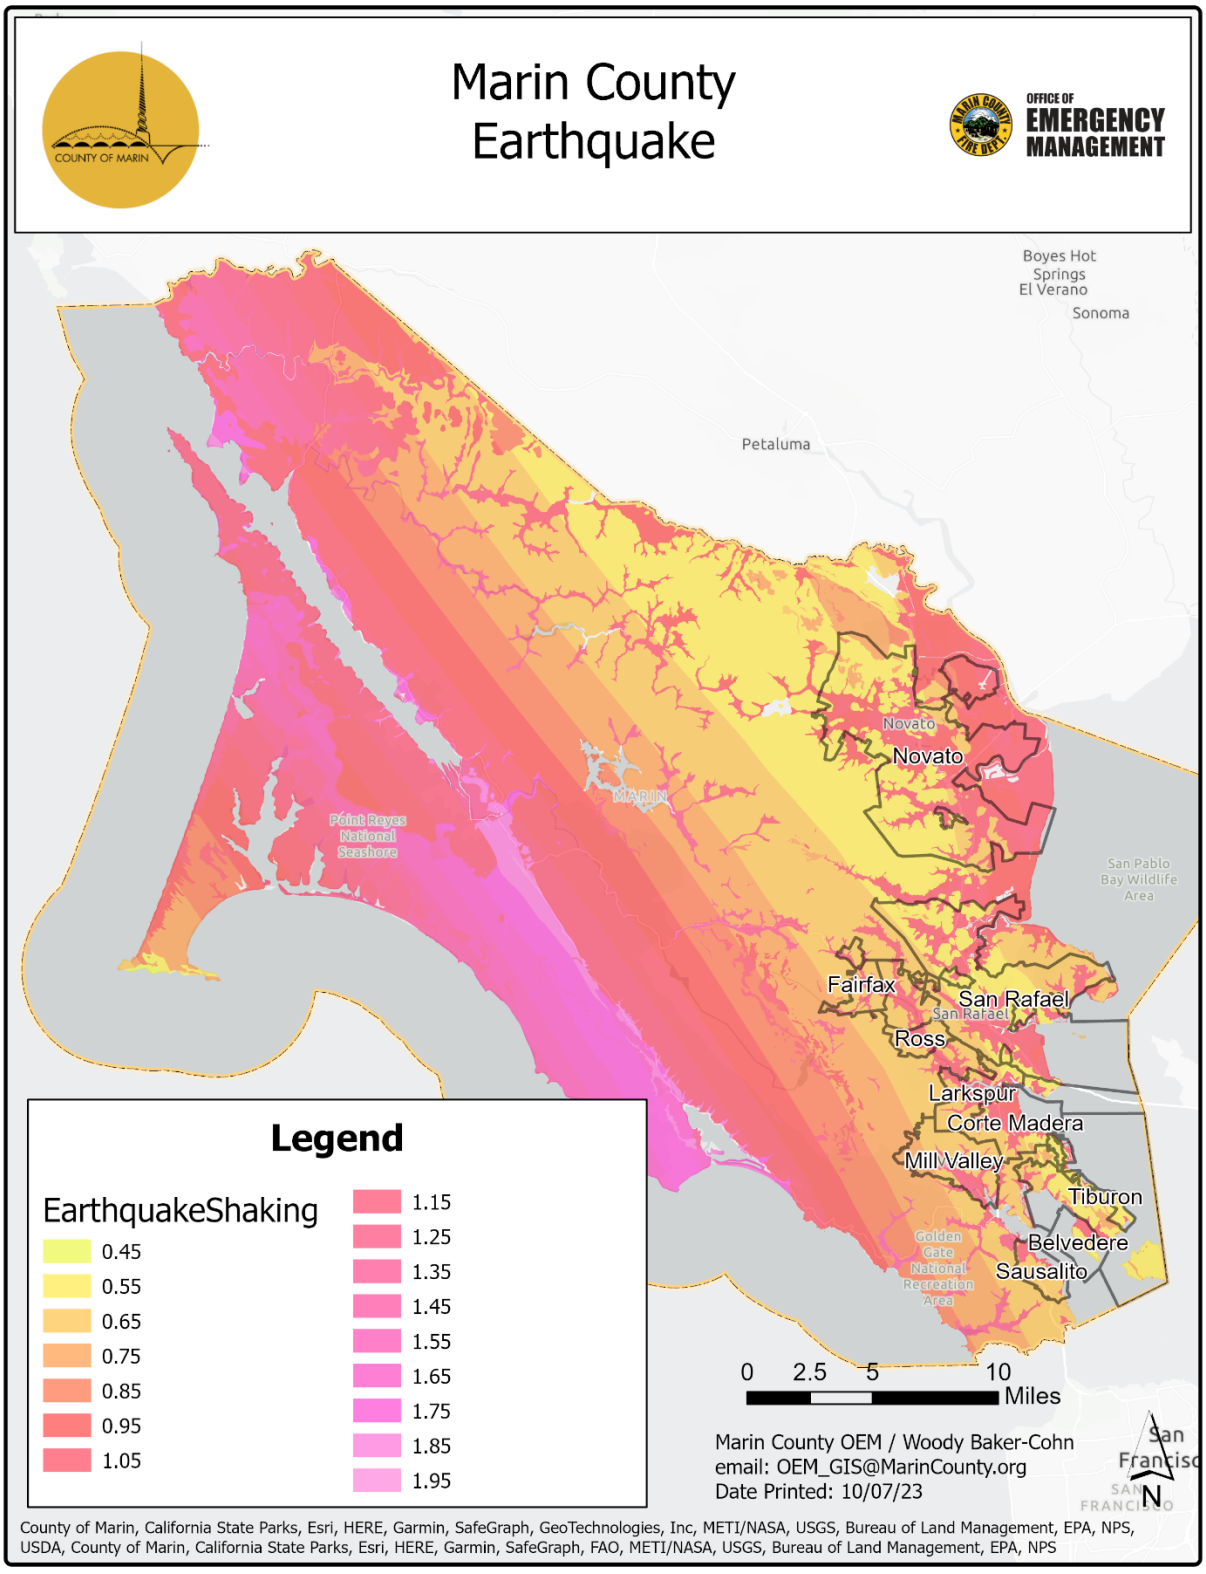

Figure 121: Marin County Earthquake Impact and Fault Lines
Source: Marin County OEM

Corte Madera is located directly between the San Andreas and Hayward faults. A moderate to extreme earthquake originating from either of these major faults or any of the other faults in the region could have major impacts to the town. There is increased risk of shaking and liquefaction in Corte Madera from an earthquake, particularly in the central and eastern lowland areas where superficial deposits and fill are more prevalent. This includes the primary commercial area of town along the Highway 101 corridor, and numerous residential neighborhoods with schools and other critical facilities. Vulnerable structures include bridges and older buildings that have not undergone major seismic retrofitting. Utility infrastructure throughout the town could be impacted by an earthquake.

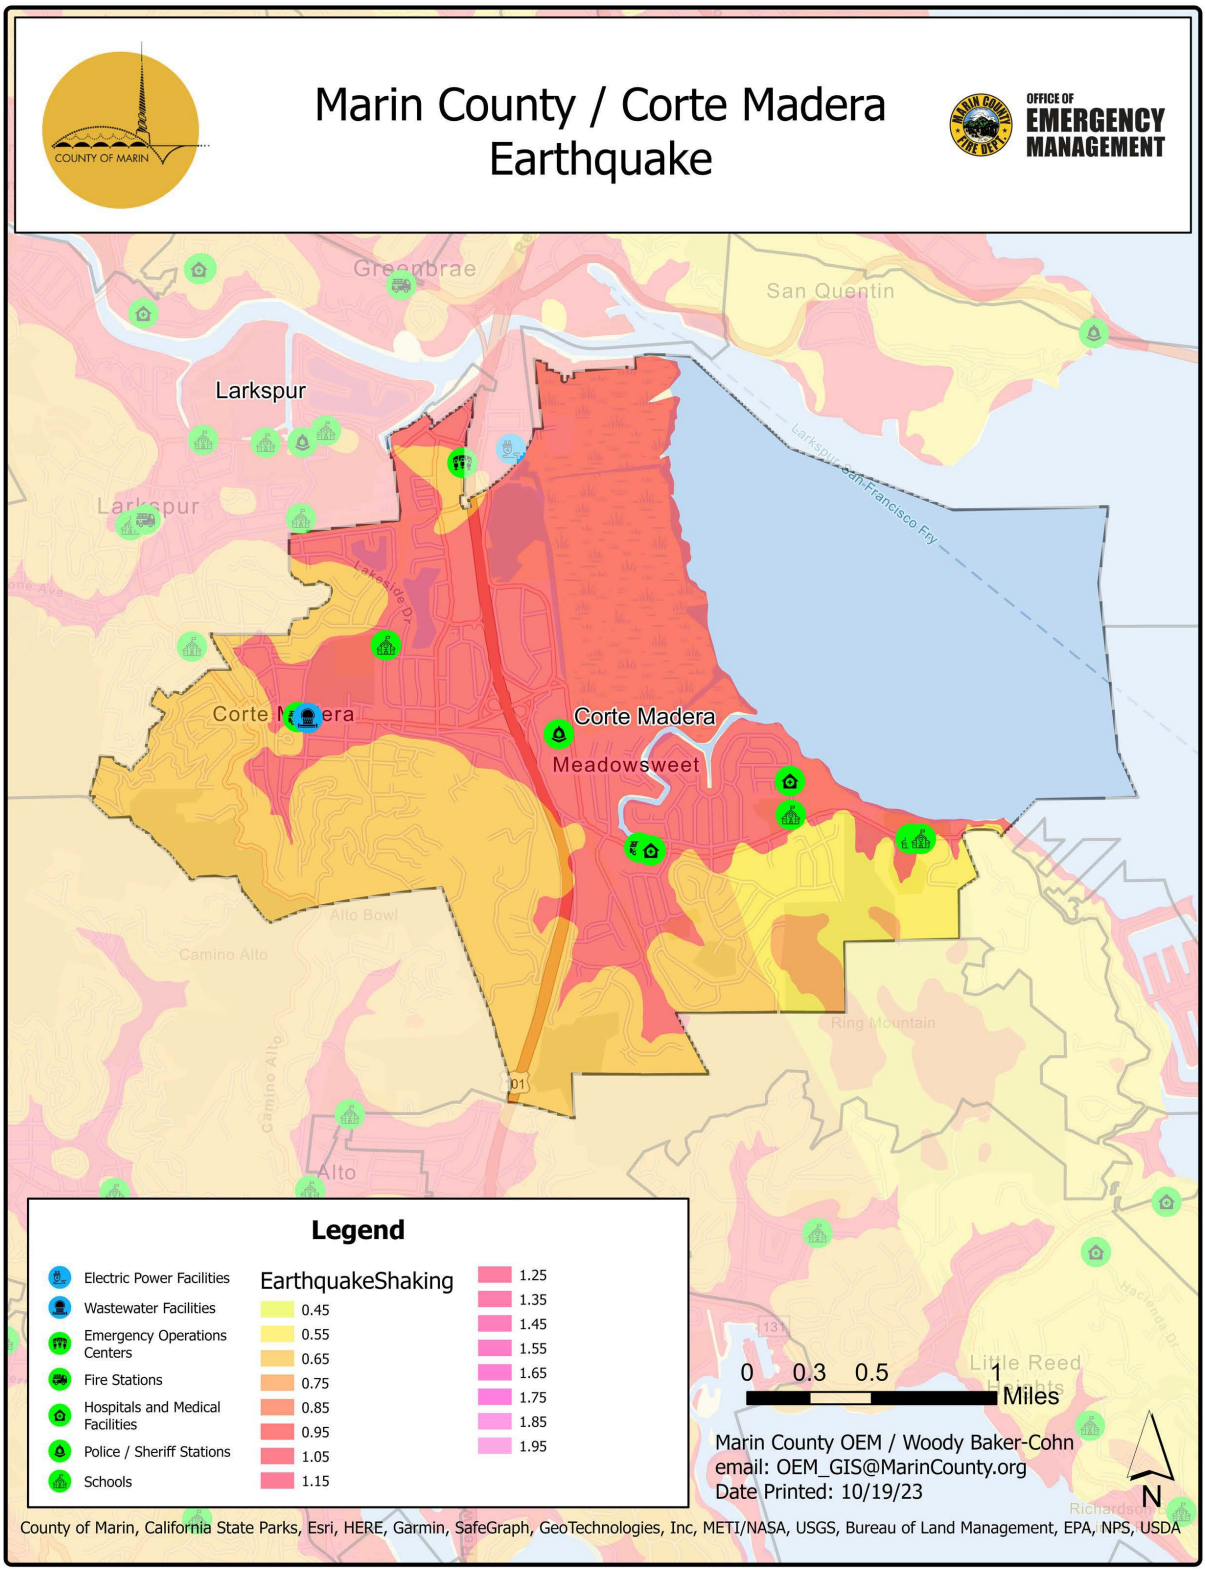

Figure 122: Town of Corte Madera Earthquake Critical Facilities and Infrastructure
Source: Marin County OEM

Earthquakes could also cause landslides in the western areas of Corte Madera with steeper terrain, causing damage to homes and roads as a result of shifting soils.

Corte Madera hasn't yet experienced a significant earthquake. Marin County was sparsely populated at the time of the 1906 San Francisco Earthquake, and the effects across the County were relatively minimal. Likewise, the 1989 Loma Prieta Earthquake caused minimal impacts across Marin County as the epicenter of the quake was further south in Santa Cruz County. Smaller earthquakes with minimal to no impacts are routinely felt in Corte Madera.

Climate Change and Future Development Considerations

There is no direct link between climate change and seismic activity that could impact the Marin County OA including Corte Madera, so climate change is not expected to cause any changes to the frequency or intensity of seismic shaking. According to a 2018 study by the Institute of Physics (IOP)[10], climate change could result in "isostatic rebounds," or a sudden upward movement of the crust because of reduced downward weight caused by glaciers. As glaciers are known to melt when overall global temperatures increase, climate change could indirectly lead to an increase in seismicity in the Marin County OA including Corte Madera. Climate change could also impact earthquakes felt in the Marin County OA as droughts can further deteriorate existing fault lines and pumping groundwater can put further pressure on the earth's crust. Future development in the populated areas of Marin County OA where seismic shaking and subsidence are more prevalent could exacerbate the impacts of an earthquake. This includes the lowlands of Corte Madera, where the risk of subsidence and subsequent earthquake shaking are higher. Future development in these areas could expose more people and infrastructure to earthquake shaking as a result of climate change.

2.2.5 FLOODING

Flooding is the rising and overflowing of a body of water onto normally dry land. Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. The area adjacent to a channel is the floodplain. Floodplains are illustrated on inundation maps, which show areas of potential flooding and water depths. In its common usage, the floodplain most often refers to that area that is inundated by the 100-year flood, the flood that has a one percent chance in any given year of being equaled or exceeded. The 100-year flood is the national minimum standard to which communities regulate their floodplains through the National Flood Insurance Program. The 200-year flood is one that has 0.5% chance of being equaled or exceeded each year. The 500-year flood is a flood that has a 0.2 percent chance of being equaled or exceeded in any given year. The potential for flooding can change and increase through various land use changes and changes to land surface, which result in a change to the floodplain. A change in environment can create localized flooding problems inside and outside of natural floodplains by altering or confining natural drainage channels. These changes are most often created by human activity such as construction of bridges or channels. In areas where flow contains high sediment load, such as Easkoot Creek in Stinson Beach (due to an active landslide upstream), the flow carrying capacity of the channel may be reduced dramatically during a single flood event. Coastal floodplains may also change over time as waves and currents alter the coastline (especially wetlands) and sea levels rise.

[10] An Enhanced Seismic Activity Observed Due to Climate Change: Preliminary Results from Alaska. https://iopscience.iop.org/article/10.1088/1755-1315/167/1/012018

Flooding can occur in several ways:

Riverine flooding – Riverine flooding, defined as when a watercourse exceeds its "bank-full" capacity, generally occurs as a result of prolonged rainfall, or rainfall that is combined with snowmelt and/or already saturated soils from previous rain events. This type of flood occurs in river systems whose tributaries may drain large geographic areas and include one or more independent river basins. The onset and duration of riverine floods may vary from a few hours to many days and is often characterized by high peak flows combined with a large volume of runoff. Factors that directly affect the amount of flood runoff include precipitation amount, intensity and distribution, the amount of soil moisture, seasonal variation in vegetation, snow depth, and water-resistance of the surface due to urbanization. In the Marin County OA, riverine flooding can occur anytime from November through April and is largely caused by heavy and continued rains, sometimes combined with snowmelt, increased outflows from upstream dams, and heavy flow from tributary streams. These intense storms can overwhelm the local waterways as well as the integrity of flood control structures. Flooding is more severe when antecedent rainfall has resulted in saturated ground conditions. The warning time associated with slow rise riverine floods assists in life and property protection.

Flash flooding – Flash flooding describes localized floods of great volume and short duration. This type of flood usually results from a heavy rainfall on a relatively small drainage area. Precipitation of this sort usually occurs in the winter and spring. Flash floods often require immediate evacuation within the hour and thus early threat identification and warning is critical for saving lives.

Localized/Stormwater flooding – Localized flooding problems are often caused by flash flooding, severe weather, or an unusual amount of rainfall. Flooding from these intense weather events usually occurs in areas experiencing an increase in runoff from impervious surfaces associated with development and urbanization as well as inadequate storm drainage systems.

Tidal flooding – Tidal flooding develops when high tides exceed either the top of bank elevation of tidal sloughs and channels, or the crest of bay levees. An especially high tide event that occurs during alignment of the gravitational pull between the sun and the moon, causing tidal water levels to rise to higher-than normal levels. King tides are normal, predictable events that occur semi-annually during winter months. Typically storms in which high tides coincide with peak stormwater flow may be damaging to municipal infrastructure and private property.

The area is also at risk to flooding resulting from levee failures and dam failures. Dam failure flooding is discussed separately in the Dam Failure Section of this document; levee failure flooding is discussed separately in the Levee Failure Section of this document. Regardless of the type of flood, the cause is often the result of severe weather and excessive rainfall, either in the flood area or upstream reach.

A weather pattern called the "Atmospheric River" contributes to the flooding potential of the area. An Atmospheric River brings warm air and rain to the West. A relatively common weather pattern brings southwest winds to the Pacific Northwest or California, along with warm, moist air. The moisture sometimes produces many days of heavy rain, which can cause extensive flooding. The warm air also can melt the snowpack in the mountains, which further aggravates the flooding potential. In the colder parts of the year, the warm air can be cooled enough to produce heavy, upslope snow as it rises into the higher elevations of the Sierra Nevada or

Cascades. Forecasters and others on the West Coast often used to refer to this warm, moist air as the "Pineapple Express" because it comes from around Hawaii where pineapples are grown. A diagram of an atmospheric river event is shown in Figure 31.

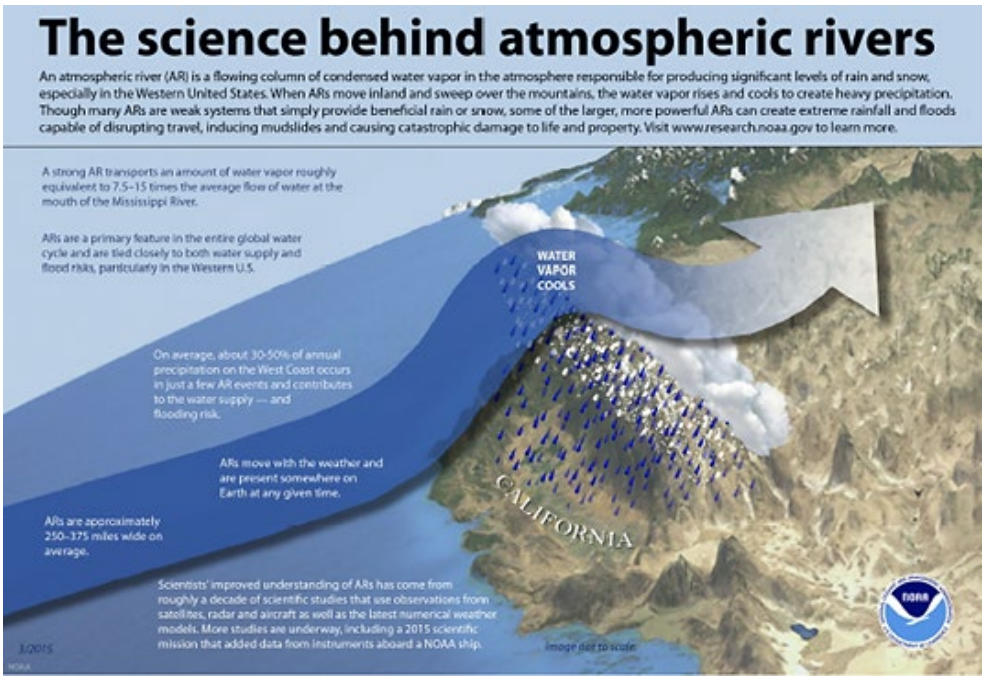

Figure 123: Diagram of an Atmospheric River Event
Source: NOAA

The Marin County OA is susceptible to various types of flood events. In coastal areas, flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Other types of flooding in Marin include isolated ponding and stormwater overflow. Isolated ponding is when pools form on the ground and can occur in any area that doesn't drain effectively – for example, in a natural depression in the landscape. Stormwater overflow is when storm drains back up. Stormwater drainage systems quickly convey rainwater through underground pipes to creeks and the Bay. When the storm drains are obstructed or broken or when the water bodies to which they lead to are already full, water backs up onto the streets. Although stormwater overflow and isolated ponding also occur throughout the County, the effects are typically not widespread or significantly damaging.

Flooding in Corte Madera generally results from a combination of high tides and storm runoff in low-lying areas. Most of the lowland areas in Corte Madera are in the 100-year floodplain, with several areas in the 500-year floodplain.

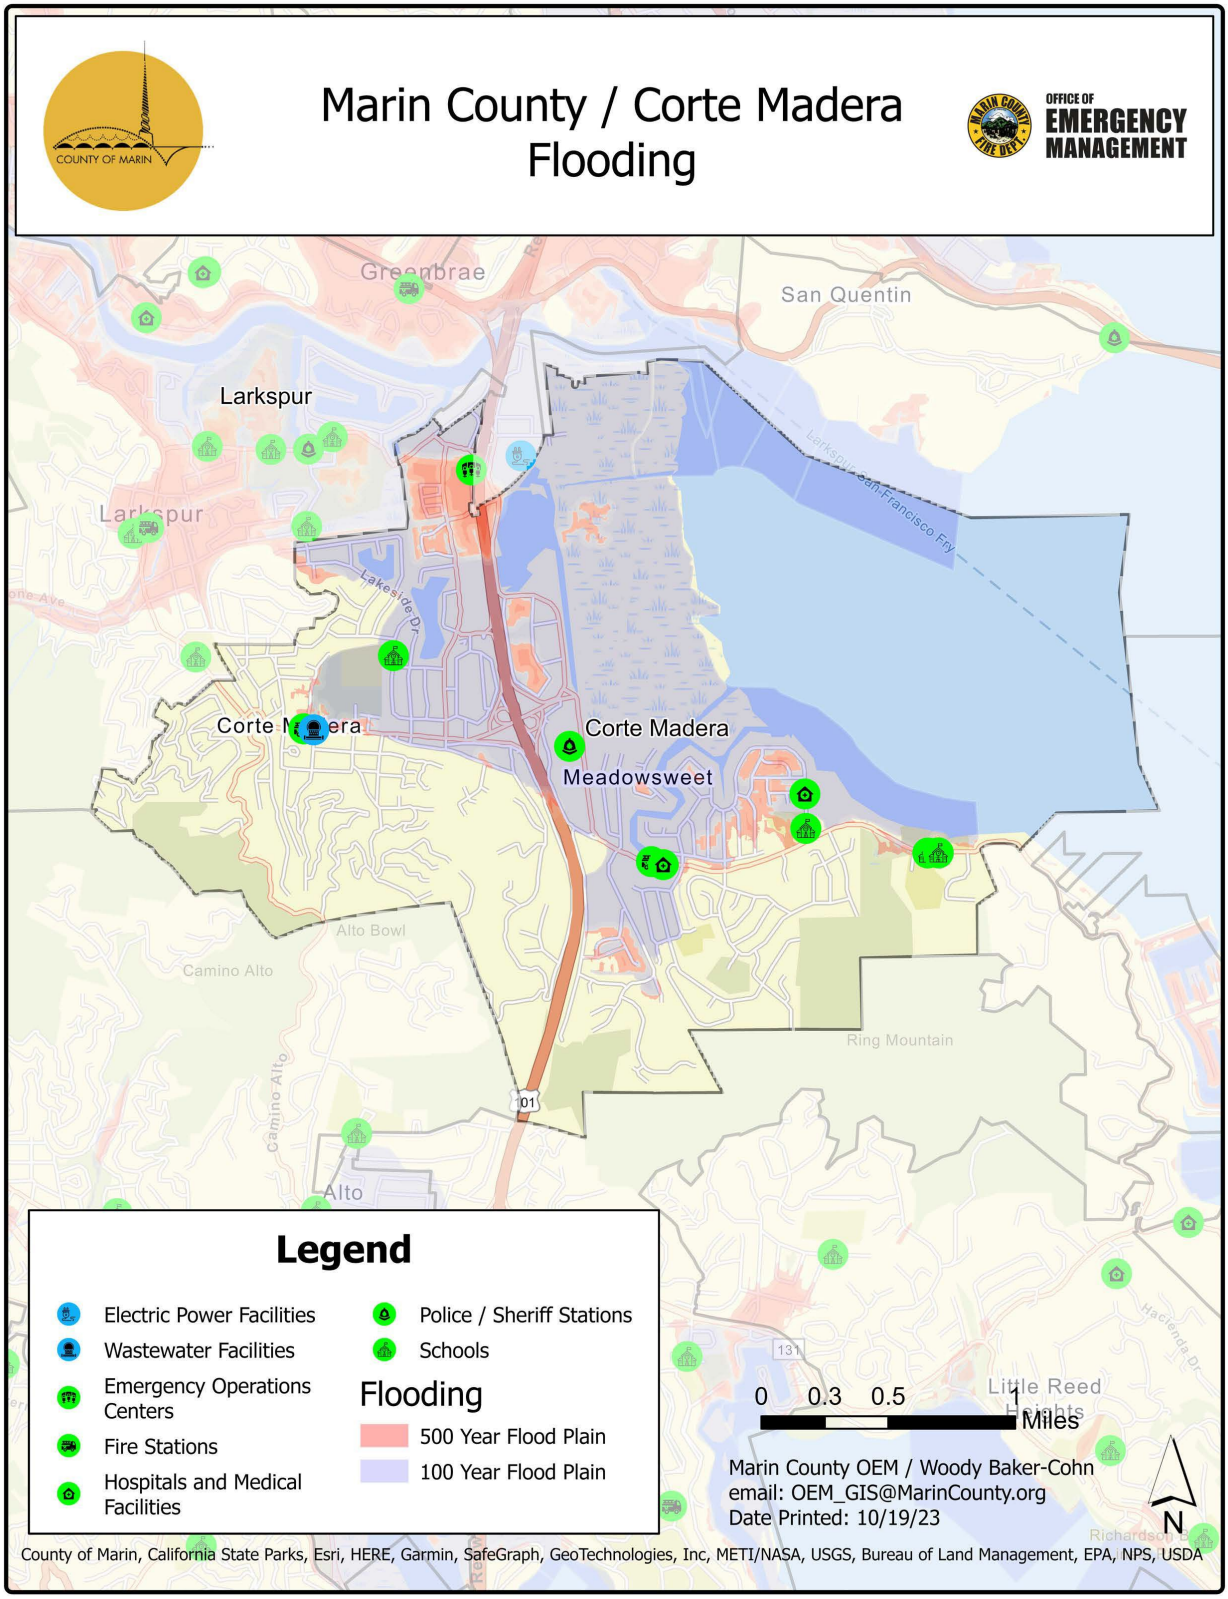

Figure 124: Town of Corte Madera Flooding Critical Facilities and Infrastructure
Source: Marin County OEM

Numerous businesses, residential neighborhoods, schools, churches, community centers, roads, and other critical facilities lie in this area and are susceptible to flooding. Table 17 shows the number of residential structures by flood zone in the Town of Corte Madera.

Table 17: Residential Structures in The Town of Corte Madera by Flood Zone

Flood Zone	FEMA Flood Zone Designations	Improved Residential Parcels
High Risk Areas		
A	Areas with a 1% annual chance of flooding and a 26% chance of flooding over the life of a 30-year mortgage. Because detailed analyses are not performed for such areas; no depths or base flood elevations are shown within these zones.	
AE	The base floodplain where base flood elevations are provided. AE Zones are now used on new format FIRMs instead of A1-A30 Zones.	**1245**
A1-30	These are known as numbered A Zones (e.g., A7 or A14). This is the base floodplain where the FIRM shows a BFE (old format).	
AH	Areas with a 1% annual chance of shallow flooding, usually in the form of a pond, with an average depth ranging from 1 to 3 feet. These areas have a 26% chance of flooding over the life of a 30-year mortgage. Base flood elevations derived from detailed analyses are shown at selected intervals within these zones.	
AO	River or stream flood hazard areas, and areas with a 1% or greater chance of shallow flooding each year, usually in the form of sheet flow, with an average depth ranging from 1 to 3 feet. These areas have a 26% chance of flooding over the life of a 30-year mortgage. Average flood depths derived from detailed analyses are shown within these zones.	
AR	Areas with a temporarily increased flood risk due to the building or restoration of a flood control system (such as a levee or a dam). Mandatory flood insurance purchase requirements will apply, but rates will not exceed the rates for unnumbered A zones if the structure is built or restored in compliance with Zone AR floodplain management regulations.	
A99	Areas with a 1% annual chance of flooding that will be protected by a Federal flood control system where construction has reached specified legal requirements. No depths or base flood elevations are shown within these zones.	
High Risk - Coastal Areas		
V	Coastal areas with a 1% or greater chance of flooding and an additional hazard associated with storm waves. These areas have a 26% chance of flooding over the life of a 30-year mortgage. No base flood elevations are shown within these zones.	
VE, V1 - 30	Coastal areas with a 1% or greater chance of flooding and an additional hazard associated with storm waves. These areas have a 26% chance of flooding over the life of a 30-year	**17**

	mortgage. Base flood elevations derived from detailed analyses are shown at selected intervals within these zones.	
Moderate to Low-Risk Areas		
B and X (shaded)	Area of moderate flood hazard, usually the area between the limits of the 100-year and 500-year floods. B Zones are also used to designate base floodplains of lesser hazards, such as areas protected by levees from 100-year flood, or shallow flooding areas with average depths of less than one foot or drainage areas less than 1 square mile	**2390**
C and X (unshaded)	Area of minimal flood hazard, usually depicted on FIRMs as above the 500-year flood level. Zone C may have ponding and local drainage problems that don't warrant a detailed study or designation as base floodplain. Zone X is the area determined to be outside the 500-year flood and protected by levee from 100-year flood.	
Undetermined Risk Areas		
D	Areas with possible but undetermined flood hazards. No flood hazard analysis has been conducted. Flood insurance rates are commensurate with the uncertainty of the flood risk.	
Total		**3,652**

Table 59: Town of Corte Madera Critical Facilities in the Flood Zones
Source: Marin County/FEMA DFIRM

Significant waterways that contribute to flooding within Corte Madera include Corte Madera Creek (draining the Ross Valley watershed), San Clemente Creek (a tidal slough winding between subdivisions and open space draining runoff into the San Francisco Bay), High Canal and associated channels, lagoons, and the Shorebird Marsh ponding area. Siltation within San Clemente Creek has significantly reduced its capacity to carry floodwaters from town.

Although the Town of Corte Madera has not experienced recent catastrophic flooding, floodwaters can be deep enough to drown people and move fast enough to sweep people and vehicles away, lift buildings off foundations, and carry debris that smashes into buildings and other property. Flood waters can cause significant erosion which can lead to slope instability, severely damaging transportation and utility infrastructure by undermining foundations or washing away pavement. If water levels rise high enough to get inside buildings, flooding can cause extensive damage to personal property and the structure itself. Flood events that develop very quickly are especially dangerous because there may be little advance warning. Flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Tide elevations within San Francisco Bay have the potential to significantly impact the Corte Madera storm drain system. Corte Madera already sees flooding from king tides in San Francisco Bay and this is only expected to increase with sea level rise and climate change. A failure of the Phoenix Lake Dam or a breach and/or overtopping of the levees along Corte Madera Creek could contribute to flooding in the lowland areas of Corte Madera.

On 1/9/2023, a significant rain event flooded Corte Madera roads that fed into Highway 101, rendering them impassable. there was extensive flooding in streets of the low lying neighborhood Mariner Cove, and rainfall caused a significant landslide on Endeavor Drive.

On 12/27/2022, an atmospheric river dumped enough standing water on Highway 101 at Lucky Drive in Corte Madera to close all of the northbound lanes, affecting morning traffic.

On 10/24/2021, a large storm caused lane closures on Highway 101 at Lucky Drive in Corte Madera.

On 1/10/2017, a moderate storm flooded roads and yards in Corte Madera. Seawolf Passage wasn't passable for much of the morning and several blocks in one neighborhood were flooded.

In 2005, there was extensive roadway flooding in the Madera Gardens neighborhood of Corte Madera after Larkspur's pump station in Redwood Marsh failed and water backed up into the neighborhood.

During every king tide higher than 6.5', the lowest areas of the Mariner Cove neighborhood are inundated with saltwater as tidal water pours in between houses and floods Golden Hind Passage interrupting traffic and cutting off some residents from accessing their homes. The neighborhood relies on a gravity storm system which does not function during certain high tides.

Figure 125: Flooding on Golden Hind Passage in Corte Madera, January 10, 2017
Source: ABC 7

Climate Change and Future Development Considerations

Climate change is expected to affect California's precipitation patterns, which are likely to influence future flood events. A 2017 study[11] found that the number of very intense precipitation days in California is projected to more than double by the end of the century, increasing 117 percent, making it likely that flood events will become more frequent in the Marin County OA including Corte Madera. Climate change is expected to alter rainfall patterns in Northern California, including the Marin County OA. As the climate warms, rain events are predicted to become more intense. The Marin County OA including Corte Madera will likely experience more rain inundation events that lead to flooding and increase the potential threat of dam and levee failure, tree mortality, and other potential hazards. Sea level rise as a result of climate change will exacerbate the impacts of tidal flooding in the lowland areas of the Marin County OA including the shoreline areas of Corte Madera. Future development in these areas will expose more people and infrastructure to the effects of flooding. Development in the marshland area of Corte Madera would expose additional people and infrastructure to flooding as marshlands act as a natural buffer to storm surge. Development along Corte Madera Creek and the High Canal would expose more people, structures and infrastructure including major roads to creek flooding and storm surge from Corte Madera Creek as a result of climate change.

2.2.6 LAND SUBSIDENCE

Land subsidence is a gradual settling or sudden sinking of the Earth's surface owing to subsurface movement of earth materials. The principal causes are aquifer-system compaction, drainage of organic soils through groundwater pumping, underground mining, hydro-compaction, natural compaction, sinkholes, and thawing permafrost. More than 80 percent of the identified subsidence in the United States is a consequence of underground water

[11] Precipitation in a Warming World: Assessing Projected Hydro-Climate Changes in California and other Mediterranean Regaions. https://www.nature.com/articles/s41598-017-11285-y

exploitation. The increasing development of land and water resources threatens to exacerbate existing land-subsidence problems and initiate new ones.

Sinkholes can form in three primary ways. Dissolution sinkholes form when dissolution of the limestone or dolomite is most intensive where the water first contacts the rock surface. Aggressive dissolution also occurs where flow is focused in preexisting openings in the rock, such as along joints, fractures, and bedding planes, and in the zone of water-table fluctuation where groundwater is in contact with the atmosphere. See Figure 34 for a picture and description of how dissolution sinkholes form.

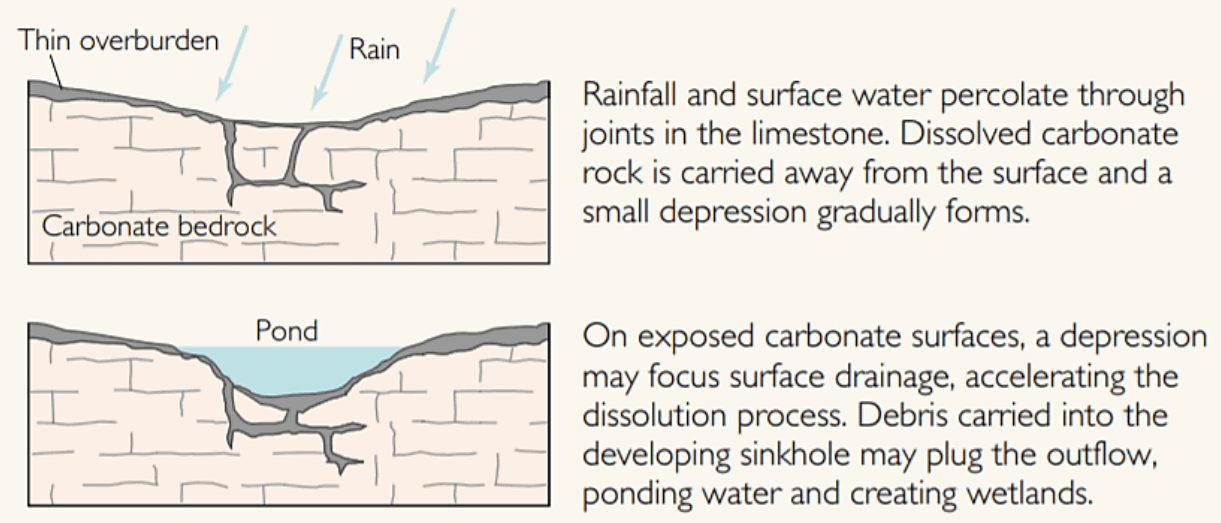

Figure 126: Dissolution Sinkhole Formation
Source: USGS

Cover-subsidence sinkholes tend to develop gradually where the covering sediments are permeable and contain sand. In areas where cover material is thicker, or sediments contain more clay, cover-subsidence sinkholes are relatively uncommon, are smaller, and may go undetected for long periods. See Figure 35 for a picture and description of how cover-subsidence sinkholes form.

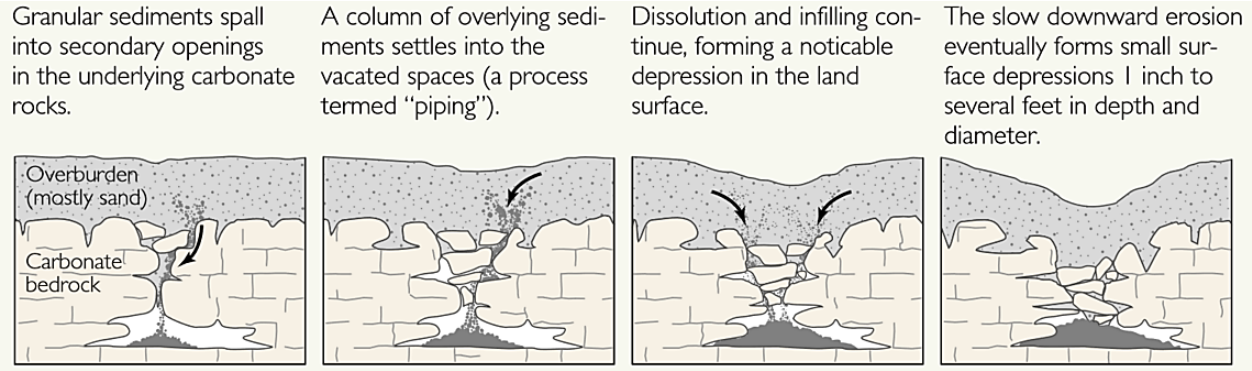

Figure 127: Cover-Subsidence Sinkhole Formation
Source: USGS

Cover-collapse sinkholes may develop abruptly over a period of hours and cause catastrophic damages. They occur where the covering sediments contain a significant amount of clay. Over

time, surface drainage, erosion, and deposition of sediment transform the steep-walled sinkhole into a shallower bowl-shaped depression. See Figure 36 for a picture and description of how cover-collapse sinkholes form.

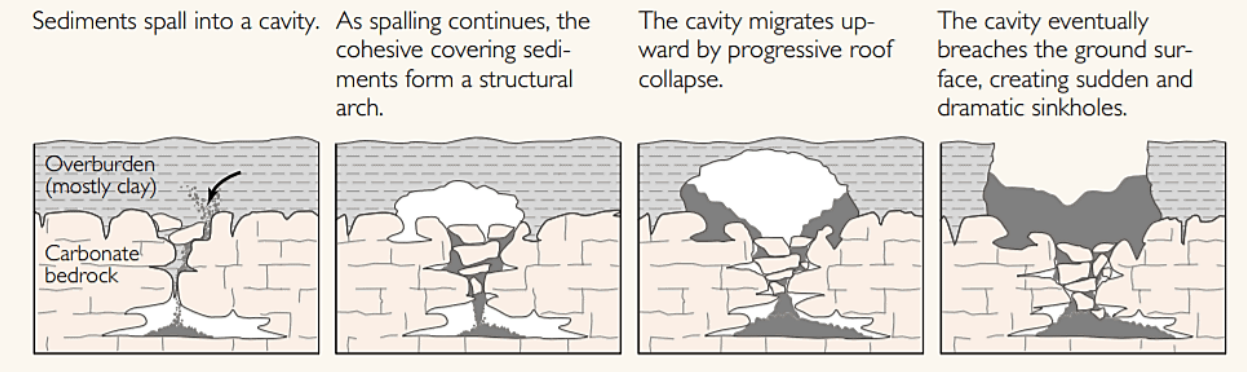

Figure 128: Cover-Collapse Sinkhole Formation
Source: USGS

New sinkholes have been correlated to land-use practices, especially from groundwater pumping and from construction and development practices that cause land subsidence. Sinkholes can also form when natural water-drainage patterns are changed and new water-diversion systems are developed. Some sinkholes form when the land surface is changed, such as when industrial and runoff-storage ponds are created. The substantial weight of the new material can trigger an underground collapse of supporting material, thus causing a sinkhole.

The overburden sediments that cover buried cavities in the aquifer systems are delicately balanced by groundwater fluid pressure. The water below ground helps to keep the surface soil in place. Groundwater pumping for urban water supply and for irrigation can produce new sinkholes in sinkhole-prone areas. If pumping results in a lowering of groundwater levels, then underground structural failure, and thus, sinkholes, can occur.

Land subsidence and sinkholes would most likely occur in the central and eastern lowland areas of Corte Madera where superficial deposits and fill are more prevalent. This includes the primary commercial area of town along the Highway 101 corridor, and numerous residential neighborhoods with schools and other critical facilities. These areas could anticipate increased rates of subsidence as bay waters saturate the soil from below. Land subsidence could have numerous impacts for Corte Madera, including the settling of businesses and homes as well as the shifting of roadways and utility infrastructure that run through the town.

It has been observed that there has been significant subsidence occurring in the low lying neighborhoods in the central and east side of Town that were built over existing marshes and have a significant amount of bay mud below them. These neighborhoods will continue to subside in the future putting them at risk of tidal inundation and flooding.

There have been no major sinkholes recorded in Corte Madera, however, there have been several smaller sink holes around town caused by a variety of factors.

Climate Change and Future Development Considerations

Climate change could indirectly influence land subsidence as more severe and prolonged periods of drought may encourage more groundwater withdrawals. In coastal areas like the Marin County OA including Corte Madera, land subsidence leads to higher sea levels and increased flood risk. The rate of land subsidence could increase across the Marin County OA including the lowland areas of Corte Madera as a result of climate change. The impacts of land subsidence on infrastructure, including roads and underground utilities, in Corte Madera could increase with future development in the lowland populated areas of the city where land subsidence is more likely to occur.

2.2.7 Levee Failure

Levee failure is the overtopping, breach or collapse of the levee. Levees can fail in the event of an earthquake, internal erosion, poor engineering/construction or landslides, but levees most commonly fail as a result of significant rainfall or very high tides. During a period of heavy rainfall, the water on the water-body side of the levee can build up and either flow over the top ("overtopping") or put pressure on the structure causing quickening seepage and subsequent erosion of the earth. The overflow of water washes away the top portion of the levee, creating deep grooves. Eventually the levee weakens, resulting in a breach or collapse of the levee wall and the release of uncontrollable amounts of water. Figure 37 shows a levee and the multiple ways it can fail.

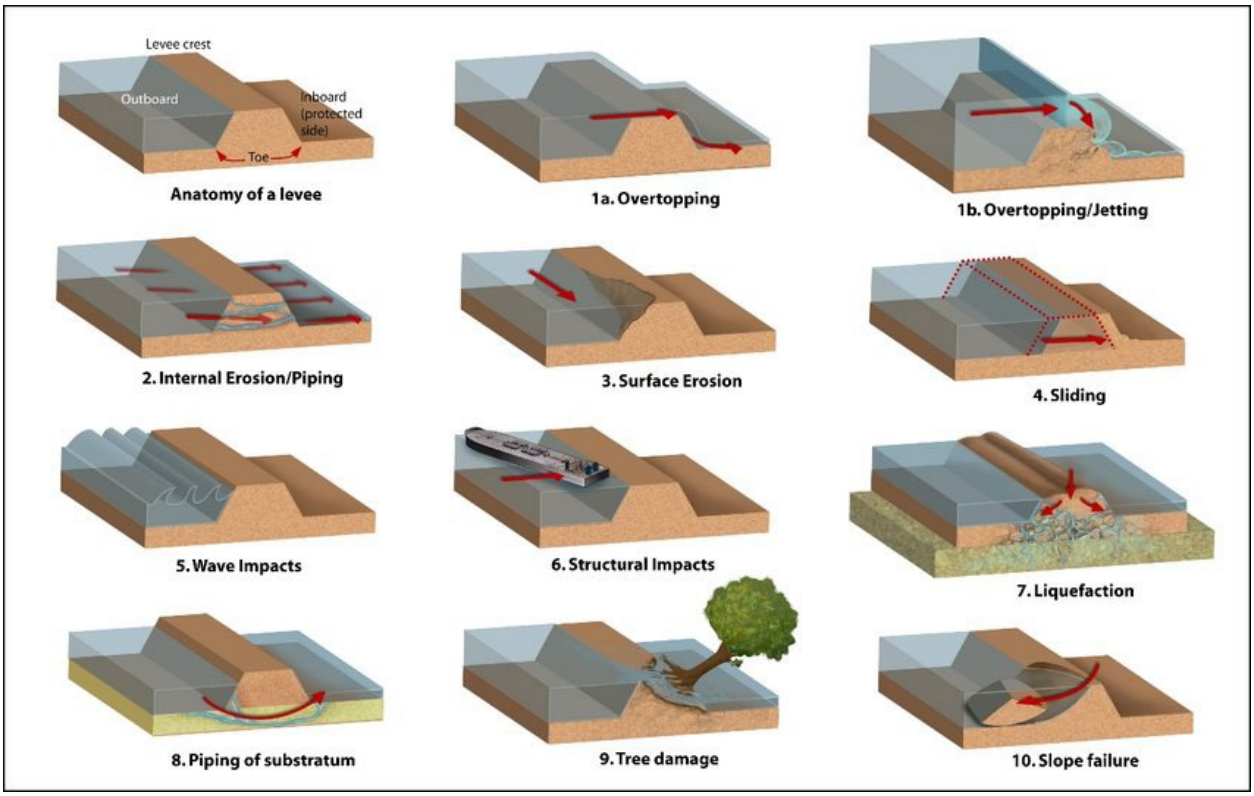

Figure 129: Levee Failure Mechanisms
Source: University of California

Corte Madera is protected by levees along Corte Madera Creek in the City of Larkspur, none of which are FEMA-accredited. The Corte Madera Creek Levee Evaluation Project was created to

evaluate the feasibility of increasing the level of flood protection for residences and businesses within Corte Madera Creek's 100-year floodplain, and to work towards having the levees become FEMA accredited. A failure of the levees along Corte Madera creek, along the Sonoma-Marin Area Rail Transit (SMART) right of way, or around Marina Village during a high rain event could cause flooding into the several areas of Corte Madera, with property and infrastructure within the 100-year floodplain being most susceptible.

Climate Change and Future Development Considerations

Climate change is expected to lead to an increase in the frequency and severity of major storm events, which can place added strain on levee systems. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in leveed areas across the Marin County OA including in Corte Madera, increasing the potential for a levee failure. Rising seas will lead to increased stress on the levees around the Marin County OA shoreline including in Corte Madera, particularly during a major tidal event and potential tsunami. As development increases in the populated areas of Corte Madera protected by its levees, particularly along Corte Madera Creek and around its marshlands, the potential for significant impacts to residents and infrastructure will only increase.

2.2.8 Sea Level Rise

Climate change is the distinct change in measures of weather patterns over a long period of time, ranging from decades to millions of years. More specifically, it may be a change in average weather conditions such as temperature, rainfall, snow, ocean and atmospheric circulation, or in the distribution of weather around the average. While the Earth's climate has cycled over its 4.5-billion-year age, these natural cycles have taken place gradually over millennia, and the Holocene, the most recent epoch in which human civilization developed, has been characterized by a highly stable climate until recently.

The Marin County OA MJHMP is concerned with human-induced climate change that has been rapidly warming the Earth at rates unprecedented in the last 1,000 years. Since industrialization began, the burning of fossil fuels (coal, oil, and natural gas) at escalating quantities has released vast amounts of carbon dioxide and other greenhouse gases responsible for trapping heat in the atmosphere, increasing the average temperature of the Earth. Secondary impacts include changes in precipitation patterns, the global water cycle, melting glaciers and ice caps, and rising sea levels. According to the Intergovernmental Panel on Climate Change (IPCC), climate change will "increase the likelihood of severe, pervasive and irreversible impacts for people and ecosystems" if unchecked.

Through changes to oceanic and atmospheric circulation cycles and increasing heat, climate change affects weather systems around the world. Climate change increases the likelihood and exacerbates the severity of extreme weather – more frequent or intense storms, floods, droughts, and heat waves. Consequences for human society include loss of life and injury, damaged infrastructure, long-term health effects, loss of agricultural crops, disrupted transport and freight, and more. Climate change is not a discrete event but a long-term hazard, the effects of which communities are already experiencing.

Climate change adaptation is a key priority of the State of California. The 2013 State of California Multi- Hazard Mitigation Plan stated that climate change is already affecting

California. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Rising sea levels are considered a secondary effect of climate change due to warming ocean temperatures and melting glacial ice sheets into the ocean. The California coast has already seen a rise in sea level of four to eight inches over the 20th century due to climate change. Sea level rise impacts can be exacerbated during coastal storms, which often bring increased tidal elevations called “storm surge.” The large waves associated with such storm surges can cause flooding in low-lying areas, erosion of coastal wetlands, saltwater contamination of drinking water, disruption of septic system operations, impacts on roads and bridges, and increased stress on levees. In addition, rising sea levels results in coastal erosion as shoreline sediment is re-deposited back into the ocean. Evidence shows that winter storms have increased in frequency and intensity since 1948 in the North Pacific, increasing regional wave heights and water levels during storm events.

According to the 2017 “Rising Seas in California, An Update on Sea-Level Rise Science” report Marin County may experience impacts from Sea Level Rise over defined periods of time, to include long-term changes (second half of this century and beyond), and short- to mid-term projections (within the next two or three decades).

Much of Corte Madera was built on fill and is at a lower elevation than many of the coastal areas in Marin County. As such, the lowland areas in Corte Madera are particularly vulnerable to sea level rise and could experience between one and six feet of inundation (Mean High Water (MHW)), especially as these neighborhoods continue to subside over time. (Marin Shoreline Sea Level Rise Vulnerability Assessment, 2017)

Numerous businesses, residential neighborhoods, schools, churches, community centers, roads, and other critical facilities lie in areas of Corte Madera susceptible to sea level rise. The 2017 Marin Shoreline Sea Level Rise Vulnerably Assessment estimates that Corte Madera could anticipate impacts to nearly 40 percent of the residential parcels and 80 percent of the commercial parcels in a 100-year sea level rise scenario and including storm surge, with over $30 million in damages and $725 million in total losses to vulnerable buildings. Structures throughout the town can become damaged extensively with their foundations compromised over time. Of particular concern are those structures and infrastructure that have not been elevated to projected sea level rise heights over the next century, including Highway 101 which could become more isolated due to sea level rise flooding. Sea level rise in Corte Madera has the potential to exacerbate inland flooding when a significant rain or tidal event occurs, pushing water from local creeks over their banks and into adjacent neighborhoods. Sea level rise can also cause increased subsidence along Corte Madera’s shoreline, which may damage underground water and wastewater pipelines and disrupt services. Corte Madera’s marshland would eventually turn into open water as a result of sea level rise, eliminating a natural barrier that protects the town from increased storm surge. Corte Madera would begin to experience seasonal, king tide, and storm surge flooding more frequently in the future.

Climate Change and Future Development Considerations

The two major causes of global sea level rise are thermal expansion of warming oceans and the melting of land-based glaciers and polar ice caps. Climate change is affecting natural and built systems around the world, including the California coast. In the past century, average global temperature has increased about 1.4°F, and average global sea level has increased 7 to 8 inches. Sea level rise in the San Francisco Bay Area is projected to increase by eight inches MHW in 2050 and could reach 4.5 to eight feet by 2021 if greenhouse gas emissions aren't reduced.

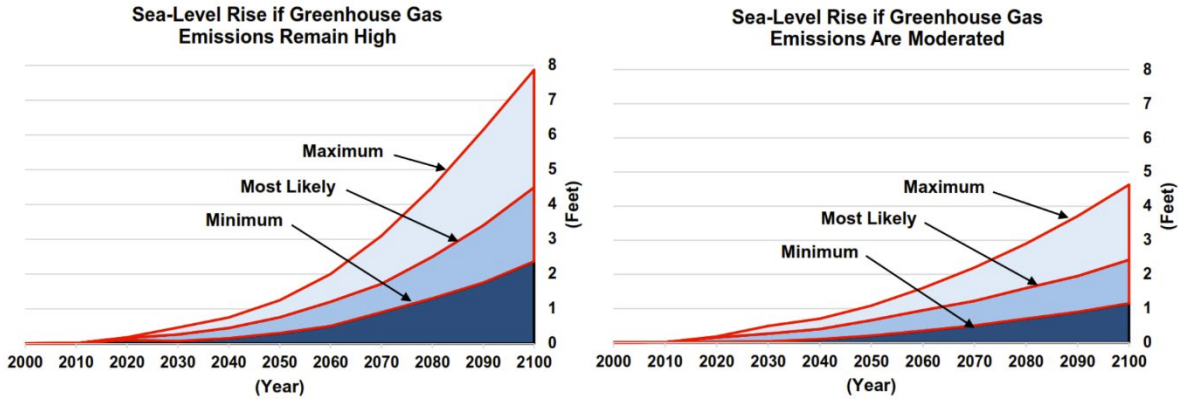

Figure 134: Projections of Sea Level Rise in the San Francisco Bay Area, 2000-2100
Source: 2019–2020 Marin County Civil Grand Jury, Climate Change: How Will Marin Adapt?

While the Marin County OA shoreline including around Corte Madera already experiences regular erosion, flooding, and significant storm events, sea level rise will exacerbate these natural processes, leading to significant social, environmental, and economic impacts. The third National Climate Assessment cites strong evidence that the cost of doing nothing exceeds the costs associated with adapting to sea level rise by 4 to 10 times. Sea level rise will continue to affect the Marin County OA including Corte Madera with increased tidal flooding and storm surge during severe weather events, and future development along the Marin County OA shoreline including around Corte Madera will only amplify these impacts. Sea level can also lead to increased land subsidence and the potential of levee failure. The impacts of a tsunami would also be magnified with rising seas. Future development in the coastal and lowland areas of Corte Madera will put more people and property at risk from flooding as a result of sea level rise. Roads and utility infrastructure across Corte Madera will continue to become inundated.

2.2.9 Severe Weather – Extreme Heat

Extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. A heat wave is an extended period of extreme heat, often with high humidity. When relative humidity is factored in, the temperature can feel much hotter as reflected in the Heat Index (see Figure 43):

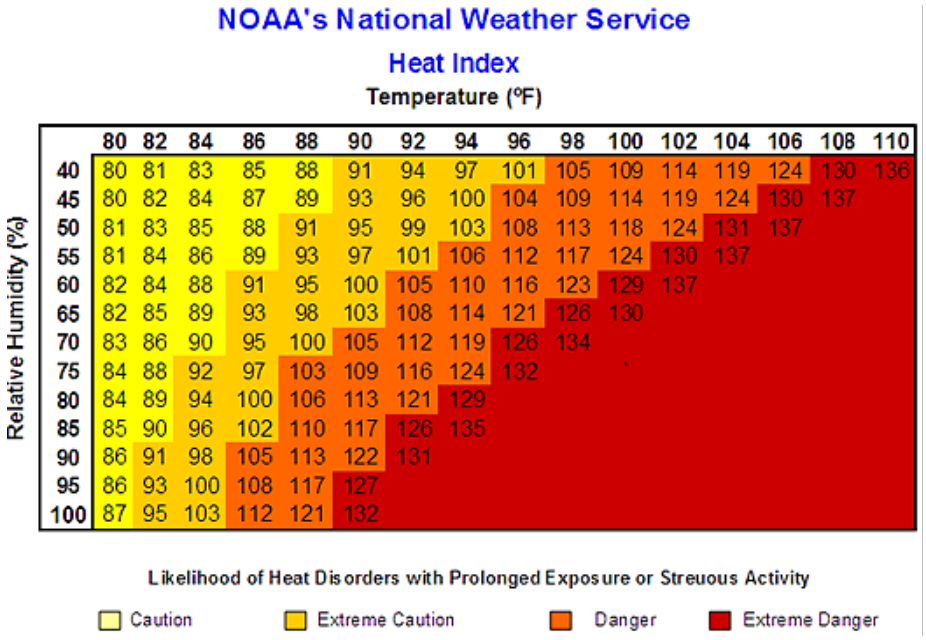

Figure 135: Heat Index
Source: NOAA

Heat kills by taxing the human body beyond its abilities. In a normal year, about 1,300 Americans succumb to the demands of summer heat. Heat is the leading weather-related cause of mortalities in the US. In 2006, California reported a high of 204 heat related deaths, with 98 reported in 2017 and 93 deaths reported in 2018.

Extreme heat has the potential to impact all areas of Corte Madera and would be felt more at lower elevations in the central and eastern areas of the town. Temperatures can feel warmer in this area due to the widespread presence of concrete and asphalt, which stores heat longer. Heat waves can cause power outages and can sicken people who are exposed to high temperatures too long, particularly infants and the elderly.

In September 2022 the Marin County OA experienced an Extreme Heat Event with temperatures exceeding 103 degrees.

Climate Change and Future Development Considerations

The primary effect of climate change is warmer average temperatures. The annual average daily high temperatures in California are expected to rise by 2.7°F by 2040, 5.8°F by 2070, and 8.8°F by 2100 compared to observed and modeled historical conditions. At the current rate, annual average temperatures in the Marin County OA region and Bay Area will likely increase by approximately 4.4 degrees by 2050 and 7.2 degree by the end of the century unless significant efforts are made to reduce greenhouse emotions according to California's latest climate change assessment.

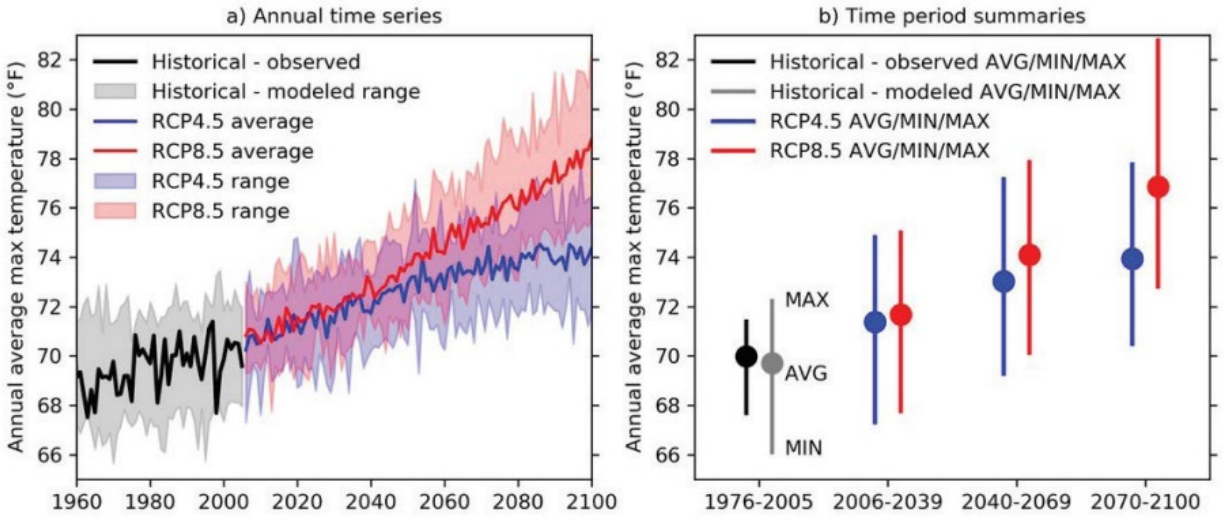

Figure 136: Annual Average Temperatures in the San Francisco Bay Area, 2000-2100
Source: California Climate Change Assessment (Fourth Edition)

As climate change accelerates in the 21st century, it is anticipated that extreme heat events will become more frequent and intense across the Marin County OA including in Corte Madera. There will be increased residential and business needs for cooling and addressing heat-related issues. These effects would primarily be felt in the lowland areas of Corte Madera where heat builds in developed areas. Heat waves also tax the energy grid. Future development in the Marin County OA including Corte Madera could exacerbate the impacts from heat related events, particularly in electricity provision and water delivery. Increased temperatures will also lead to an increase in the occurrence and severity of wildfires across the Marin County OA including Corte Madera as conditions become hotter and drier. These effects will primarily be felt in the mountainous and marshlands areas of Corte Madera where hotter and drier conditions are more apt to lead to wildfires. Future development near the many open spaces around Corte Madera could expose more people and infrastructure to the threat of a major wildfire as a result of increasing temperatures.

2.2.10 Severe Weather – High Wind & Tornado

High Wind

High wind is defined as a one-minute average of surface winds 40 miles per hour or greater lasting for one hour or longer, or winds gusting to 58 miles per hour or greater regardless of duration that are either expected or observed over land. These winds may occur as part of a seasonal climate pattern or in relation to other severe weather events such as thunderstorms. The Beaufort scale is an empirical measure that relates wind speed to observed conditions on land and is a common measure of wind intensity (see Figure 45).

Beaufort number	Description	Wind speed		Land conditions
		kts	km/h	
0	Calm	< 1	< 1	Calm. Smoke rises vertically.
1	Light air	1 – 2	1 – 5	Wind motion visible in smoke.
2	Light breeze	3 – 6	6 – 11	Wind felt on exposed skin. Leaves rustle.
3	Gentle breeze	7 – 10	12 – 19	Leaves and smaller twigs in constant motion.
4	Moderate breeze	11 – 15	20 – 28	Dust and loose paper raised. Small branches begin to move.
5	Fresh breeze	16 – 20	29 – 38	Branches of a moderate size move. Small trees begin to sway.
6	Strong breeze	21 – 26	39 – 49	Large branches in motion. Whistling heard in overhead wires. Umbrella use becomes difficult. Empty plastic garbage cans tip over.
7	High wind, Moderate gale, Near gale	27 – 33	50 – 61	Whole trees in motion. Effort needed to walk against the wind. Swaying of skyscrapers may be felt, especially by people on upper floors.
8	Gale, Fresh gale	34 – 40	62 – 74	Some twigs broken from trees. Cars veer on road. Progress on foot is seriously impeded.
9	Strong gale	41 – 47	75 – 88	Some branches break off trees, and some small trees blow over. Construction/temporary signs and barricades blow over. Damage to circus tents and canopies.
10	Storm, Whole gale	48 – 55	89 – 102	Trees are broken off or uprooted, saplings bent and deformed. Poorly attached asphalt shingles and shingles in poor condition peel off roofs.
11	Violent storm	56 – 63	103 – 117	Widespread vegetation damage. Many roofing surfaces are damaged; asphalt tiles that have curled up and/or fractured due to age may break away completely.
12	Hurricane	≥ 64	≥ 118	Very widespread damage to vegetation. Some windows may break; mobile homes and poorly constructed sheds and barns are damaged. Debris may be hurled about.

Figure 137: Beaufort Wind Scale
Source: NOAA

Windstorms in the Marin County OA are typically straight-line winds. Straight-line winds are generally any thunderstorm wind that is not associated with rotation (i.e., is not a tornado). It is these winds, which can exceed 100 mph, which represent the most common type of severe weather and are responsible for most wind damage related to thunderstorms.

Tornado

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes are the most powerful storms that exist, and damage paths can be in excess of one mile wide and 50 miles long. The Enhanced Fujita Scale (see Figure 46) is commonly used to rate the intensity of tornadoes in the United States based on the damages that they cause.

Enhanced Fujita Scale	
EF-0	65-85 mph winds
EF-1	86-110 mph winds
EF-2	111-135 mph winds
EF-3	136-165 mph winds
EF-4	166-200 mph winds
EF-5	>200 mph winds

Figure 138: Enhanced Fujita Scale
Source: NOAA

Tornadic waterspouts are tornadoes that form over water or move from land to water. They have the same characteristics as a land tornado. They are associated with severe thunderstorms, and are often accompanied by high winds and seas, large hail, and frequent dangerous lightning.

Figure 139: Waterspout Formation
Source: MarineInsights

All of Corte Madera is susceptible to storms and damage from wind and tornadoes, though the mountainous areas on the western side of town have increased susceptibility due to a higher presence of trees. Drought can increase the susceptibility of trees toppling over in a high wind

event. Fallen trees could damage homes and other facilities. Power lines could be impacted by fallen trees and wind, causing power outages. Roadways could also become blocked by fallen trees, affecting the ability of residents to reach their homes. On 12/23/2012, high wind blew down a large pine tree in Corte Madera, which crashed into a playground structure.

Climate Change and Future Development Considerations

It is anticipated that the atmospheric rivers that deliver storms to Northern California may intensify because of climate change. This increase in storm intensity may bring more intense winds and potential tornados to Northern California, including the Marin County OA and Corte Madera. Significant wind events and tornados can topple trees, particularly those that may be saturated, or drought stressed as a result of climate change. An increase in fallen trees in Corte Madera as a result of increased storms due to climate change can lead to an increase in power outages. Future development in any of the forested areas of Corte Madera including in the southern and western mountainous residential areas will increase the effects of severe wind events.

2.2.11 TSUNAMI

Tsunamis consist of waves generated by large disturbances of the sea floor, which are caused by volcanic eruptions, landslides or earthquakes. Shallow earthquakes along dip slip faults are more likely to be sources of tsunami than those along strike slip faults. The West Coast/Alaska Tsunami Warning Center (WC/ATWC) is responsible for tsunami warnings. Tsunamis are often incorrectly referred to as tidal waves. They are actually a series of waves that can travel at speeds averaging 450 (and up to 600) miles per hour with unusual wave heights. Tsunamis can reach the beach before warnings are issued.

A tsunami experienced by Corte Madera would most likely occur from an earthquake, the location of which would determine the amount of time that the tsunami waves would reach the town. Much of the central and eastern half of Corte Madera is at a lower elevation and lies in a tsunami hazard area. This includes the primary commercial area of town along the Highway 101 corridor, and numerous residential neighborhoods with schools and other critical facilities that could experience flooding impacts from a tsunami. Communities that are particularly susceptible are those south of San Clemente Creek located directly on the shoreline of San Francisco Bay. A tsunami could also push water up Corte Madera Creek, impacting homes and businesses lying along the creek. Waves from a tsunami could reach about 10-15 feet by the time they reach bayside communities in Corte Madera.

Corte Madera has never experienced a tsunami however, given its proximity to the San Francisco Bay, it is within a Tsunami zone and could potentially experience the impacts of one.

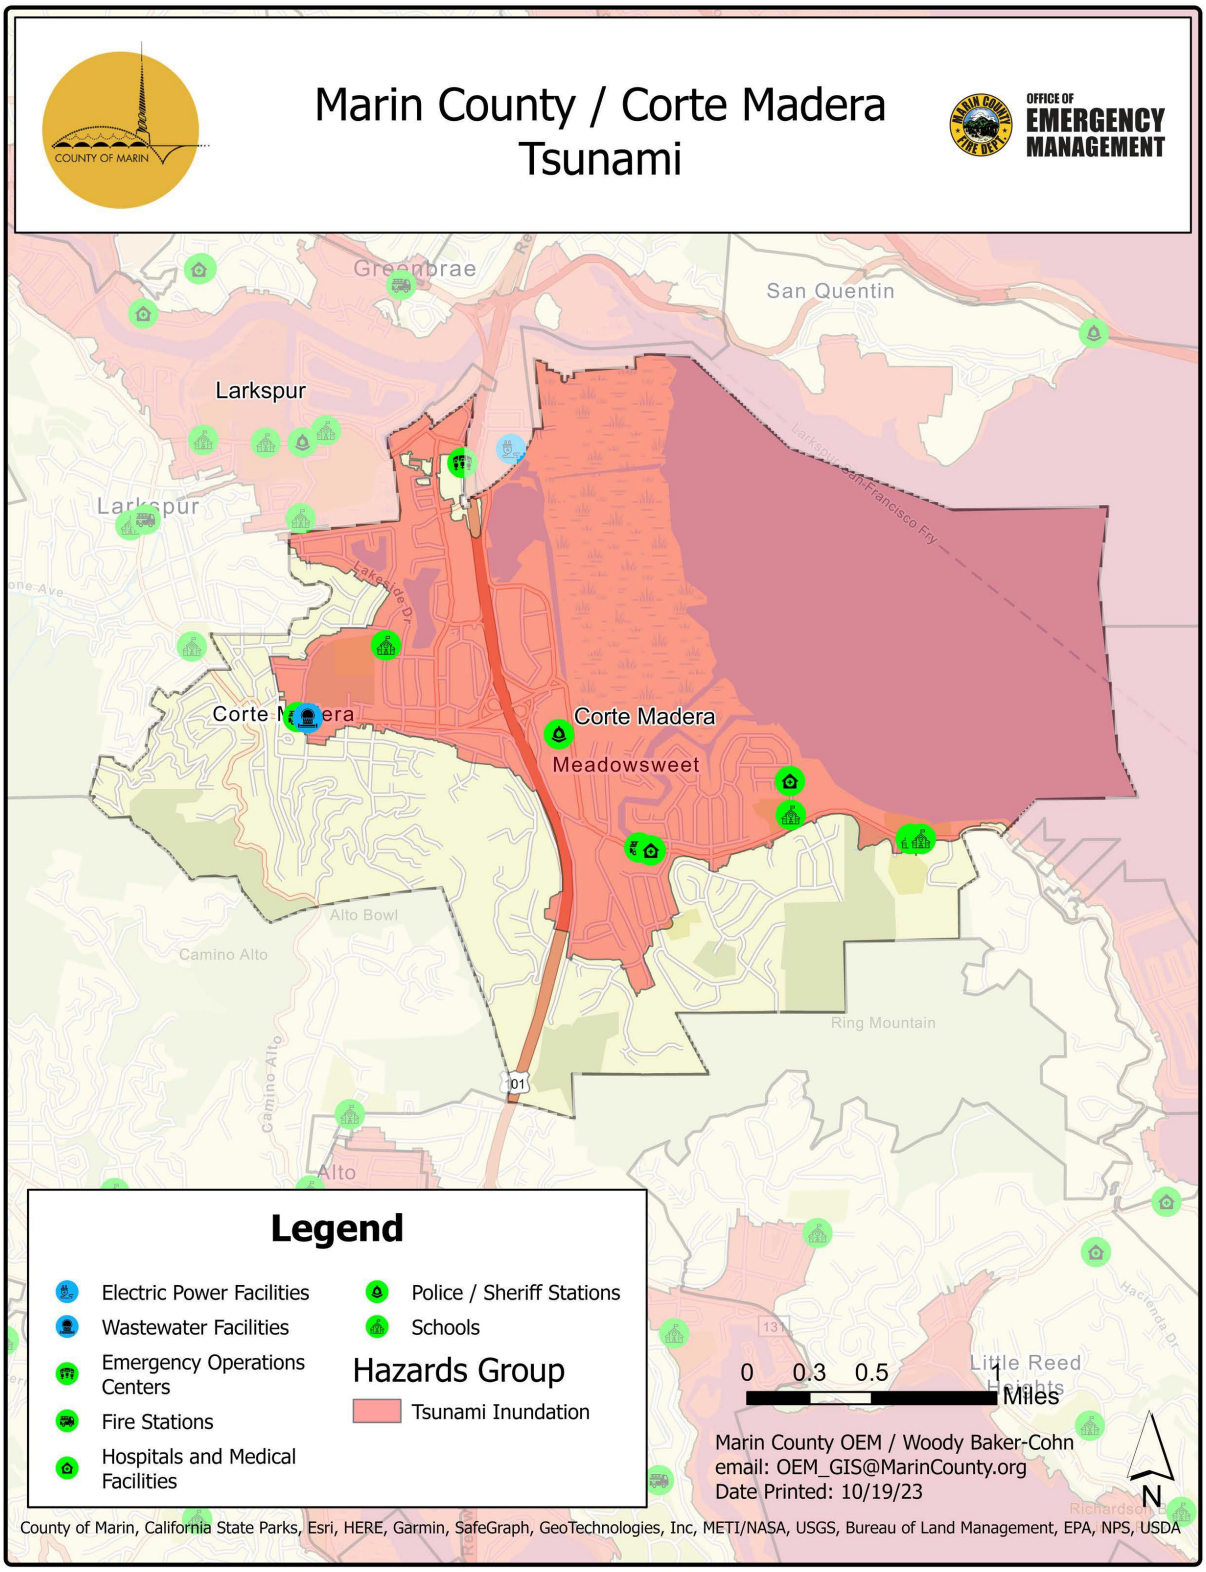

Figure 140: Town of Corte Madera Tsunami Critical Facilities and Infrastructure
Source: Marin County OEM

Climate Change and Future Development Considerations

The biggest threat to tsunamis is sea level rise which is a direct result of climate change. Sea level rise can make tsunamis worse than they already are because higher sea levels allow for tsunamis to travel further inland and cause even more damage. Sea level rise results in more vulnerable coastlines which make coastal communities even more vulnerable to an incoming tsunami as the natural buffer to absorb the energy of an incoming tsunami will cease to exist. This is particularly true in the Marin County OA including Corte Madera, where a large segment of the developed population lies in an area vulnerable to sea level rise. Furthermore, it has been theorized that ocean warming, caused by climate change, can impact the tectonic plates that rest below large bodies of water. Ultimately, this can result in more geological activities and worse tsunamis. Climate change has also affected ocean patterns, which could eventually lead to tsunamis distributing themselves across the ocean and impacting areas that are currently not susceptible to a tsunami. Tsunamis as a result of climate change and associated sea level rise will exacerbate the impacts of flooding in the lowland areas of the Marin County OA including Corte Madera. This is particularly true along Corte Madera Creek and around the marshland areas of Corte Madera where additional storm surge as a result of a larger tsunami could cause greater impacts. Future development in these areas will expose more people and infrastructure to the effects of flooding in the Marin County OA as tsunami inundation areas expand with climate change. Development in marshland in Corte Madera would expose additional people and infrastructure to flooding as marshlands act as a natural buffer to a tsunami. Flooding could be exacerbated in areas where levees could fail along Corte Madera Creek and along the shoreline of Corte Madera as a result of high wave heights associated with a more significant tsunami.

2.2.12 WILDFIRE

A wildfire is a fire that occurs in an area of combustible vegetation. The three conditions necessary for a wildfire to burn are fuel, heat, and oxygen. Fuel is any flammable material that can burn, including vegetation, structures, and cars. The more fuel that exists and the drier that fuel is, the more intense the fire can be. Wildfires can be started naturally through lightning or combustion or can be set by humans. There are many sources of human-caused wildfires including arson, power lines, a burning campfire, an idling vehicle, trains, and escaped controlled burns. On average, four out of five wildfires are started by humans. Uncontrolled wildfires fueled by wind and weather can burn acres of land and everything in their path in mere minutes and can reach speeds up to 15 miles per hour or faster depending upon wind speed and ember distribution. On average, more than 100,000 wildfires burn 4 to 5 million acres of land in the United States every year. Although wildfires can occur in any state, they are most common in the Western states including California where heat, drought, and thunderstorms create perfect wildfire conditions.

Wildfires are of primary concern when they occur in the Wildland Urban Interface (WUI), which is defined as areas where homes are built near or among lands prone to wildfire. Even relatively small acreage fires may result in disastrous damages. Most structures in the WUI are not destroyed from direct flame impingement, but from embers carried by wind. The damages can be widely varying, but are primarily reported as damage to infrastructure, built environment, and injuries to people.

The pattern of increased damages is directly related to increased urban spread into historical forested areas that have wildfire as part of the natural ecosystem. Many WUI fire areas have long histories of wildland fires that burned only vegetation in the past. However, with new

development, a wildland fire following a historical pattern may now burn these newly developed areas. WUI fires can occur where there is a distinct boundary between the built and natural areas or where development or infrastructure has encroached or is intermixed in the natural area. WUI fires may include fires that occur in remote areas that have critical infrastructure easements through them, including electrical transmission towers, railroads, water reservoirs, communications relay sites or other infrastructure assets.

Consequently, wildland fires that burn in natural settings with little or no development are part of a natural ecological cycle and may actually be beneficial to the landscape. Century old policies of fire exclusion and aggressive suppression have given way to better understanding of the importance fire plays in the natural cycle of certain forest types.

Warning times are usually adequate to ensure public safety, provided that evacuation recommendations and orders are heeded in a timely manner. While in most cases wildfires are contained within a week or two of outbreak, in certain cases, they have been known to burn for months, or until they are completely extinguished by fall rains.

Wildfire poses the greatest risk to human life and property in the Marin County OA's densely populated WUI, which holds an estimated 69,000 living units. The Marin County OA is home to 23 communities listed on CAL FIRE's Communities at Risk list, with approximately 80% of the total land area in the county designated as having moderate to very high fire hazard severity ratings. The county has a long fire history with many large fires over the past decades, several of which have occurred in the WUI. To compound the issue, national fire suppression policies and practices have contributed to the continuous growth (and overgrowth) of vegetation resulting in dangerously high fuel loads. The Community Wildfire Protection Plan (CWPP) provides a scientifically based assessment of wildfire threat in the WUI of the Marin County OA.

Fire protection in California is the responsibility of either the federal, state, or local government depending upon the location of the incident. On federally owned land, or federal responsibility areas (FRA), fire protection is provided by the federal government, and or in partnership with local agreements. In state responsibility areas (SRA), CAL FIRE typically provides fire protection. However, in some counties CAL FIRE contracts with county fire departments to provide protection of the SRA – this is the case in the Marin County OA, where CAL FIRE contracts with MCFD. Local responsibility areas (LRA) include incorporated cities and cultivated agriculture lands, and fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

CAL FIRE contracts with MCFD to provide wildland fire protection and associated fire prevention activities for lands designated by the State Board of Forestry as SRA.. The MCFD is responsible for the protection of approximately 200,000 acres of SRA within the county and is the primary agency that handles wildland fires. MCFD also provides similar protection services to approximately 100,000 acres of FRA in the Golden Gate National Recreation Area (GGNRA), the Muir Woods National Monument, and the Point Reyes National Seashore.

Figure 49 indicates the federal responsibility areas, state responsibility areas and local responsibility areas in the Marin County OA.

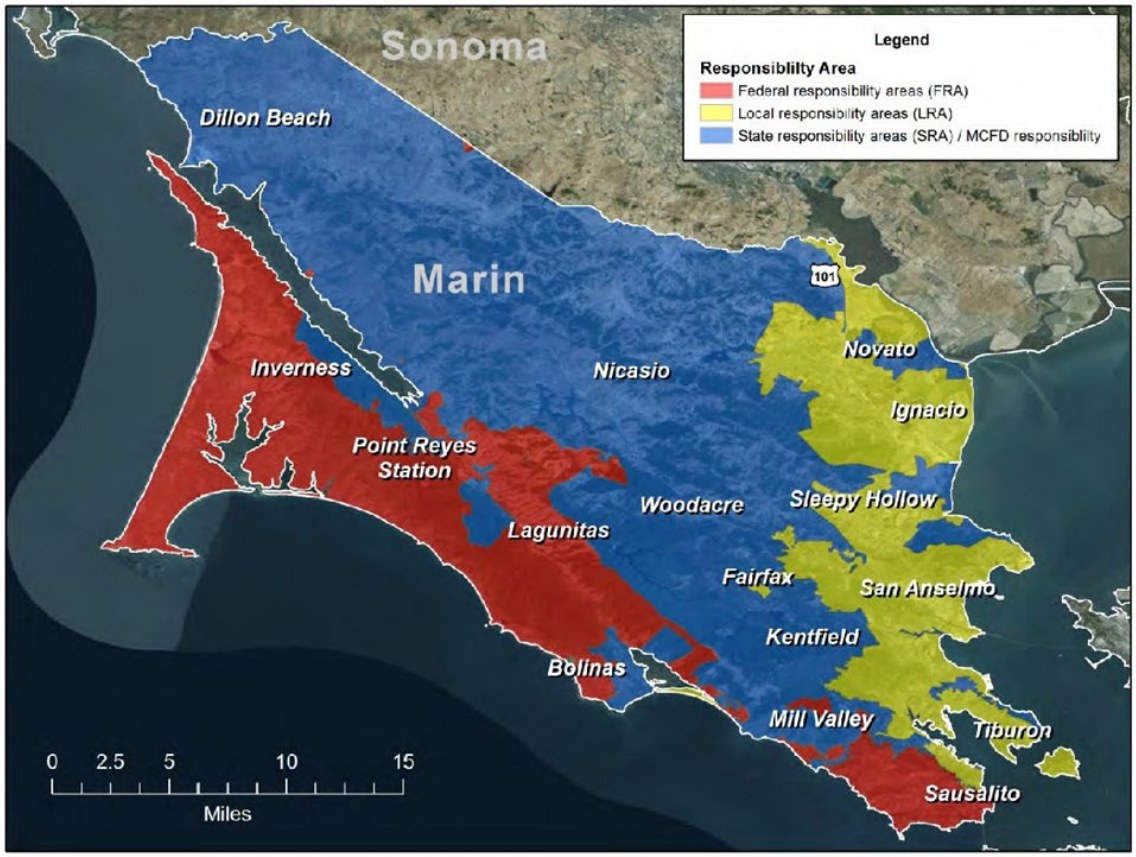

Figure 141: Federal, State and Local Responsibility Areas in the Marin County OA
Source: Marin Community Wildfire Protection Plan, 11/27/23

The mix of weather, diverse vegetation and fuel characteristics, complex topography, and land use and development patterns in the Marin County OA are important contributors to the fire environment. The MCFD Woodacre ECC currently manages the data from four Remote Automated Weather Stations (RAWS) for predicting fire danger utilizing the National Fire Danger Rating System (NFDRS) during the fire season. The RAWS are located in Woodacre, Middle Peak, Barnabe, Big Rock and a new station will be coming online in Novato.

The Marin County OA is bounded by the cool waters of the Pacific Ocean to the west, the San Francisco and Richardson Bays to the southeast, the San Pablo Bay to the east, and Sonoma County agricultural lands to the north. The combination of these large bodies of water, location in the mid-latitudes, and the persistent high pressure over the eastern Pacific Ocean results in several micro-climates. Weather in the OA consists of warm, dry summers and cool, wet winters. The climate in early fall and late spring is generally similar to the summer, and late fall is similar to winter. Spring is generally cool, but not as wet as the winter. While these general weather conditions are fairly representative of the typical Marin County OA weather, complex topography, annual variability of weather patterns, and less frequent and transient weather patterns are important to fire conditions.

In the late spring through early fall, the combination of frequent and strong high-pressure systems (known as the Pacific High) over California combined with the cool waters of the ocean/bays results in persistent fog and low clouds along the coast (including over the southern

Marin County OA near the San Francisco Bay) with winds. The fog often penetrates into the inland valleys of the northern and central Marin County OA, especially during overnight hours. At the coastline, mist from fog can keep the land surfaces modestly moist while inland land surfaces above the fog or inversion are often very dry.

The Pacific High that persists from late spring through early fall over the eastern Pacific, combined with a thermal low pressure over the Central Valley of California, results in an almost continuous sea breeze. These winds usher in cool and moist air and can be strong at times (15 to 25 mph), especially over the ridge tops and through northwest to southeast lying valleys, including San Geronimo/Ross, Hicks, Lucas Valleys, and Mill Valley and the Marin Headlands. These westerly winds are usually highest in the afternoon, decrease in the evening, and are light overnight before increasing again in the late morning/early afternoon.

Occasionally in the summer and more often in the fall, the Pacific High moves inland and centers over Oregon and Idaho, while low pressure moves from the Central Valley of California to southern California and Arizona. The resulting north-to-south pressure gradient can be strong enough to retard the typical sea breeze and can even result in winds blowing from the land to the ocean (offshore winds). As the offshore winds move air from the Central Valley to the coastal areas of California, the air descends and compresses, which greatly warms and dries the air. Under these “Diablo” wind conditions, temperatures in the Marin County OA can reach 100°F in the inland areas and even 80°F at the coast, and relative humidity can be very low. In addition, wind speeds can be high (20 to 40 mph), gusty and are often much faster over the mountains and ridge tops such as Mt. Tamalpais, Loma Alta, Marin Headlands and Mt. Burdell compared to low-lying areas. Wind speeds can be high over the ridges and mountains at all times of day under this “offshore” wind pattern and are often much slower or even calm at night in low-lying areas because nighttime cooling decouples the aloft winds from the surface winds. It is during these Diablo wind events that there is a high potential for large, wind-driven fires should there be an ignition. Historically, the largest and most destructive fires have occurred during these offshore (also known as Foehn) wind events including the Angel Island and the Vision fires which were located in West Marin.

A few times per year in the summer and early fall, monsoonal flow from Mexico may bring in moist and unstable air over central and northern California, which can result in thunderstorms with or without precipitation. With the otherwise dry summer conditions, lightning from this type of weather pattern can ignite fires. These monsoonal flow patterns are usually only one to two-day events.

Beginning in late November and lasting through the end of March, the Pacific High moves south and weakens, allowing storms that originate in the Gulf of Alaska to move over California.

These storms bring precipitation and, at times, strong winds out of the south. Each storm usually results in one fourth inch to several inches of rain over a day or so. Near Mt. Tamalpais, rainfall amounts are enhanced by orographic lifting, resulting in higher rain amounts in the Kentfield and Fairfax areas compared to the rest of the county. Typically, after the first rain in November, the cool weather and occasional storm keeps the ground wet through late Spring. However, in some years, significant rain does not occur until later in the year (e.g., early-to-late December) and there can be several weeks without any storms and rain. During storms, temperatures are usually mild.

When there are no storms over California, a land-breeze typically forms (i.e., winds blowing from the Central Valley to the Pacific Ocean). These winds can reach 30 mph, and travel through the southeast to northwest lying valleys, over low-lying ridges such as the Marin Headlands, and through the Golden Gate. These winds are usually highest in the mid-morning hours and decrease in the afternoon as the Central Valley warms during the day. The winds are associated with cold and modestly moist air.

In late February/early March through late April, the Pacific High strengthens and moves north, and storms impacting the county become less frequent. During this time of year there is often a low-pressure area over the desert in southwest California. The combination of the Pacific High to the north and low-pressure to the southwest results in strong winds blowing from the northwest to the southeast. Like the sea breeze, these winds bring in cool, moist air and are usually highest in the afternoon hours. Because of winter and spring rains, the land is wet and there is little danger of wildland fire despite the strong winds and only occasional precipitation. There is often little coastal fog this time of year.

Vegetation, which is also known as fuel, plays a major role in fire behavior and potential fire hazards. A fuel's composition, including moisture level, chemical make-up, and density, determines its degree of flammability. Of these, fuel moisture level is the most important consideration. Generally, live trees contain a great deal of moisture while dead logs contain very little. The moisture content and distribution of fuels define how quickly a fire can spread and how intense or hot it may become. High moisture content will slow the burning process since heat from the fire must first eliminate moisture.

In addition to moisture, a fuel's chemical makeup determines how readily it will burn. Some plants, shrubs, and trees such as chamise and eucalyptus (both present in the Marin County OA) contain oils or resins that promote combustion, causing them to burn more easily, quickly, and intensely.

Finally, the density of a fuel influences its flammability; when fuels are close together but not too dense, they will ignite each other, causing the fuel to spread readily. However, if fuels are so close that air cannot circulate easily, the fuel will not burn freely.

The Marin County OA has extensive topographic diversity that supports a variety of vegetation types. Marin County's OA has significant changes in topography with steep vegetated slopes which can also add to the ability of the fuel to further expand a wildfire.

Environmental factors, such as temperature, precipitation, soil type, aspect, slope, and land use history, all help determine the existing vegetation at any given location. In the central and eastern parts of the county, north facing slopes are usually densely wooded from lower elevations to ridge peaks with a mixture of mostly hardwood tree species such as coast live oak, California bay, Pacific madrone, and other oak species. Marshlands are also present throughout the county; once ignited marsh fires can be difficult to contain and extinguish.

Grasslands with a mixture of native and nonnative annual and perennial plant species occur most often in the northern and western parts of the county due to a combination of soil type, lower rainfall, and a long history of ranching. The southern and western facing slopes tend to have a higher percentage of grasslands, which in turn have the potential to experience higher rates of fire spread. Grassland fires are dangerous even without extreme fire weather scenarios

due to the rapid rate of fire spread; in some cases, fires spread so quickly that large areas can burn before response resources are able to arrive.

In the west portion of the county closer to the coast, where precipitation is higher and marine influence is greater, most areas are densely forested with conifer species (i.e., Bishop pine, Douglas-fir, and coast redwood) and associated hardwood species. Chaparral vegetation also occurs in parts of the county, especially on steeper south and west facing slopes. This mix of densely forested areas mixed with chaparral results in higher fuel loads and potentially higher fire intensity. Expansion of the residential community into areas of heavier vegetation has resulted in homes existing in close proximity to dense natural foliage; these homes are often completely surrounded by highly combustible or tall vegetation, increasing the potential that wildland fires could impact them.

As part of the development of the Marin Community Wildfire Protection Plan (CWPP), an updated vegetation map layer was created using the most recent vegetation information available from a variety of state and local data sources.

Vegetation distribution in the Marin County OA is characterized by approximately 20 different types of vegetation which have been classified into 15 fire behavior fuel models.

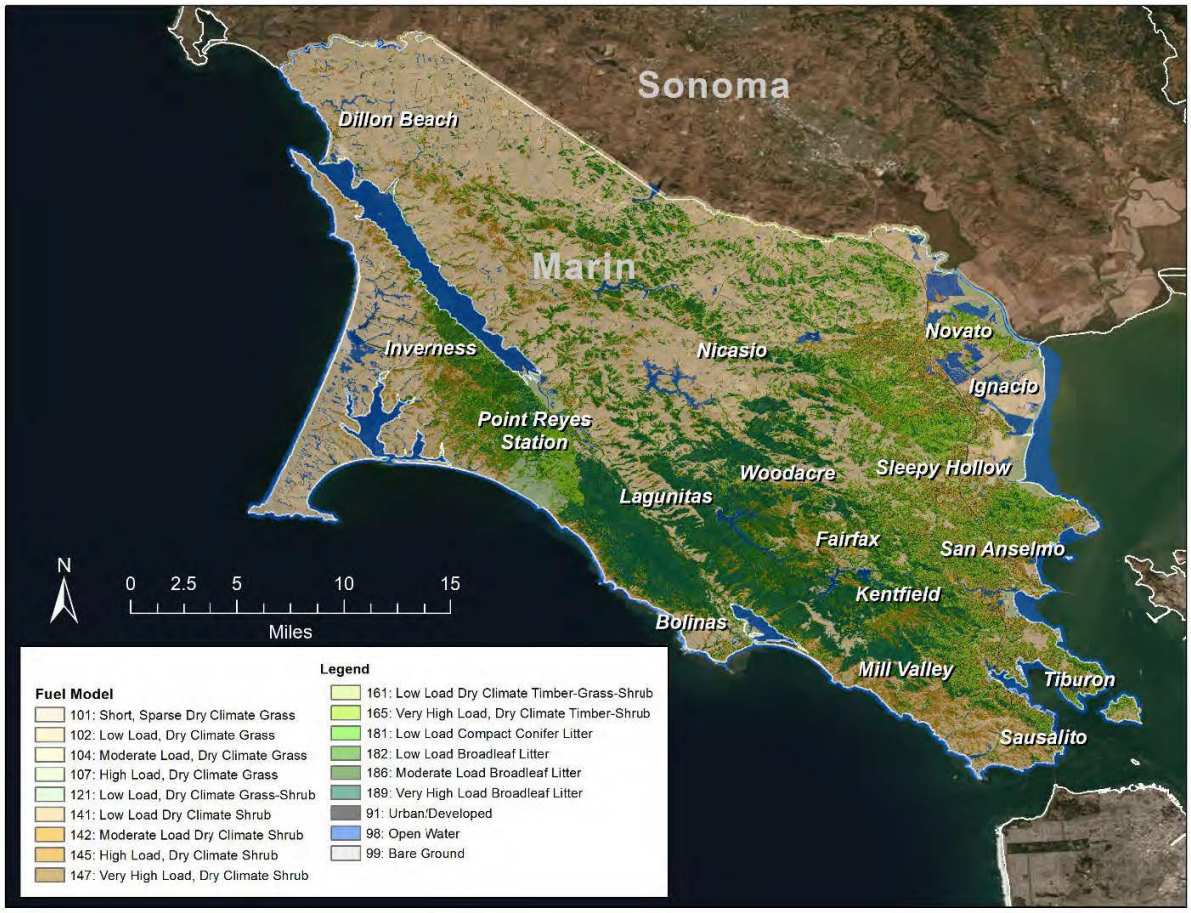

Figure 142: Fuel Model Map for the Marin County OA
Source: Marin CWPP, 11/27/23

Insect infestations and plant diseases, such as California oak mortality syndrome (sudden oak death), are increasing and threaten to change the structure and overall health of native plant communities in Marin County. Sudden oak death has no known cure and is the biggest concern; this syndrome is caused by the fungus-like Phytophthora ramorum, which has led to widespread mortality of several tree species in California since the mid-1990s; the tanoak (Lithocarpus densiflorus) in particular appears to have little or no resistance to the disease. Sudden oak death has resulted in stands of essentially dead trees with very low fuel moistures.

Studies examining the impacts of sudden oak death on fire behavior indicate that while predicted surface fire behavior in sudden oak death stands seems to conform to a common fuel model already in use for hardwood stands, the very low moisture content of dead tanoak leaves may lead to crown ignitions more often during fires of “normal” intensity.

Two other plant diseases prevalent in the Marin County OA are pitch canker (which affects conifers such as Bishop pine and other pine species) and madrone twig dieback (which affects Pacific madrones). Pitch canker is caused by the fungus Fusarium circinatum (F. subglutinans, F. sp. pini), which enters the tree through wounds caused by insects. While some trees do recover, most infected trees are eventually killed by the fungus. Management of this disease largely focuses on containment to reduce the fungus spreading to other trees. Pitch canker is a particular issue in the NPS lands of Pt. Reyes National Seashore, where many acres of young Bishop Pines that were seeded on the Inverness Ridge by the Mount Vision Fire of 1995 have been infected.

These dead and dying trees have created large swaths of land with dense and dry fuel loads. Madrone twig dieback is caused by the native fungus Botryosphaeria dothidea and appears to be getting worse throughout the county due to drought effects on Pacific madrones. Three additional threats to trees common to the Marin County OA include:

- Bark and ambrosia beetles (Monarthrum dentiger and monarthrum scutellare), which target oak and tanoak trees. Sudden oak death may be exacerbating the effects of beetle infestations which prey on trees already weakened by this disease.
- Root rot, caused by oak root fungus (Armillaria mellea), is primarily associated with oaks and other hardwoods but also attacks conifers. These fungal infestations cause canopy thinning and branch dieback and can kill mature trees. As with the beetle infestations, sudden oak death may be exacerbating the effects of root rot fungus in the county forests.
- Velvet-top fungus (Phaeolus schweinitzii) is a root rot fungus affecting Douglas-fir and other conifers, with the infection typically occurring through a wound.

Topography characterizes the land surface features of an area in terms of elevation, aspect, and slope. Aspect is the compass direction that a slope faces, which can have a strong influence on surface temperature, and more importantly on fuel moistures. Both elevation and aspect play an important role in the type of vegetation present, the length of the growing season, and the amount of sunlight absorbed by vegetation. Generally, southern aspects receive more solar radiation than northern aspects; the result is that soil and vegetation on southern aspects is warmer and dryer than soil and vegetation on northern aspects. Slope is a measure of land steepness and can significantly influence fire behavior as fire tends to spread

more rapidly on steeper slopes. For example, as slope increases from 20 – 40%, flame heights can double and rates of fire spread can increase fourfold; from 40 – 60%, flame heights can become three times higher and rates of spread can increase eightfold.

The Marin County OA is topographically diverse, with rolling hills, valleys and ridges that trend from northwest to southeast. Elevation throughout the county varies considerably, with Mt. Tamalpais' peak resting at 2,574 feet above sea level and many communities at or near sea level. Correspondingly, there is considerable diversity in slope percentages. The San Geronimo Valley slopes run from level (in the valley itself) to near 70%. Mt. Barnabe has slopes that run from 20 to 70%, and Throckmorton ridge has slopes that range in steepness from 40 – 100%. These slope changes can make fighting fires extremely difficult.

In the WUI where natural fuels and structure fuels are intermixed, fire behavior is complex and difficult to predict. Research based on modeling, observations, and case studies in the WUI indicates that structure ignitability during wildland fires depends largely on the characteristics and building materials of the home and its immediate surroundings.

The dispersion of burning embers from wildfires is the most likely cause of home ignitions. When embers land near or on a structure, they can ignite near-by vegetation or accumulated debris on the roof or in the gutter. Embers can also enter the structure through openings such as an open window or vent and could ignite the interior of the structure or debris in the attic.

Wildfire can further ignite structures through direct flame contact and/or radiant heat. For this reason, it is important that structures and property in the WUI are less prone to ignition by ember dispersion, direct flame contact, and radiant heat.

Public Safety Power Shutoff (PSPS) Events

As a result of the 2017 Northern California Wildfires, the 2018 Camp Fire in Butte County and other wildfires caused by power line infrastructure, Pacific Gas & Electric (PG&E) began initiating Public Safety Power Shutoff (PSPS) events in their service areas (including Marin County) to help prevent the start of future wildfires. PG&E will initiate a PSPS if conditions indicate potentially dangerous weather conditions in fire-prone areas due to strong winds, low humidity, and dry vegetation. During these events, PG&E will proactively turn off power in high fire risk areas to reduce the threat of wildfires. The most likely electric lines to be considered for a public safety power outage will be those that pass through areas that have been designated by the California Public Utilities Commission (CPUC) High Fire-Threat District at elevated (Tier 2) or extreme risk (Tier 3) for wildfire. Customers outside of these areas could have their power shut off, though, if their community relies upon a line that passes through a high fire-threat area or an area experiencing severe weather. PG&E will consider numerous factors and analyze historical data to help predict the likelihood of a wildfire occurring, and closely monitoring weather watch alerts from the National Weather Service (NWS). These factors generally include, but are not limited to:

- A Red Flag Warning declared by the National Weather Service
- Low humidity levels, generally 20 percent and below
- Forecasted sustained winds generally above 25 mph and wind gusts in excess of approximately 45 mph, depending on location and site-specific conditions such as temperature, terrain and local climate
- Condition of dry material on the ground and live vegetation (moisture content)

- On-the-ground, real-time observations from PG&E's Wildfire Safety Operations Center and field crews

Pacific Gas & Electric Company (PG&E) operates a total of 1,179 miles of overhead electricity transmission and distribution lines in the Marin County OA. Overhead electricity lines and poles can be damaged or downed under severe weather conditions, particularly severe wind conditions, which increases the potential for wildfire ignition. 52 percent of PG&E's overhead distribution lines and 41 percent of its overhead transmission lines are located in CPUC-identified High-Fire Threat Districts subject to elevated or extreme fire risk. PG&E is currently planning and implementing safety measures to prevent wildfires and reduce the impacts of Public Safety Power Shutoff (PSPS) events on communities in the Marin County OA and throughout California.

In October 2019 Marin County and the Town of Corte Madera experienced two PSPS events.

These measures include installing weather stations; installing high-definition cameras; installing sectionalizing devices on its overhead lines to separate the grid into smaller sections; hardening the system by installing stronger power poles, covering lines, and undergrounding lines in targeted areas; creating temporary microgrids to provide electricity during PSPS events; and enhancing existing vegetation management activities. From 2018 to July 2021, PG&E hardened three miles of overhead lines, installed 68 transmission and distribution sectionalizing devices, completed enhanced vegetation management on approximately 51 of overhead line miles, installed 28 weather stations, and installed 12 high-definition cameras in the Marin County OA. PG&E has also begun undergrounding several overhead transmission lines throughout California.

A wildfire in Corte Madera would most likely occur on the southern side of the town where there is more forested terrain. This area of Corte Madera is primarily residential and consists of numerous winding streets and hillside homes that could be damaged or destroyed by a wildfire. Many of the hillside neighborhoods are at risk of wildfires and have extremely limited ingress and egress for residents and emergency services.

Specific communities in Corte Madera at high risk of wildfire include Marin Estates, Chapman Park, Meadowsweet, Christmas Tree Hill, and Madera del Presidio. All of Corte Madera could be impacted by a Public Safety Power Shutoff (PSPS) event and/or suffer poor air quality from smoke as a result of a wildfire in Marin County or the surrounding region. As wildland areas around Corte Madera become drier due to climate change, the risk of a wildfire occurring and impacting the town will continue to increase. Brush fires in the town may increase over time as marshlands, parks, and other open spaces experience drier conditions.

Corte Madera has never experienced a major wildfire, but brush fires have occurred in the town.

On 9/27/2022, a brush fire that grew to a half-acre triggered the closure of Corte Madera Avenue west of Tamalpais Drive in Corte Madera.

On 6/13/2020, an arsonist set several brush fires in Corte Madera marshland that were quickly extinguished.

On 10/10/2019, a brush fire broke out along Highway 101 amid reg flag weather conditions and PSP shutoffs. Firefighters were able to keep the fire from spreading across Casa Buena Drive.

On 9/14/2016, a brush fire started at a homeless camp in a marshland behind the Cost Plus Plaza off Redwood Highway and burned a half-acre of grass, threatening nearby grazing goats.

On 1/3/2014, a brush fire started near a homeless camp in Corte Madera and burned six acres of grassland near the Village Shopping Center.

Source: Marin County OEM

Climate Change and Future Development Considerations

Climate change can lead to an increase in wildfire events. Climate change has been a key factor in increasing the risk and extent of wildfires in the western United States. Changes in climate create warmer, drier conditions. Increased drought, and a longer fire season are boosting these increases in wildfire risk.

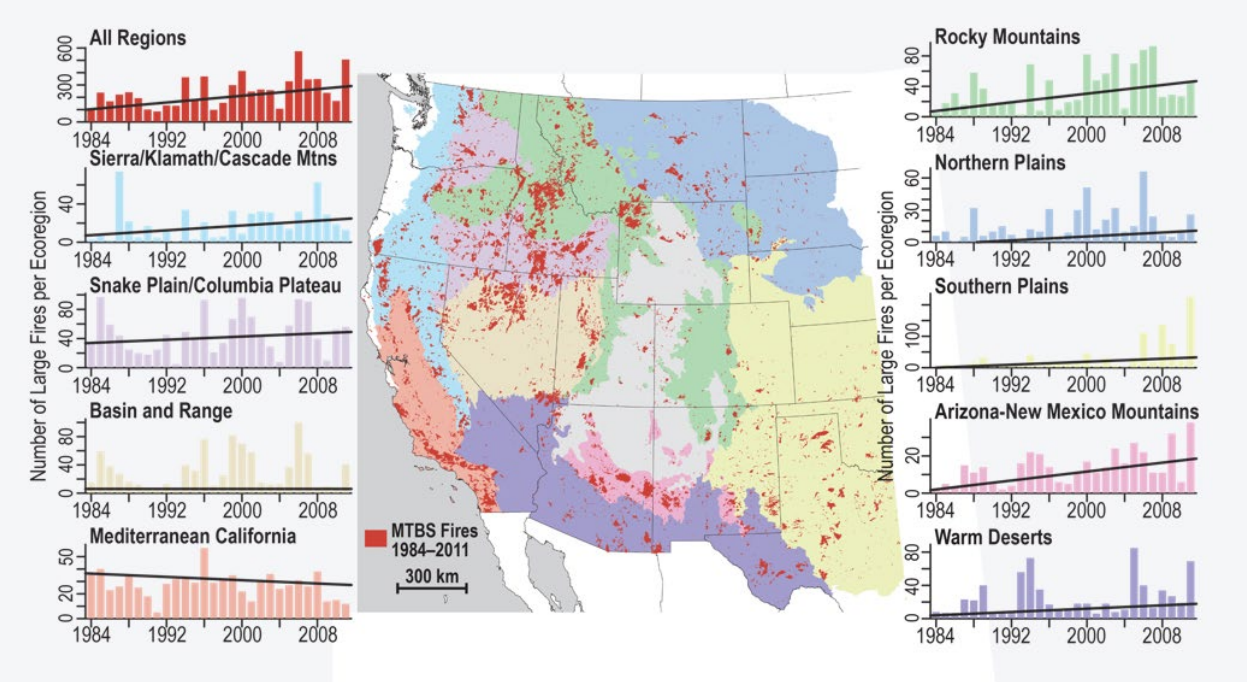

Figure 144: Trends in the Annual Number of Large Wildfires in the United States
Source: Fourth Climate Change Assessment, 01/04/23

As summer conditions in Northern California become hotter and drier due to climate change, the occurrence and severity of wildfires will only increase. The Marin County OA including Corte Madera is particularly susceptible to these future impacts of climate change on wildfire, as the OA's climate has generally been wet enough historically to avoid major wildfires. Extreme heat events and high wind events could cause electrical systems to become overloaded and fail, sparking wildfires. An increase in wildfires as a result of climate change could lead to more significantly burned areas that could contribute to debris flows after a significant storm event, particularly in the open space areas around southern and western Corte Madera. Future development in the WUI throughout Corte Madera will expose more people and property to the impacts of a potentially significant wildfire. The growing number of people in the Corte Madera WUI can increase risk to life, property and public health as a result of a wildfire. Future development around the Corte Madera marshlands would expose more people to the effects of brush fires as the marshlands dry out in the summer due to climate change.

SECTION 3.0: MITIGATION STRATEGY

3.1 CHANGES IN DEVELOPMENT

The various Marin County Jurisdiction's General Plans guide growth and development across the County based on maintaining the County's small communities with their own unique character. In 2023 the County of Marin updated the Housing Element of the General Plan, with input from the various jurisdictions within the county. Future large development in the County is not expected within the next 5 years, however, some managed development has been identified, approved, or submitted. In 2023, the Town of Corte Madera also updated the Housing Element of the General Plan.

There has not been a significant amount of development within the Town of Corte Madera since the last plan update in 2018. There has not been any increased risk to the town as a result of new development since the last plan update in 2018.

Future land use and growth management strategies in the Town of Corte Madera are consistent with priorities detailed in the 2018 Marin County MJHMP and aim to concentrate future development into and toward existing communities away from locations where natural characteristics may limit development (e.g., steep slopes or sensitive habitats), and to areas that have, or can readily be supplied with, adequate public facilities and services. This is done through various policies relating to zoning and minimum development standards and requirements. Zoning designations prescribe allowed land uses and minimum lot sizes for the purpose of supporting efficient infrastructure design, conservation of natural resources, and to avoid conflicting uses.

Table 19: Town of Corte Madera Future Growth Areas

Development	# of Units	# of Parcels	Project Date[1]	Acres	Fire Severity Zone	Flood Zone
111 Lucky Drive	25	1	N/A	1.67	No	AE
5651 Paradise Drive	33	3	N/A	1.55	No	AE
41 Tamal Vista Blvd.	74	1	N/A	2.11	No	AE
400 & 500 Tamal Plaza	105	2	N/A	3	No	AE
2 Fifer Ave, 10 Fifer Ave, 110 Nellen & 150 Nellen	120	4	N/A	3.45	No	AE

Table 60: Town of Corte Madera Future Growth Areas
Source: Town of Corte Madera

3.2 Capability Assessment

The overall priorities in the Town of Cote Madera have not changed since the 2018 MJHMP update. However, the strategies in which to support the overall town priorities have changed and are reflected in the sections below. There were many projects that were either ongoing day-to-day business activities or were response related that were completed or deleted from the 2018 MJHMP project list and not carried over to this plan update. Several actions were completed and new projects were added to coincide with the changes in priorities, progress in local mitigation efforts and changes in development.

Capabilities are the programs and polices currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. The capability assessment identifies the local planning mechanisms where information from the 2018 MJHMP is incorporated and where updated hazard mitigation information from this 2023 MJHMP will be incorporated once approved. The 2018 capability assessments have been successfully incorporated into the Town of Corte Madera General Plan to include the Public Safety Element, Land Use Element, and Housing Element and the 2023 capability assessments will also be incorporated into the General Plan and these Elements. The capability assessment is divided into four sections: regulatory, administrative and technical, fiscal, and outreach and partnerships.

3.2.1 Regulatory Capabilities

The legal and regulatory capabilities include existing ordinances and codes that affect the Town's physical or built environment. Examples of legal and/or regulatory capabilities can include: a jurisdiction's building codes, zoning ordinances, subdivision ordnances, special purpose ordinances, growth management ordinances, site plan review, general plans, capital improvement plans, economic development plans, emergency response plans, and real estate disclosure plans. The table below lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place.

Opportunities for Enhancement

The 2023 Marin County OA MJHMP update provided the Town of Corte Madera an opportunity to review and update the capabilities currently in place to mitigate hazards. This also provided an opportunity to identify where capabilities could be improved or enhanced. Specific opportunities could include:

- **Local Emergency Operations Plan and Continuity of Operations Plan**: The Town would benefit from the development of our own emergency operations Plan and Continuity of Operations Plan. These Plans would allow the Town to develop response and contingency plans for the risk and vulnerability of the Town to the hazards identified in the Hazard Mitigation Plan.
- **Community Wildfire Protection Plan:** The Town plans to take an active role in mitigation actions to enhance wildfire protection.
- **Emergency Manager:** The Town will consider identifying staff to provide emergency management or disaster preparedness duties as a collateral role.
- **StormReady certification and Firewise Communities certification:** The town will consider participation in these programs.

Table 20: Legal and Regulatory Capabilities		
Plans	Yes/No Latest Update	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
General Plan/Master Plan/ Housing Element Safety Element	Y 2009/ 2023 2023	The General Plan outlines long-term direction for development and policy. The Town has a Safety Element in its General Plan that includes a discussion of fire, earthquake, flooding, and landslide hazards. This 2018 Local Hazard Mitigation Plan was adopted as an implementation appendix to the Safety Element. In addition, the Town enforces the requirements of the California Environmental Quality Act (CEQA), which, since 1988, requires mitigation for identified natural hazards. The Town has used these pre-existing programs as a basis for identifying gaps that may lead to disaster vulnerabilities in order to work on ways to address these risks through mitigation. As this plan gets updated there is potential to improve it with updated risk information and strategies. The Housing and Safety Elements of the Town General Plan were updated in 2023.
Strategic Plan	N	
Capital Improvements Plan	Y 2022	The Capital Improvement Plan (CIP) directs construction activities for Town owned facilities and infrastructure for the next five years. Mitigation actions may involve construction of new or upgraded facilities and infrastructure. As this plan gets updated there is potential to improve it with updated strategies.
Economic Development Plan	N	
Local Emergency Operations Plan	N	
Continuity of Operations Plan	N	
Flood Mitigation Plan (FMP)	Y 2011	This plan includes more specific information on Flood Mitigation, including listing additional resources, goals, strategies, and actions.
Engineering Studies for Streams	N	
Open Space Management Plan	N	
Regional Transportation Plan (RTP)	N	Regional transportation plan completed by Transportation Authority of Marin
Stormwater Management Plan/Program	Y 2022	Storm Drain Master Plan currently underway.
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate	Y 2021	Climate Adaptation Assessment

change adaptation)		
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Yes. Projects are reviewed for compliance with building code standards. Building permit applications are routed to various departments for review (Building, Planning, Fire, and Public Works) as necessary to ensure compliance with applicable codes and standards.
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	
Fire department ISO rating:	Y	The Central Marin Fire Department has an ISO rating of 2.
Site plan review requirements	Y	Yes. Projects are reviewed for compliance with development standards, including required setbacks. The majority of building permit applications submitted to the Town are required to provide a site plan.
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Municipal Code	Y	The Muni Code includes several sections that address hazard mitigation including Title 6 Health and Sanitation, Title 15 Buildings and Construction, and Title 16 Protection of Flood Hazard Areas
Zoning ordinance	Y	The Zoning Ordinance implements the General Plan by establishing specific regulations for development. It includes standards for where development can be located, how buildings must be sized, shaped, and positioned, and what types of activities can occur in an area. Mitigation actions that pertain to new or substantially redeveloped buildings can be adopted into the Zoning Ordinance.
Subdivision ordinance	Y	Title 17 (Subdivisions). In addition, Chapter 18.31A (Two-Unit Developments & Urban Lot Splits) establishes a ministerial review process and provide objective zoning standards for Two-Unit Developments and Urban Lot Splits.
Floodplain ordinance	Y	Chapter 16.10 (Flood Damage Prevention)
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	Y	
Elevation Certificates	Y	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	Y	

Table 61: Town of Corte Madera Legal and Regulatory Capabilities
Source: Town of Corte Madera

Town of Corte Madera General Plan or Master Plan

California Government Code 65300 requires that every City and County in the state have a General Plan. The Town of Corte Madera General Plan, adopted in April 2009, was prepared over a one year period that included an extensive public review process. The General Plan is the most important policy and planning document in the Town and is used by virtually every department. The General Plan is the Town's statement of its vision for the future. The General Plan contains policies covering every aspect of the Town: land use (how land can be developed), circulation, noise, air quality, housing, open space and conservation, and health and safety. The Housing, Land Use, and Safety Elements of the General Plan were updated in 2023.

Town of Corte Madera specific goals and policies related to mitigation of natural hazards are as follows:

Table 21: Town of Corte Madera General Plan

Goal/Policy/ Program	Explanation
Land Use Element	
Goal	A mix and distribution of land uses that enhances community character and serves the needs of existing and future Town residents. A variety of safe, pleasant, well-maintained and distinctive residential neighborhoods. Infill development that achieves a more livable, sustainable community. Strong and vibrant commercial and office centers that serve local and regional needs. A strong and vibrant local economy. An efficient and well-maintained network of public and institutional facilities and services that meet the health, education, and governmental needs of all citizens.
Policy	Lu-1.3. Provide high quality plan review and inspection services through the Town's Building division for all construction activities undertaken in the community.
Program	LU-1.3.a – Building Code Enforcement. Continue Building code plan checking and inspection services.
Policy	LU-2.3. Protect and conserve the existing housing stock and existing residential areas. Require owners to maintain their properties in good condition and appearance and to eliminate unsafe and unhealthy conditions. Protect residents and maintain the housing stock by enforcing the Zoning Ordinance and the building, housing, and fire codes for all types of residential units.
Program	LU-2.3.a: Code Enforcement. Continue zoning, building, and fire code enforcement to ensure compliance with development and maintenance regulations as well as health and safety standards.
Policy	LU-2.4. Ensure new residential development and upgrades to existing residential development are compatible with existing neighborhood character and structures.
Program	LU-2.4.a: Development compatibility. Require that new single-family, residential mixed-use, medium-density and high-density residential development and upgrades to residential developments are of high quality and in accordance with the Housing Chapter, Resource Conservation and Sustainability Chapter, and Community Design Chapter of the General Plan, and with Town adopted design guidelines.
Policy	LU-2.5. Encourage property owner reinvestment in upgrades to existing residences and related property improvements.

Table 21: Town of Corte Madera General Plan	
Goal/Policy/ Program	**Explanation**
Program	LU-2.5.a; Property Upgrades. Support upgrades to existing residential structures when consistent with the General Plan and Zoning Ordinance, the Town development standards and design review.
Policy	LU-6.2. Provide high-quality fire protection and paramedic services for residents and businesses in the community
Program	LU-6.2.a: Response Times. Maintain the existing target response time of five minutes or less for emergency Fire calls through adequate staffing and proper distribution of Fire stations and equipment.
Program	LU-6.2.b: Update Town Impact Fees. Through periodic updates to Town impact fees require all new development to contribute funding toward necessary Fire and paramedic facilities and equipment.
Program	LU-6.2.c: CERT Training. Use available staff resources to support community Emergency Response Team training classes.
Program	LU-6.2.d: Fire Department Review. Include Fire Department review and comments on proposed building plans to address safety concerns.
Program	LU-6.2.e: Upgrade Fire Facilities. Identify necessary upgrades to Fire and paramedic facilities and equipment during development project, environmental review and planning activities.
Policy	LU-6.3. Provide high-quality law enforcement services for residents and businesses in the community.
Program	LU-6.3.a: Target Response Time: Maintain the existing target response time of three minutes or less for urgent assistance calls.
Program	LU-6.3.b: Financing of Police Services. Through periodic updates to Town impact fees, require all new development to contribute fair-share funding toward necessary law enforcement facilities and equipment.
Program	LU-6.3.c: Promote Public Safety Programs. Regularly promote ongoing public safety programs, including Neighborhood Watch, Police Explorers, and other public education and crime prevention efforts.
Program	LU-6.3.d: Police Department Review. Include Police Department review and comments on proposed building plans to address safety concerns.
Program	LU-6.3.e: Law Enforcement Facilities. Identify and support necessary upgrades to law enforcement facilities and equipment. This should include improvements to the existing Twin Cities Police Department facility in Larkspur, coordinate with the City of Larkspur.
Policy	LU-6.9. Maintain existing infrastructure systems.
Program	LU-6.9.a: Infrastructure Maintenance. Continue to work with service agencies to ensure the maintenance of infrastructure systems in Corte Madera.
Conservation and Open Space Element	
Goal	An established vision for a sustainable Corte Madera. Reduced consumption of non-renewable energy sources in Corte Madera. Reduce existing and future levels of GHG emissions originating from within the community. Increased recycling participation by Town residents and businesses. An enhanced environment through conservation of valuable resources. Sustainable resources management. Biodiversity and sustainable habitat.

Table 21: Town of Corte Madera General Plan	
Goal/Policy/ Program	**Explanation**
	Long-term sustainability of wetlands. Protect, restore and enhance the quality of surface and groundwater resources to meet the needs of all beneficial uses. Attainment of Air Quality standards in the San Francisco Bay Air Basin. Preservation and enhancement of historic resources within the community.
Policy	RCS-2.2. Increase energy conservation and efficiency within Corte Madera
Program	RCS-2.2f: Heat Islands. Minimize heat islands and the resulting increase in energy use for cooling, by avoiding the use of materials such as some types of artificial turf that have excessive heat reflect characteristics, and by using cooling techniques such as landscape sharing where reasonable feasible.
Policy	RCS-3.1. Actively seek to reduce greenhouse gas emissions within the planning area.
Program	RCS-3.1.a: Implement California Air Resources Board Regulations. The Town shall implement regulations adopted by the California Air Resources Board or other applicable regulatory agencies to reduce greenhouse gas emissions.
Program	RCS-3.1.b: Support Marin County's Greenhouse Gas Reduction Plan. The Town shall support Marin County's greenhouse gas mitigation measures.
Program	RCS-3.1.c: Cities Climate Protection Campaign. Continue participation in the Cities for Climate Protection Campaign, administered by ICLEI (Local Governments for Sustainability), which includes conducting a greenhouse gas emissions audit and establishing a greenhouse gas emissions reduction target.
Policy	RCS-6.1. Protect natural values of open space and habitat areas while promoting recreational and related uses that are compatible with resource protection.
Program	RCS-6.1.a: Open Space Uses. Maintain open space areas in natural states, making open space recreational use secondary to protection of resources by implementing General Plan Land Use policies.
Program	RCS-6.1.b: Management of Open Space. Continue supporting the protection of existing environmental and open space preserves. Coordinate management actions of these areas with adjoining cities and Marin County Open Space District.
Policy	RCS-6.2. Protect wetlands, other waters of the United States, and essential habitat for special status species, including, but not limited to, other wetland habitat areas, habitat corridors, and sensitive natural communities.
Program	RCS.6.2.a: Resource Protection. Protect sensitive biological resources, including wetlands and other waters of the Unites States and other wetland habitat areas, and habitat corridors, and sensitive natural communities through environmental review of development applications in compliance with CEQA provision.
Program	RCS-6.2.b: Restoration Objectives. Where feasible restore lost or damaged habitat. Support restoration objectives for local habitat types identified by the California Department of Fish and Wildlife and in other regional planning documents.
Policy	RCS 6.3. Manage the development review process in compliance with CEQA provisions to promote resource conservation and sustainability.
Program	RCS-6.3.a: Environmental Review. Continue to require environmental review of development applications pursuant to CEQA to assess the impact of proposed development on species and habitat diversity, particularly special-status species, sensitive habitat areas, wetlands and other wetland habitats, and habitat connectivity. Require adequate mitigation measures for ensuring the protection of sensitive habitat acreage, value and functions. Require specific mitigation measures for wetlands and waters of the United States.

Table 21: Town of Corte Madera General Plan	
Goal/Policy/ Program	**Explanation**
Policy	RCS-6.7. Protect migratory corridors.
Program	RCS-6.7.a: Migratory Corridors. Condition approval of development proposals to assure that movement corridors for migratory fish and wildlife species are maintained. Coordinate with Marin County and adjoining jurisdictions, and federal and state agencies such as CalTrans, to assure regional connectivity of open space and wildlife corridors.
Policy	RCS-7.1. Conserve, restore and enhance areas containing important habitat, wetlands and special status species.
Program	RCS-7.1. Protect biodiversity. Protect areas known to support a high degree of biological diversity and that may contain species known to be rare or protected under the State or Federal Endangered Species Act. These include the Town's tidal wetlands, freshwater wetlands, and hillside oak woodlands.
Policy	RCS 7.2. Retain sensitive habitat areas and restore to their natural state, where feasible, and protect from inappropriate development and landscaping.
Program	RCS 7.2.c: Limit Impacts. As part of the development review process, restrict or modify proposed development in areas that contain essential habitat for special status species, sensitive habitat areas or wetlands as necessary to ensure the continued health and survival of these species and sensitive area.
Policy	RCS 7.4. Protect woodland and tree resources.
Program	RCS 7.4.a: Tree Protection. Protect large native trees, trees with historical importance, oak woodlands, and forest habitats, and prevent the untimely removal of trees through implementation of standards in the Town's Municipal Code. Evaluate tree protection standards as part of the project to develop Design Guidelines and update the Tree Ordinance accordingly.
Policy	RCS-7.8. Limit utility placement in open space.
Program	RCS-7.8.a: Utility Placement. Discourage placement of utilities in open space areas. Necessary utilities should be located and designed to minimize impacts to open space and habitat areas. Ensure that adequate tree canopy visually buffers utility facilities from lower vantages.
Policy	RCS-8.3. Use flood basins for seasonal habitat.
Program	RCS-8.3.a: Utilize natural or managed flood basins to provide seasonal habitat for waterfowl and shorebirds, and avoid development in these basins to protect habitat values.
Policy	RCS-8.4. Work towards integrated management of tidal areas and drainages within the Town limits.
Program	RCS8.4.b: Restore Waterway Function. Restore waterway's natural functions where possible. Keep drainageways open and daylight culverted drainageways wherever feasible.
Policy	RCS-9.1. Continue to comply with local, state, and federal standards for water quality.
Program	RCS-9.1.b. Stormwater Runoff Measures. Continue to incorporate measures for stormwater runoff control and management in construction sites.
Program	RCS-9.1.c: Water Quality Improvements in Waterways. Support water quality improvements in creeks and drainage in accordance with standards of the Regional Water Quality Control Board or any agencies with jurisdiction.
Policy	RCS-9.3. Establish development guidelines to protect areas that are particularly susceptible to erosion and sediment loss.

Table 21: Town of Corte Madera General Plan	
Goal/Policy/ Program	**Explanation**
Public Safety	
Goal	Reduced fire hazards Town-wide. Achieve high level of public safety for all Town residents and businesses. Emergency access availability in hillside areas. Minimized noise intrusion to commercial and office areas along the Highway 101 frontage. Town noise standards to provide protection from unsafe and undesirable noise levels. Projects that minimize noise impacts to sensitive receptors. Residential and structural protection from hazardous seismic and subsidence activity.
Policy	PSH -1.1. Require fire safe construction practices, such as fire preventive site design, landscaping, and building materials, and installation of sprinklers on new development and redevelopment projects.
Program	PSH-1.1.a: Non-Combustible Construction. Continue to implement requirements for non-combustible roofs and expand the Fire code to include non-combustible exterior siding.
Program	PSH 1.1.b: Development Review. Through the project review process, continue to ensure that landscaping, lighting, building siting and design, adequate water pressure and peak load storage capacity, and building construction materials reduce the opportunity for fire hazards.
Program	PSH 1.1c: Firefighting Access. Continue to require access for emergency vehicles and firefighting equipment on all new development and redevelopment projects. The Town shall also identify the feasibility of constructing additional emergency access improvements.
Program	PSH-1.1.d: Seismic Shutoff Program. Continue to operate the Seismic Shutoff Program by requiring emergency shutoff valves on natural gas lines as part of new construction and remodel projects as required by the Fire Code.
Policy	PSH-1.2. Encourage landscaping maintenance programs to reduce potential fire hazards in the hills, wildland areas and urban interface.
Program	PSH-1.2.a: Vegetation Management. Continue to aggressively enforce vegetation management as required by the Fire Code. The Town shall also identify the feasibility of other aggressive vegetation management options.
Program	PSH-1-2.b: Construction Materials. Continue to require use of construction materials that decrease fire hazards in new developments in hillside areas, including mandatory use of spark arresters on chimneys.
Program	PSH-1.2.c: Landscaping Requirements. Require the use of fire-safe planting materials in landscape plans for new development, including the use of non-prolific species. Include provisions in the Design Guidelines.
Program	PSH-1.2.d: Use Website for Fire Awareness. Provide information on methods for reducing fire hazards through the Town's website and newsletter, including clearing of plant debris and use fire-safe landscaping.
Policy	PSH-1.3. Reduce fire hazard risks in existing developments by ensuring that private property is maintained to minimize vulnerability.
Program	PSH-1.3.a: Structure Compliance. Conduct annual inspections to require property owners to maintain their structures in compliance with safety standards identified in adopted Codes.

Table 21: Town of Corte Madera General Plan	
Goal/Policy/ Program	**Explanation**
Program	PSH-1.3.b: Smoke Detector Requirements. Continue to promote smoke detector installation in existing structures. Require the installation of smoke detectors as a condition for granting a permit on any new development or redevelopment project.
Program	PSH-1.3:c: Fire Extinguisher Installation. Continue to promote fire extinguisher installation in existing structures through distribution of informational brochures and notices to Town residents and businesses.
Program	PSH-1.3.d: Wildland Urban Interface Ordinance. Continue to implement the Wildland Urban Interface Ordinance.
Policy	PSH-1.4. Adopt and regularly update Standards of Coverage for the Town.
Program	PSH-1.4.a: Standards of Coverage. The Fire Department shall complete its Standards of Coverage document addressing provisions of fire protection for the Town. Additionally, the Town Council will adopt and regularly update the Standards of Coverage report.
Policy	PSH-2.1. Establish and maintain an effective emergency response program that anticipates the potential for disaster.
Program	PSH-2.1.a: Implement Town Emergency Plan. Continue to implement consolidated emergency response programs and plans for fire, flooding, seismic and other potential hazard events contained in the Town Emergency Response Plan. The Plan shall be shared among Town departments, emergency response providers and support groups.
Program	PSH-2.1.b: Community-Based Disaster Plan. Continue to involve community-based disaster response planning that involves local businesses and neighborhoods.
Program	PSH-2.1.c: Emergency Response Plan. Regularly update and publicize the Town's Emergency Response Plan to include evacuation routes, emergency connectors, and emergency shelters in conformance with state guidelines through the Library, Town website, local radio and other community outreach sources.
Program	PSH-2.1.d: Emergency Drills. Hold regular (at least one per year) emergency preparedness drills and include the services of the Community Emergency Response Training (CERT), Marin OEM and related emergency services agencies and groups.
Program	PSH-2.1.e: Natural Hazards Awareness. Promote awareness and caution among residents regarding possible natural hazards, including landslides, earthquakes, flooding, fire hazards through a publicized disaster plan.
Policy	PSH-2.2. Provide public safety employee training to ensure team members' skills remain current.
Program	PSH-2.2.a: Training for Town Employees. Continue to train Town and public safety employees in emergency responsiveness. Include the Marin County Office of Emergency Management (OEM) in training exercises.
Policy	PSH-2.3. Maintain active involvement with Marin Emergency Radio Authority (MERA) and pursue installation and activation of the MERA radio system.
Program	PSH-2.3.a: MERA Radio System. Work with MERA to install and activate the MERA radio system in Corte Madera, consistent with Town emergency response plan needs.
Policy	PSH-2.4. Maintain active maps of fire hazards.
Program	PSH-2.4.a: Update Fire Hazard Maps. Periodically update maps identifying fire hazard areas in Corte Madera.
Policy	PSH-2.5. Continue to coordinate neighborhood disaster response preparedness planning efforts through fire programs and coordination with emergency response agencies.
Program	PSH-2.5.a: Neighborhood Safety Training. Organize neighborhood teams of CERT graduates and continue to support neighborhood training on how to maintain public safety.

Table 21: Town of Corte Madera General Plan	
Goal/Policy/ Program	**Explanation**
Program	PSH-2.5.b: Special Needs Services. Work with social service community to ensure the safety of special needs population during times of disaster.
Policy	PSH-2.6. Utilize mutual aid agreements that provide public safety personnel in times of emergency.
Program	PSH-2.6.a: Mutual Aid Agreements. Continue to support mutual aid agreements with local agencies and jurisdictions that provide public safety personnel in times of emergency.
Policy	PSH-2.7. Explore ways to transport public safety employees from outlying areas when damaged infrastructure prevents them from driving to Corte Madera in emergency situations.
Program	PSH-2.7.a: Ingress/Egress Plans. Include a public safety "ingress" component to the Town's emergency preparedness plans.
Policy	PSH-2.8. Ensure that public safety facilities, apparatus, and equipment are designed and constructed adequately to efficiently operate paramedic, fire, and police services in times of disaster.
Program	PSH-2.8.a: Public Safety Audits. Conduct performance audits of public safety facilities and identify any needed corrective measures.
Policy	PSH-2.9. Establish or identify facilities and provide equipment that may be used by residents during the first days immediately after a major disaster.
Program	PSH-2.9.a: Identify Emergency Supplies. Identify needed emergency supplies to assist Town residents in the first days following an emergency or major disaster.
Program	PSH-2.9:b. CIP Funding for Emergencies. Use Capital Improvement Program or similar funding to establish a readily accessible supply of funds for use by the Town in times of an emergency or major disaster.
Policy	PSH-3.1. Encourage hillside residents to learn the trails and footpaths in their neighborhoods for use as alternative escape routes.
Program	PSH-3.1.a: Ingress and Egress Routes. Work with the Christmas Tree Hilldweller's Association and similar groups to identify emergency ingress and egress routes, including opportunities for construction of periodic vehicle pullouts.
Policy	PSH-3.2. Pursue the development of emergency route connectors to service roads in the hillside areas in a manner that resects the established semirural neighborhood character.
Program	PSH-3.2.a: Emergency Vehicle Access. Increase accessibility to emergency vehicles in hillside areas and improve evacuation routes through construction of vehicle pullouts and through exploration of road widening or construction in selected wildland fire hazard areas.
Policy	PSH-3.3. Maintain road conditions for improved emergency access.
Program	PSH-3.3.a: CIP Funding for Vehicle Access. Use Capital Improvement Program funding to maintain roadways and to improve vehicle emergency access.
Policy	PSH-8.1. All construction in Corte Madera shall comply with the California Building Code, including requirements for seismic design.
Program	PSH-8.1.a: Enforce California Building Codes. Enforce requirements of the California Building Code, including seismic design provisions, as part of the building permit issuance and inspection process.
Program	PSH-8.1.b: Adopt Updated CBC. Adopt updated versions of the California Building Code to address new technical and structural requirements that improve safety.
Policy	PSH-8.2. New development and redevelopment projects with the potential for geological hazards, such as slope failures or soil subsidence, shall be subject to geotechnical

Table 21: Town of Corte Madera General Plan	
Goal/Policy/ Program	**Explanation**
	evaluation prior to approval.
Program	PSH-8.2.a: Geotechnical Reports. Require new development and redevelopment projects in hillside areas subject to the Hillside Land Capacity Overlay District regulations, on slopes of 30% or more, or on sites designated “3” or”4” on the map entitled “Interpretation of the Relative Stability of Upland Slopes on the Tiburon Peninsula, Sausalito, and Adjacent Areas, Marin County, California, 1976” or areas subject to subsidence to submit a geologic investigation and a report by a qualified engineering geologist with application materials. The reports shall address potential for slope failure, soil subsidence and related geologic events, and recommend measures to minimize hazards.
Program	PSh-8.2.b: Development Standards. In areas with identified geotechnical hazards, development shall conform to geotechnical report mitigation measures and/or project and site modifications to respond to site-specific hazards and constraints.
Program	PSH-8.2.c: Denial Condition. The Town may deny applications for development on excessively steep hillsides where slope stability mitigations are not deemed feasible by the Town Engineer and where a significant hazard to Town residents may result from construction of a proposed development.
Program	PSH-8.2:d: Drought Resistant Plants. Require the use of drought-tolerant plants in hillside areas to reduce excessive watering of hillsides.
Program	PSH-8.2.e: Site and Building Design. Include site planning and building design features that reduce potential impacts from geologic hazards in the Town’s Design Guidelines, including provisions to limit damage to structures caused by subsidence and accepted grading practices on hillsides.
Program	PSH-8.2.f: Subdivision Design. Condition subdivision and lot line adjustment approvals to assure that lots on hillsides are large enough to provide flexibility in finding a stable buildable site and driveway location.
Policy	PSH-8.3. Conduct landslide repair operations in conjunction with new development
Program	PSH-8.3.a: Landslide Mitigation. Where known landslide areas exist, require comprehensive landslide mitigation actions to improve slope stability. This can include, with affected property owner support, landslide repair extending beyond the boundaries of a proposed development project site. As part of the review and approval of development and public works projects, the planting of vegetation on unstable slopes to protect structures at lower elevations or other appropriate measures shall be incorporated into the project design. Native plans may be required for landscaping in areas with landslide potential to eliminate the need for supplemental water and to reduce the risk of landslide.
Policy	PSH-8.4. Maintain current information on seismic hazards and landscaping.
Program	PSH-8.4.a: Seismic and Landslide Hazards. Develop and periodically update Town maps and information on seismic and landslide hazards for use in evaluating development proposals.
Public Facilities Element	
Goal	Well-distributed and maintained system of park and recreational facilities. A range of recreation programs that offers opportunities to participate for all Town residents. Community trails system that will promote non-automotive, environmentally sound circulation. Adequate access to open space.
Policy	Policy PR-3.2. Identify linkages, corridors and other connectors to provide a

Table 21: Town of Corte Madera General Plan	
Goal/Policy/ Program	**Explanation**
	functional network of parks, open space areas, and bicycle paths through Town.
Program	Program PR3.2:b: Habitat Protection. Protect and retain existing natural habitats when planning a Town-wide trail system.
Policy	PR-4.1. Encourage the provision of access to open space areas in the design of adjacent development projects.
Program	PR-4.1.a: Subdivision Requirements. Identify access paths and parking areas as part of development approvals. Design access paths to avoid neighborhood and user disputes; minimize intrusion into sensitive wildfire habitat areas.
Program	PR-4.1.b: Marsh and Preserve Access. Coordinate access to and use of the Town's varied open spaces, canals and ecological preserves with policy and implementation actions in Chapter 3 (Resource Conservation).

Table 62: Town of Corte Madera General Plan
Source: **Town of Corte Madera** General Plan

3.2.2 Administrative and Technical Capabilities

The administrative and technical capability identifies the Town personnel responsible for activities related to mitigation and loss prevention. Many positions are full time and/or filled by the same person.

Table 22: Administrative and Technical Capabilities		
Administrative	Yes/No	Is coordination effective?
Planning Commission	Y	The Planning Commission meetings on the second and fourth Tuesday of each month. The Commission holds public hearings and takes action on subdivision, design reviews, conditional use permits, and items that may be forwarded to or called up by the commission.
Administrative Services	Y	Administrative Services Department handles finance and purchasing, budgeting, risk management, information technology, and business licensing for the community. The department may be responsible for implementing mitigation actions related to the department's scope.
Hazard Mitigation Planning Committee	Y	The Town participates in the Marin County Multi-Jurisdictional Hazard Mitigation Planning Committee that meets quarterly to review and manage Hazard Mitigation projects and programs.
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Public works maintenance staff regularly sweep streets and clean out/maintain the storm systems to keep them functional. The Town, Central Marin Fire Department, and PG&E all are involved in tree trimming around town.
Mutual aid agreements	Y	The Central Marin Fire Department utilizes mutual aid agreements with local agencies and jurisdictions that provide public safety personnel in times of emergency.

Technical	Yes/No	Has capability been used to assess/mitigate risk in the past?
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Utilizes the emergency warning systems through the EAS system as their primary warning capability. Utilizes the emergency warning systems through telephone notification utilizing reverse 911.
Hazard data and information	N	
Grant writing	Y	The Town acquired a state grant to undertake the Climate Adaptation Assessment.
Hazus analysis	N	
Staff/Personnel Resources	Yes/No FT/ PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y/FT	
Floodplain Administrator	Y	Director of Public Works is also the Floodplain Administrator.
Emergency Manager	N	
Community Planner	N	
Civil Engineer	Y/FT	
Engineer(s), project manager(s), technical staff, equipment operators, and maintenance and construction staff.	Y/FT	Maintains and operates a wide range of local equipment and facilities as well as providing assistance to members of the public. These include providing reliable sewer services, street maintenance, storm drainage systems, street cleaning, streetlights and traffic signals.
GIS Coordinator	N	
Community Development Staff	Y/FT	Develops and maintains the General Plan, including the Safety Element. Develops area plans based on the General Plan, to provide more specific guidance for the development of more specific areas. Reviews private development projects and proposed capital improvements projects and other physical projects involving property for consistency and conformity with the General Plan.
Town Planning, Building, and Public Works Staff	Y/FT	These departments are responsible for planning and building related activities including issuing permits, conducting environmental review, preparing planning documents, and addressing housing issues. Mitigation activities related to planning and building can be implemented by this department. Public Works Department is responsible for Town-owned infrastructure, including streets, bike lanes and sidewalks, storm drains, traffic signals, and streetlights. Mitigation actions involving new or retrofitted public infrastructure, as well as those related to water conservation, fall within the purview of the Public Works

		Department.
Police Department Staff	Y/FT	The Central Marin Police Authority conducts emergency preparedness activities for the community. Mitigation activities related to emergency preparedness can be implemented by the Police Department.
Fire Protection District Staff	Y/FT	The Corte Madera Fire Department protects the town from the effects of fire and other hazardous conditions and supports implementation of mitigation actions that reduce the risk of wildfire.

Table 63: Town of Corte Madera Administrative and Technical Capabilities
Source: **Town of Corte Madera**

3.2.3 Fiscal Capabilities

The fiscal capability assessment shows specific financial and budgetary tools available to the jurisdictions such as community development block grants; capital improvements project funding; authority to levy taxes for specific purposes; fees for water, sewer, gas, or electric services; impact fees for homebuyers or developers for new development; ability to incur debt through general obligations bonds; and withholding spending in hazard-prone areas.

Table 23: Fiscal Capabilities

Financial	Yes/No	Has the funding resource been used in the past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Funding has not been used in the past for mitigation, but could possibly fund future mitigation activities.
Authority to levy taxes for specific purposes	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Fees for water, sewer, gas, or electric services	Y	Water, gas, and electric utilities are managed by other agencies. Sanitary funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Impact fees for new development	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Storm water utility fee	Y	The Town does not collect a storm water utility fee, however it could be a source of revenue in the future.
Incur debt through general obligation bonds and/or special tax bonds	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Incur debt through private activities	N	
Community Development Block Grant	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Other federal funding programs	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
State funding programs	Y	Funding has not been used in the past for mitigation but

		could possibly fund future mitigation activities.

Table 64: Town of Corte Madera Fiscal Capabilities
Source: **Town of Corte Madera**

3.2.4 COMMUNITY OUTREACH

The outreach and partnerships capability assessment shows outreach and public education programs available to the Town of Corte Madera and the Town of Corte Madera partnerships utilized to promote those programs.

Table 24: Town of Corte Madera Community Outreach

Outreach and Partnerships	Yes/No	Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	The Town produces a weekly digest of local issues in Town, which is an effective outreach tool. Additionally the Town website contains links to a wide variety of mitigation information and training opportunities. The Town has a Flood Control Board that advises on flood related issues. There is also a Climate Action Committee that advises the Town Council on climate related issues.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	The Town uses mailers and social media outreach to educate the public about flood, fire, and sanitary sewer related issues.
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Community Rating System	Y	The Town is part of the CRS system and has a current rating of 6.
Public-private partnership initiatives addressing disaster-related issues	Y	The Get Ready program, developed in Marin County, is a free 2-hour course provided to the community. The course is designed to help residents plan for an emergency with a family plan, evacuation checklist, and strategies to keep residents and their families safe. (https://readymarin.org/get-ready/)

Table 65: Town of Corte Madera Community Outreach
Source: **Town of Corte Madera**

3.2.5 Participation in the National Flood Insurance Program

Town of Corte Madera has participated in the Regular Phase of the NFIP since **12/15/1977**. Since then, the Town of Corte Madera has administered floodplain management regulations that meet the minimum requirements of the NFIP. Under that arrangement, residents and businesses paid the same flood insurance premium rates as most other communities in the country.

The Community Rating System (CRS) was created in 1990. Town of Corte Madera has been in the CRS program since **10/01/03**. The program is designed to recognize floodplain management activities that are above and beyond the NFIP's minimum requirements. CRS is designed to reward a community for implementing public information, mapping, regulatory, loss reduction and/or flood preparedness activities. On a scale of 10 to 1, Town of Corte Madera is currently ranked Class 6 community, which gives a 20% premium discount to individuals in the Town of Corte Madera Special Flood Hazard Area (SFHA), and a 10% discount to policyholders outside the SFHA.

Repetitive Loss Structures

Repetitive Loss Residential Structures: 6
Repetitive Loss Non-Residential Structures: 3
Severe Repetitive Loss Residential Structures: 1
Severe Repetitive Loss Non-Residential Structures: 0

Presently, the Town of Corte Madera manages its floodplains in compliance with NFIP/CRS requirements and implements a floodplain management program designed to protect the people and property of the County. Floodplain regulations are a critical element in local floodplain management and are a primary component in the Town's participation in the NFIP. As well, the Town's floodplain management activities apply to existing and new development areas, implementing flood protection measures for structures and maintaining drainage systems to help reduce the potential of flooding within the Town.

The Town of Corte Madera will continue to manage their floodplains in continued compliance with the NFIP. An overview of the Town's NFIP status and floodplain management program are discussed in Table 25: Town of Corte Madera NFIP Status. Additional information on the Town's CRS program follows.

The activities credited by the CRS program provide direct benefits to Marin County and its residents, including:

- Enhanced public safety;
- A reduction in damage to property and public infrastructure;
- Avoidance of economic disruption and losses;
- Reduction of human suffering; and
- Protection of the environment.

The activities that Marin County implements and receives CRS credits include:

Corte Madera's CRS program as of January 12, 2023

Activity 310 – Construction Certificate Management: Credit is provided for having written construction certificate management procedures for all new and substantially improved/substantially damaged buildings. (38 points)

Activity 320 – Map Information Service: Credit is provided for furnishing inquirers with basic flood zone information from the community's latest Flood Insurance Rate Map (FIRM). Credit is also provided for the community offering additional FIRM information, historical flood information, and natural floodplain functions. The service is publicized annually and records are maintained. (90 points)

Activity 330 – Outreach Projects: Credit is provided for general outreach projects and targeted outreach projects. These projects are disseminated annually. (50 points)

Activity 340 – Hazard Disclosure: Credit is provided for state regulations requiring disclosure of flood hazards. (15 points)

Activity 350 – Flood Protection Information: Documents relating to floodplain management are available in the reference section of the Corte Madera Library. Credit is also provided for floodplain information displayed on the community's website.

(73 points)

Activity 360 – Flood Protection Assistance: Credit is provided for offering one-on-one advice regarding property protection and making site visits before providing advice. The service is publicized annually and records are maintained. (55 points)

Activity 420 – Open Space Preservation: Credit is provided for preserving approximately 55 percent of the Special Flood Hazard Area (SFHA) as open space, and preserving open space land in a natural state. (912 points)

Activity 430 – Higher Regulatory Standards: Credit is provided for enforcing regulations that require freeboard for new construction and substantial improvement, foundation protection, cumulative substantial improvement, and local drainage protection. Credit is also provided for the enforcement of building codes and Building Code Effectiveness Grading Schedule (BCEGS®) Classification. (181 points)

Activity 440 – Flood Data Maintenance: Credit is provided for maintaining and using additional map data in the day to day management of the floodplain. Credit is also provided for establishing and maintaining a system of benchmarks and maintaining copies of all previous FIRMs and Flood Insurance Study reports. (177 points)

Activity 450 – Stormwater Management: The community enforces regulations for soil and erosion control, and water quality. (31 points)

Section 502 – Repetitive Loss Category: Based on the updates made to the NFIP Report of Repetitive Losses as of October 3, 2022, the Town of Corte Madera, CA has 10 repetitive loss properties and is a Category B community for CRS purposes. All requirements for a Category B community have been met. (No credit points are applicable to this section)

Activity 510 – Floodplain Management Planning: Credit is provided for the Marin County Multi-Jurisdictional Local Hazard Mitigation Plan, adopted on September 17, 2019. A progress report must be submitted on an annual basis. (171 points)

Activity 610 – Flood Warning and Response: Credit is provided for a program that provides timely identification of impending flood threats, disseminates warnings to appropriate floodplain residents, and coordinates flood response activities. A description of the flood exercise or After-Action Report from an actual flood event must be submitted on an annual basis. Warning information and safety measures must be publicized annually. (215 points)

Activity 630 – Dams: Credit is provided for a State Dam Safety Program. (37 points)

Table 25: Town of Corte Madera NFIP Status

NFIP Topic	Comments
Insurance Summary	
How many NFIP policies are in the community? What is the total premium and coverage?	384 NFIP policies in Town. Total premium is $456,952 and total coverage is $127,563,000.
How many claims have been paid in the community? What is the total amount of paid claims? How many of the claims were for substantial damage?	167 losses paid for a total of $1,413,723.30. Two substantial damage claims.
How many structures are exposed to flood risk within the community? *"flood risk" is defined as the 1% annual chance flood (100-year flood. Numbers are from overlay of FEMA SFHA and building stock data.	Approximately 1204 structures within A-zones.
Describe any areas of flood risk with limited NFIP policy coverage	None
Staff Resources	
Is the Community Floodplain Administrator or NFIP Coordinator certified?	No
Is floodplain management an auxiliary function?	Floodplain management is a full-time function with the City of CM. Duties are performed on a daily basis.
Provide an explanation of NFIP administration services (e.g., permit review, GIS, education or outreach, inspections, engineering capability)	The community is a CRS Class 6 with a floodplain management program that is exceeding the minimum standards of the NFIP. This includes the level of permit review, GIS capabilities, annual outreach program, inspection, and engineering staff and capabilities.
What are the barriers to running an effective NFIP program in the community, if any?	Staff time
Compliance History	
Is the community in good standing with the NFIP?	Yes
Are there any outstanding compliance issues (i.e., current violations)?	No
When was the most recent Community Assistance Visit (CAV) or Community Assistance Contact (CAC)?	The most recent Community Assistance Visit was on 9/14/2018.
Is a CAV or CAC scheduled or needed?	There are no CAV or CACs scheduled for Corte Madera. None are needed at this time.
Regulation	
When did the community enter the NFIP?	12/15/1977
Are the FIRMs digital or paper?	03/16/2016 Digital and historical paper copies of FIRMs are maintained in the office.
Do floodplain development regulations meet or exceed FEMA or State minimum requirements? If so, in what ways?	Exceed the NFIP by State mandated building codes and adopted higher regulatory standards. Based on the credited CRS program:

	• State regulations for required disclosure of flood hazards • Current building code adoption and enforcement • Freeboard requirements for residential and non-residential development • Cumulative substantial improvement • Foundation protection requirements with required compaction reports • Positive drainage from foundation walls per building code
Provide an explanation of the permitting process.	When a permit application is received by the Building Department, if it is identified to be within the floodplain, the permit application and construction documents are provided to Public Works to complete the floodplain development review and identify requirements for inspections and/or elevation certificates.
Community Rating System (CRS)	
Does the community participate in CRS?	Yes
What is the community's CRS Class Ranking?	CRS Class 6
What categories and activities provide CRS points and how can the class be improved?	c310 38 — 38 c320 90 — 90 c330 50 — 50 c340 15 — 15 c350 73 — 73 c360 55 — 55 c370 — — c410 — x CGA — = — c420 894 x CGA 1.02 = 912 c430 177 x CGA 1.02 = 181 c440 174 x CGA 1.02 = 177 c450 30 x CGA 1.02 = 31 c510 171 — 171 c520 — — c530 — — c540 — — c610 215 — 215 c620 — — c630 37 — 37 **Community Classification Calculation:** cT = total of above — cT = 2045 Community Classification (from Table 110-1): — Class = 6 The score sheet referenced is from the 2022 CRS verification visit and accurately represents the community's level of effort and capabilities. An additional 500 points would need to be identified for a CRS Class 5 points baseline. This would include introducing and exploring new creditable CRS activities and verifying that the credit criteria would be met and qualify. Potential new credits may include: 330 OP 330 FRP 370 FIA 510 RLAA, SDMP 540 CDR, PSM, CIP1, CIP2, SDR
Does the plan include CRS planning requirements	The CRS Manual and CRS Addendum are referenced for all CRS credit criteria guidelines. The current hazard mitigation plan includes the CRS 10-steps for the planning requirements.

DRAFT

Table 66: Town of Corte Madera NFIP Status

3.3 MITIGATION GOALS

44 CFR Requirement § 201.6(c)(3)(i) [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long‐term vulnerabilities to the identified hazards.

The information developed from the risk assessment was used as the primary basis for developing mitigation goals and objectives. Mitigation goals are defined as general guidelines explaining what each jurisdiction wants to achieve in terms of hazard and loss prevention.

Hazard Risk Prioritization
↓
Mitigation Goals & Objectives
↓
Mitigation Project Identification
↓
Mitigation Project Implementation

Goal statements are typically long-range, policy-oriented statements representing jurisdiction-wide visions. Objectives are statements that detail how each jurisdiction's goals will be achieved, and typically define strategies or implementation steps to attain identified goals. Other important inputs to the development of jurisdiction-level goals and objectives include performing reviews of existing local plans, policy documents, and regulations for consistency and complementary goals, as well as soliciting input from the public.

The following represents overarching strategic goals associated with the identification and eventual implementation of appropriate and meaningful hazard mitigation efforts in relation to prioritized hazards and threats confronting Marin County. These goals form the basis for specific supporting process objectives and are shown from the highest priority, at the top of the list, to those of lesser importance.

The establishment of hazard mitigation goals represents both individual and collective strategies that have been mutually agreed upon by the Steering Committee and have changed with the 2023 MJHMP update. Objectives were added to Goals 2 and 5. Eventually, these goals have been adopted by Marin County and its participating jurisdictions as the guiding policy behind local hazard mitigation efforts, in conjunction with other associated principles.

Goals were defined for the purpose of this mitigation plan as broad-based public policy statements that:

- Represent basic desires of the community;
- Encompass all aspects of community, public and private;
- Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;
- Are future-oriented, in that they are achievable in the future; and
- Are time-independent, in that they are not scheduled events.

Goals are stated without regard to implementation. Implementation cost, schedule, and means are not considered. Goals are defined before considering how to accomplish them so that they are not dependent on the means of achievement. Goal statements form the basis for objectives

and actions that will be used as means to achieve the goals. Objectives define strategies to attain the goals and are more specific and measurable.

Goal 1: Minimize risk and vulnerability of the community to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, and environment in Marin County.

- Minimize economic and resource impacts and promote long-term viability and sustainability of resources throughout Marin County.
- Minimize impact to both existing and future development.
- Provide protection for public health.
- Prevent and reduce wildfire risk and related losses.

Goal 2: Provide protection for critical facilities, infrastructure, utilities, and services from hazard impacts.

- Incorporate defensible space and reduce hazard vulnerability.
- Develop redundancies in utilities and services.
- Enhance resilience through enhanced construction.

Goal 3: Improve public awareness, education, and preparedness for hazards that threaten our communities.

- Enhance public outreach and participation in the Alert Marin Emergency Notification System.
- Enhance public outreach, education, and preparedness program to include all hazards of concern.
- Increase public knowledge about the risk and vulnerability to identified hazards and their recommended responses to disaster events, including evacuation and sheltering options.
- Provide planning and coordination for "At-Risk" populations.
- Provide planning and coordination for companion animals, livestock, and other animal populations.
- Increase community awareness and participation in hazard mitigation projects and activities.

Goal 4: Increase communities' capabilities to be prepared for, respond to, and recover from a disaster event.

- Improve interagency (local, state, federal) emergency coordination, planning, training, and communication to ensure effective community preparedness, response and recovery.
- Enhance collaboration and coordination of disaster-related plans, exercises, and training with local, state, and federal agencies, neighboring communities, private partners, and volunteers.
- Enhance the use of shared resources/Develop a strong mutual aid support system.
- Create and maintain a fully functional, interoperable radio and communication system with all regional public safety partners.

Goal 5: Maintain FEMA Eligibility/Position the communities for grant funding.

- Review hazard events and ongoing hazard mitigation projects annually.
- Assess the need to pursue or adjust hazard mitigation projects after significant hazard events.

Goal 6: Reduce exposure to High Hazard Dams that pose an unacceptable risk to the public.

- Improve alert and warning systems to provide residents downstream of a High Hazard Dam to receive timely warning to evacuation when threatened by potential or imminent dam failure.
- Enhance overall community preparedness to respond and evacuate a potential or imminent dam failure.
- Increase public awareness of the risk posed by High Hazard Dams and the potential for relocation of housing outside a possible inundation zone.
- Prioritize High Hazard Dam Mitigation projects and programs.

3.4 Status of Previous Mitigation Actions

Table 26 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 26: Status of Previous Hazard Mitigation Actions

Action Number / Name	Completed	Ongoing	Not Started	Still Relevant	Included in Updated Action Plan
Government Mitigation Strategies: As a member of the Marin Emergency Radio Authority (MERA), the Town participates in the decisions on management of the current county-wide, interagency emergency radio system. MERA, with the Town as participant, is also studying the replacement for the system as it reaches the end of its service life. Town employees have been offered CERT, Get Ready, and appropriate EOC training for their duties as disaster service workers. An updated General Plan was adopted which includes significant public safety components.		X			X
Economy Mitigation Strategies: The Town continues to review and adopt current California Building and Fire codes. The town also provides public disaster preparedness education to the business community to reduce the impact and aid the recovery of their economically-vital functions. We also work closely with the Chamber of Commerce in these endeavors.		X			X
Environmental Mitigation Strategies: The Town now requires Vegetation Management Plans (VMP) for development in the Wildland-Urban Interface (WUI) areas. This reduces the chance of a wildland fire igniting the structure(s) and reciprocally, wildland ignition from a structure fire. The Town also has been removing exotic, invasive, and hazardous species and replacing with native, safer vegetation.			X		X
Earthquake natural gas valves are required in new construction or during substantial remodel work		X			X
Continue to participate in FEMA's National Flood Insurance Program and Community Rating System (CRS)		X			X

Table 26: Status of Previous Hazard Mitigation Actions					
Action Number / Name	**Completed**	**Ongoing**	**Not Started**	**Still Relevant**	**Included in Updated Action Plan**
As new development occurs, roadways and driveways are required to be of minimal 12 to 20 foot width and with approved turnarounds and/or turnouts.		X			X
Implement projects identified in Capital Improvement Plan, such as maintaining & upgrading of flood control and sewer facilities.		X			X
Fire code amendments to reduce the damage to structures from earthquake, landslide and fire. Including automatic natural gas shut-off valves and fire sprinklers for new and substantially remodeled structures.		X			X

3.5 HAZARD MITIGATION ACTIONS

The 2023 Marin County MJHMP and Town of Corte Madera Annex were revised to reflect progress in local mitigation efforts. Mitigation projects were selected for each hazard and for the Town of Corte Madera based off the hazard risk assessment. The projects are supported by the mitigation goals and objectives, and are ranked using the following criteria; approximate cost, timeframe of completion, whether the project requires Town Council regulatory action, and an assumption as to whether or not the project would be subject to CEQA or NEPA requirements. Funding sources are identified for all projects. All projects consider new, future, and existing development. Project worksheets are used by the Planning Team and Marin County and Town of Corte Madera Steering Committee to describe criteria for each project.

Based on the hazard profiles, threat assessment, capabilities assessment, community survey results, discussions among the Planning Team members, and existing best practices, a set of potential mitigation actions was developed and then evaluated based on the following criteria:

- FEMA requires local governments to evaluate the monetary and non-monetary costs and benefits of potential mitigation actions. Although local governments are not required to assign specific dollar values to each action, they should identify the general size of costs and benefits.
- The Planning Team may elect to include measures with a high cost or low benefits, but such measures should be clearly beneficial to the community and an appropriate use of local resources.

In addition, FEMA directs local governments to consider the following questions as part of the financial analysis:

- What is the frequency and severity of the hazard type to be addressed by the action, and how vulnerable is the community to this hazard?
- What impacts of the hazard will the action reduce or avoid?
- What benefits will the action provide to the community?

The Planning Team also chose to review and revise the potential hazard mitigation actions with consideration for climate impact and social vulnerability. Projects and programs were assessed with consideration of these variables.

Prioritization

As part of the mitigation actions development and review, the Planning Team also prioritized the actions. The prioritization efforts looked at the risks and threats from each hazard; lifesaving, life safety, property protection and lastly environmental protection; financial costs and benefits; technical feasibility; consideration for climate impact, and social vulnerability, and community values. Planning Team members were asked to identify their priority actions using the following criteria.

Implementation priority ratings were assigned as follows:

- **High Priority** - An action that meets multiple objectives, is linked to a high risk hazard, has benefits that exceed costs, and has a potential source of funding. Action can begin within the short term (1 to 5 years).
- **Medium Priority** - An action that meets multiple objectives, is linked to a high or medium risk hazard, has benefits that exceed costs, and is eligible for funding though no funding has yet been secured for it. Action can begin within the short term (1 to 5 years) once funding is secured.
- **Low Priority** - An action that will mitigate the risk of a hazard, has benefits that do not exceed the costs or are difficult to quantify, has no secured source of funding, and is not eligible for any known grant funding. Action can be completed in the long term (1 to 10 years). Low-priority actions may be eligible for grant funding from programs that have not yet been identified.

Table 27 lists the Current Hazard Mitigation Actions for the Town of Corte Madera and Sanitary District #2 .

Table 27: Town of Corte Madera Current Hazard Mitigation Actions

No.	Mitigation Actions	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
CM-1	Marin Emergency Radio Authority (MERA) Upgrades. MU-13 Protect Infrastructure and Critical Facilities	All Hazards/ 1, 2, 3, 4, 5	Marin County and Town of Corte Madera.	Existing (2018)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	Ongoing/ High	
CM-2	Town is studying replacement for the Marin Emergency Radio Authority (MERA) system as it reaches the end of its service life.	All Hazards/ 1, 2, 3, 4, 5	Marin County and Town of Corte Madera.	Existing (2018)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	Ongoing/ High	
CM-3	Update public safety components of the General Plan. MU-4 Adopt Development Regulations in Hazard Areas	All Hazards/ 1, 2, 4, 5	Town of Corte Madera, Community Development	Existing (2018)	Cost: General Funds	1 – 3 years/ High	An updated General Plan was adopted which includes significant public safety components.
CM-4	Review and adopt current California Building and Fire codes. MU-8 Adopt and Enforce Building Codes	All Hazards/ 1, 2, 4, 5	Town of Corte Madera, Central Marin FPD	Existing (2018)	Cost: General Funds	1 – 3 years/ High	The Town continues to review and adopt current California Building and Fire codes.
CM-5	Review and adopt current California Building codes for seismic, flood, fire and other disaster. MU-8 Adopt and Enforce Building Codes	All Hazards/ 1, 2, 4, 5	Town of Corte Madera	Existing (2018)	Cost: General Funds	3 - 5 years/ Medium	The Town continues to review and adopt current California Building codes.
CM-6	As new development occurs, roadways and driveways are required to be of minimal 12 to 20 foot width and with approved turnarounds and/or turnouts.	All Hazards/ 1, 2, 4, 5	Town of Corte Madera	Existing (2018)	Cost: General Funds	1 – 3 years/ High	
CM-7	Encourage participation in Alert Marin and other community alert & warning systems to ensure the public is aware of any potential emergencies.	Dam Failure 1, 2, 3, 4, 5,	Town of Corte Madera Marin County	New (2023)	Cost: General Funds	Ongoing/ Low	Continue to encourage residents to participate in Alert Marin with an emphasis on properties at risk from all hazards.
CM-8	Enhance and promote community and individual emergency preparedness. MU-15 Develop and Conduct a Household Disaster Preparedness Program. ET-2 Increase awareness of extreme temperatures risk and safety.	All Hazards/ 3, 4, 5	Town of Corte Madera, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	Focus on signing residents up for Alert Marin and establish a personal evacuation kit and plan.

Table 27: Town of Corte Madera Current Hazard Mitigation Actions

No.	Mitigation Actions	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
CM-9	Enhance Community facilities to support the socially vulnerable population during extreme weather events. ET-3 Assist Vulnerable Population	All Severe Weather 1, 2, 4, 5	Town of Corte Madera, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1 - 2 years/ High	
CM-10	Fire code amendments to reduce the damage to structures from earthquake, landslide and fire. Including automatic natural gas shut-off valves and fire sprinklers for new and substantially remodeled structures.	Earthquake, Debris Flow, Wildfire, Land Subsidence/ 1, 2, 4, 5	Town of Corte Madera	Existing (2018)	Cost: General Funds	1 – 3 years/ High	
CM-11	Vegetation Management Plans (VMP) for development in the Wildland-Urban Interface (WUI) areas. WF-9 Implement a Fuels Management Program	Wildfire/ 1, 2, 4, 5,	Town of Corte Madera, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	This reduces the chance of a wildland fire igniting the structure(s) and reciprocally, wildland ignition from a structure fire.
CM-12	Vegetation Management Plan to include the removal of exotic, invasive, and hazardous species and replacing them with native, safer vegetation. WF-9 Implement a Fuels Management Program, ET-1 Reduce Urban Heat.	Wildfire, Drought, Severe Weather – Heat & Wind 1, 2, 4, 5,	Town of Corte Madera, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	Reduces the chance of a wildland fire igniting the structure(s) and reciprocally, wildland ignition from a structure fire. Supports environmental restoration.
CM-13	Vegetation Management around at risk PG&E power lines and electrical line undergrounding projects by PG&E.	Wildfire, Drought, Severe Weather – Heat & Wind 1, 2, 4, 5,	Town of Corte Madera, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	
CM-14	Hillside neighborhoods adaptation projects to protect against wildfire risk including widening narrow roads and adding road pullouts, increasing number of emergency egress roads from neighborhoods, continue vegetation management in highest risk areas, and other projects listed in the assessment.	Wildfire/ 1, 2, 4, 5,	Town of Corte Madera, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	Project aligned and identified in the Town's Climate Adaptation Assessment

Table 27: Town of Corte Madera Current Hazard Mitigation Actions

No.	Mitigation Actions	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
CM-15	Shoreline adaptation projects to protect against flooding and sea level rise including improved, replaced, or new levees, raising structures out of the flood zone, raising road elevations, and other projects listed in the assessment.	Flooding, Sea Level Rise, Levee Failure, Tsunami/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost TBD: HMGP, FMA, CDAA	2 -5 Years/ Medium	Project aligned and identified in the Town's Climate Adaptation Assessment
CM-16	Central Corte Madera adaptation projects to protect against flooding including maintaining, replacing, or new flood control pump stations, maintaining and dredging existing lagoons and canals, maintain and improve storm drainage throughout neighborhoods, and other projects listed in the assessment.	Flooding, Sea Level Rise, Tsunami/ 1, 2, 4, 5	Town of Corte Madera, Marin County	New (2023)	Cost TBD: HMGP, FMA, CDAA	2 -5 Years/ Medium	Project aligned and identified in the Town's Climate Adaptation Assessment
CM-17	Updating or enhancing flood control pump stations, storm force mains, and gravity storm lines around town. This will also include maintaining and dredging existing flood control open channels, canals, and lagoons.	Flooding, Sea Level Rise, Levee Failure, Dam Failure, Tsunami/ 1, 2, 4, 5	Town of Corte Madera, Marin County	New (2023)	Cost TBD: HMGP, FMA, CDAA	2 -5 Years/ Medium	Projects listed in the Storm Drain Master Plan which will be released in early 2024.
CM-18	Earthquake natural gas valves are required in new construction or during substantial remodel work.	Earthquake/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost TBD: HMGP, BRIC, CDAA	2 -5 Years/ High	
CM-19	Encourage participation in Alert Marin and other community alert & warning systems to ensure the public is aware of any potential Dam related emergencies or risk.	Dam Failure 1, 2, 3, 4, 5, 6	Town of Corte Madera, NMWD	New (2023)	Cost: General Funds	Ongoing/ Low	Continue to encourage residents to participate in Alert Marin with an emphasis on properties at risk from dam failure.
CM-20	Map and Assess Vulnerability to Landslides	Landslide/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost: General Funds	2-5 Years/ Low	Review landslides to date and geological data to determine areas at risk of future landslides.

Table 27: Town of Corte Madera Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
CM-21	Require Water Conservation During Drought Conditions and Enhance Landscaping and Design Measures	Drought 1, 2, 3, 4, 5	Town of Corte Madera	New (2023)	Cost: General Funds	Ongoing/ Low	Follow MMWD and State guidelines on water conservation during droughts.
CM-22	Establish Local Funding Mechanisms for Flood Mitigation	Flooding/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost: General Funds	Ongoing/ High	Determine amount of funding needed for flood protection improvements and decide on a method to raise money.
CM-23	Elevate or Retrofit Structures and Utilities	Flooding/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost: TBD, Grants-HMGP, FMA, BRIC, CDAA or privately funded	Ongoing/ High	Recommend and support property owners in raising their homes out of the flood zone.
CM-24	Protect and Restore Natural Buffers	Sea Level Rise/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost: Grants-HMGP, FMA, BRIC, CDAA or General Funds	Ongoing/ High	Continue to protect wetlands along the bay and include ecotone slopes as possible protection measure where possible.
CM-25	Increase Awareness of Sea Level Rise	Sea Level Rise/ 1, 2, 3, 4, 5	Town of Corte Madera	New (2023)	Cost: General Funds	1-3 Years/ High	Create a sea level rise webpage to provide data and links to information about sea level rise
CM-26	Reduce Urban Heat Island Effect	Severe Weather-Heat/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost: General Funds	5-10 Years/ Low	Implement green streets initiatives and plant street trees around Town.
CM-27	Map and Assess Vulnerability to Subsidence	Subsidence/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost: General Funds	2-5 Years/ Low	Monitor subsidence in low lying neighborhoods and estimate future subsidence.
CM-28	Increase height and retrofit existing levees in town	Levee Failure/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost: TBD, grant funding- HMGP, FMA, BRIC, CDAA	5-20 Years/ High	Systematically retrofit existing levees based on risk of failure and increase height to FEMA standards where possible.
CM-29	Require or Encourage Fire-Resistant Construction Techniques	Wildfire/ 1, 2, 4, 5	Town of Corte Madera	New (2023)	Cost: General Funds	2-5 Years/ High	Encourage fire-resistant construction for new or major

Table 27: Town of Corte Madera Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
							remodels in hillside neighborhoods.
CM-30	Reduce flood control pump station reliance on fossil fuel generators by replacing with clean energy back up power facilities.	Flooding, Sea Level Rise, Tsunami/ 1, 2, 3, 4, 5	Town of Corte Madera	New (2023)	Cost TBD: HMGP, FMA, CDAA	5-20 Years/ Low	
	Sanitary District #2						
SD-1	Updating or enhancing sanitary pump stations, force mains, and gravity storm lines around town.	Flooding, Sea Level Rise/ 1, 2, 3, 4, 5	Sanitary Dist. #2, Marin County	New (2023)	Cost TBD: HMGP, FMA, CDAA	2 -5 Years/ High	Project listed in Sanitary Sewer Master Plan to be finalized in 2023.
SD-2	Install bypass force mains where none currently exist from the Paradise Pump Station to the joint force main connection on the north side of Corte Madera Creek.	Flooding, Sea Level Rise, Tsunami/ 1, 2, 3, 4, 5	Sanitary Dist. #2, Marin County	New (2023)	Cost TBD: HMGP, FMA, CDAA	2 -5 Years/ High	
SD-3	Improve the Paradise Pump Station wet well capacity to help prevent sewer overflows during storms.	Flooding, Sea Level Rise, Tsunami/ 1, 2, 3, 4, 5	Sanitary Dist. #2, Marin County	New (2023)	Cost TBD: HMGP, FMA, CDAA	2 -5 Years/ High	
SD-4	Reduce sanitary pump station reliance on fossil fuel generators by replacing with clean energy back up power facilities.	Flooding, Sea Level Rise, Tsunami/ 1, 2, 3, 4, 5	Sanitary Dist. #2, Marin County	New (2023)	Cost TBD: HMGP, FMA, CDAA	5-20 Years/ Low	

Table 68: Town of Corte Madera & Sanitary District #2 Current Hazard Mitigation Actions

3.6 Progress in Local Mitigation Efforts

This plan has been created as a "living" document with input from the population and professionals within the Town of Corte Madera. Based on the planning meetings and the progress monitored by the steering committee members several mitigation actions were accomplished since the last planning cycle. Table 26 provides a brief description of the progress made in the local mitigation efforts and the plan for those mitigation actions that were not completed or are ongoing.

The planning team for the Town of Corte Madera identified and prioritized the mitigation actions as detailed in Table 27, based on the risk assessment and in accordance with the process outline in Section 3, Mitigation Strategy, of the base plan. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. General processes and information on plan implementation and maintenance of this LHMP by all participating jurisdictions is included in Section 4.0: Plan Review, Evaluation, and Implementation.

3.7 Plan Integration

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning, capital facilities planning, emergency management, hazard specific planning, and that relevant information from those sources is also used in hazard mitigation. This section identifies where such integration is already in place from the 2018 MJHMP, and where the 2023 MJHMP will be used for further integration.

The planning team for the Town of Corte Madera will maintain this plan and will serve as a lead staff for grant project applications on Town projects selected for application under the Hazard Mitigation Assistance grant programs.

An important implementation mechanism that is highly effective and low-cost is incorporation of the hazard mitigation plan recommendations and their underlying principles into town plans and mechanisms. Where possible the Town of Corte Madera will use existing plans and/or programs to implement hazard mitigation actions. Mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and development. As described in this plan's capability assessment, the Town of Corte Madera already implements policies and programs to reduce losses to life and property from hazards. This plan builds upon the momentum developed through previous and related planning efforts and mitigation programs and recommends implementing actions, where possible, through these other program mechanisms. These existing mechanisms include Integration opportunities for the 2023 Marin County MJHMP:

Town General Plan - Integrates hazard mitigation through the consideration of hazards most likely to impact the Town. These hazards are considered in the Safety Element, Housing Element and Open Space Element.

Town Emergency Operations Plans – Integrates hazard mitigation through the consideration of the Town's planned response to hazards most likely to impact the Town.

County, City and Town Ordinances - Integrates hazard mitigation through the consideration of plans and policies outlined in the capability assessments in the jurisdictional annexes.

Flood/Storm Water Management/Master Plans - Integrates hazard mitigation through the consideration of strategies to reduce flood risk and storm water management for the protection of life and property.

Community Wildfire Protection Plan - Integrates hazard mitigation through the consideration of strategies to reduce fire hazard and the risk of catastrophic wildfires in the WUI, while promoting the protection and enhancement of the county's economic assets and ecological resources.

The successful implementation of this mitigation strategy will require review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. A few examples of incorporation of the MJHMP into existing planning mechanisms include:

7. As recommended by Assembly Bill 2140, each community should adopt (by reference or incorporation) this MJHMP into the Safety Element of their General Plans. Evidence of adoption (by formal, certified resolution) shall be provided to CalOES and FEMA
8. Integration of flood actions identified in this mitigation strategy with the actions and implementation priorities established in existing Flood Management Programs
9. Using the risk assessment information to update the hazards section in the County, City and Town Emergency Operations Plans

Efforts should continuously be made to monitor the progress of mitigation actions implemented through these other planning mechanisms and, where appropriate, their priority actions should be incorporated into updates of this hazard mitigation plan.

3.8 FUTURE DEVELOPMENT TRENDS

The Town of Corte Madera is located in Marin County, approximately eight miles north of the Golden Gate Bridge. Incorporated in 1916, the Town of Corte Madera encompasses approximately 4.5 square miles in total. However, 1.25 square miles of this area is submerged under bay waters and 0.67 square mile is protected marshland, leaving a net land area of 2.55 square miles. Parks, open space, and flood control areas comprise 0.38 square mile of this net land area. Highway 101, the main freeway connecting San Francisco with the Marin communities and Sonoma County, bisects Corte Madera. The Town's most significant growth period was from 1940 to 1970 when the community's population increased from 1,098 to 8,464. The Town currently has a population of 10,029 according to the California Department of Finance.

Housing affordability in Marin County and in the Bay Area has become an increasingly important issue. Corte Madera's housing conditions are reflective of many area-wide and even nation-wide trends. Over the past several decades, housing costs have skyrocketed out of proportion to many people's ability to pay, with increasing construction and land costs contributing to the rise in housing prices. In the Bay Area, the high demand for housing pushes prices even higher. This mismatch in household incomes and housing costs has several implications: it becomes more difficult for employers to recruit and retain employees; new residents are pushed farther away from job centers where home prices are less expensive, leading to long traveling distances to work, higher greenhouse gas emissions from vehicles, and increasingly clogged highways; and many young families, longtime residents, their children, and other community members without high incomes relocate because they can no longer afford to live in the community.

The Town recognizes that it occupies the ancestral home of the Coast Miwok indigenous people. The Coast Miwok were displaced during Spanish colonization and the rise of missionaries, and were further excluded from their land during Mexican occupation and the ranching era. Today, there are few Native American people living in Corte Madera and Marin County.

Historical lending and zoning practices, including redlining and exclusionary covenants, have resulted in segregated living patterns in Marin and racially disparate housing outcomes. People of color have not benefited from the generational transfer of home equity and homes themselves, as some white people have, and rapidly escalating housing costs in more recent decades have made it extremely difficult for people of color to get a foothold in the housing market. Anti-development sentiment throughout Marin County has also restricted new housing development, helping maintain patterns of segregation. As a result, Marin is one of the most segregated counties in the Bay Area, with five of the ten most segregated Census tracts in the region. Providing more housing and a variety of housing types at different affordability levels will help to diversify the Corte Madera community and result in more balanced and integrated living patterns throughout the Bay Area. It will also bring fresh perspectives, lived experiences, skills, and expertise to Corte Madera, ensuring that the community is well equipped to face future challenges and opportunities.

SECTION 4.0: PLAN REVIEW, EVALUATION, AND IMPLEMENTATION

The strategies presented are deemed appropriate and effective by recommendation of the Town of Corte Madera.

4.1 PLAN ADOPTION

Upon submission to the California Office of Emergency Services (CalOES) for review, and subsequent approval by the Federal Emergency Management Agency (FEMA), the Marin County MJHMP will be presented to local government for formal adoption. As appropriate, the adopted plan and accompanying Town of Corte Madera Community Profile will then be incorporated into local general plans for integration into organizational policy.

4.2 PLAN MONITORING

The process of hazard mitigation does not end with the completion, approval, and adoption of the Marin County OA MJHMP. During the five-year lifespan the Marin County and Town of Corte Madera plan, the County, cities, towns and special districts, along with community-based organizations will ensure that the mitigation goals and strategies identified are exercised and monitored under a collaborative and cooperative umbrella, and that the document itself is properly maintained.

The Marin County Office of Emergency Management, as lead coordinating agency for hazard mitigation planning within the Marin County OA, leads the Marin Operational Area Hazard Mitigation Working Group that meets quarterly to review and manage the plan, projects, and programs. The Town of Corte Madera is a participating member of the Marin Operational Area Hazard Mitigation Working Group. The Town of Corte Madera Public Works Director will monitor and update the Town of Corte Madera and Sanitary District #2 Annex to the Marin County OA MJHMP.

The review will identify changing community priorities, updated or new planning documents and the progress or status of the mitigation actions as detailed in the mitigation strategy. Additional questions to complete the review will be considered as follows:

- Do the goals address current and expected conditions?
- Are the goals and objectives consistent with changes in the local, state, and federal policy?
- Status updates on all mitigation actions?
- Have the hazards or risks changed?
- Are current resources appropriate for implementing the MJHMP?
- Have the outcomes occurred as expected?
- Is the County and jurisdictions or districts participating in the plan implementation process as expected?

The Working Group is a subgroup of the Marin Disaster and Citizens Corps Council. During the five-year update cycle, the Marin Operational Area Hazard Mitigation Working Group will have quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. Further, Marin OEM will host an annual one-day mitigation summit to increase

engagement and enhance collaboration on the plan and projects. The summit will also have the goal to educate stakeholders on innovative approaches to mitigation, trends, and new plan requirements. Marin OEM, as the host, will seek subject matter experts, state and federal officials, and representatives from within the Marin OA to speak to mitigation and planning. The knowledge gathered and the coordination facilitated during the summit will be used to update the base plan and annexes.

Marin OEM has the capacity to lead the Working Group and Multi-Jurisdictional Planning with one coordinator assigned with direct maintenance of the plan, a department analyst assigned to support the coordinator with project and grant tracking, and a community preparedness coordinator assigned with conducting regular public outreach on the plan and education on mitigation. Community feedback and integration will continue through outreach events and OEM website, where residents and visitors are invited to provide feedback through a survey, available in English or Spanish.

Specific plan maintenance activities by the Marin County Office of Emergency Management and its participating jurisdictions/special districts may include:

- Hold quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions.
- Annual Hazard Mitigation Summit
- Holding public meetings after the first quarter and third quarter update meetings.
- Maintaining the Marin County OEM Hazard Mitigation Website, which provides the public with the ability to access identified hazard impact maps, location address search capability, and a listing of hazard mitigation actions.
- Monitoring of the Marin County and all participating jurisdiction mitigation project activities and dissemination of status reports.
- Generation of reports relative to plan status, project management, and revision updates to executive leadership.
  Preparations for the plan's future revision and updating.

4.3 Plan Evaluation

Upon approval and adoption by the Town of Corte Madera, the prioritized mitigation strategies will be further developed for funding and implementation by the lead agencies. The plan describes the potential sources of hazard mitigation funding, and general procedures to obtain that funding.

The mitigation strategies represented and adopted within this plan are recommendations only and must be approved and funded in order to be implemented as official mitigation solutions. Ultimately, it is the responsibility of jurisdictional and agency officials within the Marin County to undertake project implementation based upon identified mitigation strategies, funding availability, and local need when it arises. The Marin County Office of Emergency Management will meet with the Marin Operational Area Hazard Mitigation Working Group, including the Town of Corte Madera, to evaluate the plan after each update meeting.

4.4 Plan Update

The Town of Corte Madera Public Works Director will monitor and update the Town of Corte Madera and Sanitary District #2 Annex to the Marin County OA MJHMP. During the five-year update cycle, the Town of Corte Madera and the Marin County Office of Emergency

Management will hold quarterly update meetings with the Marin Operational Area Hazard Mitigation Working Group and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. The Marin County Office of Emergency Management and all participating jurisdictions and special districts will continue to hold public meetings after the first quarter and third quarter update meetings annually and will continue to invite public participation in the update process via updated public surveys.

4. Town of Fairfax Community Profile

Marin County Multi-Jurisdictional Hazard Mitigation Plan 2023

This page is intentionally blank.

ACKNOWLEDGEMENTS

The Town of Fairfax and Preparative Consulting would like to thank those collaborators and partners who participated in the planning and development of this document.

The official Marin County Operational Area (OA) Multi-Jurisdictional Hazard Mitigation Plan (MJHMP) Steering Committee provided the oversight and dedication to this project that was required, and without their commitment, this project would not be possible.

As with any working plan, this document represents planning strategies and guidance as understood as of the date of this plan's release. This plan identifies natural hazards and risks and identifies the hazard mitigation strategy to reduce vulnerability and make the communities of the Town of Fairfax more disaster resistant and sustainable.

SECTION 1.0: INTRODUCTION

1.1 INTRODUCTION

The Town of Fairfax, Community Profile has been prepared in conjunction with the Marin County Operational Area (OA) Multi-Jurisdictional Hazard Mitigation Plan (MJHMP), establishing an inter-jurisdictional process for the development and implementation of effective hazard mitigation strategies in association with identified hazards that pose real or potential threats to the Town of Fairfax.

1.2 PLANNING PROCESS

The majority of Marin County OA is unincorporated sparsely populated rural and protected lands. Most of the 262,000 county population is consolidated into the Eastern portion of the county. The Marin County OA MJHMP Steering Committee and broader Planning Team approached the development of the Marin County OA MJHMP and the associated jurisdictional and district profiles from a coordinated and collaborative planning and public engagement unity of effort.

The Steering Committee felt a unified effort, led by the Marin County Office of Emergency Management (OEM), would be the most effective approach for this planning process. This approach allowed the small jurisdictions and districts with limited staffing and resources to take advantage of the combined efforts of the County and other jurisdictions to reach a broader segment of each of their own populations and do so in a way to ensure greater equity and inclusion of the public in this planning process. Extensive and coordinated public outreach was done involving all participating jurisdictions and districts with an eye towards equity, inclusion, openness, accessibility, and ensuring they meet the population where they live, work, or recreate to provide the public convenience of access and ease of participation in this planning process.

The Marin County OA is very different from most California counties in that the populated portion of the OA where the jurisdictions and district's planning areas are located has the same climate, similar topography, and are exposed to many of the same hazards. Only three jurisdictions San Anselmo, Ross, and Fairfax are not coastal jurisdictions and are not impacted by Tsunami or Sea Level Rise.

This unity of effort approach allowed the Steering Committee to establish a more robust Planning Team representing local, countywide, regional, state, and federal stakeholders servicing the Marin County OA planning area. These stakeholders were in a unique position to provide informed and specific information and recommendations on hazard mitigation goals and actions, as well as population needs and social vulnerability for each of the jurisdictional and district planning areas. This united effort allowed the planning team to attend fewer meetings than they would have been required to attend if they were required to attend separate meetings for each participating jurisdiction and district. The reduced number of meetings allowed the planning team the opportunity and time to provide more detailed and thoughtful contributions to the planning effort.

In addition to providing representation on the coordinated Marin County OA MJHMP Steering Committee, the Town of Fairfax involved additional internal planning team members to support the broader planning process. The Town of Fairfax jurisdictional representatives for the

coordinated Marin County OA MJHMPs Steering Committee and the Planning Team Members are represented below.

1.2.1 Steering Committee Members (Jurisdictional Representatives)

Primary Point of Contact
Loren Umbertis, Director of Public Works
Telephone: (415) 458-2370
E-mail address: lumbertis@townoffairfax.org

Alternate Point of Contact
Mark Lockaby, Building Official
Telephone: (415) 458-2370
E-mail address: mlockaby@townoffairfax.org

This annex was developed by the primary point of contact with assistance from the members of the local mitigation planning team listed in Table 1.

Fairfax	Heather Abrams	Town Manager	415-453-1584	habrams@townoffairfax.org

Table 69: Local Hazard Mitigation Planning Team Members

This 2023 Marin County OA MJHMP is a comprehensive update of the 2018 Marin County OA MJHMP. The planning area and participating jurisdictions and organizations were defined to consist of unincorporated County of Marin, five special districts, and the eleven incorporated jurisdictions to include the Town of Fairfax. All participating jurisdictions are within the geographical boundary of the Marin County OA and have jurisdictional authority within this planning area.

The Steering Committee led the planning process based on the contribution and input from the whole community stakeholders who identified the community's concerns, values, and priorities. The Steering Committee met and reviewed the mitigation recommendations and strategies identified within this plan. Each participating local jurisdiction established a mechanism for the development and implementation of jurisdictional mitigation projects, as identified within this plan and associated locally specific supporting documents. As deemed necessary and appropriate, participating jurisdictions will organize local mitigation groups to facilitate and administer internal activities.

The Steering Committee assisted with the planning process in the following ways:

- Attending and participating in the Steering Committee meetings.
- Identification of potential mitigation actions.
- Updating the status of mitigation actions from the 2018 Marin County OA MJHMP.
- Collecting and providing other requested data (as available).
- Making decisions on plan process and content.
- Reviewing and providing comments on plan drafts; including annexes.

- Informing the public, local officials, and other interested stakeholders about the planning process and providing opportunity for them to be involved and provide comment.
- Coordinating, and participating in the public input process.
- Coordinating the formal adoption of the plan by the governing boards.

1.2.2 Steering Committee Planning Process

The Steering Committee met monthly to develop the plan. Email notifications were sent out to each Steering Committee member to solicit their participation in the Steering Committee meetings. The meetings were conducted using a Zoom platform videoconferencing. Meeting attendees signed in using the chat feature to record their attendance.

The Steering Committee agreed to make and pass plan-based general policy recommendations by a vote of a simple majority of those members present. The Steering Committee will also seek input on future hazard mitigation programs and strategies from the mitigation planning team by focusing on the following:

- Identify new hazard mitigation strategies to be pursued on a state and regional basis, and review the progress and implementation of those programs already identified.
- Review the progress of the Hazard Mitigation program and bring forth community input on new strategies.
- Coordinate with and support the efforts of the Marin County OEM to promote and identify resources and grant money for implementation of recommended hazard mitigation Strategies within local jurisdictions and participating public agencies.

During the planning process, the Steering Committee communicated through videoconferencing, face-to-face meetings, email, telephone conversations, and through the County website. The County website included information for all stakeholders on the MJHMP update process. Hannah Tarling of the Marin County OEM and Preparative Consulting established a Microsoft 365 SharePoint folder which allowed the Steering Committee members and Marin OEM and Preparative Consulting to share planning documents and provide a format for the planning partners to submit completed documents and access other planning related documents and forms. Draft documents were also posted on this platform and the Marin County OEM website so that the Steering Committee members and the public could easily access and review them.

1.2.3 Coordination with Stakeholders and Agencies

Opportunities for involvement in the planning process must be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other private and nonprofit interests (44 CFR, Section 201.6(b)(2)).

Early in the planning process, the Marin County and Town of Fairfax Steering Committee reached out to the following Local and Regional Agencies involved in hazard mitigation activities to invite them to participate in this planning process as a member of the Planning Team. These individuals work with Marin County and the Town of Fairfax communities and could provide subject matter expertise and relevant information to the planning process regarding the community history, hazard risk, vulnerability, and impact, mitigations efforts, community needs, demographics, and social vulnerability, economic concerns, ecology,

and other community services and needs.

As detailed in 1.2 PLANNING PROCESS, the planning process enjoyed a robust unity of effort. Early in the process the Steering Committee determined that data collection, risk assessment analyses, mitigation strategy development, and plan approval would be greatly enhanced by inviting other local, state and federal agencies and organizations to participate in the process. Based on their involvement in hazard mitigation planning, and/or their interest as a neighboring jurisdiction, representatives from the following groups were invited to participate on the Planning Team:

Eighty-five planning partners participated in this update, as listed in Table 2.

Table 70: 2023 MJHMP Planning Team Members

Several opportunities were provided for the groups listed above to participate in the Town of Fairfax's planning process. At the beginning of the planning process, invitations were extended to these groups to actively participate on the Planning Team. Participants from these groups assisted in the process by attending several videoconferencing meetings where hazard vulnerability and risk were discussed along with hazard mitigation strategies and actions. Planning Team members provided data and other applicable information directly as requested in meetings, emails, telephone calls, videoconferencing, worksheets, or through data contained on their websites or as maintained by their offices. This information was used to develop hazard vulnerability and risk profiles along with mitigation actions.

These key agencies, organizations, and advisory groups received meeting announcements, agendas, and minutes by e-mail throughout the plan update process. They supported the effort by attending meetings or providing feedback on issues. All the agencies were provided with an opportunity to comment on this plan update and were provided with a copy of the plan to review and offer edits and revisions. They were also provided access to the Marin County OEM hazard mitigation plan website to review all planning documents and hazard mapping tools.

Each was sent an e-mail message informing them that draft portions of the plan were available for review. In addition, the complete draft plan was sent to the California Governor's Office of Emergency Services (Cal OES) and FEMA Region IX for a pre-adoption review to ensure program compliance.

In addition, through the public meetings conducted at the beginning of the planning process, members of the planning team, the public, and other key stakeholders were invited to participate in the planning process through public outreach activities.

Further as part of the public outreach process, all planning areas engaged in public outreach and education by providing information on their Town of Fairfax website or though press releases directing the public to the main Marin County OEM website that provided coordinated and detailed public information of the planning process and how the public could participate. All planning areas were invited to attend the public meetings and to review and comment on the plan prior to submittal to Cal OES and FEMA. Additional public outreach action is detailed in the 1.2.4 PUBLIC ENGAGEMENT section of this annex.

The following planning meetings were held with the planning team:

1.2.4 PUBLIC ENGAGEMENT

Early discussions with the Marin County OEM established the initial plan for public engagement to ensure a meaningful and inclusive public process with a focus on equity and access to the whole community. The Public Outreach efforts mirrored the Planning Team approach with a unified effort, led by the County OEM, involving all participating jurisdictions and districts. Public outreach for this plan update began at the beginning of the plan development process with a detailed press release informing the community of the purpose of the hazard mitigation planning process for the Marin County OA planning area and to invite the public to participate in the process.

Public involvement activities for this plan update were conducted by the County and all participating jurisdictions and districts and included press releases; website postings; a community survey; stakeholder and public meetings; and the collection of public and stakeholder comments on the draft plan which was posted on the County website. Information provided to the public included an overview of the mitigation status and successes resulting from implementation of the 2018 plan as well as information on the processes, new risk assessment data, and proposed mitigation strategies for the plan update.

Equity and Whole Community Approach

The Marin County OEM and the Steering Committee prioritized equity and engagement of the whole community in the development of the Marin County OA MJHMP by establishing a framework with key actions for each step of the planning process. Elements of the equity approach included:

Engaging hard-to-reach populations

This effort was to ensure the greatest equity and access to the public to enable participation in the process. The Marin County OEM outreach strategy is to “meet people where they are.” The Town hall meetings were conducted at different familiar locations within the county where people could easily access them and were conducted on both a weekday and weekend, and in the evening and during the daytime. The meetings were offered in-person with a virtual broadcast using Zoom videoconferencing and streamed live on Marin County OEM Facebook

account. After the meeting, Marin County OEM uploaded the recorded meeting to their website to allow the public on demand access to the meeting.

Translation and Interpretation Services

The survey and outreach materials were provided in both English and Spanish to improve accessibility among populations with limited English proficiency. The website uses Google Translate for accessibility in multiple languages. Interpretation services were offered for both town hall meetings. Each town hall meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

Three stakeholder and public meetings were held, two at the beginning of the plan development process and one prior to finalizing the updated plan. Where appropriate, stakeholder and public comments and recommendations were incorporated into the final plan, including the sections that address mitigation goals and strategies. Specifically, public comments were obtained during the plan development process and prior to plan finalization.

All press releases and website postings are on file with the Marin County OEM. Public meetings were advertised in a variety of ways to maximize outreach efforts to both targeted groups and to the public at large. Advertisement mechanisms for these meetings and for involvement in the overall MJHMP development process include:

- Development and publishing of an MJHMP public outreach article
- Providing press releases to local newspapers and radio stations
- Posting meeting announcements on the local County MJHMP website
- Email to established email lists
- Personal phone calls

The public outreach activities were conducted with participation from and on behalf of all jurisdictions participating in this plan.

The Steering Committee has made the commitment to periodically bring this plan before the public through public meetings and community posting so that citizens may make input as strategies and implementation actions change. Public meetings will continue to be held twice a year after the first and third MJHMP meetings. Public meetings will continue to be stand-alone meetings but may also follow a council meeting or other official government meeting. The public will continue to be invited to public meetings via social media messaging, newspaper invitations, and through the website for each jurisdiction participating in the plan. Each jurisdiction is responsible for assuring that their citizenry is informed when deemed appropriate by the Steering Committee.

WEBSITE

At the beginning of the plan update process, Marin County OEM established a hazard mitigation website https://emergency.marincounty.org/pages/lhmp on behalf of all the planning areas to ensure consistent messaging and information, to keep the public posted on plan development milestones, and to solicit relevant input. The website also provided information on signing up for Alert Marin, provided detailed information about the hazard mitigation process and plan development, provided a URL and QR code link to the survey in both English and Spanish, and provided information about upcoming town hall meetings. (See Figure 1)

The site's address was publicized in all press releases, surveys and public town hall meetings. Each planning partner also established a link on their own agency website. Information on the plan development process, the Steering Committee, a link to the Hazard Mitigation survey, and drafts of the plan were made available to the public on the site. The County of Marin intends to keep a website active after the plan's completion to keep the public informed about successful mitigation projects and future plan updates.

Figure 145: Marin County OEM MJHMP Website

PUBLIC MEETINGS

Two separate Marin County OA MJHMP Public Town Hall Meeting were conducted at different locations within the County, on different days of the week and during different times of the day. This effort was to ensure the greatest equity and access by the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." Each Town Hall Meeting included, live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

The first Town Hall Meeting was conducted on Thursday, April 13, 2023, from 6:00 pm to 7:30 pm, at the Marin County Board of Supervisors Chambers, Marin County Civic Center, 3501 Civic Center Drive, Room #330 San Rafael, CA 94903. The in-person meeting was also broadcast virtually using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. Each of the jurisdictions participating in the MJHMP released a Press Release on their respective websites announcing the Public Town Hall Meeting and providing the date, time, and URL link to the Zoom Meeting for the public to log in and attend the Zoom Meeting. Marin County OEM also posted a notice for the Public Town Hall Meeting on their Facebook account. At the conclusion of the presentation, a question and answer session was held to answer questions from the attendees.

The second Town Hall Meeting was conducted on Saturday, April 29, 2023, from 10:00 am to 11:30 am, at the Marin County Health and Wellness Center, 3240 Kerner Ave. Rooms #109 and #110 San Rafael, CA. 94903. The meeting followed the same format as the first and hosted the same access level of equity and accessibility.

The Marin County OA MJHMP Public Town Hall Meeting was recorded and downloaded from Zoom and made available to all of the jurisdictions and districts to place on their websites and local Access TV for the public to view.

Meeting participants were also invited to complete the Hazard Mitigation Survey and were provided the URL link to the Survey Monkey website to complete the survey.

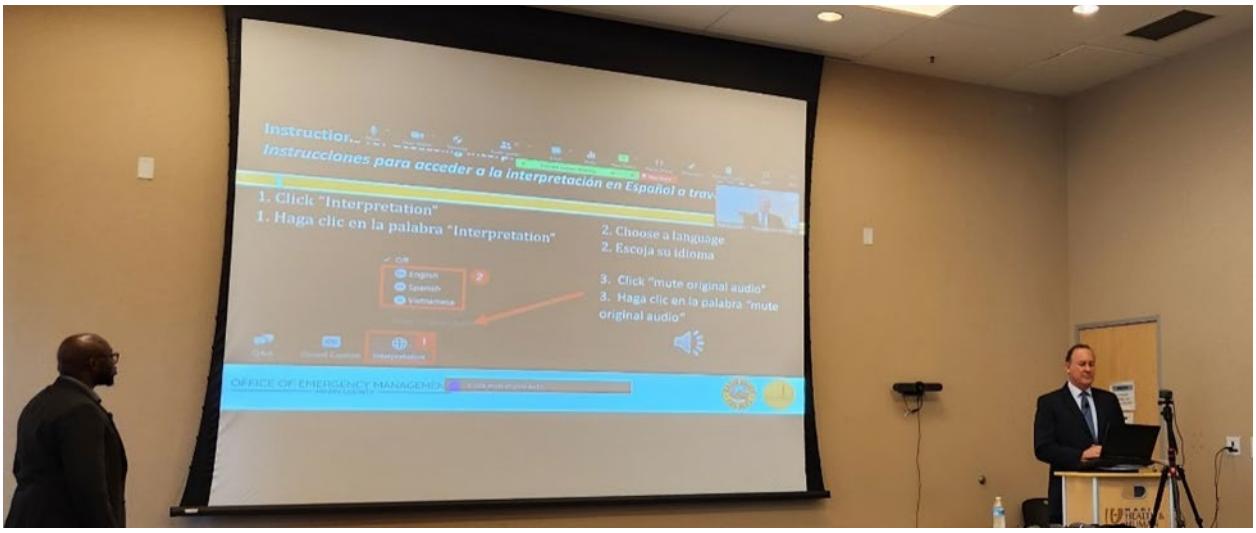

Figure 146: Marin County OA MJHMP Public Town Hall Meeting

SOCIAL MEDIA

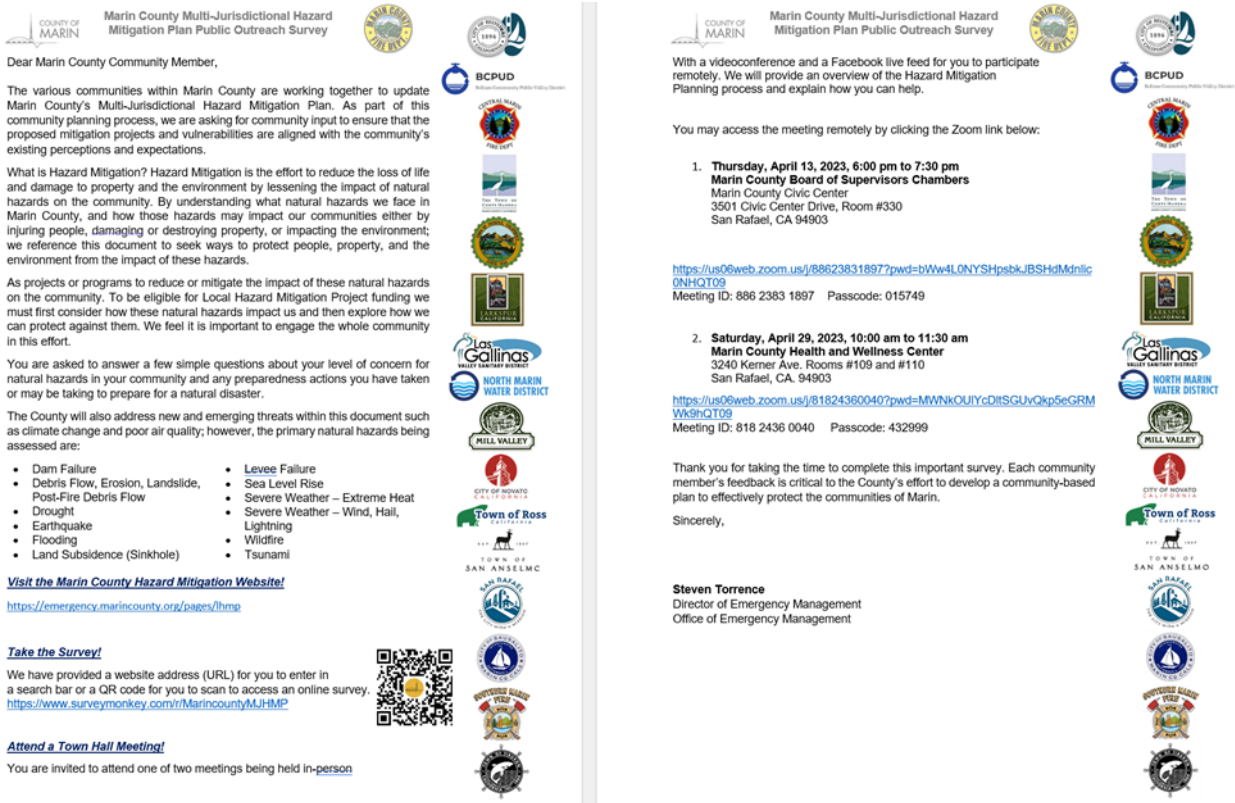
The Marin County OA utilized several forms of social media to reach residents and customers. Information about the Hazard Mitigation Planning process was communicated to the public via Facebook, Twitter, and local access TV. Residents and customers were invited to complete the Hazard Mitigation Plan survey which was accessible via an attached URL or QR Code and provide feedback on potential hazard mitigation projects or programs.

The results of the survey were provided to each of the planning partners and used to support the jurisdictional annex process. Each planning partner was able to use the survey results to help identify actions as follows:

- Gauge the public's perception of risk and identify what citizens are concerned about.
- Identify the best ways to communicate with the public.
- Determine the level of public support for different mitigation strategies.
- Understand the public's willingness to invest in hazard mitigation.

PRESS RELEASES

Press releases were distributed over the course of the plan's development as key milestones were achieved and prior to each Marin County OA MJHMP Public Town Hall Meeting. All press releases were made available to the community in both English and Spanish.



Marin County Multi-Jurisdictional Hazard Mitigation Plan Public Outreach Survey

Dear Marin County Community Member,

The various communities within Marin County are working together to update Marin County's Multi-Jurisdictional Hazard Mitigation Plan. As part of this community planning process, we are asking for community input to ensure that the proposed mitigation projects and vulnerabilities are aligned with the community's existing perceptions and expectations.

What is Hazard Mitigation? Hazard Mitigation is the effort to reduce the loss of life and damage to property and the environment by lessening the impact of natural hazards on the community. By understanding what natural hazards we face in Marin County, and how those hazards may impact our communities either by injuring people, damaging or destroying property, or impacting the environment; we reference this document to seek ways to protect people, property, and the environment from the impact of these hazards.

As projects or programs to reduce or mitigate the impact of these natural hazards on the community. To be eligible for Local Hazard Mitigation Project funding we must first consider how these natural hazards impact us and then explore how we can protect against them. We feel it is important to engage the whole community in this effort.

You are asked to answer a few simple questions about your level of concern for natural hazards in your community and any preparedness actions you have taken or may be taking to prepare for a natural disaster.

The County will also address new and emerging threats within this document such as climate change and poor air quality; however, the primary natural hazards being assessed are:

- Dam Failure
- Debris Flow, Erosion, Landslide, Post-Fire Debris Flow
- Drought
- Earthquake
- Flooding
- Land Subsidence (Sinkhole)
- Levee Failure
- Sea Level Rise
- Severe Weather – Extreme Heat
- Severe Weather – Wind, Hail, Lightning
- Wildfire
- Tsunami

Meeting ID: 818 2436 0040 Passcode: 432999

Thank you for taking the time to complete this important survey. Each community member's feedback is critical to the County's effort to develop a community-based plan to effectively protect the communities of Marin.

Sincerely,

Steven Torrence
Director of Emergency Management
Office of Emergency Management

Figure 147: Hazard Mitigation Plan Public Outreach Press Release

SURVEY

A hazard mitigation plan survey (see Figure 4) was developed by the Steering Committee and made available to the public in both English and Spanish. The survey was used to gauge household preparedness for natural hazards and the level of knowledge of tools and techniques that assist in reducing risk and loss from natural hazards. This survey was designed to help identify areas vulnerable to one or more natural hazards. The answers to its ten questions helped guide the Steering Committee in defining our hazards, and selecting goals, objectives, and mitigation strategies. The survey was available on the hazard mitigation plan website, advertised in press releases, and at town hall meetings. Finally, the survey and the process of public input was advertised throughout the course of the planning process. The survey was available to the public on March 13, 2023, and closed on June 12, 2023. At the conclusion of the planning process over 293 surveys were completed by the public.

Public Comments Considered by the Planning Team

The Planning Team used the following information gathered from the Public Outreach Survey to inform decisions regarding hazard mitigation strategies, actions, and priorities.

- Climate Change, Wildfire, and Drought were the top hazards of concern for the public.
- Text messages, mail, and the County website were the preferred methods for receiving hazard mitigation information.
- 48% of respondents expressed that they were “Very Much” concerned and 31% were “Moderately” concerned that a natural disaster could impact their home or place of residence.
- 85% of respondents own their own home.
- 99% of respondents have access to the internet.

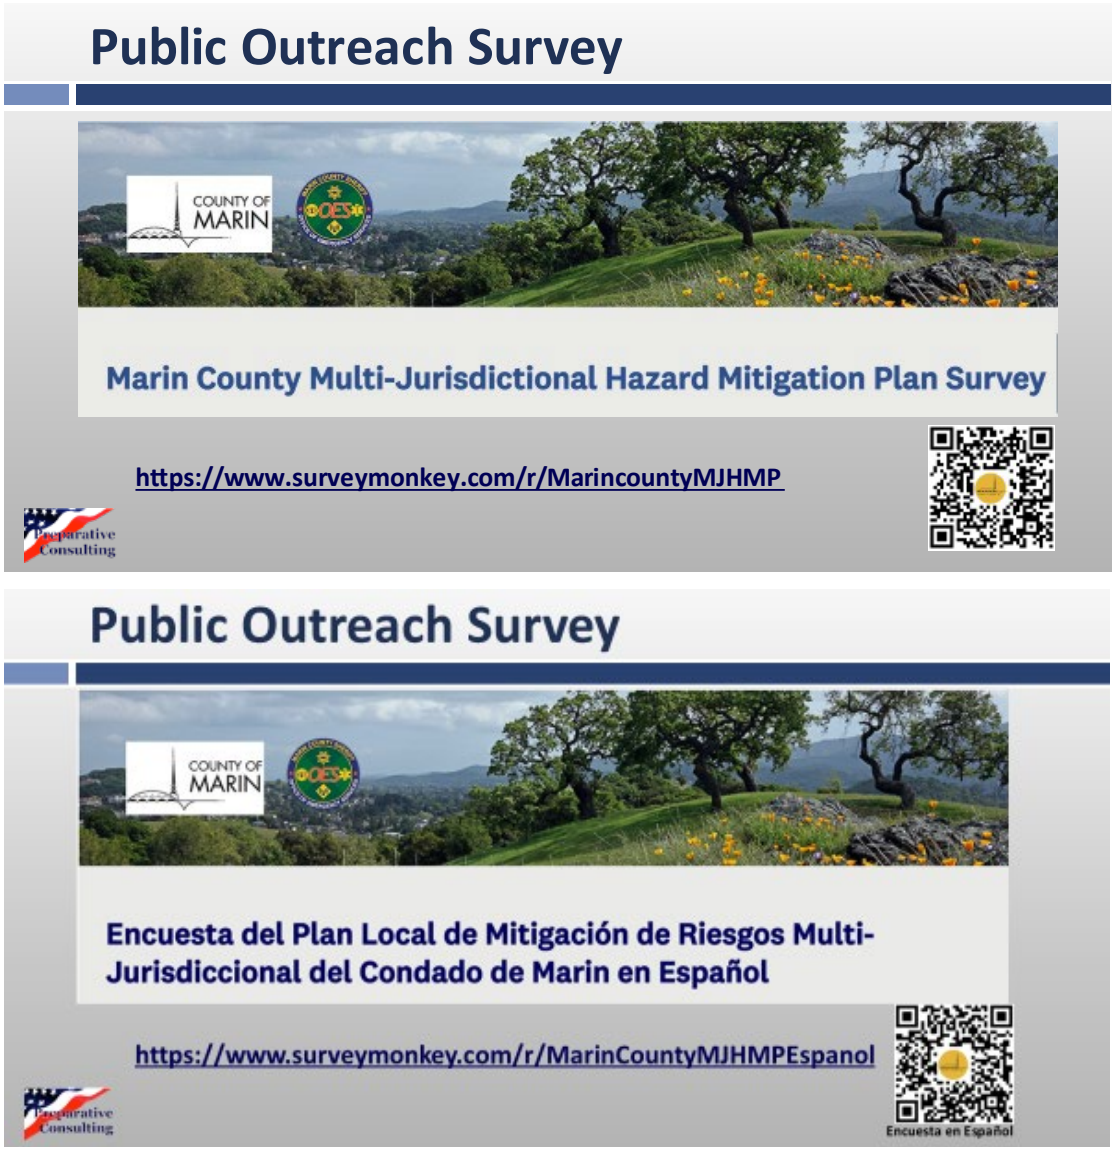

Figure 148: Hazard Mitigation Plan Survey

PUBLIC COMMENT ON THE PLAN

To solicit public feedback on the draft plan, Marin OEM engaged in a multi-faceted approach intended to reach as many Marin residents as possible, including members of the community

who are under-served and under-represented. All members of the community had the opportunity to provide initial comments on the plan during a two-week period from Wednesday, December 4, 2023, to Wednesday, December 18, 2023. Although the initial comment period was listed as two weeks, the public could submit comments indefinitely via the County's website to support the County's continuous improvement efforts. The base plan, as well as city, town and special district annexes, were available for download on emergency.marincounty.org (include photos). The website additionally asked for feedback in a survey in English and Spanish (include photos), the survey was designed to establish where that person lives or works, their top hazards of concern, elicit feedback on the plan and offer a place for them to share projects to reduce risk in their community. The survey collected responses from the community in English and in Spanish.

The website and survey were shared through traditional and social media (photos) The Marin Independent Journal (Marin IJ) used the press release to write an article (hopefully; include photos). Social media accounts were updated four times with an initial ask, two reminders, and a closing announcement. The Marin OEM Public Information Officer coordinated with the Marin County Public Information Officers (MAPIO) working group to distribute information to partner jurisdictions (city, town, and special districts) to share this information on their social media sites and with the communities in the area.

To reach those who may not be engaged digitally, the planning team worked with Marin County Community Response Teams, (CRTs are a collaboration of non-profit organizations supporting underrepresented communities in four zones) to conduct outreach with half-sheet flyers in English and Spanish to share in the 4 CRT zones (southern Marin, north Marin, west Marin, San Rafael). These half sheets were also shared county-wide at libraries, including in areas not covered by CRTs, like at the Fairfax library. CRTs are designed to reach Marin's traditionally underserved and underrepresented communities, so by conducting outreach through this method, we were able to inform residents who may not have been engaged otherwise, including residents in Marin City, West Marin, and the Canal District of San Rafael.

After December 18, 2023, the various participating jurisdiction and district profiles remained on the Marin County OEM website for public comments. The Town of Fairfax had an additional 14-day comment period for the Town of Fairfax Community Profile where their profile was posted on the Town website for final public comment from January 29 – February 5, 2024.

The 14-day public comment period gave the public an opportunity to comment on the draft plan update prior to the plan's submittal to Cal OES. Comments received on the draft plan are available upon request. All comments were reviewed by the planning team and incorporated into the draft plan as appropriate.

Public Comments Considered by the Planning Team

The Marin County OEM posted the draft Hazard Mitigation Plan and hazard mitigation actions on their website and solicited public comments on the content. The Town of Corte Madera distributed press releases directing the community to the Marin County OEM website to review the draft plans. The Planning Team gathered public comments and information on the Marin County OEM website regarding proposed and current Hazard Mitigation Actions. The Planning Team used the comments and suggestions to inform

decisions regarding hazard mitigation strategies, actions, and priorities. Most comments included ideas for hazard mitigation projects and comments on the effectiveness of current mitigation projects. These comments were used to revise the proposed hazard mitigation actions which resulted in the final list of hazard mitigation actions listed in 3.5 Hazard Mitigation Actions.

1.3 Overview and History

The Coast Miwok Native Americans occupied stretches along local creeks, spring and seep areas; moreover, prehistoric habitations were usually chosen near permanent and seasonal drainages, typically along flat ridges and terraces.

Fairfax is a unique and very diverse community located in a spectacular setting in Upper Ross Valley. The Town was once part of the 6,558-acre Canada de Herrera land grant given to Domingo Sais on August 10, 1839, by the Mexican government as a reward for his military service. This grant covered all of Fairfax and part of San Anselmo. Sais occupied the land, with his wife and eleven children. Shortly before he died in 1853, Sais gifted the area that is now the site of the Fair-Anselm Shopping Center and the former Marin Town and Country Club to Dr. Alfred W. Taliaferro, formerly of Virginia, one of the first Europeans to settle in what is now the Marin County OA, becoming its first physician. In 1855, Dr. Taliaferro, in turn, transferred a 32 acre site to a fellow Virginian and boyhood friend, Charles Snowden Fairfax, as a wedding gift. Fairfax, the tenth Baron of Cameron, Scotland, had come to California in 1849 as part of the Gold Rush at the age of 20. Fairfax and his wife, Ada, named their home, the “Bird’s Nest Glen.”

In 1876, the Fairfax District was granted its own school district for the lands contained in the former Sais Rancho. The first school was built in Sleepy Hollow.

Charles and Adele Pastori leased the “Bird’s Nest Glen” in 1890 from Emma Woodward, opening a restaurant in 1893, and purchasing the property outright in 1905. The couple operated a high quality restaurant in the original Fairfax residence until 1911 when the building was destroyed in a fire. Charles also died in 1911.

The first post office was opened in Blagg’s Store in 1910 (now 1780-1788 Sir Francis Drake) and John Blagg became the Town’s first postmaster. The community began to grow rapidly when the Fairfax Tract at Pastori’s Station, Ridgeway and Deer Park was developed in 1907 and 1908. Additional development occurred as the Fairfax Improvement Company marketed the Pacheco Tract in 1910. Next, the Fairfax Development Company subdivided the Fairfax Manor Tract, and Henry Frustuck subdivided the Fairfax Park Tract, both of which occurred in 1911. By 1911, there were 100 homes in Fairfax, while in 1905 only five homes existed. The expansion of the community continued, as the Rocca Brothers developed Fairfax Heights in 1912, and the Bush Annex, Bothin Park, and the Manor Tracts became available for residential use in 1913.

The Cascades subdivision was developed in 1914, and later expanded in 1921 and 1926. St. Rita’s Church was built in 1916, the original building is still in place and now used as the Church Hall, the new church being built alongside in 1953. The area around the Town was used as the setting for western movie productions during the early years of the motion picture industry between 1910 and 1923. Essanay Film Manufacturing Company with Bronco Billy filmed several movies in Fairfax in 1911.

The demographics of the growing community changed significantly with the construction of Alpine Dam in 1917, which precipitated an influx of Italian laborers and caused the Willow Avenue portion of the Town to be known as “Little Italy” for many years after the dam was completed. The dam was dedicated in 1919.

In 1920 the Fairfax Volunteer Firemen purchased nine acres of the Fairfax Park Tract from Henry Frustuck for a park for the Town. The current Pavilion was constructed on the park site in 1921. A year later, part of the area reserved as a park was sold to the School District as the site for Central School, today’s School Street Plaza.

The Town was officially incorporated in February 1931, governed by a five-member council. Today, Fairfax is a small town located at the western edge of the Marin County OA’s city centered corridor that parallels U.S. Highway 101, with the agriculturally rich rural portion of the county just beyond to the west. The town’s natural setting encompasses a series of valleys, canyons, and forested hills with largely undeveloped ridgelines. Scenic and natural resources are key aspects of the community’s sense of place and contribute to the overall quality of life in Fairfax. In addition to the form of the land, mature trees and the extensive areas of protected open space in and around the Town help define the Town's identity as a community that values nature and environmental preservation. The architectural diversity of the neighborhoods and the compact, small scale Town Center area also make Fairfax a very special place for residents and visitors.

The residential development that occurred between 1907 and 1914, with winding streets and a wide range of lots sizes, set the stage for the future development of the community’s built environment. Much of the subsequent residential and commercial development of Fairfax prior to World War II was related to the town’s status as a summer resort for residents of San Francisco attracted by the warm, sunny weather of the Ross Valley. In recent years, rapidly rising housing prices have resulted in numerous proposals to significantly renovate existing residential structures. Any change to the existing fabric of the Town will not occur primarily as a result of subdivisions of land, but rather as infilling scattered undeveloped or underdeveloped sites, or through the replacement of one residential structure with another.

The Town of Fairfax was incorporated as a town in 1931. The Town of Fairfax had an estimated population of 7,605 in 2020, with 5,518 housing units in the Town. The Town has a total area of 2.677 square miles. The median income for a household in the Town is $111,290 and the per capita income for the Town is $87,951. Approximately 0 percent of families and 3.9 percent of the population is below the poverty line (2021 data, U.S. Census Bureau).

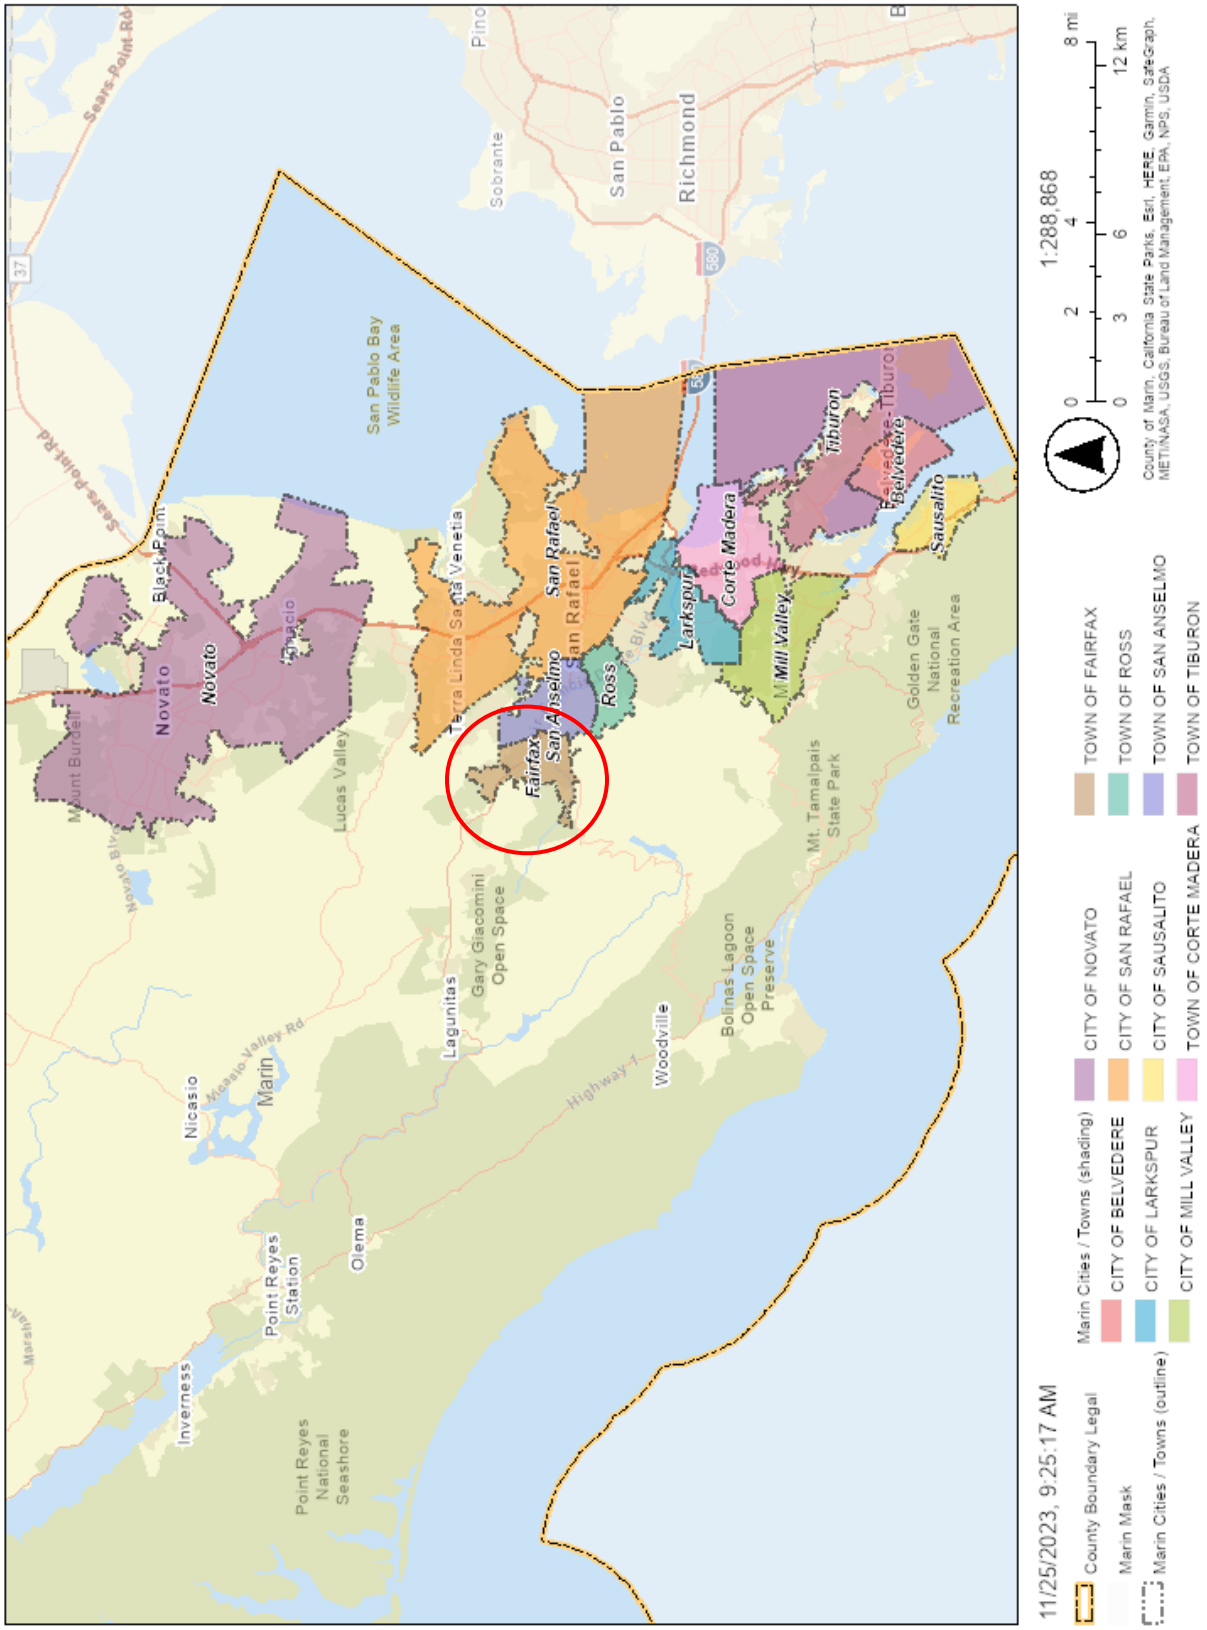

Figure 149: Location of the Town of Fairfax within the Marin County OA
Source: Marin County OEM

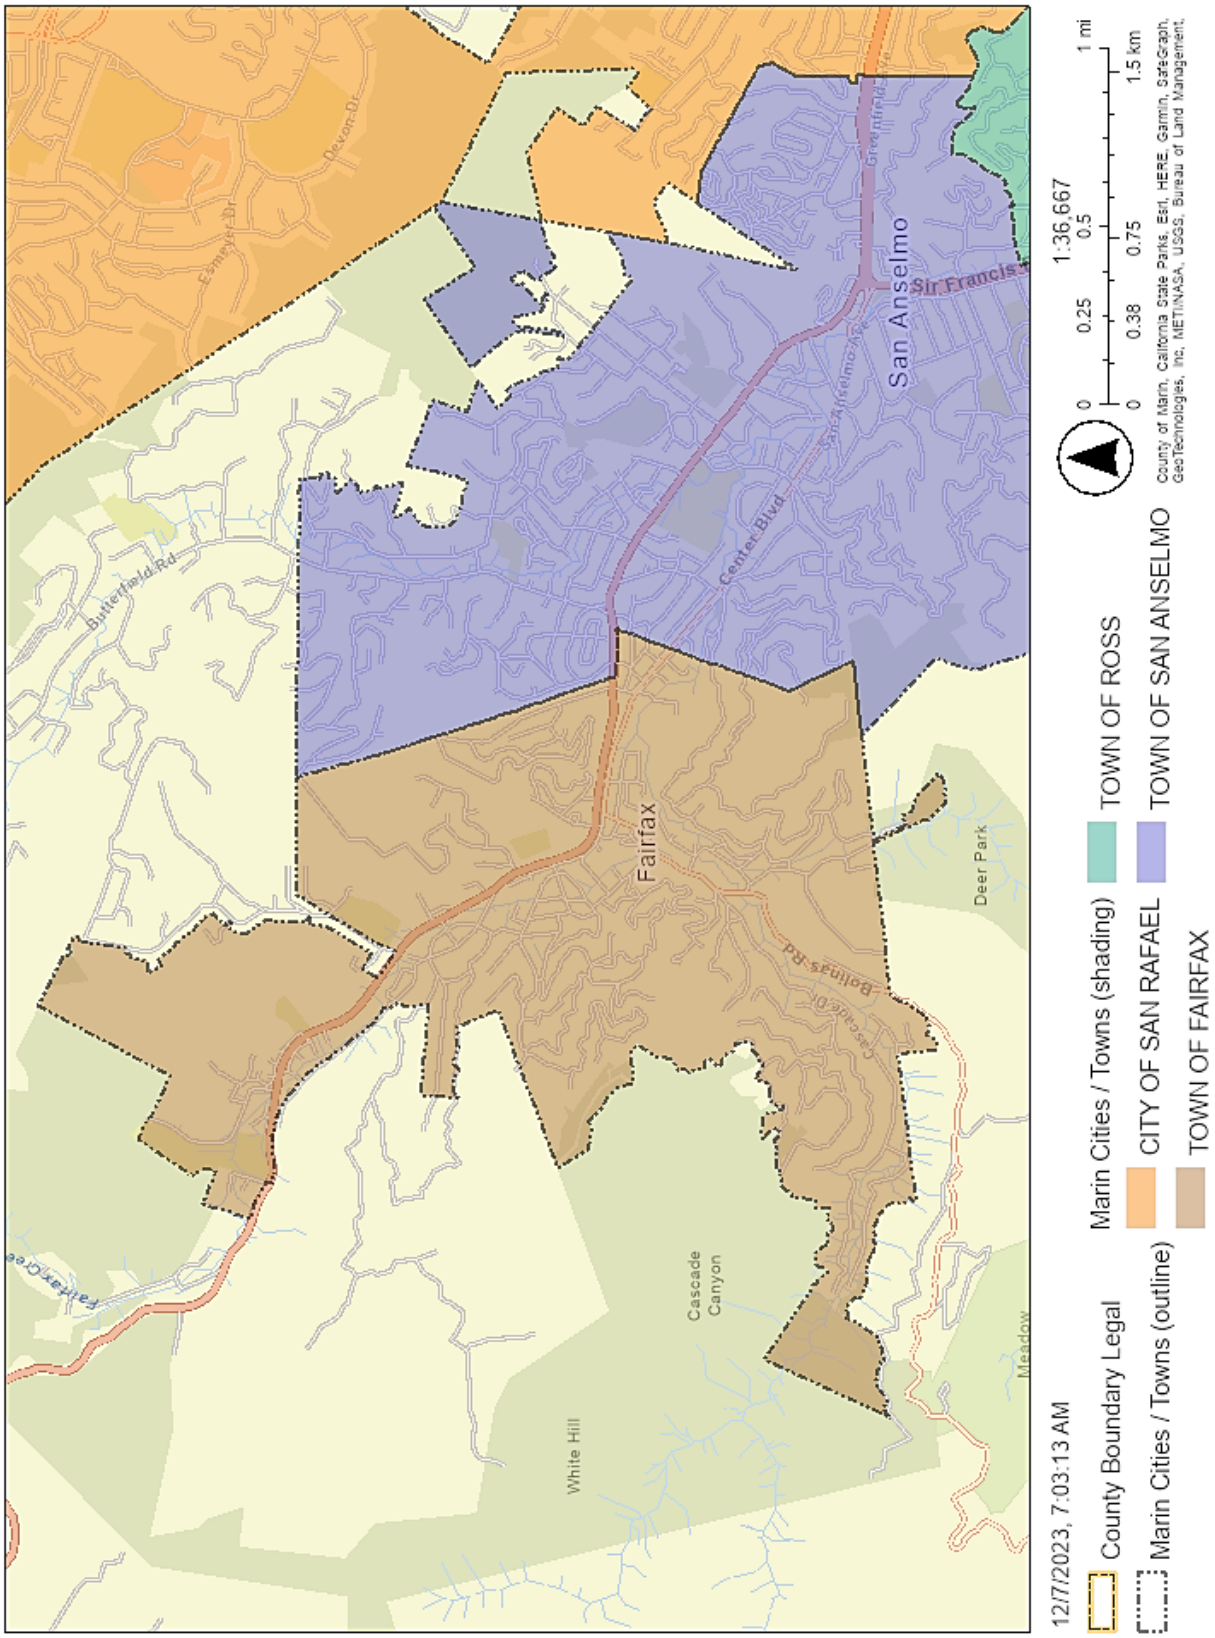

Figure 150: Map of the Town of Fairfax
Source: Marin County OEM

1.4 GOVERNMENT

The Town of Fairfax was incorporated as a town in 1931 and is governed by a five-person Town Council. Each year the Town Council elects one of its members to serve as Mayor, the executive head of the Town; and appoints a Town Manager, the administrative head of the Town. The Town consists of 9 departments: the Administration, Climate and Environment, Finance, Fire Department, Human Resources, Planning and Building, Police, Public Works, and Recreation and Community Services.

The Town Council assumes responsibility for the adoption of this plan; and the Town Manager will oversee its implementation.

The Ross Valley Fire Department provides Fire services to the Towns of Fairfax, San Anselmo, Ross and the Sleepy Hollow Fire Protection District In 2012, Ross Valley Fire Department's Board of Directors voted to consolidate fire services with the Town of Ross, incorporating the Town of Ross fire Station 18, and the 6 firefighters employed there, into the Ross Valley Fire Department.

The Fairfax Police Department is a full service Police department. Although the town did not incorporate until the early 1930s, in 1925 the state legislature allowed counties to appoint police chiefs for unincorporated areas and Fairfax appointed its first police officer. The Police Department is currently staffed at 12 officers.

1.5 WEATHER AND CLIMATE

The Town of Fairfax lies 115 ft (35 m) above sea level. In Fairfax, the summers are long, comfortable, arid, and mostly clear and the winters are short, cold, wet, and partly cloudy. Over the course of the year, the temperature typically varies from 48°F to 62°F and is rarely below 42°F or above 72°F. The difference in precipitation between the driest month and the wettest month is 8 inches. The annual rainfall is 43 inches. The month of highest relative humidity is February (80%). The month with the lowest relative humidity is June (70%). The month which sees the most rainfall is January. The driest month of the year is July.

	January	February	March	April	May	June	July	August	September	October	November	December
Avg. Temperature °C (°F)	9.3 °C (48.7) °F	9.8 °C (49.7) °F	10.9 °C (51.6) °F	11.8 °C (53.2) °F	13.6 °C (56.5) °F	15.6 °C (60.2) °F	16 °C (60.8) °F	16.4 °C (61.4) °F	16.4 °C (61.5) °F	15 °C (58.9) °F	11.9 °C (53.5) °F	9.5 °C (49) °F

1.6 DEMOGRAPHICS

The California Department of Finance shows an overall estimated decrease in the population of the Marin County OA and the Town of Fairfax since the last plan update in 2018. Of the total estimated 257,135 residents of the Marin County OA in 2022 based on the 2020 U.S. Census Survey, 190,148 residents live in the incorporated county and 66,987 residents live in the unincorporated county.

The Town of Fairfax had an estimated population of 7,625 in the 2018 plan. 2020 U.S. Census Survey estimated the Town's population at 7,605. However, revised estimates for 2022 estimate the population to decrease to 7,418 population.

Table 4: Town of Fairfax Estimated Jurisdictional Population

Jurisdiction	Population 2022 (Estimate)	Population 2020	Population 2018 (Estimate)	Percent Change 2018-2022
Marin County OA	257,135	262,321	262,179	-1.92%
Town of Fairfax	7,418	7,605	7,625	-2.71%

Table 72: Town of Fairfax Estimated Jurisdictional Population
Source: California Department of Finance

According to the U.S. Census, the population of The Town of Fairfax is 7,605 as of 2020. Between 2018-2022, the City's growth rate decreased at an average annual rate of -2.71%, lower than the historic twenty-year average growth rate of 3.2%. Table 5 shows the population growth comparison of the State of California, The Marin County OA and the Town of Fairfax between 2010 - 2020.

Table 5: Population Change of The Town of Fairfax				
Jurisdiction	Total Population		Change, 2010-2020	
	April 1, 2010	April 1, 2020	Number	Percent
California	37,253,956	39,538,223	2,284,267	6.1%
Marin County OA	252,409	262,321	9,912	3.9%
Fairfax, town	7,441	7,605	164	2.2%

1.7 Social Vulnerability and Risk

The California Governor's Office of Emergency Services (Cal OES) has initiated the "Prepare California" grant program focused on building community resilience amongst vulnerable individuals living in the areas of the state most susceptible to natural disasters. The Prepare California Initiative is aimed at reducing long-term risks from natural disasters by investing in local capacity building and mitigation projects designed to protect communities.

Prepare California leverages funds approved in Governor Gavin Newsom's 2021-22 State Budget and is designed to unlock federal matching funds for community mitigation projects that vulnerable communities would otherwise be unable to access. This program is intended for communities that are the most socially vulnerable and at the highest risk for future natural hazard events. The state identified communities by prioritizing California census tracts according to their estimated hazard exposures and social vulnerability.

The National Risk Index is a dataset and online tool to help illustrate the United States communities most at risk for 18 natural hazards: Avalanche, Coastal Flooding, Cold Wave, Drought, Earthquake, Hail, Heat Wave, Hurricane, Ice Storm, Landslide, Lightning, Riverine Flooding, Strong Wind, Tornado, Tsunami, Volcanic Activity, Wildfire, and Winter Weather.

For purposes of this plan the following National Risk Index (NRI) hazards are profiled in support of eight of the twelve Marin County OA MJHMP Hazards. NRI data was not available for Dam Failure, Land Subsidence, Levee Failure, or Sea Level Rise.

Table 8: NRI Hazards and Marin County OA MJHMP Hazards	
NRI Hazards	Marin County OA MJHMP Hazards
Earthquake	Earthquake
Riverine Flooding	Flooding
Coastal Flooding	Flooding
Wildfire	Wildfire
Landslide	Debris Flow
Drought	Drought
Heat Wave	Severe Weather -Extreme Heat
Tsunami	Tsunami
Strong Wind	Severe Weather – Wind, Tornado

Table 76: NRI Hazards and Marin County OA MJHMP Hazards
Source: FEMA National Risk Index 2023

The National Risk Index leverages available source data for Expected Annual Loss due to these 18 hazard types, Social Vulnerability, and Community Resilience to develop a baseline relative risk measurement for each United States county and Census tract. These measurements are calculated using average past conditions, but they cannot be used to predict future outcomes for a community. The National Risk Index is intended to fill gaps in available data and analyses to better inform federal, state, local, tribal, and territorial decision makers as they develop risk reduction strategies.

Calculating the Risk Index

Risk Index scores are calculated using an equation that combines scores for Expected Annual Loss due to natural hazards, Social Vulnerability and Community Resilience:

Risk Index = Expected Annual Loss × Social Vulnerability ÷ Community Resilience

Hazard Type Risk Index

Hazard type Risk Index scores are calculated using data for only a single hazard type, and reflect a community's Expected Annual Loss value, community risk factors, and the adjustment factor used to calculate the risk value. Table 9 illustrates the NRI Hazard Type Risk Index for Fairfax Census Tract 1141.00.

Table 9: NRI Hazard Type Risk Index for Fairfax Census Tract 1141.00

Hazard Type	EAL Value	Social Vulnerability	Community Resilience	CRF	Risk Value	Score
Earthquake	$882,375	Relatively Low	Very High	1.01	$894,568	90.4
Riverine Flooding	$400,764	Relatively Low	Very High	1.01	$406,302	95.6
Wildfire	$39,159	Relatively Low	Very High	1.01	$39,700	90.2
Landslide	$24,490	Relatively Low	Very High	1.01	$24,828	98.6
Heat Wave	$8,195	Relatively Low	Very High	1.01	$8,308	48.2
Tornado	$3,711	Relatively Low	Very High	1.01	$3,762	8.8
Strong Wind	$263	Relatively Low	Very High	1.01	$266	9.3
Coastal Flooding	$0	Relatively Low	Very High	1.01	$0	0
Drought	$0	Relatively Low	Very High	1.01	$0	0

Table 77: NRI Hazard Type Risk Index for Fairfax Census Tract 1141.00
Source: FEMA National Risk Index 2023

Social groups in Census tract 0604114100 have a Very Low susceptibility to the adverse impacts of natural hazards when compared to the rest of the U.S.

Figure 10 illustrates the Social Vulnerability Map for Fairfax Census Tract 1141.00. Social groups in Census tract 0604114100 have a Relatively Low susceptibility to the adverse impacts of natural hazards when compared to the rest of the U.S.

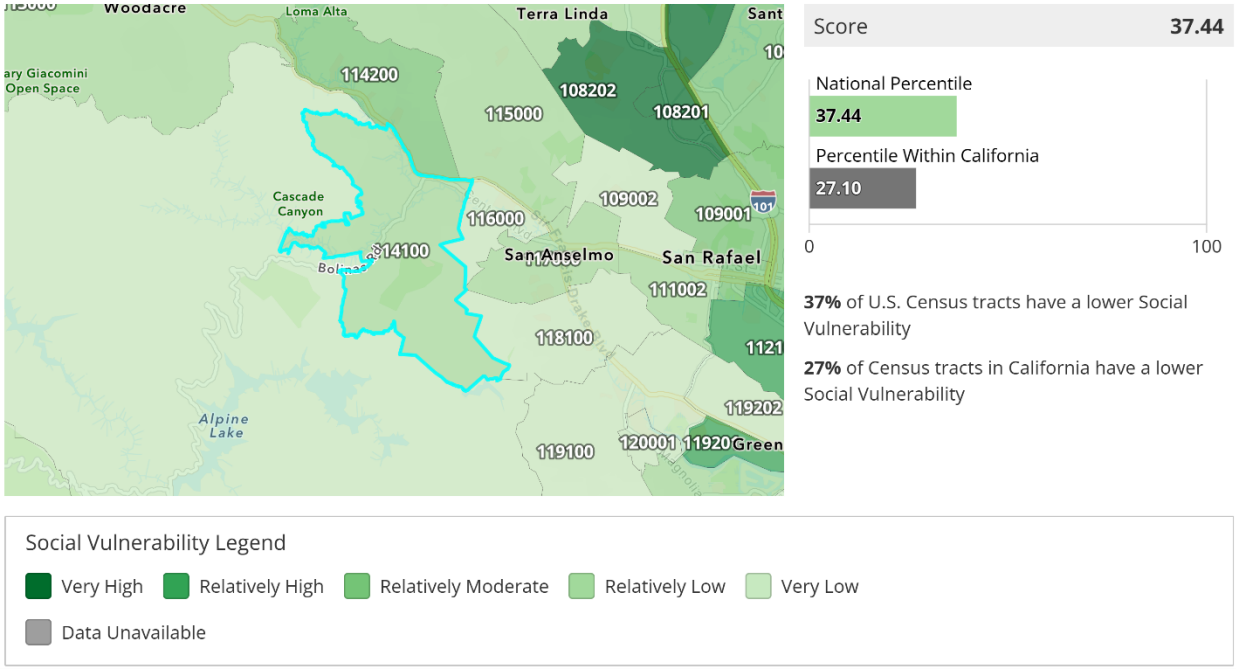

Figure 154: Town of Fairfax Social Vulnerability Map Census Tract 1141.00
Source: FEMA National Risk Index 2023

Most socially vulnerable residents in the Marin County OA reside in parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and the unincorporated areas of Marin City and Santa Venetia. This aligns with what the County knows about Marin residents. However, discrepancy lies in the western, more rural area of the county. West Marin is comprised of seven villages, and other populated areas, that are distanced from the centralized resources in the eastern part of the county. At three local elementary school in West Marin (2022-2023 school year), students eligible for free and reduced lunch program are, 62%, 41%, and 52%, a reflection of the financial capacity of local families. West Marin is home to many farms that may employ and house underrecognized workers that may not have taken part in a census survey, what the SVI is calculated from. In the fourth quarter of FY 2021/22 the bus routes traveling to West Marin (Rural Routes) were the only service category to have increased in ridership since pre-COVID (increase 0.1%; Marin Transit, 2022) showing the reliance of West Marin residents on public transportation; however, this data continues to adjust based upon the increase in alternate methods of mass transportation. Considering this, the County of Marin acknowledges that unique social factors in West Marin require different approaches than other parts of the County.

The Town of Fairfax has a “Relatively Low” Social Vulnerability rating. The Town of Fairfax had an estimated population of 7,441 in 2020, with 3,479 housing units in the Town. The Town has a total area of 2.204 square miles. The median income for a household in the Town is $111,290 and the per capita income for the Town is $59,011. Approximately 0.3 percent of families and 10.1 percent of the population is below the poverty line (2020 data, U.S. Census Bureau).

1.8 ECONOMY AND TAX BASE

Table 10 shows income by household in The Town of Fairfax as of 2021.

Table 10: Household Income for the Town of Fairfax as of 2021		
Household Income	Number	Percent
Total Households	3410	-
Less than $10,000	222	6.5
$10,000 to $14,999	48	1.4
$15,000 to $24,999	211	6.2
$25,000 to $34,999	194	5.7
$35,000 to $49,999	303	8.9
$50,000 to $74,999	361	10.6
$75,000 to $99,999	239	7.0
$100,000 to $149,999	743	21.8
$150,000 to $199,999	426	12.5
$200,000 or more	668	19.6
Median household income (dollars)	$111,290	
Mean household income (dollars)	$131,887

1.10 HISTORICAL PROPERTIES

The Town of Fairfax has one registered historically significant homes, public buildings, or landmarks. To inventory these resources, the HMPC collected information from a number of sources:

- California Department of Parks and Recreation Office of Historic Preservation (OHP) OHP is responsible for the administration of federally and state mandated historic preservation programs to further the identification, evaluation, registration, and protection of California's irreplaceable archaeological and historical resources. OHP administers the National Register of Historic Places, the California Register of Historical Resources, California Historical Landmarks, and the California Points of Historical Interest programs.
- Town of Fairfax Chamber of Commerce.
- Town of Fairfax website.

As defined by the National Environmental Policy Act (NEPA), any property over 50 years of age is considered a potential historic resource and is potentially eligible for the National or California Register. Thus, in the event that the property is to be altered, or has been altered, as the result of a major federal action, the property must be evaluated under the guidelines set forth by NEPA. Structural mitigation projects are considered alterations for the purpose of this regulation. Similar regulations exist for buildings under the California Environmental Quality Act (CEQA).

Table 13: Historic Sites in Fairfax

Name/Landmark State Plaque Number	National Register (NR)	State Landmark	California Register	Date Listed (NR)	Jurisdiction
Lord Charles Snowden Fairfax Home (679)		X	X		Fairfax

SECTION 2.0: HAZARD IDENTIFICATION AND RISK ASSESSMENT

The Town of Fairfax identified hazards that affect the city and developed natural hazard profiles based upon the countywide risk assessment, past events and their impacts. Figure 12 shows the top hazards that the Jurisdiction is at risk from according to the hazard mitigation Steering Committee.

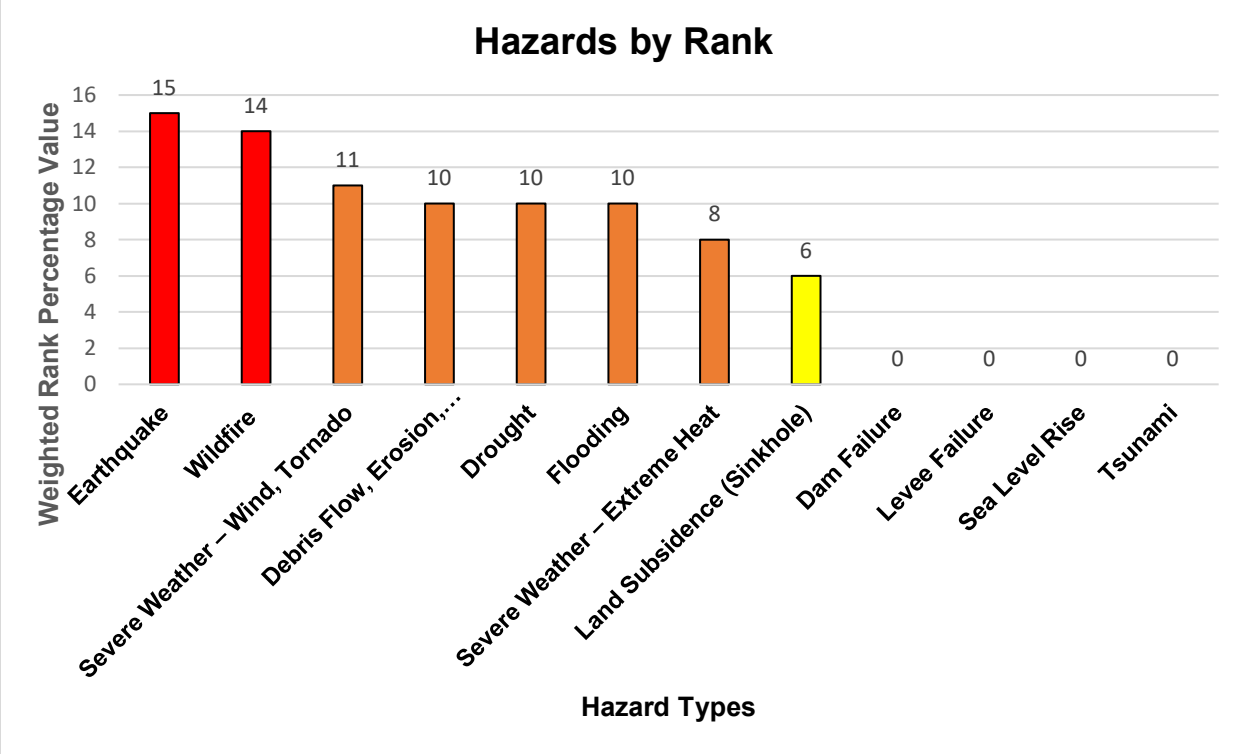

Figure 156: Town of Fairfax Risk Assessment – Planning Team Top Hazards

Figure 13: Risk Rank Categorization	
Risk Level	**Risk Numerical Score**
High Risk	**12 - 16**
Serious Risk	**8 - 11**
Moderate Risk	**4 - 7**
Low Risk	**1 - 3**

Figure 157: Hazard Risk Categorization

Each Marin County OA MJHMP participating jurisdiction and organization reviewed and approved the Top Hazards identified by the Planning Team. Each participating jurisdiction and organization then completed a more complex assessment tool to further develop their hazard assessment and prioritization.

The planning process used the available FEMA tools to evaluate all the possible threats faced. The primary tool selected was the Hazard Assessment and Prioritization Tool. This matrix allowed

the participating jurisdiction or organization to assess their own level of vulnerability and mitigation capability. Each participating Jurisdiction and organization assessed the top hazards for:

- Probability/ Likelihood of Future Events
- Geographic Extent
- Magnitude/ Severity
- Climate Change Influence
- Significance

Probability/ Likelihood of Future Events

- **Unlikely:** Occurs in intervals greater than 100 years - Less than 1% probability of occurrence in the next year or a recurrence interval greater than 100 years.
- **Occasional:** Occurring every 11 to 100 years - 1-10% probability of occurrence in the next year or a recurrence interval of 11 to 100 years.
- **Likely:** Occurring every 1 to 10 years - 10-90% probability of occurrence in the next year or recurrence interval of 1 to 10 years.
- **Highly Likely:** Occurring almost every year - 90-100% probability of occurrence in the next year or a recurrence interval of less than 1 year.

Geographic Extent

- **Negligible:** Less than 10% of the planning area
- **Limited:** 10-25% of the planning area
- **Significant:** 25-75% of planning area
- **Extensive:** 75-100% of planning area

Magnitude/ Severity

- **Weak:** Limited classification on scientific scale, slow speed of onset or short duration of event, resulting in little to no damage.
- **Moderate:** Moderate classification on scientific scale, moderate speed of onset or moderate duration of event, resulting in some damage and loss of services for days.
- **Severe:** Severe classification on scientific scale, fast speed of onset or long duration of event, resulting in devastating damage and loss of services for weeks or months.
- **Extreme:** Extreme classification on scientific scale, immediate onset or extended duration of event, resulting in catastrophic damage and uninhabitable conditions.

Table 14: Select Hazards Magnitude and Severity Scale					
Hazard	**Scale/Index**	**Weak**	**Moderate**	**Severe**	**Extreme**
Drought	Palmer Drought Severity Index	+1.99 to -1.99	-2.00 to -2.99	-3.00 to -3.99	-4.00 and below
Earthquake	Modified Mercalli	I to IV	V to VII	VIII	IX to XII
	Richter Magnitude	2,3	4,5	6	7,8
Tornado	Fujita Tornado Damage Scale	FO	F1, F2	F3	F4, F5

Table 82: Select Hazards Magnitude/ Severity Scale or Index

Climate Change Influence

- **Low:** Minimal potential impact
- **Medium:** Moderate potential impact
- **High:** Widespread potential impact

Significance

- **Low:** Minimal potential impact - Two or more criteria fall in lower classifications, or the event has a minimal impact on the planning area. This rating is sometimes used for hazards with a minimal or unknown record of occurrences or for hazards with minimal mitigation potential.
- **Medium:** Moderate potential impact - The criteria fall mostly in the middle ranges of classifications and the event's impacts on the planning area are noticeable but not devastating. This rating is sometimes used for hazards with a high extent rating but very low probability rating.
- **High:** Widespread potential impact - The criteria consistently fall in the high classifications and the event is likely/highly likely to occur with.

2.1 CLIMATE CHANGE

The County of Marin and associated jurisdictions profiled jointly recognize that the earth's climate is forcibly being augmented due to humans' reliance on fossil fuels and non-natural resources which pose negative impacts on the earth's climate. Reliance on fossil fuels and non-natural products results in the climate shifting to include unseasonable temperatures, more frequent and intense storms, prolonged heat and cold events, and a greater reliance on technological advancements to maintain the wellbeing of community members and balance of the environment. The forced adaptation to climatic shifts is necessary for the County and jurisdictions to understand and include with these assessments.

Locally to Marin, drought and rain events have already had devastating impacts to critical infrastructure, agriculture, and water resources; and globally, unseasonable temperatures have been identified as the cause for enhanced wildfires, severe droughts, ice sheets and glaciers disappearing, and persons emigrating from their countries due to a lack of sustainable, local resources. Melting land ice contributes additional water to the oceans and as ocean temperatures rise the water expands, both of which contribute to increase rates of sea level rise. Marin is bordered on the west by the Pacific Ocean and on the east by San Francisco Bay, making it particularly vulnerable to flooding and erosion caused by sea level rise.

The cause of current climate change is largely human activity, burning fossil fuels, natural gas, oil, and coal. Burning these materials releases greenhouse gases into Earth's atmosphere. Greenhouse gases trap heat from the sun's rays inside the atmosphere causing Earth's average temperature to rise. This rise in the planet's temperature was formerly called, "global warming", but climate change has shown to include both intense heat and cold shifts. The warming of the planet impacts local and regional climates. Throughout Earth's history, climate has continually changed; however, when occurring naturally, this is a slower process that has taken place over hundreds and thousands of years. The human influenced climate change that is happening now is occurring at an abnormally faster rate with devastating results.

GLOBAL OBSERVED AND PROJECTED IMPACTS AND RISKS
Source: Intergovernmental Panel on Climate Change, Headline Statements from the Summary for Policymakers, 2022

- Human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability.
- Global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans.
- Beyond 2040 and depending on the level of global warming, climate change will lead to numerous risks to natural and human systems.
- The magnitude and rate of climate change and associated risks depend strongly on near-term mitigation and adaptation actions, and projected adverse impacts and related losses and damages escalate with every increment of global warming.
- Multiple climate hazards will occur simultaneously, and multiple climatic and non-climatic risks will interact, resulting in compounding overall risk and risks cascading across sectors and regions.

FUTURE TRENDS/ IMPACTS
Source: Study Confirms Climate Models are Getting Future Warming Projections Right – Climate Change: Vital Signs of the Planet (nasa.gov)

Global Warming

- If global warming transiently exceeds 1.5°C in the coming decades or later, then many human and natural systems will face additional severe risks.
- An estimated 60% of today's methane emissions are the result of human activities. The largest sources of methane are agriculture, fossil fuels, and decomposition of landfill waste.
- The concentration of methane in the atmosphere has more than doubled over the past 200 years. Scientists estimate that this increase is responsible for 20 to 30% of climate warming since the Industrial Revolution (which began in 1750).
- According to the most recent National Climate Assessment, droughts in the Southwest and heat waves (periods of abnormally hot weather lasting days to weeks) are projected to become more intense, and cold waves less intense and less frequent.
- The last eight years have been the hottest years on record for the globe.

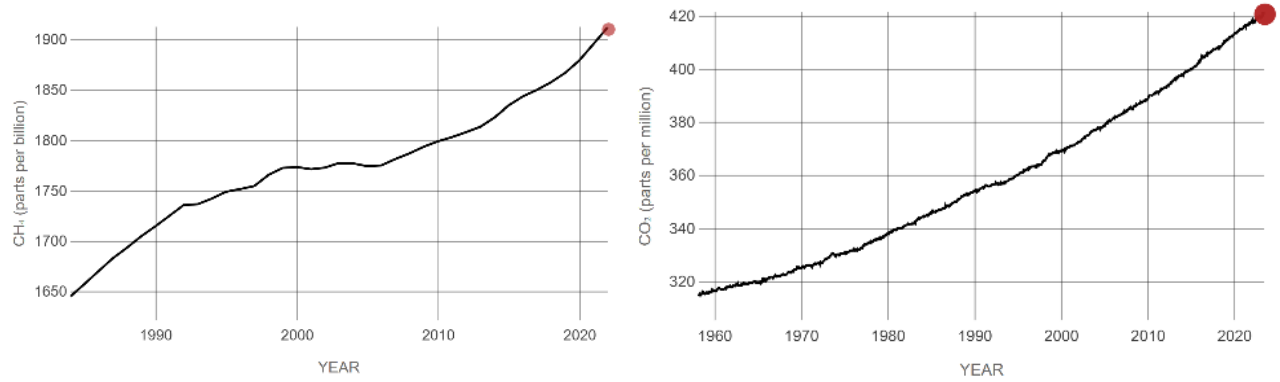

Figure 158: NASA Global Temperature Change CO2 Gas
Source: NASA Global Climate Change, 2022

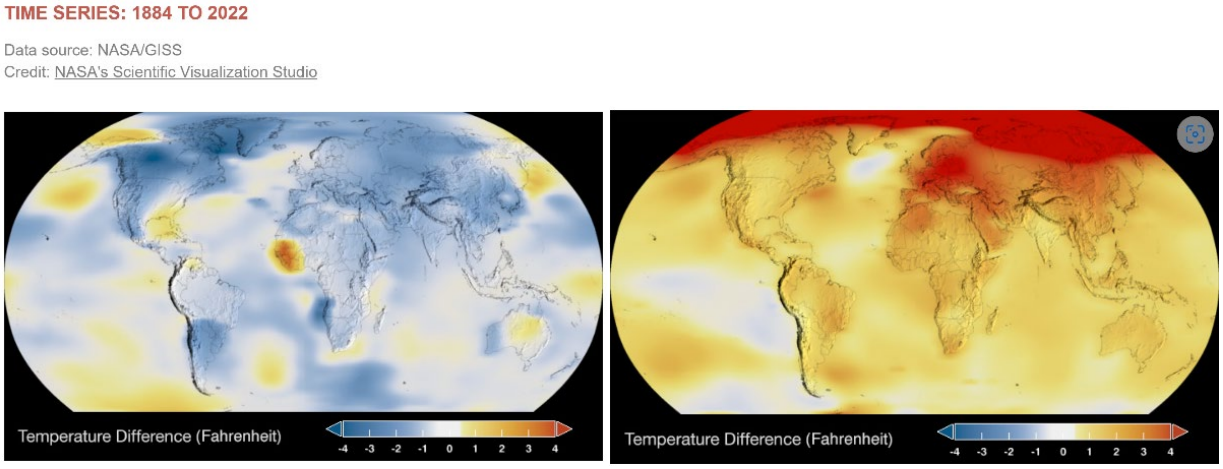

Figure 159: NASA Global Temperature Change 1884 to 2022
Source: NASA Global Climate Change, 2022

Drought

- A NASA-led study in 2022 concluded that the 22-year-long megadrought in southwestern US was the driest the territory had experienced in at least 1,200 years and was expected to persist through at least 2022.

Sea Level Rise

- Global sea levels are rising as a result of human-caused global warming, with recent rates being unprecedented over the past 2,500-plus years.
- U.S. Sea Level Likely to Rise 1 to 6.6 Feet by 2100.
- Global sea level has risen about 8 inches (0.2 meters) since reliable record-keeping began in 1880. By 2100, scientists project that it will rise at least another foot (0.3 meters), but possibly as high as 6.6 feet (2 meters) in a high-emissions scenario.

- Sea ice cover in the Arctic Ocean is expected to continue decreasing, and the Arctic Ocean will very likely become essentially ice-free in late summer if current projections hold. This change is expected to occur before mid-century.
- An indicator of changes in the Arctic sea ice minimum over time. Arctic sea ice extent both affects and is affected by global climate change.

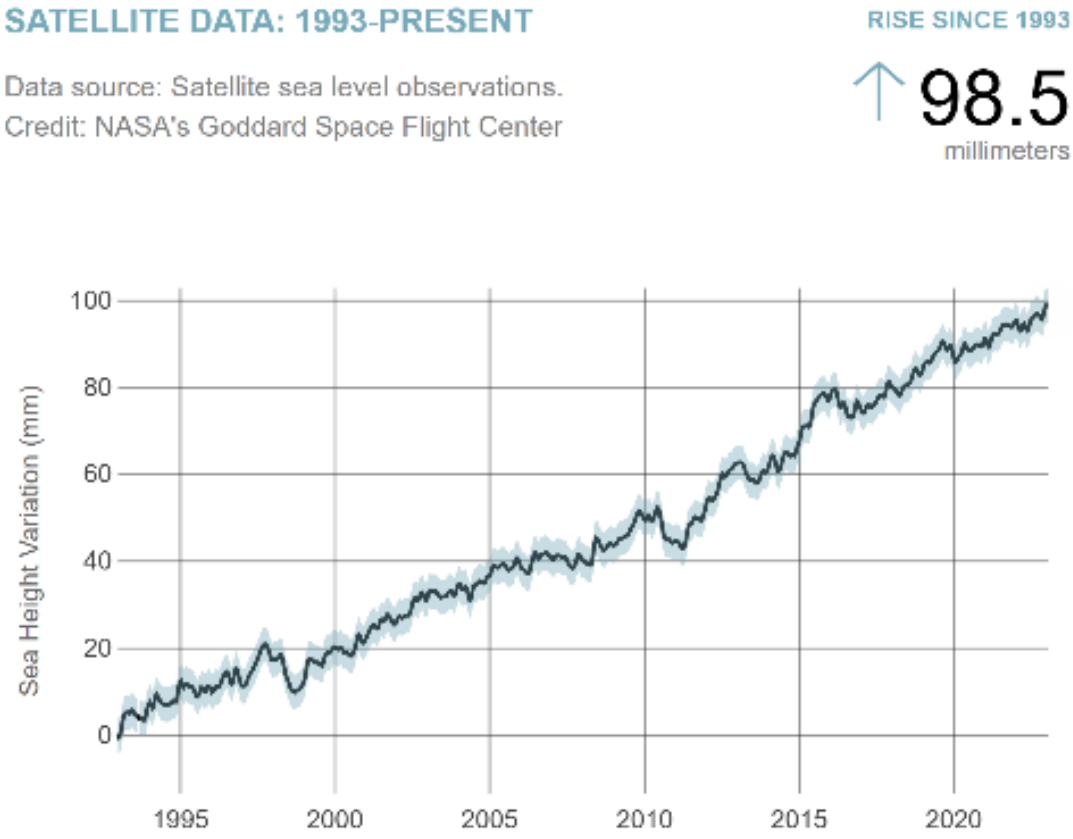

Figure 160: NASA Global Temperature Change Sea Level
Source: NASA Global Climate Change, 2022

Wildfire

- Warming temperatures have extended and intensified wildfire season in the West, where long-term drought in the region has heightened the risk of fires.
- Scientists estimate that human-caused climate change has already doubled the area of forest burned in recent decades. By around 2050, the amount of land consumed by wildfires in Western states is projected to further increase by two to six times.
- Even in traditionally rainy regions like the Southeast, wildfires are projected to increase by about 30%.

Flooding (Precipitation)

- Climate change is having an uneven effect on precipitation (rain and snow) in the United States, with some locations experiencing increased precipitation and flooding, while others suffer from drought.

- On average, more winter and spring precipitation is projected for the northern United States, and less for the Southwest, over this century.
- Projections of future climate over the U.S. suggest that the recent trend toward increased heavy precipitation events will continue. This means that while it may rain less frequently in some regions (such as the Southwest), when it does rain, heavy downpours will be more common.

Extreme Cold

- The length of the frost-free season, and the corresponding growing season, has been increasing since the 1980s, with the largest increases occurring in the western United States.

According to the California Natural Resource Agency (CNRA), climate change is already affecting California and is projected to continue to do so well into the foreseeable future. Current and projected changes include increased temperatures, sea level rise, a reduced winter snowpack, altered precipitation patterns, and more frequent storm events. Over the long term, reducing greenhouse gases can help make these changes less severe, but the changes cannot be avoided entirely. Unavoidable climate impacts result in a variety of secondary consequences including detrimental impacts on human health and safety, economic continuity, ecosystem integrity and provision of basic services. Climate change is being profiled in the 2023 Marin County OA MJHMP as a standalone hazard while addressing each of the other natural hazards. The Marin County OA is considering climate change issues when identifying future mitigation actions.

California is experiencing a climate crisis that is increasingly taking a toll on the health and well-being of its people and on its unique and diverse ecosystems. Every Californian has suffered from the effects of record high temperatures, dry winters, prolonged drought, and proliferating wildfires in recent years. California's biodiversity is threatened as alterations to habitat conditions brought about by a changing climate are occurring at a pace that could overwhelm the ability of plant and animal species to adapt.

Indicators of Climate Change in California
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

- Since 1895, annual average air temperatures in California have increased by about 2.5 degrees Fahrenheit (°F). Warming occurred at a faster rate beginning in the 1980s.
- Recent years have been especially warm: Eight of the ten warmest years on record occurred between 2012 and 2022; 2014 was the warmest year on record.
- Of all the Western states, California endured the hottest temperatures for the longest time, driving the average statewide temperature to the second warmest over the past 128 years.
- Extreme heat ranks among the deadliest of all climate-driven hazards in California, with physical, social, political, and economic factors effecting the capacity of individuals, workers, and communities to adapt, and with the most severe impacts often on communities who experience the greatest social and health inequities.
- Glaciers have essentially disappeared from the Trinity Alps in Northern California
- In 2020, wildfire smoke plumes were present in each county for at least 46 days.

- The 2022 fire season saw more fires than the previous fire season along with continued extreme drought and heat conditions.
- The drought, begun in 2019, was the third statewide drought declared in California since 2000.
- This drought has been marked by extreme swings; the state received record-breaking amounts of precipitation in October and December 2021 that were offset by the driest January, February, and March 2022 dating back more than 100 years. The year 2023 opened with California simultaneously managing both drought and flood emergencies.
- A series of storms in late December 2022 and early January 2023 broke rural levees, disrupted power, flooded roads, downed trees, and eroded coastal land.
- Sea level rise accelerates coastal erosion, worsens coastal flooding during large storms and peak tidal events, and impacts important infrastructure positioned along our state's 1,100-mile coast.
- The western drought which impacted all of California and the western United States was nearly lifted due to unseasonably heavy rains in late 2022 and early 2023.

The graph below shows the relative change, in millimeters, in sea levels at Crescent City (1933-2020), San Francisco (1900-2020), and La Jolla (1925-2020).

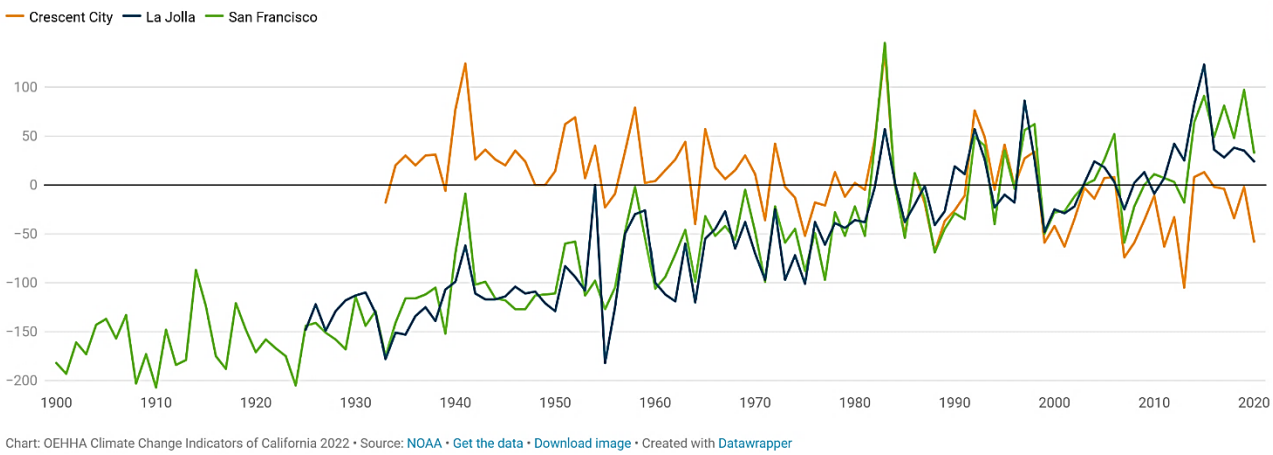

Figure 161: Annual Mean Sea Level Trends
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

Climate Change in the Marin County Operational Area

Climate change is already having significant impacts across California. Temperatures are warming, heat waves are more frequent, and precipitation has become increasingly variable.

Sea level rise in the San Francisco Bay Area is projected to increase by eight inches MHW in 2050 and could reach 4.5 to eight feet by 2021 if greenhouse gas emissions aren't reduced. Marin Shoreline Sea Level Rise Vulnerability Assessment: https://www.marincounty.org/-/media/files/departments/cd/planning/slr/baywave/vulnerability-assessment-final/final_allpages_bvbconsulting_reduced.pdf?la=en

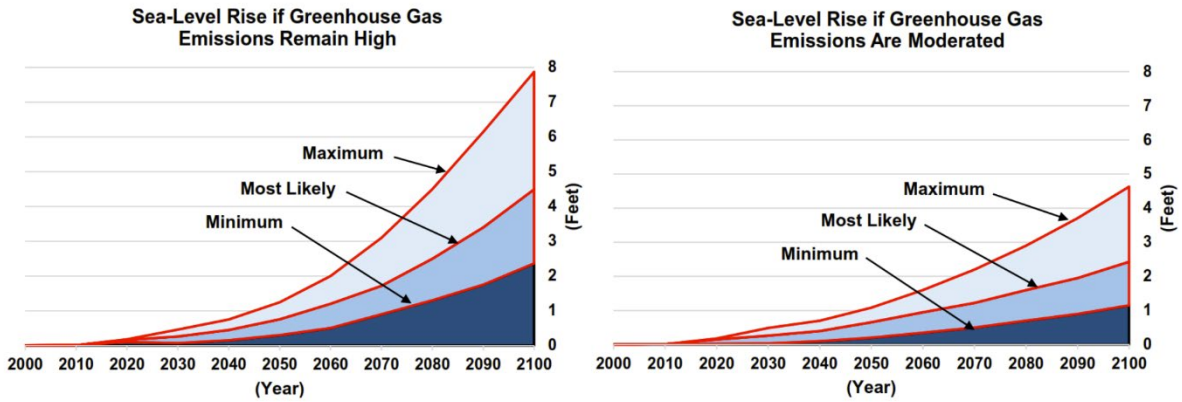

Figure 162: Projections of Sea Level Rise in the San Francisco Bay Area, 2000-2100
Source: 2019–2020 Marin County Civil Grand Jury, Climate Change: How Will Marin Adapt?

Climate Change in the Marin County Operational Area

Climate change will continue to alter Marin County OA ecosystems as a result of rising temperatures, changes in precipitation, and sea level rise, which will increase the severity and occurrence of natural hazards across the Marin County OA well into the future. Coastal cooling processes that keep temperatures down, such as fog, will continue to decrease. Rising temperatures will exacerbate drought conditions and raise the potential for significant wildfires and associated smoke as vegetation becomes drier and tree mortality increases. Forested woodlands that play a major role in carbon reduction will gradually transition into chaparral and shrublands. There will be more extreme storms and weather events, including expanded heat waves and increased rain events with changes in precipitation. Significant rain events will lead to an increase in flooding and the potential for severe landslides. Shoreline communities will become inundated with sea level rise, storm surge, and high tide events. Marshlands and wetlands that act as natural storm barriers will disappear as they transition into open water.

Notable impacts from climate change that are already evident in the Marin County OA and surrounding region as identified in a 2020 Marin County Civil Grand Jury Report include:

- From 1895-2018, the average temperature in Marin County increased by 2.3 degrees Fahrenheit.
- Over the past century, sea level rise in the San Francisco Bay Area rose by eight inches and has accelerated rapidly since 2011.
- The threat of wildfires in 2019 was so severe that Pacific Gas and Electric shut off electric power to the County for multiple days.

Climate change will continue to affect homes, businesses, infrastructure, utilities, transportation systems and agriculture across the Marin County OA. The risk to socially vulnerable populations will increase as they feel the immediate impacts of climate change more significantly and are less able to adapt to climate change and recover from its impacts.

The Marin County OA has adopted numerous planning initiatives and mitigation measures to help combat the effects of climate change across the OA. The Marin Climate Energy Partnership (MCEP), which is a partnership program of Marin County jurisdictions, the County, and Marin County regional agencies, adapted a model Climate Action Plan (CAP) that is intended to support countywide implementation efforts and is currently being used to update additional climate action plans for other jurisdictions in Marin County. The CAP supports the Climate Action Plan for the unincorporated County, which was completed in 2020. The MCEP also collects data and report on progress in meeting each County jurisdictions' individual greenhouse gas emission targets. In June 2023, the County published the Greenhouse Gas Inventory for Unincorporated Community Emissions for the Year 2021. Marin County OA jurisdictions have already met their greenhouse reduction goals for 2020 and are about halfway to meeting the statewide goal to reduce emissions 40% below 1990 levels by the year 2030. Marin County also formed a Sea Level Marin Adaptation Response Team in 2018 and had a Sea Level Rise Vulnerability Assessment and associated Adaptation Report completed for the County and each of its jurisdictions in 2017 as part of their Bay Waterfront Adaptation and Vulnerability Evaluation. Additional Marin County OA climate change mitigation initiatives include Marin Clean Energy, Electrify Marin, the Marin Solar Project, the Marin Energy Watch Partnership, Resilient Neighborhoods, and Drawdown Marin.

2.2 HAZARDS

Of the hazards profiled in the Marin County OA MJHMP, those noted in the table are specific for the Town of Fairfax as per the planning team.

Table 15: Town of Fairfax Hazard Risk Assessment

Hazard	Probability/ Likelihood of Future Events	Geographic Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Debris Flow	Likely	Limited	Moderate	Medium	Low	**10.00**
Drought	Occasional	Extensive	Weak	Medium	Low	**10.00**
Earthquake	Highly Likely	Extensive	Extreme	None	High	**15.00**
Flooding	Occasional	Limited	Moderate	Medium	Medium	**10.00**
Land Subsidence	Occasional	Negligible	Weak	Low	Low	**6.00**
Severe Weather – Extreme Heat	Unlikely	Significant	Weak	Medium	Low	**8.00**
Severe Weather – High Wind/Tornado	Likely	Limited	Moderate	Medium	Medium	**11.00**
Wildfire	Highly Likely	Significant	Severe	Medium	Medium	**14.00**

Table 83: Town of Fairfax Hazard Risk Assessment
Source: Town of Fairfax

Omitted Hazards

The Town of Fairfax does not have risk exposure to Dam Failure, Levee Failure, Sea Level Rise, or Tsunamis. The Town is not in any dam inundation zone and does not lie near a coastline.

Table 16: Marin County OA Hazard Risk Assessment						
Hazard	Probability/ Likelihood of Future Events	Geographic Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Dam Failure	Unlikely	Negligible	Extreme	Low	Medium	**9.00**
Debris Flow	Occasional	Extensive	Severe	Medium	Medium	**13.00**
Drought	Highly Likely	Extensive	Moderate	High	High	**16.00**
Earthquake	Highly Likely	Extensive	Extreme	None	High	**15.00**
Flooding	Highly Likely	Limited	Severe	High	Medium	**14.00**
Land Subsidence	Occasional	Limited	Moderate	Medium	Medium	**10.00**
Levee Failure	Unlikely	Negligible	Moderate	Medium	High	**9.00**
Sea Level Rise	Highly Likely	Limited	Extreme	High	High	**16.00**
Severe Weather – Extreme Heat	Highly Likely	Extensive	Moderate	High	Medium	**15.00**
Severe Weather – High Wind/Tornado	Highly Likely	Extensive	Moderate	High	Medium	**15.00**
Tsunami	Highly Likely	Limited	Extreme	Medium	High	**15.00**
Wildfire	Highly Likely	Significant	Severe	High	High	**16.00**

Table 84: Marin County OA Hazard Risk Assessment
Source: County of Marin

2.2.1 Debris Flows

For the purposes of the Marin County OA MJHMP, debris flows are classified as landslides (including rockslides) and mud flows.

A landside is the breaking away and gravity-driven downward movement of hill slope materials, which can travel at speeds ranging from fractions of an inch per year to tens of miles per hour depending on the slope steepness and water content of the rock/soil mass. Landslides range from the size of an automobile to a mile or more in length and width and, due to their sheer weight and speed, can cause serious damage and loss of life. The rate of a landslide is affected by the type and extent of vegetation, slope angle, degree of water saturation, strength of the rocks, and the mass and thickness of the deposit. Some of the natural causes of this instability are earthquakes, weak materials, stream and coastal erosion, and heavy rainfall. In addition, certain human activities tend to make the earth materials less stable and increase the chance of ground failure. These activities include extensive irrigation, poor drainage or groundwater withdrawal, removal of stabilizing vegetation and over-steepening of slopes by undercutting them or overloading them with artificial fill. These activities can cause slope failure, which normally produce landslides.

Landslide material types are often broadly categorized as either rock or soil, or a combination of

the two for complex movements. Rock refers to hard or firm bedrock that was intact and in place prior to slope movement. Soil, either residual or transported material, means unconsolidated particles. The distinction between rock and soil is most often based on interpretation of geomorphic characteristics within landslide deposits, but can also be inferred from geologic characteristics of the parent material described on maps or in the field. Landslide movements are also based on the geomorphic expression of the landslide deposit and source area, and are categorized as falls, topples, spreads, slides, or flows. Falls are masses of soil or rock that dislodge from steep slopes and free fall. Topples move by the forward pivoting of a mass around an axis below the displaced mass. Lateral spreads move by horizontal extension and shear or tensile fractures. Slides displace masses of material along one or more discrete planes and can either be rotational or transitional. Flows mobilize as a deforming, viscous mass without a discrete failure plane.

Natural conditions that contribute to landslide include the following:

- Degree of slope
- Water (heavy rain, river flows, or wave action)
- Unconsolidated soil or soft rock and sediments
- Lack of vegetation (no stabilizing root structure)
- Previous wildfires and other forest disturbances
- Earthquake

In addition, many human activities tend to make the earth materials less stable and, thus, increase the chance of ground movement. Human activities contribute to soil instability through grading of steep slopes or overloading them with artificial fill, by extensive irrigation, construction of impermeable surfaces, excessive groundwater withdrawal, and removal of stabilizing vegetation.

Another hazard related to landslide and erosion is the fall of a detached mass of rock from a cliff or down a very steep slope (rockfall). Weathering and decomposition of geological materials produce conditions favorable to rockfalls. Other causes include ice wedging, root growth, or ground shaking (earthquake). Destructive landslides and rockfalls usually occur very suddenly with little or no warning time and are short in duration.

Landslide susceptibly can be characterized by looking at both slope class and rock strength. Landslide susceptibility classes express the generalization that on very low slopes, landslide susceptibility is low even in weak rock, and that landslide susceptibility increases with slope and in weaker rocks. Very high landslide susceptibility includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks. Figure 19 shows landslide susceptibility classes.

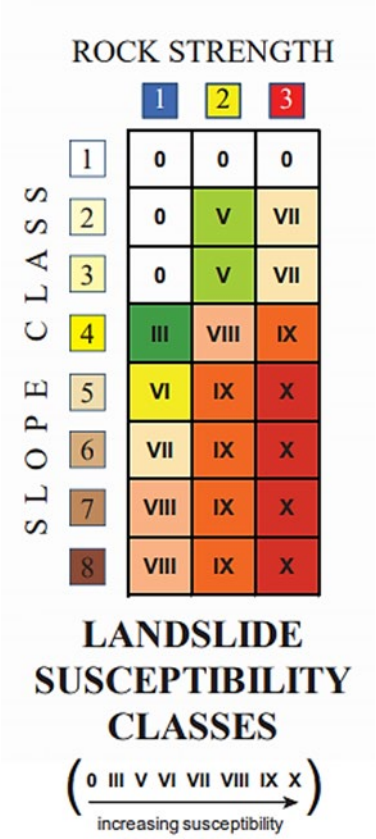

Figure 163: Landslide Susceptibility Classes
Source: USGS

A mud flow is a general term for a mass-movement landform and process characterized by a flowing mass of fine-grained earth material with a high degree of fluidity. Heavy rainfall, snowmelt, or high levels of groundwater flowing through cracked bedrock may trigger a movement of soil or sediments. Floods and debris flows may also occur when strong rains on hill or mountain slopes cause extensive erosion and/or what is known as "channel scour". Some broad mud flows are rather viscous and therefore slow; others begin very quickly and continue like an avalanche. Mud flows are composed of at least 50% silt and clay-sized materials and up to 30% water.

The point where a muddy material begins to flow depends on its grain size and the water content. Fine grainy material or soil has a smaller friction angle than a coarse sediment or a debris flow, but falling rock pieces can trigger a material flow, too. When a mud flow occurs it is given four named areas, the 'main scarp', in bigger mud flows the 'upper and lower shelves', and the 'toe'. See Figure 20 for the typical areas of a mud flow, with shelves (right) and without (left). The main scarp will be the original area of incidence, the toe is the last affected area(s). The upper and lower shelves are located wherever there is a large dip (due to mountain or natural drop) in the mud flow's path. A mud flow can have many shelves.

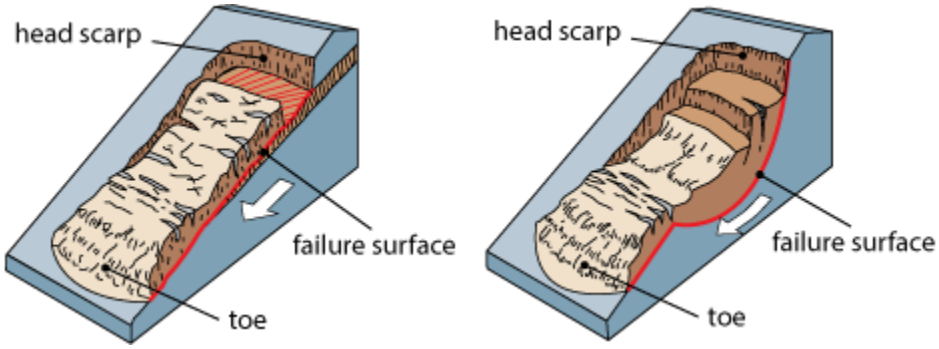

Figure 164: Mud Flow Areas
Source: Washington Department of Natural Resources

If large enough, mud flows can devastate villages and country-sides. Mud flows are common in mountain areas prone to wildfire, where they have destroyed many homes built on hillsides without sufficient support after fires destroy vegetation holding the land. The area most generally recognized as being at risk of a dangerous mud flow are:

- Areas where wildfires or human modification of the land have destroyed vegetation
- Areas where landslides have occurred before
- Steep slopes and areas at the bottom of slopes or canyons
- Slopes that have been altered for construction of buildings and roads
- Channels along streams and rivers
- Areas where surface runoff is directed

A landslide in Fairfax would occur where the terrain is steeper and is more susceptible to movement of hill slope materials. This area includes most of Fairfax with the exception of the downtown area along Sir Francis Drake Boulevard adjacent to Fairfax Creek. The areas of Fairfax that are most susceptible to a landslide are residential and consist of numerous winding streets and hillside homes that could be damaged or destroyed by a landslide. The Deer Park area of Fairfax is at the bottom of a canyon and is very landslide-prone. Road access into several residential areas of Fairfax, including along Cascade Drive and Bolinas Road and in communities north of Sir Francis Drake Boulevard, are minimal and a landslide on any of the major thoroughfares in these areas could limit ingress and egress for residents. There are hundreds of residences in these areas that could be susceptible to a landslide. All of the critical facilities in Fairfax, including the Town facilities, with the exception of two water tanks lie outside areas of high landslide susceptibility, but the Manor Elementary School and the Saint Ritas School lie in areas with some landslide susceptibility.

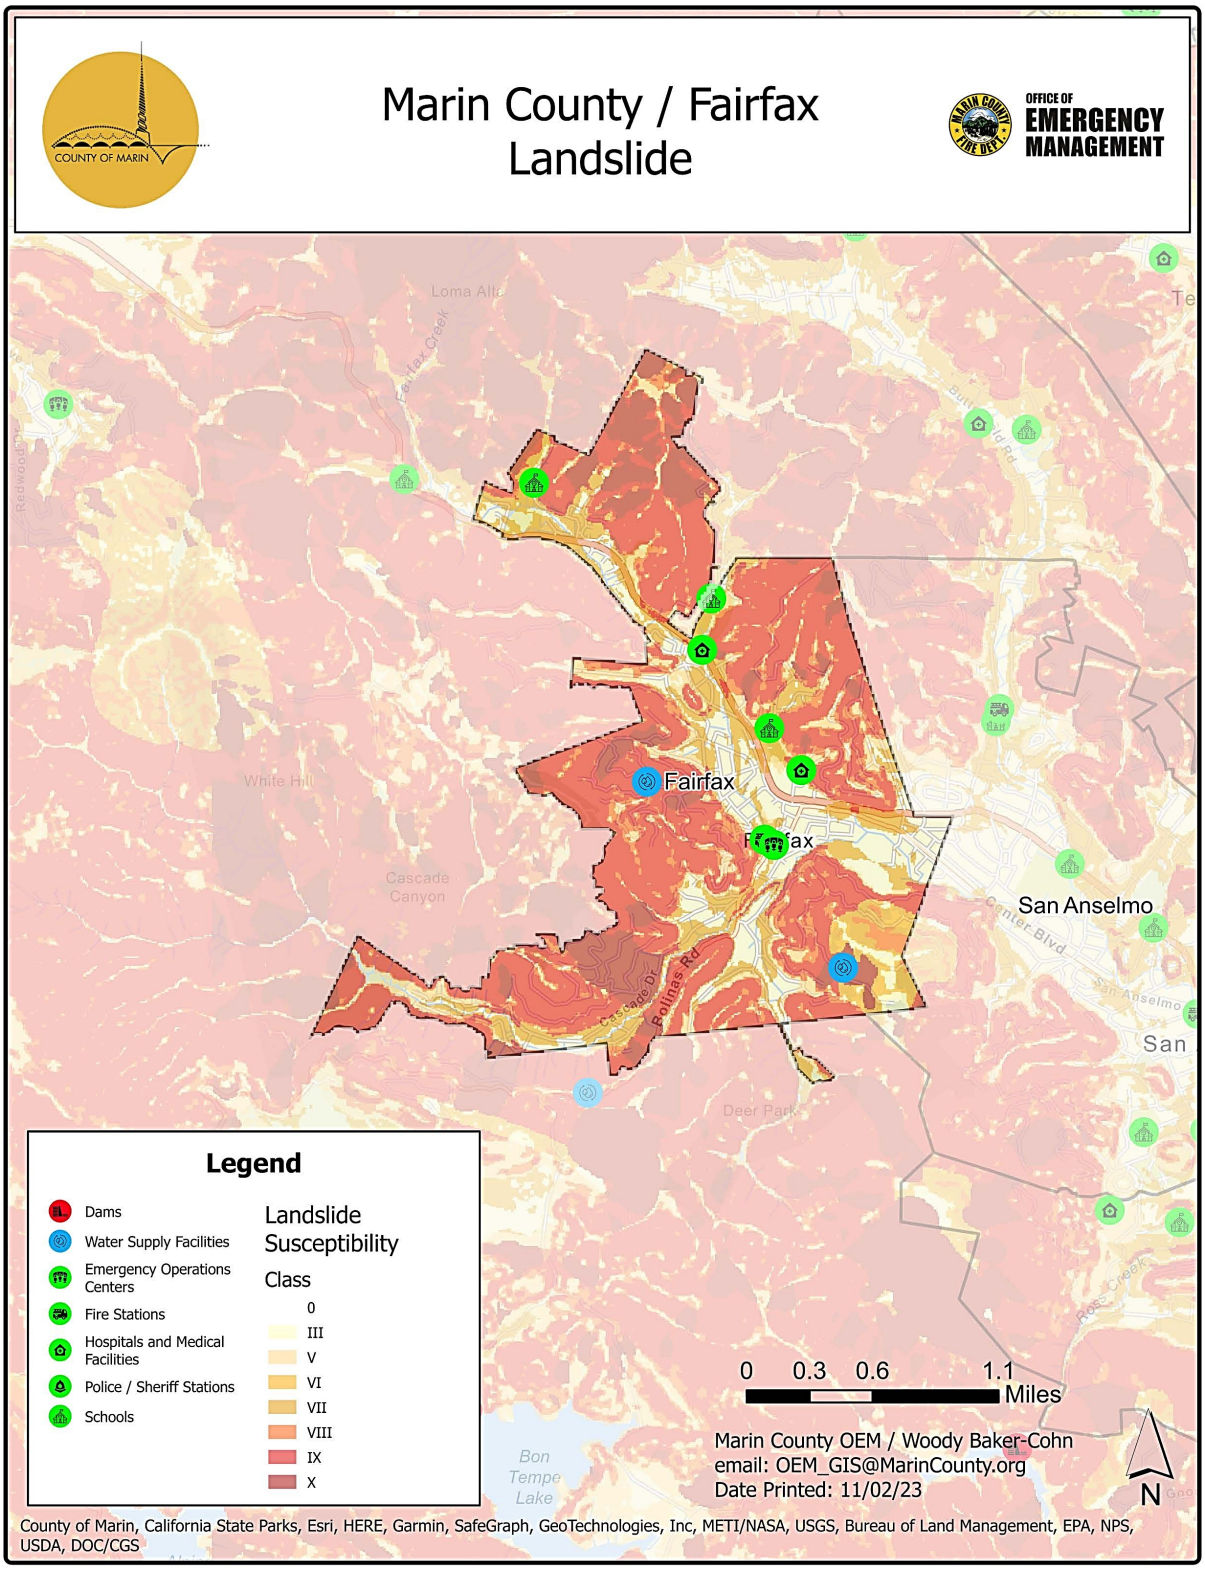

Figure 165: Town of Fairfax Debris Flow Critical Facilities and Infrastructure
Source: Marin County OEM

An earthquake has the potential to cause landslides throughout this area. A wildfire and subsequent rain event in any of the open space around Fairfax, including from Mount Tamalpais, the Cascade Canyon Preserve, the White Hill Open Space Preserve, the Hawthorne Canyon Open Space Preserve, and the Bald Hill Open Space Preserve could potentially contribute to debris flows in Fairfax. San Anselmo Creek flows from the Mount Tamalpais watershed through Fairfax and Fairfax Creek flows from near the White Hill Open Space Preserve through Fairfax. Both creeks could potentially contribute to a debris flow that could impact bridges, residences and other structures in the Town, affecting ingress and egress to residential areas.

On 1/13/2023, a storm caused a landslide in unincorporated Fairfax that damaged six apartments and displaced 19 residents at a complex on Olema Road. Mud and debris were sent through residences, breaking through walls, doors and windows. The damage was estimated at hundreds of thousands of dollars.

Figure 166: Mudslide in Fairfax – 1/13/2023
Source: The Marin Independent Journal

On 2/7/2017, a storm caused a landslide on Berry Trail in Fairfax, causing a woman and a son to have to escape through a bathroom window in their home. Olema Road was closed at Westbrae Drive because of mud, flooding and debris.

On 1/10/2017, after days of torrential rains and high winds, a hillside and trees at Sir Francis Drake Boulevard and Olema Road in Unincorperated Fairfax were sent tumbling down a hill, trapping two little girls and their grandparents in their home. A wall of mud came sliding down onto part of the home, smashing the carport and taking out the stairs.

On 12/21/2005-1/1/2006, a hillside along Wood Lane in the Deer Park area came crashing down on New Year's Eve in a storm, taking out a fence and much of a vacant house. The landslide took out the kitchen, carport, stairs and a large section of a concrete wall, and deposited a Honda parked in the carport on top of another vehicle across the street. Dozens of residences along the street had mud in their yards.

On 1/3–1/5/1982, a severe storm caused numerous landslides across the Town, isolating several areas and blocking access roads. Six houses were destroyed by mudslides and phone and electricity was out. Almost all businesses on Bolinas Road suffered damage. Total loss was estimated at $3 million.

Climate Change and Future Development Considerations

Extreme storm events and more frequent wildfires as a result of climate change have the potential to increase the amount and severity of landslides, including disastrous debris flows. Climate change is leading to more volatile precipitation patterns around the world with very dry stretches punctuated by storms that drop large amounts of rain in a short amount of time. Landslides in wetter regions of California, including the Marin County OA, move on average faster and farther downhill during rainy periods compared to drought years, according to a 2022 study by the American Geophysical Union (AGU)[12], showing the increased potential for landslides in the Marin County OA in rainy years. As development increases in the numerous canyons and around the many open spaces of the Marin County OA, the potential for significant impacts from a landslide and/or mudflow increases. Further development of the residential areas of Fairfax that have a higher landslide susceptibility, including the numerous open spaces around town will expose more people and property to landslide risk. With increased wildfire potential as a result of climate change, more residents in Fairfax could be susceptible to post-fire debris flows. This includes areas around Deer Park Creek, San Anselmo Creek and Fairfax Creek, which flow through downtown. Future development should take into account the movement of mud and debris in waterways after a major rain event. Adequate space adjacent to susceptible waterways should be maintained free of development to allow for the passage of mud and debris, and catchment basins should be built in these areas to help capture any excess mud and debris.

2.2.2 DROUGHT

A drought is a deficiency in precipitation over an extended period, usually a season or more, resulting in a water shortage causing adverse impacts on vegetation, animals, and/or people. It is a normal recurrent feature of climate that occurs in virtually all climate zones, from very wet to very dry. Drought is a temporary aberration from normal climatic conditions and can thus vary significantly from one region to another. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Drought is a complex issue involving many factors—it occurs when a normal amount of moisture is not available to satisfy an area's usual water-consuming activities.

There are several types of drought which can often be defined regionally based on its effects:

- Meteorological drought is usually defined by a period of below average water supply, based on the degree of dryness (in comparison to normal or average) and the duration of the dry period. Drought onset generally occurs with a meteorological drought.
- Agricultural drought occurs when there is an inadequate water supply to meet the needs of the state's crops and other agricultural operations such as livestock. Agricultural drought links various characteristics of meteorological (or hydrological) drought to agricultural impacts, focusing on precipitation shortages, soil water deficits, reduced ground water or reservoir levels needed for irrigation.

[12] Landslide Sensitivity and Response to Precipitation Changes in Wet and Dry Climates. https://agupubs.onlinelibrary.wiley.com/doi/10.1029/2022GL099499

- Hydrological drought is defined as deficiencies in surface and subsurface water supplies. It is generally measured as stream flow, snowpack, and as lake, reservoir, and groundwater levels. Hydrological drought usually occurs following periods of extended precipitation shortfalls.

Socioeconomic drought occurs when a drought impacts health, well-being, and quality of life, or when a drought starts to have an adverse economic impact on a region.

Drought can occur in all areas of Fairfax, though it's effects would be most felt in the mountainous areas around the Town where the risk of wildfire would increase. Dry trees in public spaces like the Cascade Canyon Preserve, the White Hill Open Space Preserve, the Hawthorne Canyon Open Space Preserve, and the Bald Hill Open Space Preserve can become a safety hazard to the public due to falling limbs or the toppling of the tree itself.

Climate Change and Future Development Considerations

Climate change increases the odds of worsening drought. Warmer temperatures enhance evaporation, which reduces surface water and dries out soils and vegetation. This makes periods with low precipitation in the summer drier than they would be in cooler conditions. Climate also alters the timing of water availability as warmer winter temperatures cause less precipitation to fall. During droughts, communities in the Marin County OA including Fairfax may have limited access to water for household use, including drinking, cooking, cleaning, and watering plants, as well as for agriculture, transportation, and power generation. Drought may lead to higher water costs, rationing, or even the decimation of important water sources like wells in the Marin County OA. As more people move into the Marin County OA and the Fairfax, additional strain will be placed on the OA's water supply. Drought can affect livestock and crops in the Marin County OA, impacting its economy. Drought can increase the occurrence and severity of wildfires and tree mortality in the Marin County OA including in the open spaces in and around Fairfax. Impacts to residents and infrastructure from wildfire as a result of drought will increase as more development occurs in the mountainous areas of the Marin County OA including Fairfax where wildfires are more likely to occur. Future development in this area and in the mountainous areas of Fairfax could expose people to drier summer conditions that could increase their vulnerability to wildfire. Drought also increases the amount of carbon dioxide in the atmosphere, including by decreasing land productivity, which reduces the amount of vegetation storing carbon dioxide. In addition, increases in drought-related wildfire and soil erosion can release carbon dioxide sequestered in trees and plants back into the atmosphere. This will only worsen climate change for the Marin County OA into the future. When considering future development, the Marin County OA including Fairfax can help prepare for both future droughts and climate change by practicing and promoting water conservation and enhancing water efficiency throughout landscapes, city plans, and water infrastructure. The Marin County OA can also identify alternative water supplies, create drought emergency plans, and encourage farmers to plant drought-resistant crops.

2.2.3 EARTHQUAKE

Earthquakes are sudden rolling or shaking events caused by movement under the earth's surface. Earthquakes happen along cracks in the earth's surface, called fault lines, and can be felt over large areas, although they usually last less than one minute.

The amount of energy released during an earthquake is usually expressed as a magnitude and is currently measured by seismologists on the Moment Magnitude (Mw Scale). The Mw Scale was developed to succeed the previously used Richter Scale and is measured on a scale of zero to ten with increasing values reflecting increasing intensity.

The other commonly used measure of earthquake severity is intensity, which is an expression of the amount of shaking at any given location on the ground service. Intensity is most commonly measured on the Modified Mercalli Intensity (MMI) Scale (see Figure 23).

Intensity	Shaking	Description/Damage
I	Not felt	Not felt except by a very few under especially favorable conditions.
II	Weak	Felt only by a few persons at rest,especially on upper floors of buildings.
III	Weak	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Light	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Moderate	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Strong	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Very strong	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Severe	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Violent	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	Extreme	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.

Figure 167: Modified Mercalli Intensity Scale
Source: USGS

Figure 24 gives intensities (measured on the MMI scale) that are typically observed at locations near the epicenter or earthquakes of different magnitudes.

Richter Magnitude Scale	Typical Maximum Modified Mercalli Intensity Scale
1.0 – 2.9	I
3.0 – 3.9	II – III
4.0 – 4.9	IV – V
5.0 – 5.9	VI – VII
6.0 – 6.9	VII – IX
7.0 or higher	VIII or higher

Figure 168: Mercalli Scale vs. Magnitude
Source: USGS

The extent of ground shaking also depends in large part on how soft the underlying soil is. Soft soils amplify ground shaking (see Figure 25). This was observed during the 1989 Loma Prieta Earthquake when the most significant damages experienced in San Francisco were in the Marina District, which was built on fill.

Soil type A	Vs > 1500 m/sec	Includes unweathered intrusive igneous rock. Occurs infrequently in the bay area. We consider it with type B (both A and B are represented by the color blue on the map). Soil types A and B do not contribute greatly to shaking amplification.
Soil type B	1500 m/sec > Vs > 750 m/sec	Includes volcanics, most Mesozoic bedrock, and some Franciscan bedrock. (Mesozoic rocks are between 245 and 64 million years old. The Franciscan Complex is a Mesozoic unit that is common in the Bay Area.)
Soil Type C	750 m/sec > Vs > 350 m/sec	Includes some Quaternary (less than 1.8 million years old) sands, sandstones and mudstones, some Upper Tertiary (1.8 to 24 million years old) sandstones, mudstones and limestone, some Lower Tertiary (24 to 64 million years old) mudstones and sandstones, and Franciscan melange and serpentinite.
Soil Type D	350 m/sec > Vs > 200 m/sec	Includes some Quaternary muds, sands, gravels, silts and mud. Significant amplification of shaking by these soils is generally expected.
Soil Type E	200 m/sec > Vs	Includes water-saturated mud and artificial fill. The strongest amplification of shaking due is expected for this soil type.

Figure 169: Soil Types
Source: USGS

An earthquake fault is defined as "a fracture or fracture zone in the earth's crust along which there has been displacement of the sides relative to one another." For the purpose of planning there are two types of faults, active and inactive. Active faults have experienced displacement in historic time, suggesting that future displacement may be expected. Inactive faults show no evidence of movement in recent geologic time, suggesting that these faults are dormant.

Two types of fault movement represent possible hazards to structures in the immediate vicinity of the fault: fault creep and sudden fault displacement. Fault creep, a slow movement of one side of a fault relative to the other, can cause cracking and buckling of sidewalks and foundations even without perceptible ground shaking. Sudden fault displacement occurs during an earthquake event and may result in the collapse of buildings or other structures that are found along the fault zone when fault displacement exceeds an inch or two. The only protection against damage caused directly by fault displacement is to prohibit construction in the fault zone.

An earthquake could occur anywhere in and around Fairfax due to the number of active faults within and near the Marin County OA.

Fairfax is located directly between the San Andreas and Hayward faults. A moderate to extreme earthquake originating from either of these major faults or any of the other faults in the region could have major impacts to the Town. Areas in Town, primarily the low-lying areas adjacent to San Anselmo Creek and along Sir Francis Drake Boulevard have a "moderate" earthquake shaking potential and could be more susceptible to an earthquake. All of the Town's critical facilities, with the exception of its two water tanks, including its schools, Police Station and Emergency Operations Center, Ross Valley Fire Station #21 and the Fairfax Community Center Town Hall lie in an area of moderate vulnerability to shaking from an earthquake. Hundreds of homes and dozens of businesses, including the main commercial area of town, lie in this area. Hundreds more homes lie in an area of lower earthquake shaking susceptibility.

Earthquake Shake Intensity

The colors on Figures 26 and 27 represent the level of ground shaking intensity of a potential future earthquake. The result is expressed as the level of ground shaking (**expressed as a percentage of gravity**) that on average occurs every 500 years.

This map shows the expected relative intensity of ground shaking and damage in California from anticipated future earthquakes. The shaking potential is calculated as the level of ground motion that has a 2% chance of being exceeded in 50 years, which is the same as the level of ground-shaking with about a 2500 year average repeat time. The relatively long-period (1.0 second) earthquake shaking is shown here. Long period-shaking affects tall, relatively flexible buildings, but also correlates well with overall earthquake damage.

Earthquake Shaking Potential Maps for California depict expected intermediate period (1s or 1hz) ground motions with 2% exceedance probability in 50 years.

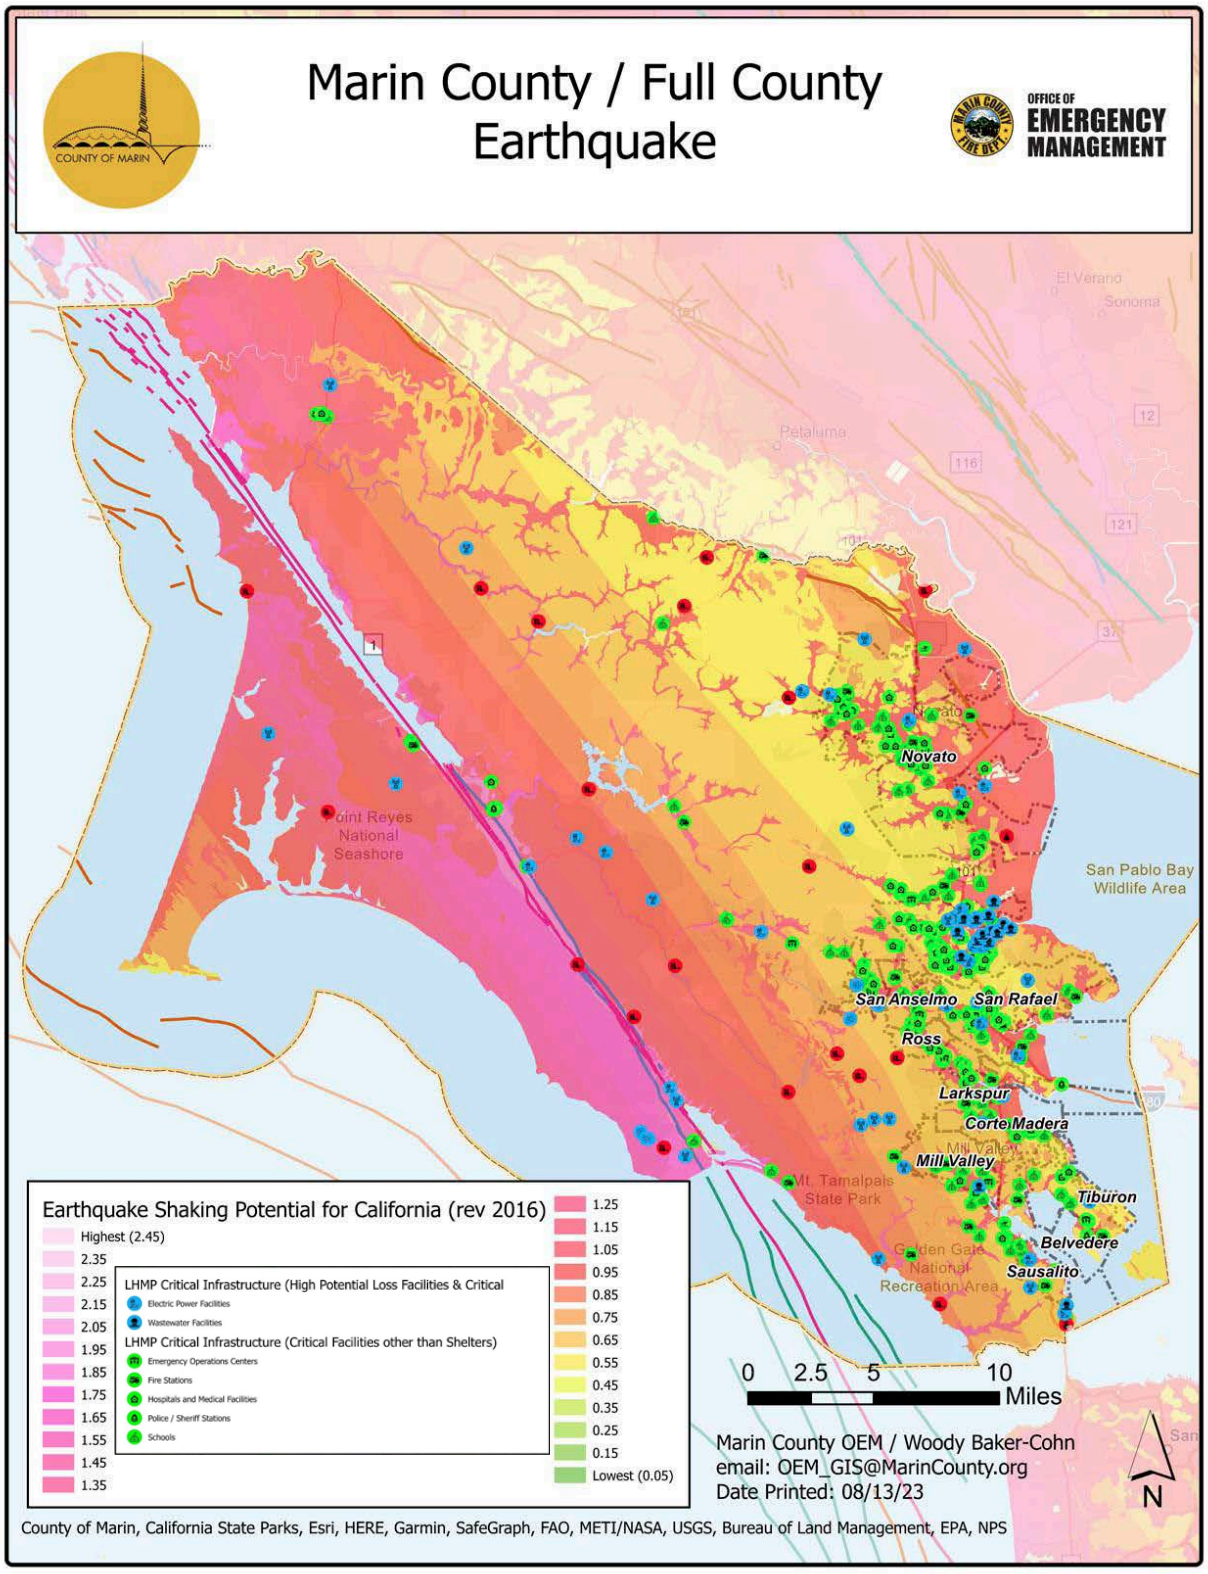

Figure 170: County of Marin Earthquake Impact and Fault Lines
Source: Marin County OEM

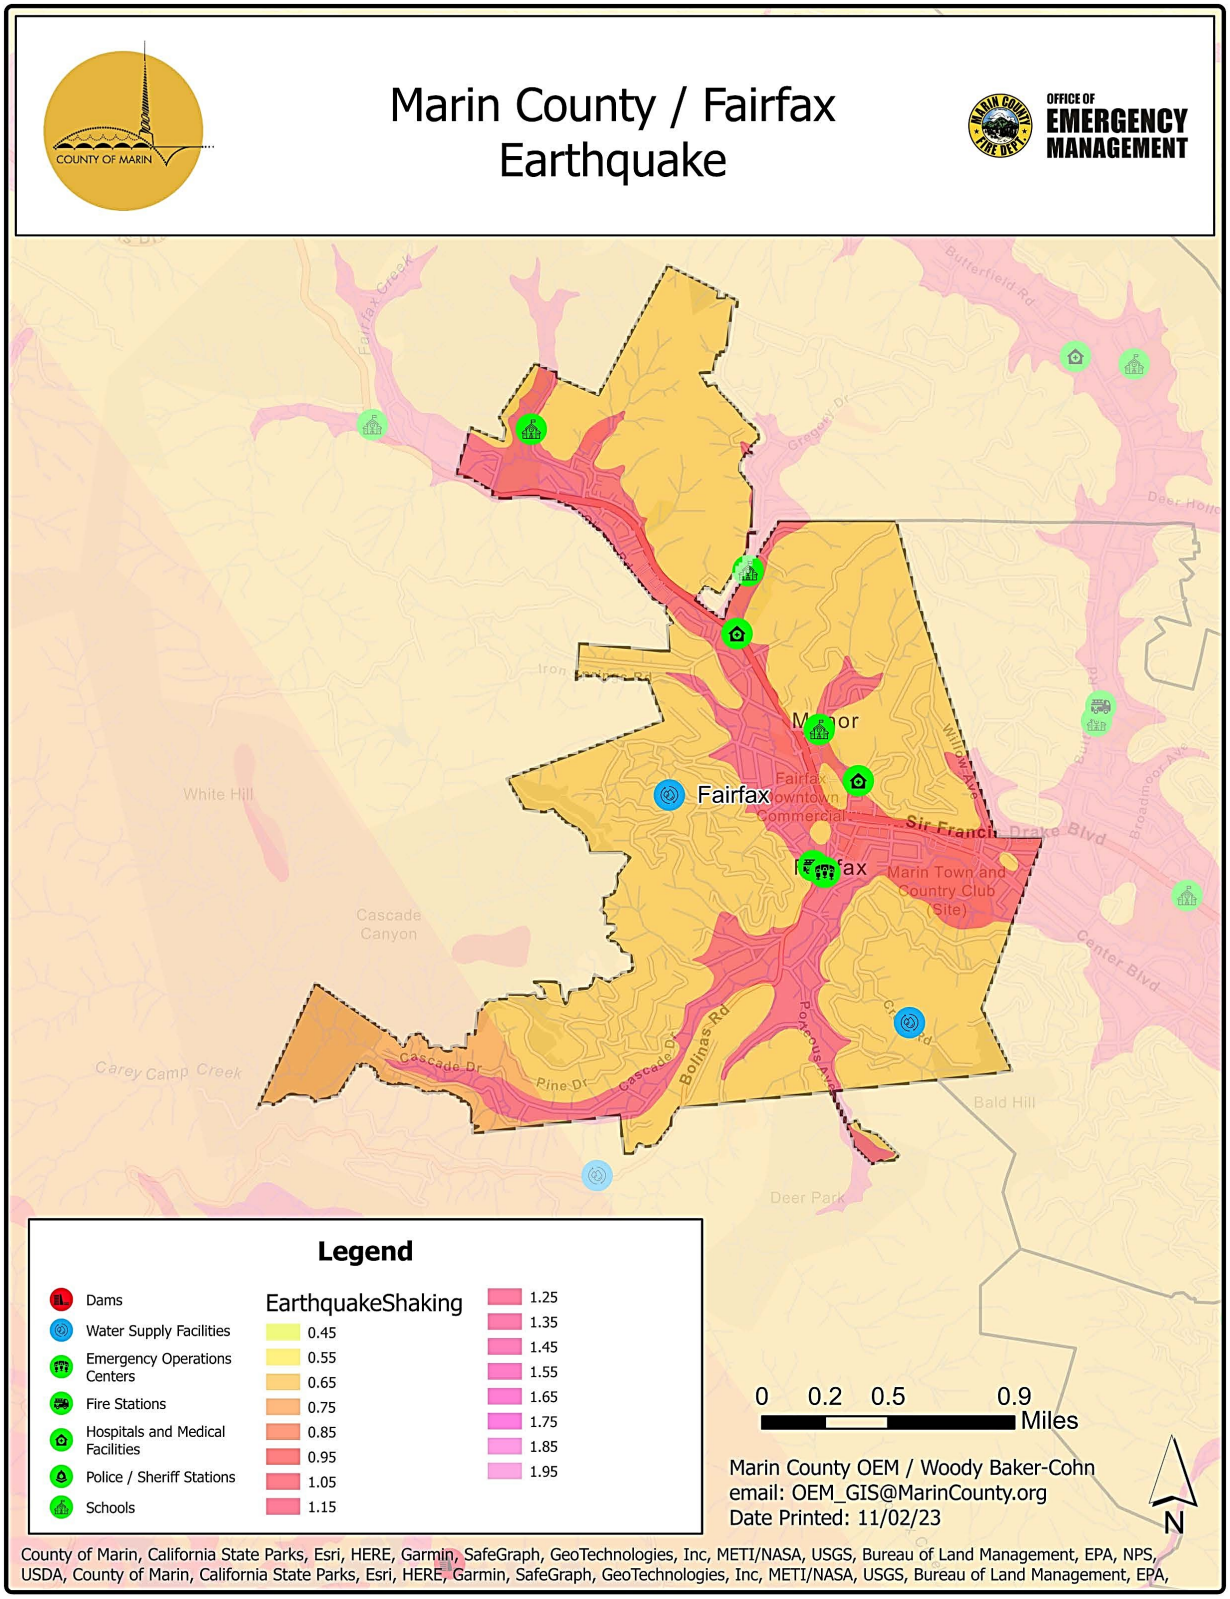

Figure 171: Town of Fairfax Earthquake Critical Facilities and Infrastructure
Source: Marin County OEM

A major earthquake event could result in deaths, injuries, property and environmental damage, and disruption of normal government and community services. Hospitals outside of the Town may be impacted by an earthquake. Telephone systems could be affected by system failure, overloads and loss of electrical power. Natural gas leaks pose a fire threat and breaks in the system could affect service to the Town. Water sources could be compromised due to damage to treatment plants, pump stations and/or the pipelines that distribute potable water. Liquefaction-related damage to water supply pipelines could impair fire suppression, leaving the Town vulnerable to a large fire. Sewage collection systems throughout the Marin County OA may sustain widespread damage if ground movement damages mains or pipelines. Electricity may be interrupted. Landslides may occur. Bridges and roads may be closed because of damage. An earthquake may also result in dam failure. Liquefaction of creeks during the winter storm season could exacerbate flood hazards. The Town may experience road closures from liquefaction, earthquake-triggered landslides, shaking damage to bridges as well as indirect causes of closures such as building damage, hazmat releases, and utility pipeline breaks and fallen trees. The Town of Fairfax will be affected by the regional impacts of regional transportation disruption, particularly closure of the Golden Gate Bridge. Earthquakes could also cause landslides in the areas around Fairfax with steeper terrain, causing damage to homes and roads as a result of shifting soils.

Fairfax hasn't yet experienced a significant earthquake. The Marin County OA was sparsely populated at the time of the 1906 San Francisco Earthquake, and the effects across Fairfax were relatively minimal. Likewise, the 1989 Loma Prieta Earthquake caused minimal impacts as the epicenter of the quake was further south in Santa Cruz County. Smaller earthquakes with minimal to no impacts are routinely felt in Fairfax.

Climate Change and Future Development Considerations

There is no direct link between climate change and seismic activity that could impact the Marin County OA including Fairfax, so climate change is not expected to cause any changes to the frequency or intensity of seismic shaking. According to a 2018 study by the Institute of Physics (IOP)[13], climate change could result in "isostatic rebounds," or a sudden upward movement of the crust because of reduced downward weight caused by glaciers. As glaciers are known to melt when overall global temperatures increase, climate change could indirectly lead to an increase in seismicity in the Marin County OA including Fairfax. Climate change could also impact earthquakes felt in the Marin County OA as droughts can further deteriorate existing fault lines and pumping groundwater can put further pressure on the earth's crust. Future development in the populated areas of Marin County OA where seismic shaking and subsidence are more prevalent could exacerbate the impacts of an earthquake. This includes the lowlands of Fairfax downtown and along its creek beds where the risk of subsidence and subsequent earthquake shaking are higher. Future development in these areas could expose more people and infrastructure to earthquake shaking as a result of climate change.

[13] An Enhanced Seismic Activity Observed Due to Climate Change: Preliminary Results from Alaska. https://iopscience.iop.org/article/10.1088/1755-1315/167/1/012018

2.2.4 FLOODING

Flooding is the rising and overflowing of a body of water onto normally dry land. Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. The area adjacent to a channel is the floodplain. Floodplains are illustrated on inundation maps, which show areas of potential flooding and water depths. In its common usage, the floodplain most often refers to that area that is inundated by the 100-year flood, the flood that has a one percent chance in any given year of being equaled or exceeded. The 100-year flood is the national minimum standard to which communities regulate their floodplains through the National Flood Insurance Program. The 200-year flood is one that has 0.5% chance of being equaled or exceeded each year. The 500-year flood is the flood that has a 0.2 percent chance of being equaled or exceeded in any given year. The potential for flooding can change and increase through various land use changes and changes to land surface, which result in a change to the floodplain. A change in environment can create localized flooding problems inside and outside of natural floodplains by altering or confining natural drainage channels. These changes are most often created by human activity such as construction of bridges or channels. In areas where flow contains high sediment load, such as Easkoot Creek in Stinson Beach (due to an active landslide upstream), the flow carrying capacity of the channel may be reduced dramatically during a single flood event. Coastal floodplains may also change over time as waves and currents alter the coastline (especially wetlands) and sea levels rise.

Flooding can occur in several ways:

Riverine flooding – Riverine flooding, defined as when a watercourse exceeds its "bank-full" capacity, generally occurs as a result of prolonged rainfall, or rainfall that is combined with snowmelt and/or already saturated soils from previous rain events. This type of flood occurs in river systems whose tributaries may drain large geographic areas and include one or more independent river basins. The onset and duration of riverine floods may vary from a few hours to many days and is often characterized by high peak flows combined with a large volume of runoff. Factors that directly affect the amount of flood runoff include precipitation amount, intensity and distribution, the amount of soil moisture, seasonal variation in vegetation, snow depth, and water-resistance of the surface due to urbanization. In the Marin County OA, riverine flooding can occur anytime from November through April and is largely caused by heavy and continued rains, sometimes combined with snowmelt, increased outflows from upstream dams, and heavy flow from tributary streams. These intense storms can overwhelm the local waterways as well as the integrity of flood control structures. Flooding is more severe when antecedent rainfall has resulted in saturated ground conditions. The warning time associated with slow rise riverine floods assists in life and property protection.

Flash flooding – Flash flooding describes localized floods of great volume and short duration. This type of flood usually results from a heavy rainfall on a relatively small drainage area. Precipitation of this sort usually occurs in the winter and spring. Flash floods often require immediate evacuation within the hour and thus early threat identification and warning is critical for saving lives.

Localized/Stormwater flooding – Localized flooding problems are often caused by flash flooding, severe weather, or an unusual amount of rainfall. Flooding from these intense weather events usually occurs in areas experiencing an increase in runoff from impervious surfaces associated with development and urbanization as well as inadequate storm drainage systems.

The area is also at risk to flooding resulting from levee failures and dam failures. Dam failure flooding is discussed separately in the Dam Failure Section of this document; levee failure flooding is discussed separately in the Levee Failure Section of this document. Regardless of the type of flood, the cause is often the result of severe weather and excessive rainfall, either in the flood area or upstream reach.

A weather pattern called the "Atmospheric River" contributes to the flooding potential of the area. An Atmospheric River brings warm air and rain to the West. A relatively common weather pattern brings southwest winds to the Pacific Northwest or California, along with warm, moist air. The moisture sometimes produces many days of heavy rain, which can cause extensive flooding. The warm air also can melt the snowpack in the mountains, which further aggravates the flooding potential. In the colder parts of the year, the warm air can be cooled enough to produce heavy, upslope snow as it rises into the higher elevations of the Sierra Nevada or Cascades. Forecasters and others on the West Coast often used to refer to this warm, moist air as the "Pineapple Express" because it comes from around Hawaii where pineapples are grown. A diagram of an atmospheric river event is shown in Figure 28.

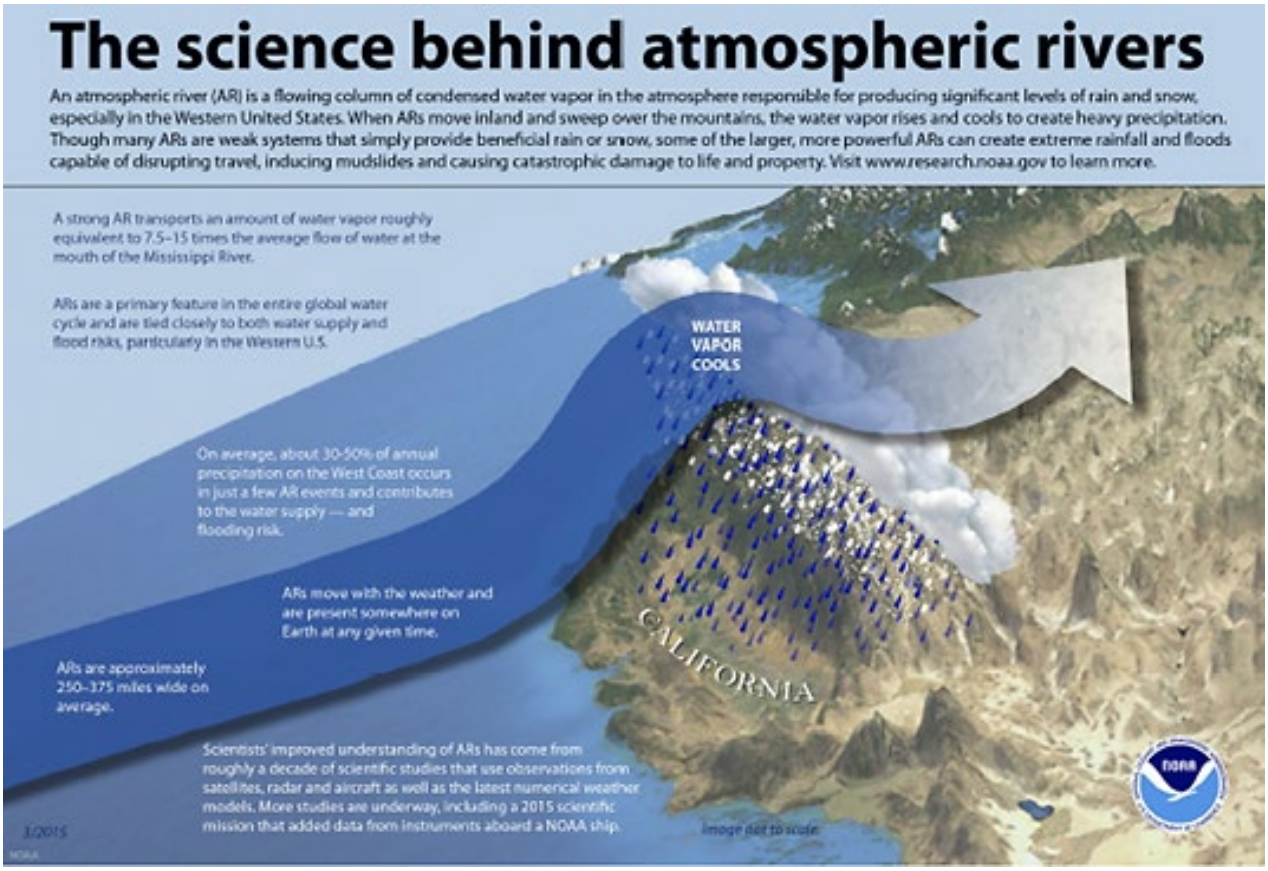

Figure 172: Diagram of an Atmospheric River Event
Source: NOAA

The Marin County OA is susceptible to various types of flood events. In coastal areas, flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Other types of flooding in Marin include isolated ponding and stormwater overflow. Isolated ponding is when pools form on the ground and can occur in any

area that doesn't drain effectively – for example, in a natural depression in the landscape. Stormwater overflow is when storm drains back up. Stormwater drainage systems quickly convey rainwater through underground pipes to creeks and the Bay. When the stormdrains are obstructed or broken or when the water bodies to which they lead to are already full, water backs up onto the streets. Although stormwater overflow and isolated ponding also occur throughout the County, the effects are typically not widespread or significantly damaging.

Flooding in Fairfax generally results from creek flooding. Fairfax is not located along the coast and would not experience coastal flooding. Fairfax is subject to periodic flooding from San Anselmo and Fairfax Creeks. Ross Valley, where Fairfax is located, is naturally prone to flooding by its location, geologic and geomorphic setting: rainfall can be intense, soils are shallow with limited absorption capacity, slopes are steep, stream channels are entrenched and in many places narrow with relatively little storage capacity. The watershed has been altered from its natural condition and many sections of creeks and streams have been placed in culverts and the natural pattern of runoff has been changed. During prolonged and heavy storms the watershed can become saturated. If rainfall is sufficiently intense, heavy runoff can result in high flows exceeding the capacity of the creek in places where conveyance is constrained. Floodwaters escape the creek capacity and breach the creek bank in downtown Fairfax. 'Localized' flooding also occurs in many places in Fairfax and is exacerbated where the storm water drainage network has inadequate capacity for peak flows or is blocked from sediment, debris, or vegetation. Localized flooding is characterized by excessive ponding in the street, and overflow onto lower-lying residential properties even during 5-year storm events. Localized flooding can occur within or outside of the FEMA designated floodplain. Severe winter storms can also be accompanied by hazards and destruction resulting from high winds. High winds knock down limbs or entire trees which subsequently damage power and utility lines, buildings, block streets, and even pose a direct risk to human safety.

Local flooding in Fairfax is exacerbated where the storm water drainage network has inadequate capacity for peak flows. The most flood-prone areas of Fairfax are downtown south of Broadway Boulevard and Center Boulevard. The 100-year floodplain extends primarily along Fairfax Creek, widening up to several hundred feet on either side from Azalea Avenue east through the downtown area to the Post Office. There are numerous homes and businesses in this area along with the Town's primary critical facilities including the Fairfax Police Station and Emergency Operations Center, the Ross Valley Fire Station #21 and the Fairfax Community Center that could be susceptible to flooding. The 100-year also floodplain also extends along San Anselmo Creek west of Bolinas Road and several hundred feet of Deer Park Creek where numerous homes could be susceptible to flooding. The 500-year floodplain occurs primarily along the 100-year floodplain fringe of Fairfax and San Anselmo Creeks, extending several hundred feet up Deer Park Creek, along Wood Lane, and along Bothin Road where there are dozens of homes. No other critical facilities in Fairfax lie within either the 100 or 500-year floodplain.

Table 85: Town of Fairfax Critical Facilities in the Flood Zones
Source: County of Marin/FEMA DFIRM

Floodwaters can be deep enough to drown people and move fast enough to sweep people and vehicles away, lift buildings off foundations, and carry debris that smashes into buildings and other property. Flood waters can cause significant erosion which can lead to slope instability, severely damaging transportation and utility infrastructure by undermining foundations or washing away pavement. If water levels rise high enough to get inside buildings, flooding can cause extensive damage to personal property and the structure itself. Flood events that develop very quickly are especially dangerous because there may be little advance warning.

On 2/7/2017, police closed Park Road because of flooding. Water also flooded most of Bolinas Road through downtown. Olema Road was closed at Westbrae Drive because of mud, flooding and debris. No major damage was reported.

On 12/11/2014, creeks in Fairfax turned into rivers after a storm that dropped over two inches of rain. Flooding was reported along Wood Lane and Porteus Avenue. Traffic on Sir Francis Drake Boulevard in west Fairfax was slowed by flooding. A tree fell on a home, but no major damage from flooding were reported.

On 1/1/2006 the town experienced major flooding with major damage to Police, Fire, and Town Hall buildings along with damage to many businesses, and residences.

On 1/3–1/5/1982, a severe storm damaged almost all businesses on Bolinas Road with flooding. Total loss was estimated at $3 million.

Climate Change and Future Development Considerations

Climate change is expected to affect California's precipitation patterns, which are likely to influence future flood events. A 2017 study[14] found that the number of very intense precipitation days in California is projected to more than double by the end of the century, increasing 117 percent, making it likely that flood events will become more frequent in the Marin County OA including Fairfax. Climate change is expected to alter rainfall patterns in Northern California, including the Marin County OA. As the climate warms, rain events are predicted to become more intense. The Marin County OA including Fairfax will likely experience more rain inundation events that lead to creek flooding and increase the potential threat of tree mortality and other potential hazards. Development along Deer Park Creek, San Anselmo Creek and Fairfax Creek, including the downtown area would expose more people, structures and infrastructure including major roads to creek flooding as a result of climate change.

2.2.5 LAND SUBSIDENCE/SINKHOLES

Land subsidence is a gradual settling or sudden sinking of the Earth's surface owing to subsurface movement of earth materials. The principal causes are aquifer-system compaction, drainage of organic soils through groundwater pumping, underground mining, hydro-compaction, natural compaction, sinkholes, and thawing permafrost. More than 80 percent of the identified subsidence in the United States is a consequence of underground water exploitation. The increasing development of land and water resources threatens to exacerbate existing land-subsidence problems and initiate new ones.

Sinkholes can form in three primary ways. Dissolution sinkholes form when dissolution of the limestone or dolomite is most intensive where the water first contacts the rock surface. Aggressive dissolution also occurs where flow is focused in preexisting openings in the rock, such as along joints, fractures, and bedding planes, and in the zone of water-table fluctuation where groundwater is in contact with the atmosphere. See Figure 30 for a picture and description of how dissolution sinkholes form.

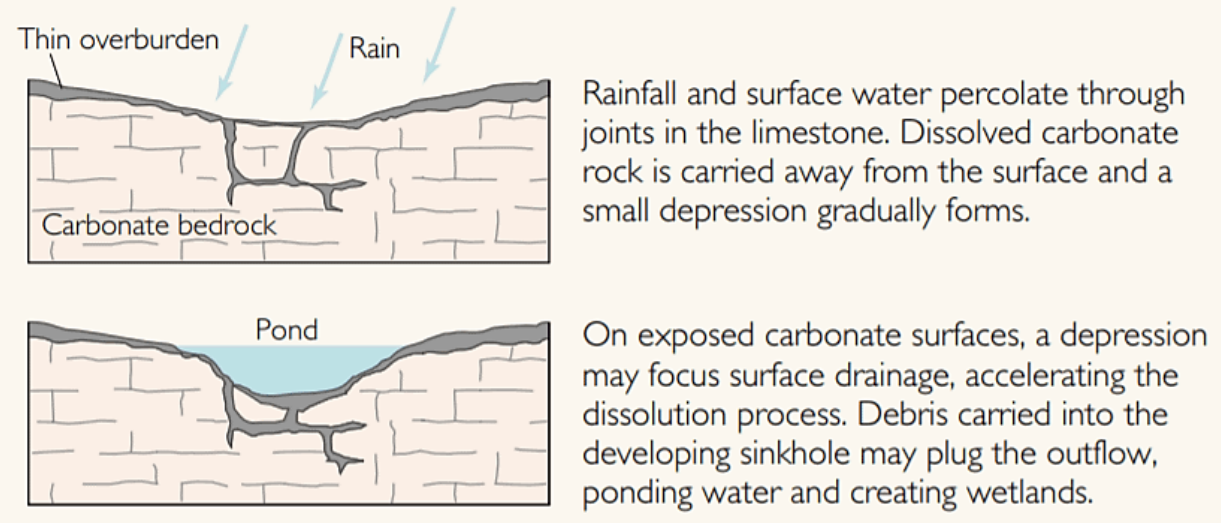

Figure 174: Dissolution Sinkhole Formation
Source: USGS

[14] Precipitation in a Warming World: Assessing Projected Hydro-Climate Changes in California and other Mediterranean Regaions. https://www.nature.com/articles/s41598-017-11285-y

Cover-subsidence sinkholes tend to develop gradually where the covering sediments are permeable and contain sand. In areas where cover material is thicker, or sediments contain more clay, cover-subsidence sinkholes are relatively uncommon, are smaller, and may go undetected for long periods. See Figure 31 for a picture and description of how cover-subsidence sinkholes form.

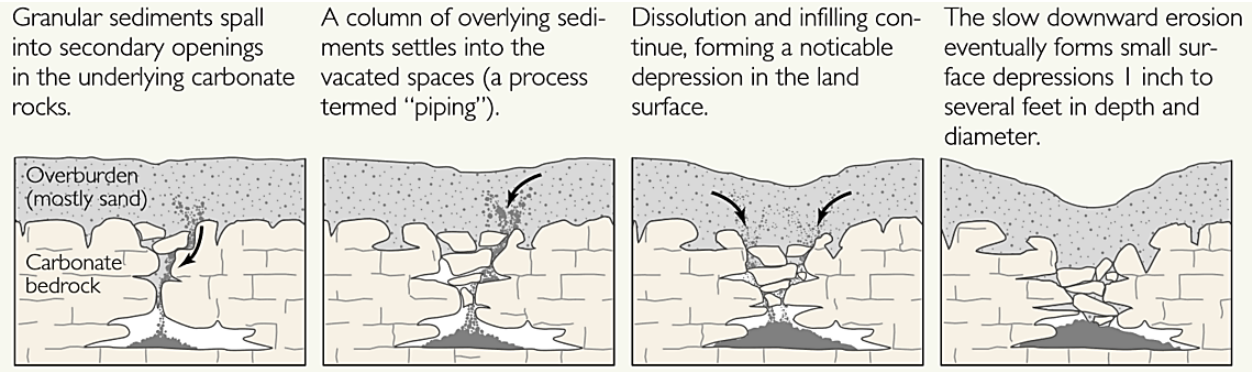

Figure 175: Cover-Subsidence Sinkhole Formation
Source: USGS

Cover-collapse sinkholes may develop abruptly over a period of hours and cause catastrophic damages. They occur where the covering sediments contain a significant amount of clay. Over time, surface drainage, erosion, and deposition of sediment transform the steep-walled sinkhole into a shallower bowl-shaped depression. See Figure 32 for a picture and description of how cover-collapse sinkholes form.

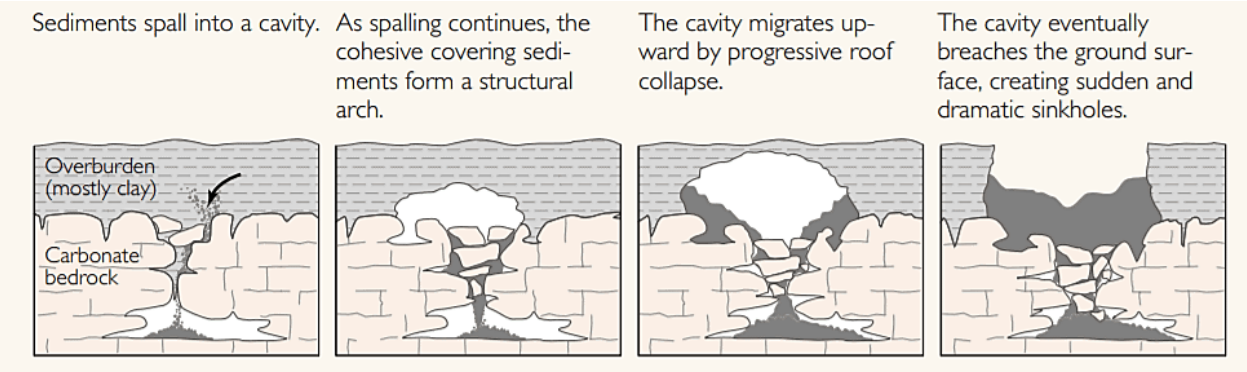

Figure 176: Cover-Collapse Sinkhole Formation
Source: USGS

New sinkholes have been correlated to land-use practices, especially from groundwater pumping and from construction and development practices that cause land subsidence. Sinkholes can also form when natural water-drainage patterns are changed and new water-diversion systems are developed. Some sinkholes form when the land surface is changed, such as when industrial and runoff-storage ponds are created. The substantial weight of the new material can trigger an underground collapse of supporting material, thus causing a sinkhole.

The overburden sediments that cover buried cavities in the aquifer systems are delicately balanced by groundwater fluid pressure. The water below ground helps to keep the surface soil in place. Groundwater pumping for urban water supply and for irrigation can produce new

sinkholes in sinkhole-prone areas. If pumping results in a lowering of groundwater levels, then underground structural failure, and thus, sinkholes, can occur.

Land subsidence and sinkholes would most likely occur in the central lowland areas of Fairfax along Fairfax and San Anselmo creeks where the ground is more porous. This includes the primary commercial area of town where there are numerous residences, businesses and critical facilities the Fairfax Police Station and Emergency Operations Center, the Ross Valley Fire Station #21 and the Fairfax Community Center. Land subsidence could have numerous impacts for Fairfax, including the settling of businesses and homes as well as the shifting of roadways and utility infrastructure that run through the Town.

On December 13, 2021 a sink hole was discovered under the sidewalk and part of the eastbound lane at the 2300 block of Sir Francis Drake. The sink hole appeared to be at least 15-feet deep.

Climate Change and Future Development Considerations

Climate change could indirectly influence land subsidence as more severe and prolonged periods of drought may encourage more groundwater withdrawals. The rate of land subsidence could increase across the Marin County OA including the lowland areas of Fairfax as a result of climate change. The impacts of land subsidence on infrastructure, including roads and underground utilities, in Fairfax could increase with future development in the lowland populated areas of the city, particularly the downtown area, where land subsidence is more likely to occur.

2.2.6 Severe Weather – Extreme Heat

Extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. A heat wave is an extended period of extreme heat, often with high humidity. When relative humidity is factored in, the temperature can feel much hotter as reflected in the Heat Index (see Figure 33):

NOAA's National Weather Service

Heat Index

Temperature (°F)

Relative Humidity (%)	80	82	84	86	88	90	92	94	96	98	100	102	104	106	108	110

Likelihood of Heat Disorders with Prolonged Exposure or Streuous Activity

Caution | Extreme Caution | Danger | Extreme Danger

Figure 177: Heat Index
Source: NOAA

Heat kills by taxing the human body beyond its abilities. In a normal year, about 1,300 Americans succumb to the demands of summer heat.

Extreme heat has the potential to impact all areas of Fairfax and would be felt more at lower elevations in the central areas of the Town. Temperatures can feel warmer in this area due to the widespread presence of concrete and asphalt, which stores heat longer. Heat waves can cause power outages and can sicken people who are exposed to high temperatures too long, particularly infants and the elderly.

In September 2022 the Marin County OA including the Town of Fairfax experienced an Extreme Heat Event with temperatures exceeding 103 degrees.

Climate Change and Future Development Considerations

The primary effect of climate change is warmer average temperatures. The annual average daily high temperatures in California are expected to rise by 2.7°F by 2040, 5.8°F by 2070, and 8.8°F by 2100 compared to observed and modeled historical conditions. At the current rate, annual average temperatures in the Marin County OA region and Bay Area will likely increase by approximately 4.4 degrees by 2050 and 7.2 degree by the end of the century unless significant efforts are made to reduce greenhouse emotions according to California's latest climate change assessment.

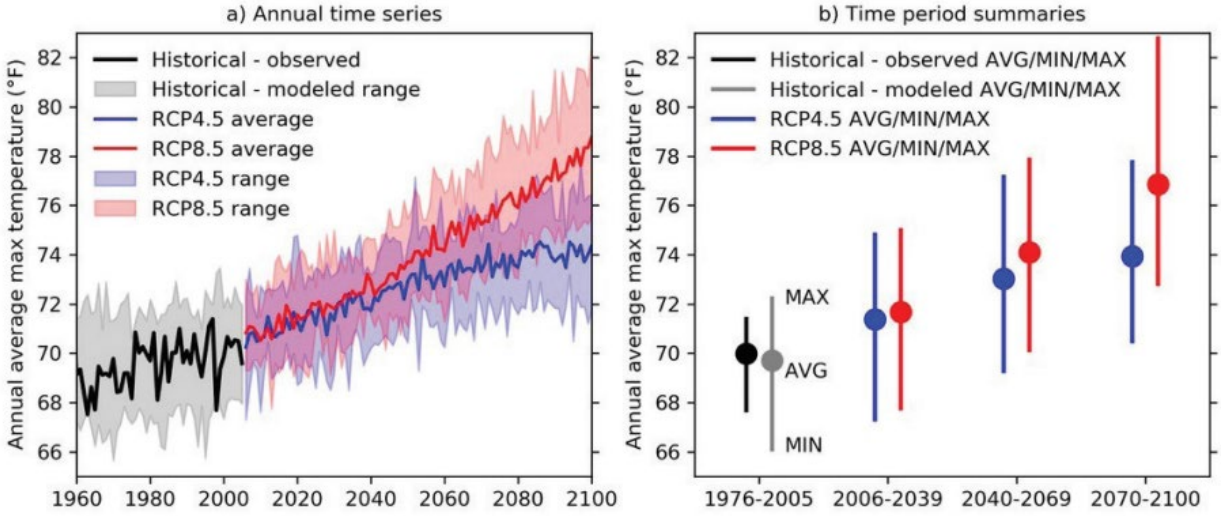

Figure 178: Annual Average Temperatures in the San Francisco Bay Area, 2000-2100
Source: California Climate Change Assessment (Fourth Edition)

As climate change accelerates in the 21st century, it is anticipated that extreme heat events will become more frequent and intense across the Marin County OA including in Fairfax. There will be increased residential and business needs for cooling and addressing heat-related issues. These effects would primarily be felt in the lowland areas of Fairfax where heat builds in developed areas. Heat waves also tax the energy grid. Future development in the Marin County OA including Fairfax could exacerbate the impacts from heat related events, particularly

in electricity provision and water delivery. Increased temperatures will also lead to an increase in the occurrence and severity of wildfires across the Marin County OA including Fairfax as conditions become hotter and drier. These effects will primarily be felt in the open space areas of Fairfax where hotter and drier conditions are more apt to lead to wildfires. Future development near the many open spaces around Fairfax could expose more people and infrastructure to the threat of a major wildfire as a result of increasing temperatures.

2.2.7 Severe Weather – High Wind & Tornado

High Wind

High wind is defined as a one-minute average of surface winds 40 miles per hour or greater lasting for one hour or longer, or winds gusting to 58 miles per hour or greater regardless of duration that are either expected or observed over land. These winds may occur as part of a seasonal climate pattern or in relation to other severe weather events such as thunderstorms. The Beaufort scale is an empirical measure that relates wind speed to observed conditions on land and is a common measure of wind intensity (see Figure 35).

Beaufort number	Description	Wind speed		Land conditions
		kts	km/h	
0	Calm	< 1	< 1	Calm. Smoke rises vertically.
1	Light air	1 – 2	1 – 5	Wind motion visible in smoke.
2	Light breeze	3 – 6	6 – 11	Wind felt on exposed skin. Leaves rustle.
3	Gentle breeze	7 – 10	12 – 19	Leaves and smaller twigs in constant motion.
4	Moderate breeze	11 – 15	20 – 28	Dust and loose paper raised. Small branches begin to move.
5	Fresh breeze	16 – 20	29 – 38	Branches of a moderate size move. Small trees begin to sway.
6	Strong breeze	21 – 26	39 – 49	Large branches in motion. Whistling heard in overhead wires. Umbrella use becomes difficult. Empty plastic garbage cans tip over.
7	High wind, Moderate gale, Near gale	27 – 33	50 – 61	Whole trees in motion. Effort needed to walk against the wind. Swaying of skyscrapers may be felt, especially by people on upper floors.
8	Gale, Fresh gale	34 – 40	62 – 74	Some twigs broken from trees. Cars veer on road. Progress on foot is seriously impeded.
9	Strong gale	41 – 47	75 – 88	Some branches break off trees, and some small trees blow over. Construction/temporary signs and barricades blow over. Damage to circus tents and canopies.
10	Storm, Whole gale	48 – 55	89 – 102	Trees are broken off or uprooted, saplings bent and deformed. Poorly attached asphalt shingles and shingles in poor condition peel off roofs.
11	Violent storm	56 – 63	103 – 117	Widespread vegetation damage. Many roofing surfaces are damaged; asphalt tiles that have curled up and/or fractured due to age may break away completely.
12	Hurricane	≥ 64	≥ 118	Very widespread damage to vegetation. Some windows may break; mobile homes and poorly constructed sheds and barns are damaged. Debris may be hurled about.

Figure 179: Beaufort Wind Scale
Source: NOAA

Windstorms in the Marin County OA are typically straight-line winds. Straight-line winds are generally any thunderstorm wind that is not associated with rotation (i.e., is not a tornado). It is these winds, which can exceed 100 mph, which represent the most common type of severe weather and are responsible for most wind damage related to thunderstorms.

Tornado

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes are the most powerful storms that exist, and damage paths can be in excess of one mile wide and 50 miles long. The Enhanced Fujita Scale (see Figure 36) is commonly used to rate the intensity of tornadoes in the United States based on the damages that they cause.

Enhanced Fujita Scale	
EF-0	65-85 mph winds
EF-1	86-110 mph winds
EF-2	111-135 mph winds
EF-3	136-165 mph winds
EF-4	166-200 mph winds
EF-5	>200 mph winds

Figure 180: Enhanced Fujita Scale
Source: NOAA

Tornadic waterspouts are tornadoes that form over water or move from land to water. They have the same characteristics as a land tornado. They are associated with severe thunderstorms, and are often accompanied by high winds and seas, large hail, and frequent dangerous lightning.

Figure 181: Waterspout Formation
Source: MarineInsights

All of Fairfax is susceptible to storms and damage from wind and tornadoes, as most of the Town has tree cover. Drought can increase the susceptibility of trees toppling over in a high wind event. Fallen trees could damage homes and other facilities. Power lines could be impacted by fallen trees and wind, causing power outages. Roadways could also become blocked by fallen trees, affecting the ability of residents to reach their homes.

Fairfax has experienced winter storms that have caused damage.

On 3/14/2023, a wild storm ripped through Fairfax, causing a tree to fall on a fence at Manor Elementary School on Oak Manor Drive.

Figure 182: Wind Damage at Manor Elementary School – 2023 Storm
Source: Marin Independent Journal

On 1/8/2017, a storm with high winds caused 2,000 customers in Fairfax to lose power. Tree branches ensnared power lines on Spruce Road.

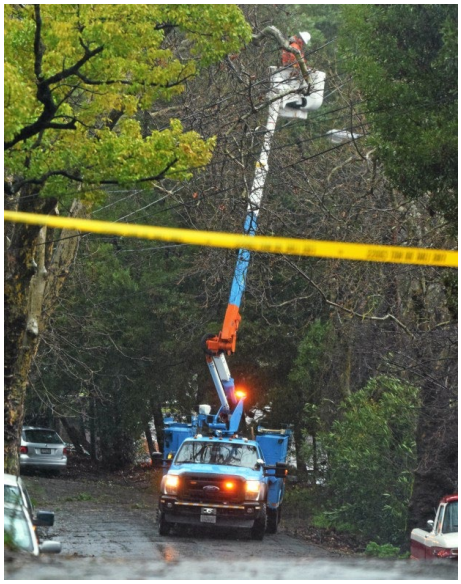

Figure 183: Wind Damage on Spruce Road – 2017 Storm
Source: Marin Independent Journal

On 11/30/2012, high winds knocked trees down onto power lines which sparked a fire that burned down a small cabin, resulting in a fatality.

Climate Change and Future Development Considerations

It is anticipated that the atmospheric rivers that deliver storms to Northern California may intensify because of climate change. This increase in storm intensity may bring more intense winds and potential tornados to Northern California, including the Marin County OA and Fairfax. Significant wind events and tornados can topple trees, particularly those that may be saturated, or drought stressed as a result of climate change. An increase in fallen trees in Fairfax as a result of increased storms due to climate change can lead to an increase in power outages.

Future development in any of the forested areas around Fairfax with high tree cover including in residential areas will increase the effects of severe wind events.

2.2.8 WILDFIRE

A wildfire is a fire that occurs in an area of combustible vegetation. The three conditions necessary for a wildfire to burn are fuel, heat, and oxygen. Fuel is any flammable material that can burn, including vegetation, structures, and cars. The more fuel that exists and the drier that fuel is, the more intense the fire can be. Wildfires can be started naturally through lightning or combustion, or can be set by humans. There are many sources of human-caused wildfires including arson, power lines, a burning campfire, an idling vehicle, trains, and escaped controlled burns. On average, four out of five wildfires are started by humans. Uncontrolled wildfires fueled by wind and weather can burn acres of land and everything in their path in mere minutes, and can reach speeds up to 15 miles per hour. On average, more than 100,000 wildfires burn 4 to 5 million acres of land in the United States every year. Although wildfires can occur in any state, they are most common in the Western states including California where heat, drought, and thunderstorms create perfect wildfire conditions.

Wildfires are of primary concern when they occur in the Wildland Urban Interface (WUI), which is defined as areas where homes are built near or among lands prone to wildfire. Even relatively small acreage fires may result in disastrous damages. Most structures in the WUI are not destroyed from direct flame impingement, but from embers carried by wind. The damages can be widely varying, but are primarily reported as damage to infrastructure, built environment, and injuries to people.

The pattern of increased damages is directly related to increased urban spread into historical forested areas that have wildfire as part of the natural ecosystem. Many WUI fire areas have long histories of wildland fires that burned only vegetation in the past. However, with new development, a wildland fire following a historical pattern may now burn these newly developed areas. WUI fires can occur where there is a distinct boundary between the built and natural areas or where development or infrastructure has encroached or is intermixed in the natural area. WUI fires may include fires that occur in remote areas that have critical infrastructure easements through them, including electrical transmission towers, railroads, water reservoirs, communications relay sites or other infrastructure assets.

Consequently, wildland fires that burn in natural settings with little or no development are part of a natural ecological cycle and may actually be beneficial to the landscape. Century old policies of fire exclusion and aggressive suppression have given way to better understanding of the importance fire plays in the natural cycle of certain forest types.

Warning times are usually adequate to ensure public safety, provided that evacuation recommendations and orders are heeded in a timely manner. While in most cases wildfires are contained within a week or two of outbreak, in certain cases, they have been known to burn for months, or until they are completely extinguished by fall rains.

Wildfire poses the greatest risk to human life and property in the Marin County OA's densely populated WUI, which holds an estimated 69,000 living units. The Marin County OA is home to 23 communities listed on CAL FIRE's Communities at Risk list, with approximately 80% of the

total land area in the county designated as having moderate to very high fire hazard severity ratings. The county has a long fire history with many large fires over the past decades, several of which have occurred in the WUI. To compound the issue, national fire suppression policies and practices have contributed to the continuous growth (and overgrowth) of vegetation resulting in dangerous fuel loads. The Community Wildfire Protection Plan (CWPP) provides a scientifically based assessment of wildfire threat in the WUI of the Marin County OA.

Fire protection in California is the responsibility of either the federal, state, or local government. On federally owned land, or federal responsibility areas (FRA), fire protection is provided by the federal government, and or in partnership with local agreements. In state responsibility areas (SRA), CAL FIRE typically provides fire protection. However, in some counties CAL FIRE contracts with county fire departments to provide protection of the SRA – this is the case in the Marin County OA, where CAL FIRE contracts with MCFD. Local responsibility areas (LRA) include incorporated cities and cultivated agriculture lands, and fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

CAL FIRE contracts with MCFD to provide wildland fire protection and associated fire prevention activities for lands designated by the State Board of Forestry as SRA. The County of Marin is one of six counties in the state who contract with CAL FIRE to protect SRA. The MCFD is responsible for the protection of approximately 200,000 acres of SRA within the county and is the primary agency that handles wildland fires. MCFD also provides similar protection services to approximately 100,000 acres of FRA in the Golden Gate National Recreation Area (GGNRA), the Muir Woods National Monument, and the Point Reyes National Seashore.

Figure 40 indicates the federal responsibility areas, state responsibility areas and local responsibility areas in the Marin County OA.

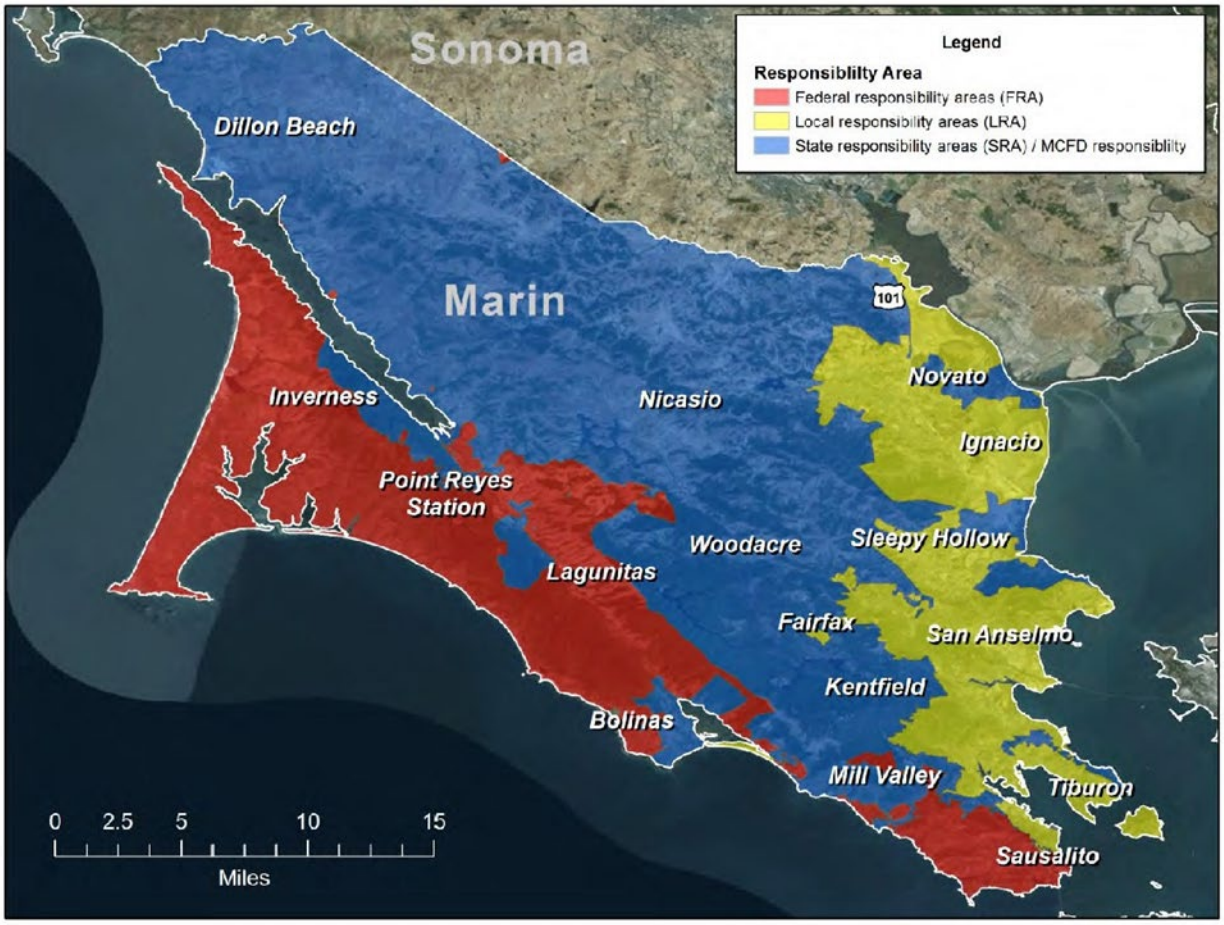

Figure 184: Federal, State and Local Responsibility Areas in the Marin County OA
Source: Marin Community Wildfire Protection Plan

The mix of weather, diverse vegetation and fuel characteristics, complex topography, and land use and development patterns in the Marin County OA are important contributors to the fire environment. The MCFD Woodacre Emergency Command Center (ECC) currently manages the data from four Remote Automated Weather Stations (RAWS) for predicting fire danger utilizing the National Fire Danger Rating System (NFDRS) during the fire season. The RAWS are located in Woodacre, Middle Peak, Barnabe, Big Rock and a new station will be coming online in Novato.

The Marin County OA is bounded by the cool waters of the Pacific Ocean to the west, the San Francisco and Richardson Bays to the southeast, the San Pablo Bay to the east, and Sonoma County agricultural lands to the north. The combination of these large bodies of water, location in the mid-latitudes, and the persistent high pressure over the eastern Pacific Ocean results in several micro-climates. Weather in the OA consists of warm, dry summers and cool, wet winters. The climate in early fall and late spring is generally similar to the summer, and late fall is similar to winter. Spring is generally cool, but not as wet as the winter. While these general weather conditions are fairly representative of the typical Marin County OA weather, complex topography, annual variability of weather patterns, and less frequent and transient weather patterns are important to fire conditions.

In the late spring through early fall, the combination of frequent and strong high-pressure systems (known as the Pacific High) over California combined with the cool waters of the ocean/bays results in persistent fog and low clouds along the coast (including over the southern Marin County OA near the San Francisco Bay). The fog often penetrates into the inland valleys of the northern and central Marin County OA, especially during overnight hours. At the coastline, mist from fog can keep the land surfaces modestly moist while inland land surfaces above the fog or inversion are often very dry.

The Pacific High that persists from late spring through early fall over the eastern Pacific, combined with a thermal low pressure over the Central Valley of California, results in an almost continuous sea breeze. These winds usher in cool and moist air and can be strong (15 to 25 mph), especially over the ridge tops and through northwest to southeast lying valleys, including San Geronimo/San Anselmo, Hicks, and Lucas Valleys. These westerly winds are usually highest in the afternoon, decrease in the evening, and are light overnight before increasing again in the late morning/early afternoon.

Occasionally in the summer and more often in the fall, the Pacific High moves inland and centers over Oregon and Idaho, while low pressure moves from the Central Valley of California to southern California and Arizona. The resulting north-to-south pressure gradient can be strong enough to retard the typical sea breeze and can even result in winds blowing from the land to the ocean (offshore winds). As the offshore winds move air from the Great Basin to the coastal areas of California, the air descends and compresses, which greatly warms and dries the air. Under these “Diablo” wind conditions, temperatures in the Marin County OA can reach 100°F in the inland areas and even 80°F at the coast, and relative humidity can be very low. In addition, wind speeds can be high (20 to 40 mph) and gusty and are often much faster over the mountains and ridge tops such as Mt. Tamalpais, Loma Alta, and Mt. Burdell compared to low-lying areas. Wind speeds can be high over the ridges and mountains at all times of day under this “offshore” wind pattern and are often much slower or even calm at night in low-lying areas because nighttime cooling decouples the aloft winds from the surface winds. It is during these Diablo wind events that there is a high potential for large, wind-driven fires should there be an ignition. Historically, the largest and most destructive fires have occurred during these offshore (also known as Foehn) wind events including the Angel Island and the Vision fires.

A few times per year in the summer and early fall, monsoonal flow from Mexico brings in moist and unstable air over central and northern California, which can result in thunderstorms with or without precipitation. With the otherwise dry summer conditions, the lightning can ignite fires. These monsoonal flow patterns are usually only one to two-day events.

Beginning in late November and lasting through the end of March, the Pacific High moves south and weakens, allowing storms that originate in the Gulf of Alaska to move over California.

These storms bring precipitation and, at times, strong winds out of the south. Each storm usually results in one fourth inch to several inches of rain over a day or so. Near Mt. Tamalpais, rainfall amounts are enhanced by orographic lifting, resulting in higher rain amounts in the Kentfield and Fairfax areas compared to the rest of the county. Typically, after the first rain in November, the cool weather and occasional storm keeps the ground wet through late Spring. However, in some years, significant rain does not occur until later in the year (e.g., early-to-late December) and there can be several weeks without any storms and rain. During storms, temperatures are usually mild.

When there are no storms over California, a land-breeze typically forms (i.e., winds blowing from the Central Valley to the Pacific Ocean). These winds can reach 30 mph, and travel through the southeast to northwest lying valleys, over low-lying ridges such as the Marin Headlands, and through the Golden Gate. These winds are usually highest in the mid-morning hours and decrease in the afternoon as the Central Valley warms during the day. The winds are associated with cold and modestly moist air.

In late February/early March through late April, the Pacific High strengthens and moves north, and storms impacting the county become less frequent. During this time of year there is often a low-pressure area over the desert in southwest California. The combination of the Pacific High to the north and low-pressure to the southwest results in strong winds blowing from the northwest to the southeast. Like the sea breeze, these winds bring in cool, moist air and are usually highest in the afternoon hours. Because of winter and spring rains, the land is wet and there is little danger of wildland fire despite the strong winds and only occasional precipitation. There is often little coastal fog this time of year.

Vegetation, which is also known as fuel, plays a major role in fire behavior and potential fire hazards. A fuel's composition, including moisture level, chemical make-up, and density, determines its degree of flammability. Of these, fuel moisture level is the most important consideration. Generally, live trees contain a great deal of moisture while dead logs contain very little. The moisture content and distribution of fuels define how quickly a fire can spread and how intense or hot it may become. High moisture content will slow the burning process since heat from the fire must first eliminate moisture.

In addition to moisture, a fuel's chemical makeup determines how readily it will burn. Some plants, shrubs, and trees such as chamise and eucalyptus (both present in the Marin County OA) contain oils or resins that promote combustion, causing them to burn more easily, quickly, and intensely.

Finally, the density of a fuel influences its flammability; when fuels are close together but not too dense, they will ignite each other, causing the fuel to spread readily. However, if fuels are so close that air cannot circulate easily, the fuel will not burn freely.

The Marin County OA has extensive topographic diversity that supports a variety of vegetation types.

Environmental factors, such as temperature, precipitation, soil type, aspect, slope, and land use history, all help determine the existing vegetation at any given location. In the central and eastern parts of the county, north facing slopes are usually densely wooded from lower elevations to ridge peaks with a mixture of mostly hardwood tree species such as coast live oak, California bay, Pacific madrone, and other oak species. Marshlands are also present throughout the county; once ignited marsh fires can be difficult to contain and extinguish.

Grasslands with a mixture of native and nonnative annual and perennial plant species occur most often in the northern and western parts of the county due to a combination of soil type, lower rainfall, and a long history of ranching. The southern and western facing slopes tend to have a higher percentage of grasslands, which in turn have the potential to experience higher rates of fire spread. Grassland fires are dangerous even without extreme fire weather scenarios due to the rapid rate of fire spread; in some cases, fires spread so quickly that large areas can burn before response resources are able to arrive.

In the west portion of the county closer to the coast, where precipitation is higher and marine influence is greater, most areas are densely forested with conifer species (i.e., Bishop pine, Douglas-fir, and coast redwood) and associated hardwood species. Chaparral vegetation also occurs in parts of the county, especially on steeper south and west facing slopes. This mix of densely forested areas mixed with chaparral results in higher fuel loads and potentially higher fire intensity. Expansion of the residential community into areas of heavier vegetation has resulted in homes existing in close proximity to dense natural foliage; these homes are often completely surrounded by highly combustible or tall vegetation, increasing the potential that wildland fires could impact them.

As part of the development of the CWPP, an updated vegetation map layer was created using the most recent vegetation information available from a variety of state and local data sources.

Vegetation distribution in the Marin County OA is characterized by approximately 20 different types of vegetation which have been classified into 15 fire behavior fuel models.

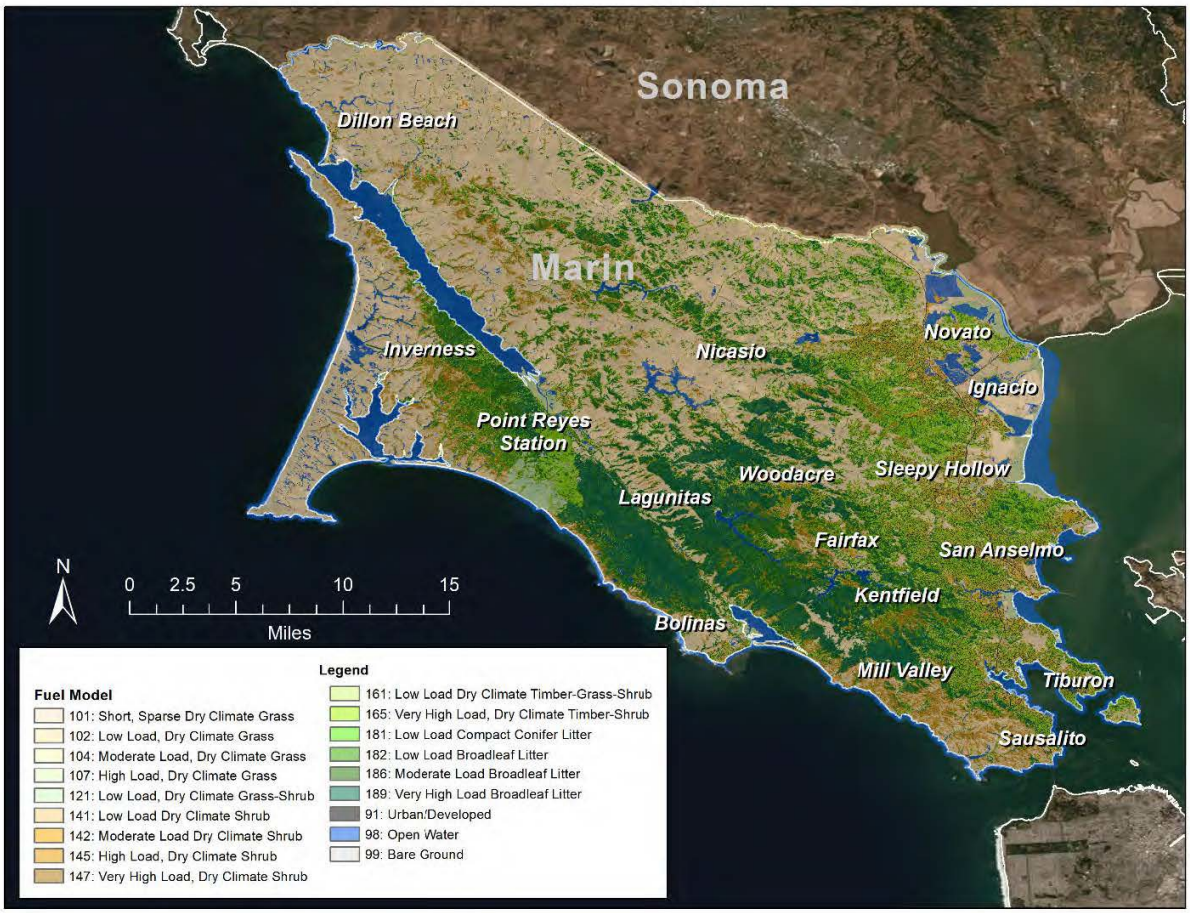

Figure 185: Fuel Model Map for the Marin County OA
Source: Unknown

Insect infestations and plant diseases, such as California oak mortality syndrome (sudden oak death), are increasing and threaten to change the structure and overall health of native plant communities in the Marin County OA. Sudden oak death has no known cure and is the biggest concern; this syndrome is caused by the fungus-like Phytophthora ramorum, which has led to

widespread mortality of several tree species in California since the mid-1990s; the tanoak (Lithocarpus densiflorus) in particular appears to have little or no resistance to the disease. Sudden oak death has resulted in stands of essentially dead trees with very low fuel moistures.

Studies examining the impacts of sudden oak death on fire behavior indicate that while predicted surface fire behavior in sudden oak death stands seems to conform to a common fuel model already in use for hardwood stands, the very low moisture content of dead tanoak leaves may lead to crown ignitions more often during fires of “normal” intensity.

Two other plant diseases prevalent in the Marin County OA are pitch canker (which affects conifers such as Bishop pine and other pine species), and madrone twig dieback (which affects Pacific madrones). Pitch canker is caused by the fungus Fusarium circinatum (F. subglutinans, F. sp. pini), which enters the tree through wounds caused by insects. While some trees do recover, most infected trees are eventually killed by the fungus. Management of this disease largely focuses on containment to reduce the fungus spreading to other trees. Pitch canker is a particular issue in the NPS lands of Pt. Reyes National Seashore, where many acres of young Bishop Pines that were seeded on the Inverness Ridge by the Mount Vision Fire of 1995 have been infected.

These dead and dying trees have created large swaths of land with dense and dry fuel loads. Madrone twig dieback is caused by the native fungus Botryosphaeria dothidea and appears to be getting worse throughout the county due to drought effects on Pacific madrones. Three additional threats to trees common to the Marin County OA include:

- Bark and ambrosia beetles (Monarthrum dentiger and monarthrum scutellare), which target oak and tanoak trees. Sudden oak death may be exacerbating the effects of beetle infestations which prey on trees already weakened by this disease.
- Root rot, caused by oak root fungus (Armillaria mellea), is primarily associated with oaks and other hardwoods but also attacks conifers. These fungal infestations cause canopy thinning and branch dieback and can kill mature trees. As with the beetle infestations, sudden oak death may be exacerbating the effects of root rot fungus in the county forests.
- Velvet-top fungus (Phaeolus schweinitzii) is a root rot fungus affecting Douglas-fir and other conifers, with the infection typically occurring through a wound.

Topography characterizes the land surface features of an area in terms of elevation, aspect, and slope. Aspect is the compass direction that a slope faces, which can have a strong influence on surface temperature, and more importantly on fuel moistures. Both elevation and aspect play an important role in the type of vegetation present, the length of the growing season, and the amount of sunlight absorbed by vegetation. Generally, southern aspects receive more solar radiation than northern aspects; the result is that soil and vegetation on southern aspects is warmer and dryer than soil and vegetation on northern aspects. Slope is a measure of land steepness and can significantly influence fire behavior as fire tends to spread more rapidly on steeper slopes. For example, as slope increases from 20 – 40%, flame heights can double and rates of fire spread can increase fourfold; from 40 – 60%, flame heights can become three times higher and rates of spread can increase eightfold.

The Marin County OA is topographically diverse, with rolling hills, valleys and ridges that trend from northwest to southeast. Elevation throughout the county varies considerably, with Mt.

Tamalpais' peak resting at 2,574 feet above sea level and many communities at or near sea level. Correspondingly, there is considerable diversity in slope percentages. The San Geronimo Valley slopes run from level (in the valley itself) to near 70%. Mt. Barnabe has slopes that run from 20 to70%, and Throckmorton ridge has slopes that range in steepness from 40 – 100%. These slope changes can make fighting fires extremely difficult.

In the WUI where natural fuels and structure fuels are intermixed, fire behavior is complex and difficult to predict. Research based on modeling, observations, and case studies in the WUI indicates that structure ignitability during wildland fires depends largely on the characteristics and building materials of the home and its immediate surroundings.

The dispersion of burning embers from wildfires is the most likely cause of home ignitions. When embers land near or on a structure, they can ignite near-by vegetation or accumulated debris on the roof or in the gutter. Embers can also enter the structure through openings such as an open window or vent and could ignite the interior of the structure or debris in the attic.

Wildfire can further ignite structures through direct flame contact and/or radiant heat. For this reason, it is important that structures and property in the WUI are less prone to ignition by ember dispersion, direct flame contact, and radiant heat.

Public Safety Power Shutoff (PSPS) Events

As a result of the 2017 Northern California Wildfires, the 2018 Camp Fire in Butte County and other wildfires caused by power line infrastructure, Pacific Gas & Electric (PG&E) began initiating Public Safety Power Shutoff (PSPS) events in their service areas (including the Marin County OA) to help prevent the start of future wildfires. PG&E will initiate a PSPS if conditions indicate potentially dangerous weather conditions in fire-prone areas due to strong winds, low humidity, and dry vegetation. During these events, PG&E will proactively turn off power in high fire risk areas to reduce the threat of wildfires. The most likely electric lines to be considered for a public safety power outage will be those that pass through areas that have been designated by the California Public Utilities Commission (CPUC) High Fire-Threat District at elevated (Tier 2) or extreme risk (Tier 3) for wildfire. Customers outside of these areas could have their power shut off, though, if their community relies upon a line that passes through a high fire-threat area or an area experiencing severe weather. PG&E will consider numerous factors and analyze historical data to help predict the likelihood of a wildfire occurring, and closely monitoring weather watch alerts from the National Weather Service (NWS). These factors generally include, but are not limited to:

- A Red Flag Warning declared by the National Weather Service
- Low humidity levels, generally 20 percent and below
- Forecasted sustained winds generally above 25 mph and wind gusts in excess of approximately 45 mph, depending on location and site-specific conditions such as temperature, terrain and local climate
- Condition of dry material on the ground and live vegetation (moisture content)
- On-the-ground, real-time observations from PG&E's Wildfire Safety Operations Center and field crews

Pacific Gas & Electric Company (PG&E) operates a total of 1,179 miles of overhead electricity transmission and distribution lines in the Marin County OA. Overhead electricity lines and poles

can be damaged or downed under severe weather conditions, particularly severe wind conditions, which increases the potential for wildfire ignition. 52 percent of PG&E's overhead distribution lines and 41 percent of its overhead transmission lines are located in CPUC-identified High-Fire Threat Districts subject to elevated or extreme fire risk. PG&E is currently planning and implementing safety measures to prevent wildfires and reduce the impacts of Public Safety Power Shutoff (PSPS) events on communities in the Marin County OA and throughout California.

In October 2019 the Marin County OA including the Town of Fairfax experienced two PSPS events.

These measures include installing weather stations; installing high-definition cameras; installing sectionalizing devices on its overhead lines to separate the grid into smaller sections; hardening the system by installing stronger power poles, covering lines, and undergrounding lines in targeted areas; creating temporary microgrids to provide electricity during PSPS events; and enhancing existing vegetation management activities. From 2018 to July 2021, PG&E hardened three miles of overhead lines, installed 68 transmission and distribution sectionalizing devices, completed enhanced vegetation management on approximately 51 of overhead line miles, installed 28 weather stations, and installed 12 high-definition cameras in the Marin County OA.

The fire season generally lasts from five to six months, when there is little rain. Access to the adjacent open space areas and the hillside and canyon areas is limited by few access routes and narrow roads. Fairfax is within the Wildland-Urban Interface (WUI) and most of the town, including all of its critical facilities, is in a high FHSZ. Road access is minimal into several residential areas of Fairfax with winding narrow roads, including along Cascade Drive and Bolinas Road, and in communities north of Sir Francis Drake Boulevard. Evacuation of these areas due to wildfire could be challenging. The Town borders directly on the open space lands of Mount Tamalpais, the Cascade Canyon Preserve, the White Hill Open Space Preserve, the Hawthorne Canyon Open Space Preserve, and the Bald Hill Open Space Preserve. The hillsides and canyons carry the potential of high fire danger. The wildland fire hazard is caused by a combination of factors including hillside terrain, highly flammable vegetation and forest, long summers, and human activity. There are heavy fuel loads. Many homes have been built on steep slopes with vegetation in close proximity. The onset of Sudden Oak Death (SOD) has significantly increased the number of dead or weakened trees in the areas, which contributes to the fuel loads.

Wind is a predominant factor in the spread of fire.

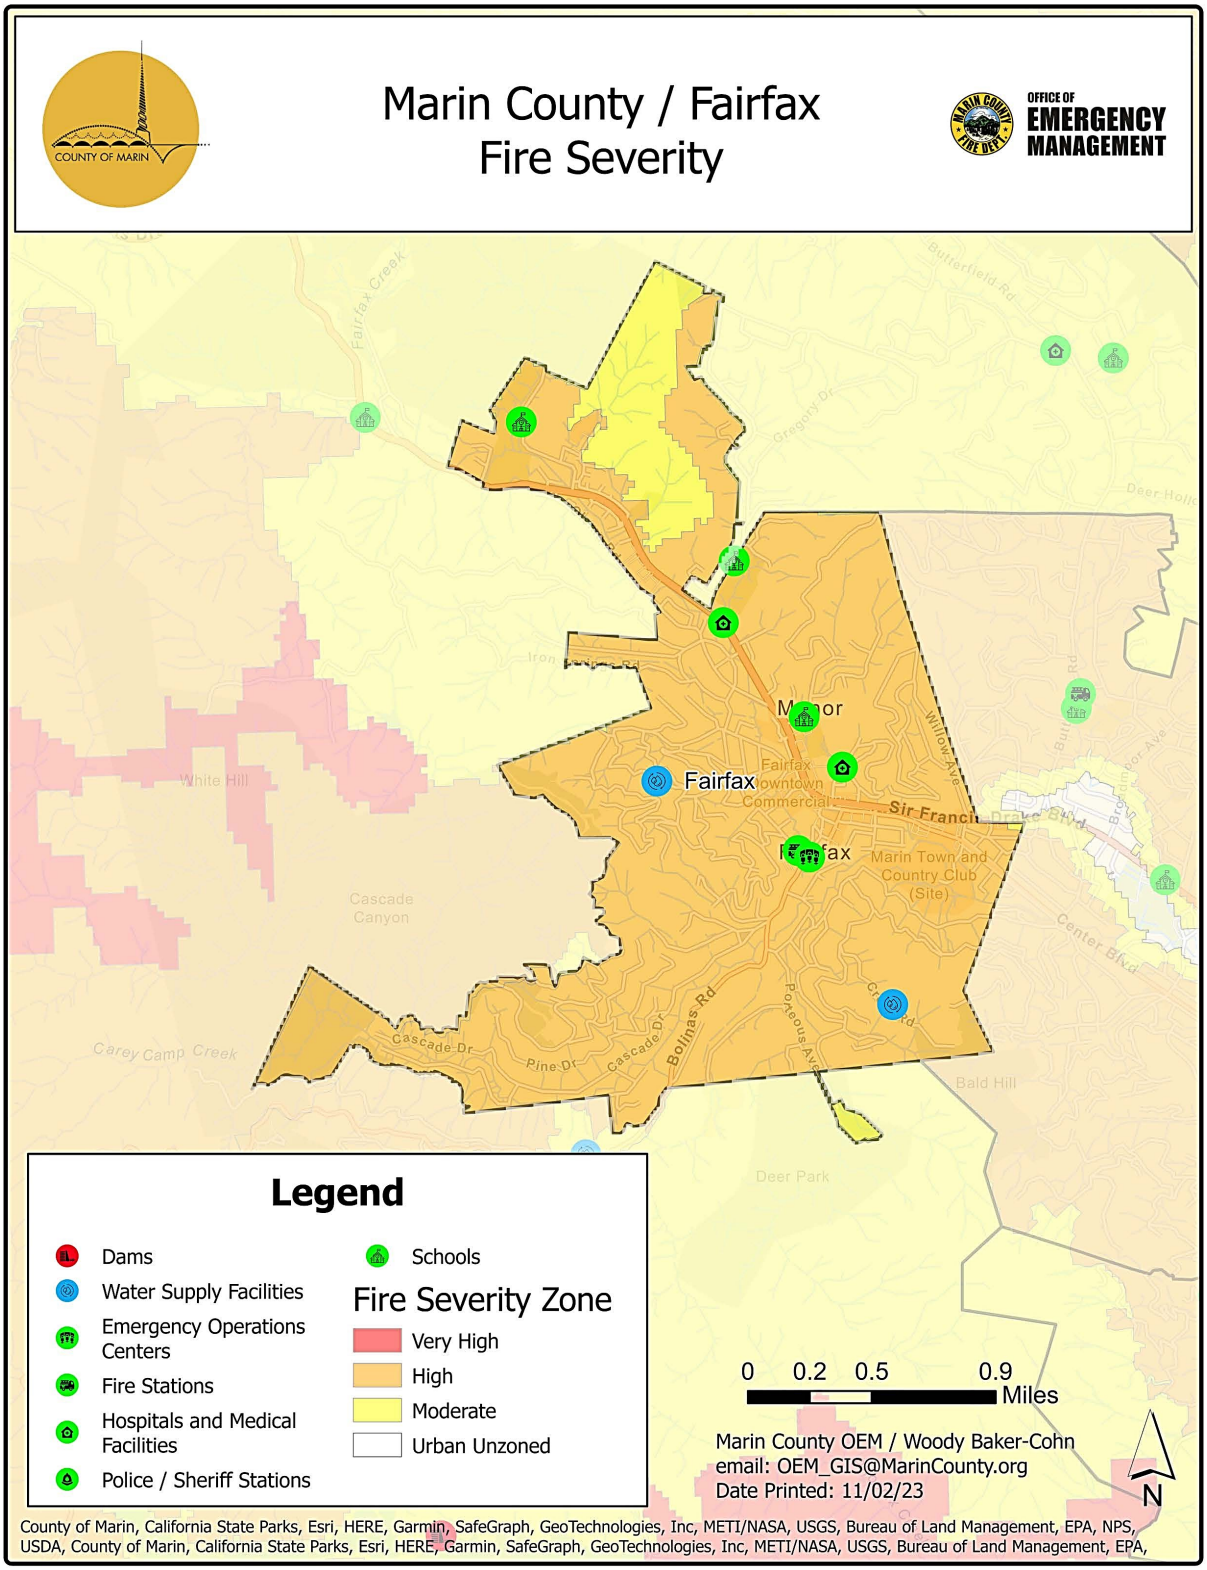

Figure 186: Town of Fairfax Wildfire Critical Facilities and Infrastructure
Source: Marin County OEM

Wildfires can cause short-term and long-term disruption to Fairfax. Fires may result in deaths and injuries and can destroy buildings and infrastructure. Additional costs associated with the loss of homes to wildland fire include disruption of utilities, transportation, and other public services. Although the physical damages and casualties arising from wildfires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. In large wildfire events, the economic impact of this loss of services may be comparable to the economic impact of physical damages to the Town. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Wildfires can also cause major damage to power lines needed to distribute electricity to operate facilities. High intensity wildfires can also have substantial effects on watersheds through loss of vegetation and soil erosion, which may impact the Town by changing runoff patterns and degrading water quality through sedimentation and contamination.

All of Fairfax could be impacted by a Power Safety Shutoff (PSP) event and/or suffer poor air quality from smoke as a result of a wildfire in the Marin County OA or the surrounding region. As wildland areas around Fairfax become drier due to climate change, the risk of a wildfire occurring and impacting the Town will continue to increase. Brush fires in the Town may increase over time as parks and other open spaces experience drier conditions.

Fairfax has never experienced a major wildfire. The Town experiences small fires annually.

On 10/6/2023, a brush fire burned three acres in Fairfax off Bolinas Fairfax Road during a three-day period of unseasonable warmth in the Town. No injuries were reported and no structures were threatened.

Figure 187: Fairfax Brush Fire - 2023
Source: Marin Independent Journal

On 7/16/2019, a house fire on a ridge on Crest Road spread into wildlands. There was no wind and the fire was extinguished with no further damage.

On 9/18/2016, a wildfire burned ten acres of parched terrain about 1.5 miles northwest of Fairfax near Camp Tamarancho. Temperatures were above 90 degrees and conditions were extremely dry. No structures were damaged by the blaze.

On 1/18/2014, a wildfire burned an acre of remote hillside along the Bolinas-Fairfax ridgeline between Kent and Alpine Lake in the unincorporated County of Marin above Fairfax. No injuries were reported and no buildings were threatened.

Climate Change and Future Development Considerations

Climate change can lead to an increase in wildfire events. Climate change has been a key factor in increasing the risk and extent of wildfires in the western United States. Changes in climate create warmer, drier conditions. Increased drought, and a longer fire season are boosting these increases in wildfire risk.

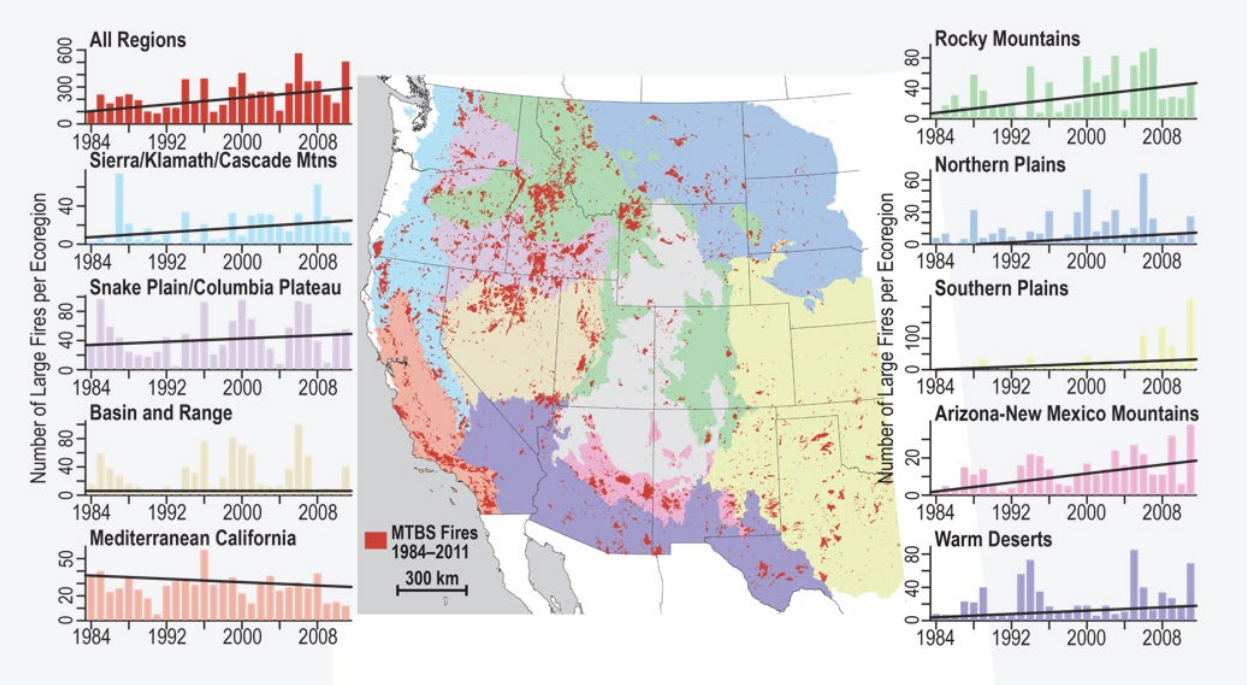

Figure 188: Trends in the Annual Number of Large Wildfires in the United States
Source: Fourth Climate Change Assessment, 01/04/23

As summer conditions in Northern California become hotter and drier due to climate change, the occurrence and severity of wildfires will only increase. The Marin County OA including Fairfax is particularly susceptible to these future impacts of climate change on wildfire, as the OA's climate has generally been wet enough historically to avoid major wildfires. Extreme heat events and high wind events could cause electrical systems to become overloaded and fail, sparking wildfires. An increase in wildfires as a result of climate change could lead to more significantly burned areas that could contribute to debris flows after a significant storm event, particularly in the open space areas around Fairfax. Post-fire debris flows could become more common in the areas of Fairfax around its creeks, including downtown. Future development in the WUI throughout Fairfax will expose more people and property to the impacts of a potentially significant wildfire. The growing number of people in the Fairfax WUI can increase risk to life, property and public health as a result of a wildfire.

SECTION 3.0: MITIGATION STRATEGY

3.1 CHANGES IN DEVELOPMENT

The County of Marin is a county located in the northwestern San Francisco Bay Area. As of the 2020 census, the population was 262,231. Its county seat and largest city is San Rafael. The Marin County OA is across the Golden Gate Bridge from San Francisco and is included in the San Francisco–Oakland–Berkeley, CA Metropolitan Statistical Area.

The core of the Town of Fairfax is a classic example of “old urbanism,” where human-scale development was oriented around a transit station. Unfortunately, planning and development patterns since 1930 have often given preference to automobile travel over all other forms, minimizing or eliminating other transit options and human-scaled development. This shift is evidenced in the Marin County OA by ever expanding commercial districts and residential development, until one community abuts another and commercial areas become continuous strips, only accessible by car or sparse public transit service.

One can see this trend most strikingly in commercial areas adjacent to the historic core of Fairfax that are zoned Highway Commercial (CH). CH areas are typified by large monolithic structures surrounded by “parking lagoons”; for example, Fairfax Market to the west on Sir Francis Drake Boulevard and the Fair-Anselm and grocery store complex to the east on Center Boulevard.

Fortunately, residents of Fairfax over the past several decades have intuitively resisted these impacts and vigorously fought to save the Town from automotive-centric development patterns, seeking instead to preserve the Town's human-centric development pattern. Fairfax citizens have sought to secure open space for future generations, limit development not compatible with the original historic scale of the Town, and inhibit development that furthers grid-lock along the Sir Francis Drake Boulevard, the main arterial that runs through the entire Ross Valley corridor. For example, plans to create a freeway through the Ross Valley in the middle of the 20th century, and proposals to create massive residential development in the east end of town at the end of the 20th century, were defeated by citizen activism.

Fairfax development can be described in terms of well-defined urban planning principles. Below is an overview of relevant concepts that currently experience renewed interest throughout the country, in our efforts to address climate change, strive for social equity, and create economically viable communities with a sense of place.

As detailed in the "Climate Change and Future Development Considerations" section of each hazard profile, development in Fairfax has occurred and will continue to occur throughout the town in areas prone to all of its identified hazards. Increased growth in these areas may increase the vulnerability of people and structures to these hazards.

Table 18: Town of Fairfax Future Growth Areas

	Development	# of Units	# of Parcels	Project Date	Acres	Fire Severity Zone	Flood Zone
1	School Street Plaza	175	1	Est. 2029	2	High	X
2	Fairfax Market	8	1	Est. 2026	1	High	X
3	Underutilized commercial sites	159	17	unknown	varies	High	X
4	Accessory Dwelling Units (ADU's)	160	-	20 yrs.	All Residentially Zoned sites	High/ Very High	varies
	Total	**83**					

Table 86: Town of Fairfax Future Growth Areas

3.2 Capability Assessment

The overall priorities in the Town of Fairfax have not changed since the 2018 MJHMP update. However, the strategies in which to support the overall town priorities have changed and are reflected in the sections below. There were many projects that were either ongoing day-to-day business activities or were response related that were completed or deleted from the 2018 MJHMP project list and not carried over to this plan update. Several actions were completed and new projects were added to coincide with the changes in priorities, progress in local mitigation efforts and changes in development.

Capabilities are the programs and polices currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. The capability assessment identifies the local planning mechanisms where information from the 2018 MJHMP is incorporated and where updated hazard mitigation information from this 2023 MJHMP will be incorporated once approved. The 2018 capability assessments have been successfully incorporated into the Town of Fairfax General Plan to include the Public Safety Element, Land Use Element, and Housing Element and the 2023 capability assessments will also be incorporated into the General Plan and these Elements. The capability assessment is divided into four sections: regulatory, administrative and technical, fiscal, and outreach and partnerships.

3.2.1 Regulatory Capabilities

The legal and regulatory capabilities include existing ordinances and codes that affect the Town's physical or built environment. Examples of legal and/or regulatory capabilities can include: a jurisdiction's building codes, zoning ordinances, subdivision ordnances, special purpose ordinances, growth management ordinances, site plan review, general plans, capital improvement plans, economic development plans, emergency response plans, and real estate disclosure plans. The table below lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place.

Table 19: Town of Fairfax Legal and Regulatory Capabilities		
Plans	Yes/No Latest Update	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
General Plan/Master Plan	Y 2010	The General Plan outlines long-term direction for development and policy. The new Safety Element includes a discussion of fire, earthquake, flooding, and landslide hazards; and importantly includes a section on Community Preparedness. Consistent with the Plan Maintenance and Update Process section of the 2018 Local Hazard Mitigation Plan (LHMP) Annex, the General Plan Advisory Committee (GPAC) reviewed, refined, and incorporated selected mitigation strategies into the 2010 General Plan Safety Element. As this plan gets updated there is potential to improve it with updated risk information and strategies.
Strategic Plan	N	
Capital Improvements Plan	Y	The Capital Improvement Plan (CIP) directs construction activities for Town owned facilities and infrastructure for the next five years. Mitigation actions may involve construction of new or upgraded facilities and infrastructure. As this plan gets updated there is potential to improve it with updated strategies.
Economic Development Plan	N	
Local Emergency Operations Plan	Y 2006	The plan is due for an update. It was created with the technical assistance of the Marin County Sheriff's Office of Emergency Services.
Continuity of Operations Plan	n	
Flood Mitigation Plan (FMP)	Y	Information on flood mitigation included in the Fairfax 2018 Local Hazard Mitigation Plan
Engineering Studies for Streams	Y	The Ross Valley Flood Protection and Watershed Program
Open Space Management Plan	N	
Regional Transportation Plan (RTP)	N	Regional Transportation Plan completed by Transportation Authority of Marin
Stormwater Management Plan/Program	Y	Town Code Chapter 17.068, Floodplains adopted 1988
Engineering Studies for Streams	Y	The Ross Valley Flood Protection and Watershed Program
Community Wildfire Protection Plan	Y	Town coordinates with Marin Wildfire Protection Authority (MWPA) on activities and mitigation efforts including Firesafe Marin
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal	N	

zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Yes, state and local building codes are adequately enforced.
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	
Fire department ISO rating:	Y	The Ross Valley Fire Department has an ISO rating of 2. It is adequately enforced.
Site plan review requirements	Y	Site plans shall include: an outline of the lot showing the length and direction of all property lines; relevant property setbacks; all buildings, fences, retaining walls, walkways, and driveways. Clearly indicate the distances from any structure to the property lines. Show all structures presently on the site and those proposed; indicate paving material for the driveway and if the paving is new or existing; a north arrow; the edge of street pavement and name of any abutting street; if a curb and/or sidewalk exists; site drainage; contour lines for properties steeper than a one-foot drop over a seven-foot horizontal distance (15% grade).
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Municipal Code	Y	The Municipal Code includes several sections that address hazard mitigation. The Town adopts the current California Building Code which applies to all construction activity within the Town boundaries. The California Building Code is comprised of 11 parts that incorporate public health, safety, energy, green building and access standards used in the design and construction of all buildings. The new code provisions will allow the Town to utilize the latest technologies, advances in construction standards and seismic design for the use in new residential and commercial construction and in remodels.
Zoning ordinance	Y	The Zoning Ordinance implements the General Plan by establishing specific regulations for development. It includes standards for where development can be located, how buildings must be sized, shaped, and positioned, and what types of activities can occur in an area. Mitigation actions that pertain to new or substantially redeveloped buildings can be adopted into the Zoning Ordinance.
Subdivision ordinance	Y	Town Code Title 16
Floodplain ordinance	Y	Town Code Chapter 17.068

Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	Hill Area Residential Development Ordinance, Town Code Chapter 17.072
Flood insurance rate maps	Y	Building and planning check all building and planning application using FEMA Flood Insurance Maps to determine if projects require inclusion of special conditions or building methods to comply with FEMA regulations
Elevation Certificates		
Acquisition of land for open space and public recreation uses	Y	Fairfax Open Space Committee is active in finding and acquiring Open Space parcels within the town limits
Erosion or sediment control program	Y	All planning and building applications are conditioned to comply Marin Countywide Stormwater Pollution Prevention Program.

Table 87: Town of Fairfax Legal and Regulatory Capabilities
Source: Town of Fairfax

Town of Fairfax General Plan or Master Plan

California Government Code 65300 requires that every City and County in the state have a General Plan. The Town of Fairfax General Plan, April 4, 2012 included an extensive public review process. The General Plan is the most important policy and planning document in the city and is used by virtually every department. The General Plan is the Town's statement of its vision for the future. The General Plan contains policies covering every aspect of the Town: land use (how land can be developed), circulation, noise, air quality, housing, open space and conservation, and health and safety.

Town of Fairfax specific goals and policies related to mitigation of natural hazards are as follows:

Table 20: Town of Fairfax General Plan

Goal/Policy/ Program	Explanation
Land Use Element	
Goal	Preserve scenic and natural resources, restore natural habitats, minimize wildfire hazards, preserve human-centered scale, mixed use and sense of community while managing growth
Policy	New development outside of the Town's boundary shall be limited and of a scale that preserves the significant scenic and natural resources and rural character of the areas adjacent to the Town
Program	Identify and pre-zone and lands outside the Town's boundaries that are considered subject to development for the purposes of maintain land use practices that respect the Town's natural environment.
Program	Create inventory of undeveloped or underdeveloped lands with the Fairfax Planning Area
Program	Proposed development of any parcel in the inventory shall be reviewed by the Fairfax Open Space Committee
Conservation and Open Space Element	
Goal	Integrate reduction of the use of non-renewable energy resources and greenhouse gas (GHG) emissions into the planning process, reduce consumption of non-renewable energy resources and reduce GHG emission by the residents and the Town, Promote

	education and citizen involvement
Policy	Develop a Climate Action Plan, promote zooming to facilitate live/work units and minimize motorized transit, encourage green building techniques for new and remodel construction, participate in state and county efforts towards energy conservation, renewable energy and GHG reduction
Program	Establish Climate Action Committee, obtain resource usage information for town and create a climate action plan (CAP).
Program	Adopt planning policies and zoning that promotes mixture of residential and commercial usage in the same building/site to promote live/work and promote infill development.
Program	Adopt green building ordinance provide links on website to green building information and resources.
Program	Continue membership in Marin Energy Authority, support Marin County Greenhouse Gas Reduction Plan, require GHG emission analysis as part of any traffic study.
Program	Implement energy efficiency and use of sustainable energy resources by Town Government
Program	Create infrastructure to facilitate the use of plug-in electric vehicles.
Public Safety	
Goal	Minimize risks due to geologic hazards, floods and fire and foster Community Preparedness
Policy	Land use decision will be made using best available geotechnical information and make that information available to the public, encourage seismic retrofit, encourage retrofitting of public and private buildings that pose a risk, preserve existing building stock, collaborate with other agencies to maintain critical infrastructure during emergency events
Program	Archive past geotechnical studies for past development, document past landslides, evaluate Town-owned critical facilities, encourage building owners to seismically retrofit their properties, retrofit seismically deficient bridges, enforce relevant codes and construction standards.

Table 88: Town of Fairfax General Plan
Source: **Town of Fairfax** General Plan

3.2.2 Administrative and Technical Capabilities

The administrative and technical capability identifies the Town personnel responsible for activities related to mitigation and loss prevention. Many positions are full time and/or filled by the same person.

Table 21: Town of Fairfax Administrative and Technical Capabilities

Administrative	Yes/No	Is coordination effective?
Administrative Services	Y	Administrative Services Department handles finance and purchasing, budgeting, risk management, information technology, and business licensing for the community. The department may be responsible for implementing mitigation actions related to the department's scope.
Planning Commission		The Planning Commission meetings on the third Thursday of each month. The Commission holds public hearings and takes action on subdivision, design reviews, conditional use permits, and items that may be forwarded to or called up by the commission.
Hazard Mitigation Planning Committee	Y	The Town participates in the Marin County OA MJHMP Planning Committee that meets quarterly to review and manage Hazard Mitigation projects and programs.
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Town has a Maintenance Plan for trees in public parks and routinely prunes/maintains trees and removes hazardous trees; Town contracts with Marin Sanitary Service for regular street cleaning
Mutual aid agreements	Y	Public Safety Mutual Aid agreements.
Technical	Yes/No	Has capability been used to assess/mitigate risk in the past?
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Utilizes the emergency warning systems through the EAS system as their primary warning capability. Utilizes the emergency warning systems through telephone notification utilizing reverse 911. Town has a warning siren for use when imminent flooding of creeks may occur
Hazard data and information	Y	Data has been used for the determination of floodplain areas. Different building code requirements are enforced based on the location of a structure in the floodplain to mitigate risk.
Grant writing	N	
Hazus analysis	N	
Staff/Personnel Resources	Yes/No Full Time/ Part Time	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y/FT	Yes

Flood Control and Water Conservation District Staff	Y	Currently administered by Building Official
Emergency Manager	N	
Community Planner	N	
Civil Engineer	Y	Town contracts for Town Engineer Services
GIS Coordinator	N	
Community Development Staff	N	Currently contracted out. Develops and maintains the General Plan, including the Safety Element. Develops area plans based on the General Plan, to provide more specific guidance for the development of more specific areas. Reviews private development projects and proposed capital improvements projects and other physical projects involving property for consistency and conformity with the General Plan. Anticipates and acts on the need for new plans, policies, and Code changes. Applies the approved plans, policies, code provisions, and other regulations to proposed land uses.
Town Planning, Building, and Public Works Staff	Y/FT	These departments are responsible for planning and building related activities including issuing permits, conducting environmental review, preparing planning documents, and addressing housing issues. Mitigation activities related to planning and building can be implemented by this department. Public Works Department is responsible for Town-owned infrastructure, including streets, bike lanes and sidewalks, storm drains, traffic signals, and streetlights. Mitigation actions involving new or retrofitted public infrastructure, as well as those related to water conservation, fall within the purview of the Public Works Department.
Police Department Staff	Y/FT	The Fairfax Police Department conducts emergency preparedness activities for the community. Mitigation activities related to emergency preparedness can be implemented by the Police Department.
Fire Department Staff	Y/FT	The Ross Valley Fire Department protects the town from the effects of fire and other hazardous conditions and supports implementation of mitigation actions that reduce the risk of wildfire.

Table 89: Town of Fairfax Administrative and Technical Capabilities
Source: **Town of Fairfax**

3.2.3 FISCAL CAPABILITIES

The fiscal capability assessment shows specific financial and budgetary tools available to the jurisdictions such as community development block grants; capital improvements project funding; authority to levy taxes for specific purposes; fees for water, sewer, gas, or electric services; impact fees for homebuyers or developers for new development; ability to incur debt through general obligations bonds; and withholding spending in hazard-prone areas.

Table 22: Town of Fairfax Fiscal Capabilities

Financial	Yes/No	Has the funding resource been used in the past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Authority to levy taxes for specific purposes	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Fees for water, sewer, gas, or electric services	Y	Water, Gas, Electric and Sewer are administered and managed by other agencies
Impact fees for new development	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Storm water utility fee	N	Storm Drainage is not considered a utility by Town of Fairfax
Incur debt through general obligation bonds and/or special tax bonds	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Incur debt through private activities	N	
Community Development Block Grant	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Other federal funding programs	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
State funding programs	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.

Table 90: Town of Fairfax Fiscal Capabilities
Source: **Town of Fairfax**

3.2.4 COMMUNITY OUTREACH

The outreach and partnerships capability assessment shows outreach and public education programs available to the Town of Fairfax and the Town of Fairfax partnerships utilized to promote those programs.

Table 23: Town of Fairfax Community Outreach		
Outreach and Partnerships	Yes/No	Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	Fairfax Volunteers supplement town staff in a variety of outreach and community activities related to hazard mitigation. This includes organizing neighborhood groups, creek and path stewardship and emergency preparedness coordination.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	In cooperation with other agencies including Marin Wildfire Prevention Authority, Marin Municipal Water District, Ross Valley Fire District and Town Newsletter, information is provided to community on a range of programs
Natural disaster or safety related school programs	N/A	Ross Valley School District is not affiliated specifically with Town of Fairfax and may have its own programs
StormReady certification	N	
Firewise Communities certification	Y	Town of Fairfax does have Firewise communities but program is not directly managed by Town of Fairfax
Community Rating System	Y	Yes, refer to section 3.2.5.
Public-private partnership initiatives addressing disaster-related issues	Y	The Get Ready program, developed in Marin County, is a free 2-hour course provided to the community. The course is designed to help residents plan for an emergency with a family plan, evacuation checklist, and strategies to keep residents and their families safe. (https://readymarin.org/get-ready/)

Table 91: Town of Fairfax Community Outreach
Source: **Town of Fairfax**

3.2.5 PARTICIPATION IN THE NATIONAL FLOOD INSURANCE PROGRAM

The Town of Fairfax has participated in the Regular Phase of the NFIP since 1/5/1978. Since then, the Town of Fairfax has administered floodplain management regulations that meet the minimum requirements of the NFIP. Under that arrangement, residents and businesses paid the same flood insurance premium rates as most other communities in the country.

The Community Rating System (CRS) was created in 1990. The Town of Fairfax has been in the CRS program since 10/01/2017. The program is designed to recognize floodplain management activities that are above and beyond the NFIP's minimum requirements. CRS is designed to reward a community for implementing public information, mapping, regulatory, loss reduction and/or flood preparedness activities. On a scale of 10 to 1, The Town of Fairfax is currently ranked Class 9 community, which gives a 5 % premium discount to individuals in the Town of Fairfax Special Flood Hazard Area (SFHA), and a 5 % discount to policyholders outside the SFHA.

Presently, the Fairfax manages its floodplains in compliance with NFIP/CRS requirements and implements a floodplain management program designed to protect the people and property of the County. Floodplain regulations are a critical element in local floodplain management and are a primary component in the Town's participation in the NFIP. as well. The Town's floodplain management activities apply to existing and new development areas, implementing flood protection measures for structures and maintaining drainage systems to help reduce the potential of flooding within the Town.

The Town of Fairfax will continue to manage their floodplains in continued compliance with the NFIP. An overview of the Town's NFIP status and floodplain management program are discussed in Table 24. Additional information on the Town's CRS program follows.

The activities credited by the CRS program provide direct benefits to the Marin County OA and its residents, including:

- Enhanced public safety;
- A reduction in damage to property and public infrastructure;
- Avoidance of economic disruption and losses;
- Reduction of human suffering; and
- Protection of the environment.

The activities that the Town of Fairfax implements and receives CRS credits include:

Activity 310 - We maintain Elevation Certificates for new and substantially improved structures in SFHA.

There are occasions that homeowners submit their elevation certificates when they are not making any improvements to their property. We keep hard copies in the office in a binder.

Activity 320 - We provide basic flood information to inquirers. We also provide additional information like flood depth, Historical flood information and etc.

Activity 330 - Outreach program. We send a flyer to all the properties in the flood zone. In the flyer we have some language for the history of flooding, protection of their property, protection

and clean local creeks and stormdrains, build responsibly for flooding and City floodplain information services.

Activity 340 - This is Hazard Disclosure. We require a residential resale inspection for all properties prior to the sale. We are disclosing whether a property was or was not in the flood zone.

Activity 350 - Our Public Library maintains flood protection materials. Also, we conduct an annual review and update of the information and links on our flood protection website.

Activity 360 - We send a brochure to properties in the flood zone. We provide flood protection advice to inquirers. We provide on-site flood protection assistance to inquirers. We let them know that flooding is not covered by the standard insurance policies whether they are property owners or renters. We also let them know that if they live or work in the Marin County OA they can register and get an alert notification during an emergency situation. We also let them know that they have to have an emergency plan and also how they can protect their property from flooding by cleaning the gutters and downspouts and area drains and making sure if they have a sump pump, the sump pump is working.

Activity 420 - This activity is preserving our open space in the floodplain.

Activity 430 - We enforce the floodplain management provisions of our zoning, subdivision and building code ordinances. Examples of this activity are requiring the lowest finished floor elevation of residences to be 1 foot higher than the base flood elevation. If the cost of improvements or repairs are more than 50% of the building's value, the owner needs to bring the building to compliance. Also, requiring new manufactured housing in existing manufactured housing parks to meet the same level of protection as is required for other new buildings.

Activity 440- We use and update our flood data maintenance system on an annual basis as needed, because we want to make the community floodplain data more accessible, current and useful.

1. We implement digital mapping or paper mapping systems that improve access and quality.
2. We maintain our historical Flood Hazard Boundary Map, FIRMs and Flood Insurance Studies.
3. We maintain benchmarks so surveyors can request obtain them from the Town.

Activity 450 - This activity is about stormwater management.

We regulate development on a case-by-case basis to ensure we treat runoff before it leaves the site and also ensure that the peak flow of stormwater runoff from each site will not exceed the pre-development. There are instances that the post-development peak flow rates for the developed area have been slightly increased from pre-development conditions however, onsite bio-retention areas or other treatment facilities have been provided to mitigate the increase in flow rate. We enforce regulations to minimize erosion from land disturbance due to construction.

Activity 502 - This is about repetitive loss Category- Properties that have had losses and reported to FEMA for these losses. We are in Category B. Category B means we are a community with at least one, but fewer than 50 repetitive loss properties that have not been mitigated. We have a map of the areas. We send a notice every year to those properties letting them know about flood

prevention and insurance information. We have 6 repetitive loss properties however we send notices to 41 properties in several repetitive loss areas.

Activity 510- Floodplain Management Planning- The Town of Fairfax has adopted the County of Marin Multi-Jurisdictional Hazard Mitigation Plan which has flood related sections like Dam Failure, Severe Storm, Flooding, Repetitive Loss Properties and Safety Warning/Evacuation Systems.

Table 24: Town of Fairfax NFIP Status

NFIP Topic	Comments
Insurance Summary	
How many NFIP policies are in the community? What is the total premium and coverage?	137 Policies $178,108 Premiums $44,273,000 coverage
How many claims have been paid in the community? What is the total amount of paid claims? How many of the claims were for substantial damage?	118 Paid losses $1,886,056.82 Paid losses 2 Substantial damage claims
How many structures are exposed to flood risk within the community? *"flood risk" is defined as the 1% annual chance flood (100-year flood. Numbers are from overlay of FEMA SFHA and building stock data.	Per our GIS Consultant who queries GIS for building footprints against the SFHA boundary, there are 2000 buildings in SFHA.
Describe any areas of flood risk with limited NFIP policy coverage	None
Staff Resources	
Is the Community Floodplain Administrator or NFIP Coordinator certified?	No
Is floodplain management an auxiliary function?	Yes
Provide an explanation of NFIP administration services (e.g., permit review, GIS, education or outreach, inspections, engineering capability)	Review permit plans for FEMA regulation compliances. Use GIS to find out if the property is in a Flood Zone. Outreach brochure mailed to all properties in SFHA. Inspection is performed as needed.
What are the barriers to running an effective NFIP program in the community, if any?	We currently only have one staff member who manages the program. In order to run it effectively we hire consultants and obtain advice/help from County staff.
Compliance History	
Is the community in good standing with the NFIP?	Yes
Are there any outstanding compliance issues (i.e., current violations)?	No
When was the most recent Community Assistance Visit (CAV) or Community Assistance Contact (CAC)?	9-1-2021
Is a CAV or CAC scheduled or needed?	No
Regulation	
When did the community enter the NFIP?	1/5/1978
Are the FIRMs digital or paper?	Digital
Do floodplain development regulations meet or exceed FEMA or State minimum requirements? If so, in what ways?	Yes. This is through development limitations, free board requirement, foundation protection, cumulative substantial improvements. We also have adopted and enforced the International Building Code. We do maintain drainage systems all year around to prevent

	flooding in different neighborhoods.
Provide an explanation of the permitting process.	Single-family residential projects require public hearings and discretionary decisions before the Planning and Building staff can process building permit applications for development. In Fairfax, residential projects are also subject to this two-step public hearing process with discretionary decisions made at each step. A "discretionary decision" by definition can either be for approval or denial of a project. If a project is denied at a Planning Commission or Design Review Board hearing, the decision can be appealed to the Fairfax Town Council.
Community Rating System (CRS)	
Does the community participate in CRS?	Yes
What is the community's CRS Class Ranking?	Class 9
What categories and activities provide CRS points and how can the class be improved?	All the activities that are performed/accomplished are described above. To improve the class to a higher classification the City needs to expand and do more work towards activities.
Does the plan include CRS planning requirements	Yes

Table 92: Town of Fairfax NFIP Status
Source: FEMA, Town of Fairfax

NFIP Insurance Coverage Details

Town of Fairfax joined the NFIP on 1-5-1978. The Town of Fairfax does participate in the Community Rating System. NFIP insurance data provided by DWR indicates that as of 9-13-2023, there were 136 policies in force in the Town of Fairfax with $175,355 in premiums, resulting in $36,668,000.00 of insurance in force. There have been 118 closed paid losses totaling $1,886,056.00 2 of the claims were considered substantial damage losses. Of these losses, 35 parcels were in AE zones, 29 parcels were in AO zone. Of the 118 claims, 0 claims were associated with pre-FIRM structures and 118 with post-FIRM structures. There were 16 repetitive loss structures in the Town of Fairfax. 14 were in A zones, and 2 were in B, C, or X zones. These repetitive loss structures account for $454,927.00 of the total losses in the Town of Fairfax. There were not any severe repetitive loss properties in the Town of Fairfax.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 16
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 0
- Number of Repetitive-Loss Properties or Severe-Repetitive-Loss Properties that have been mitigated: 0
- Repetitive Loss Residential Structures: 16
- Repetitive Loss Non-Residential Structures: 0
- Severe Repetitive Loss Residential Structures: 0
- Severe Repetitive Loss Non-Residential Structures: 0

3.3 MITIGATION GOALS

44 CFR Requirement § 201.6(c)(3)(i) [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long - term vulnerabilities to the identified hazards.

The information developed from the risk assessment was used as the primary basis for developing mitigation goals and objectives. Mitigation goals are defined as general guidelines explaining what each jurisdiction wants to achieve in terms of hazard and loss prevention.

Hazard Risk Prioritization
↓
Mitigation Goals & Objectives
↓
Mitigation Project Identification
↓
Mitigation Project Implementation

Goal statements are typically long-range, policy-oriented statements representing jurisdiction-wide visions. Objectives are statements that detail how each jurisdiction's goals will be achieved, and typically define strategies or implementation steps to attain identified goals. Other important inputs to the development of jurisdiction-level goals and objectives include performing reviews of existing local plans, policy documents, and regulations for consistency and complementary goals, as well as soliciting input from the public.

The following represents overarching strategic goals associated with the identification and eventual implementation of appropriate and meaningful hazard mitigation efforts in relation to prioritized hazards and threats confronting the Marin County OA. These goals form the basis for specific supporting process objectives and are shown from the highest priority, at the top of the list, to those of lesser importance.

The establishment of hazard mitigation goals represents both individual and collective strategies that have been mutually agreed upon by the Steering Committee and have changed with the 2023 MJHMP update. Objectives were added to Goals 2 and 5. Eventually, these goals have been adopted by the Marin County OA, including each of its jurisdictions, as the guiding policy behind local hazard mitigation efforts, in conjunction with other associated principles.

Goals were defined for the purpose of this mitigation plan as broad-based public policy statements that:

- Represent basic desires of the community;
- Encompass all aspects of community, public and private;
- Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;
- Are future-oriented, in that they are achievable in the future; and
- Are time-independent, in that they are not scheduled events.

Goals are stated without regard to implementation. Implementation cost, schedule, and means are not considered. Goals are defined before considering how to accomplish them so that they are not dependent on the means of achievement. Goal statements form the basis for objectives

and actions that will be used as means to achieve the goals. Objectives define strategies to attain the goals and are more specific and measurable.

Goal 1: Minimize risk and vulnerability of the community to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, and environment in the Marin County OA.

- Minimize economic and resource impacts and promote long-term viability and sustainability of resources throughout the Marin County OA.
- Minimize impact to both existing and future development.
- Provide protection for public health.
- Prevent and reduce wildfire risk and related losses.

Goal 2: Provide protection for critical facilities, infrastructure, utilities, and services from hazard impacts.

- Incorporate defensible space and reduce hazard vulnerability.
- Develop redundancies in utilities and services.
- Enhance resilience through enhanced construction.

Goal 3: Improve public awareness, education, and preparedness for hazards that threaten our communities.

- Enhance public outreach and participation in the Alert Marin Emergency Notification System.
- Enhance public outreach, education, and preparedness program to include all hazards of concern.
- Increase public knowledge about the risk and vulnerability to identified hazards and their recommended responses to disaster events, including evacuation and sheltering options.
- Provide planning and coordination for "At-Risk" populations.
- Provide planning and coordination for companion animals, livestock, and other animal populations.
- Increase community awareness and participation in hazard mitigation projects and activities.

Goal 4: Increase communities' capabilities to be prepared for, respond to, and recover from a disaster event.

- Improve interagency (local, state, federal) emergency coordination, planning, training, and communication to ensure effective community preparedness, response and recovery.
- Enhance collaboration and coordination of disaster-related plans, exercises, and training with local, state, and federal agencies, neighboring communities, private partners, and volunteers.
- Enhance the use of shared resources/Develop a strong mutual aid support system.
- Create and maintain a fully functional, interoperable radio and communication system with all regional public safety partners.

Goal 5: Maintain FEMA Eligibility/Position the communities for grant funding.

- Review hazard events and ongoing hazard mitigation projects annually.
- Assess the need to pursue or adjust hazard mitigation projects after significant hazard events.

Goal 6: Reduce exposure to High Hazard Dams that pose an unacceptable risk to the public.

- Improve alert and warning systems to provide residents downstream of a High Hazard Dam to receive timely warning to evacuation when threatened by potential or imminent dam failure.
- Enhance overall community preparedness to respond and evacuate a potential or imminent dam failure.
- Increase public awareness of the risk posed by High Hazard Dams and the potential for relocation of housing outside a possible inundation zone.
- Prioritize High Hazard Dam Mitigation projects and programs.

3.4 STATUS OF PREVIOUS MITIGATION ACTIONS

Table 25 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 25: Status of Previous Hazard Mitigation Actions

Action Number / Name	Completed	Ongoing	Not Started	Still Relevant	Included in Updated Action Plan
Seismically retrofit and renovate Town Pavilion			X	X	Yes
Seismically retrofit/Renovate Town owned Women's Club (Council Chambers)			X	X	Yes
Conduct Periodic Testing of emergency sirens and early warning systems including Nixle		X		X	Yes
Mitigate flooding impacts to Town Facilities such as Town Hall		X		X	Yes
Incorporate FEMA guidelines and suggested activities into local government plans and procedures for managing flood hazards		X		X	Yes
Seek Grant Funding for vegetation removal along roadways and roadside collection/chipping of hazardous vegetation within the Wildlife Urban Interface (WUI)		X		X	Yes

Table 93: Status of Previous Hazard Mitigation Actions
Source: Town of Fairfax

"Still Relevant" indicates that the project or program was first proposed in the 2018 MJHMP and remains still relevant to the current 2023 MJHMP hazard vulnerabilities.

3.5 HAZARD MITIGATION ACTIONS

The 2023 Marin County OA MJHMP was revised to reflect progress in local mitigation efforts. Mitigation projects were selected for each hazard and for the Town of Fairfax based off the hazard risk assessment. The projects are supported by the mitigation goals and objectives, and are ranked using the following criteria; approximate cost, timeframe of completion, whether the project requires City Council regulatory action, and an assumption as to whether or not the project would be subject to CEQA or NEPA requirements. Funding sources are identified for all projects. All projects consider new, future, and existing development. Project worksheets are used by the Planning Team and Steering Committee to describe criteria for each project.

A cost benefit review process will be completed for each project that will be submitted during a given fiscal year. The general priorities of the cost benefit risk analysis will focus on projects that are lifesaving, life safety, property protection and lastly environmental protection. A ratio of at least one dollar of benefit for each dollar invested will be considered the minimum cost benefit ratio for any projects submitted within the Town of Fairfax.

The Town of Fairfax maintains project worksheets with detailed descriptions of each project. A summary of each project is found in the table below.

Table 26 lists the Current Hazard Mitigation Actions for the Town of Fairfax.

Table 26: Town of Fairfax Current Hazard Mitigation Actions

No.	Mitigation Actions	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
F-1	Marin Emergency Radio Authority (MERA) Upgrades. MU-13 Protect Infrastructure and Critical Facilities	All Hazards/ 1, 2, 3, 4, 5	County of Marin and the Town of Fairfax	Existing (2018)	Cost TBD; State and/or Federal Homeland Security grants.	1-3 years High	Town as a participant, is also studying replacement for the system as it reaches the end of its service life.
F-2	Implement the Goals, Policies, and Actions listed in Table 20 of the General Plan Safety Element.	All Hazards/ 1, 2, 4, 5	Town of Fairfax	New (2023)	Cost: General Funds	1-3 years High	A new General Plan Safety Element was adopted which includes significant public safety components.
F-3	Review and adopt current California Building and Fire codes. MU-8 Adopt and Enforce Building Codes	All Hazards/ 1, 2, 4, 5	Town of Fairfax	Existing (2018)	Cost: General Funds	1 – 3 years/ High	The Town continues to review and adopt current California Building and Fire codes.
F-4	Review and adopt current California Building codes for seismic, flood, fire, and other disaster. MU-8 Adopt and Enforce Building Codes	All Hazards/ 1, 2, 4, 5	Town of Fairfax	Existing (2022)	Cost: General Funds	3 - 5 years/ Medium	The Town continues to review and adopt current California Building codes.
F-5	Fairfax Creek Flood Plain/trash capture	Flooding/ 1, 2, 4, 5	Town of Fairfax	New (2023)	$1,000,000, Coastal Conservancy, Marin County Storm Water Protection	1-2 years High	Expansion of flood plain and trash capture area easily accessible and maintained by staff to protect critical town facilities. ARPA Funds, stormwater master plan
F-6	Creek Retaining Walls Evaluation and Repair	Debris Flow, Land Subsidence / 1, 2, 4, 5	Town of Fairfax	Existing (2018)	1,000,000 Coastal Conservancy, BRIC, Marin County Flood District	1-3 years High	Evaluate condition of retaining walls supporting roadways along creeks and streams;
F-7	Bolinas Road Repaving and Restabilization	Debris Flow/ 1, 2, 4, 5	Fairfax and County of Marin	New (2023)	$5,000,000 TAM, Fed. Hwy Admin. (FHWA), SR1.	2-3 years Medium	Re-pave section of Bolinas Road, evaluate and repair failing walls; SB1 and gas tax, possible TAM funding
F-8	Sir Francis Drake Repaving and Restabilization	Sinkholes, Landslide / 1, 2, 4, 5	Town of Fairfax	New (2023)	2.500,000 TAM, FHWA, SB1 gast tax	1-3 years High	Re-pave section of Sir Francis Drake, evaluate

Table 26: Town of Fairfax Current Hazard Mitigation Actions

No.	Mitigation Actions	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
							subsurface; SB1 and Gas Tax, possible TAM funding
F-9	Resiliency Hub at Town Facilities	All Hazards/ 1, 2, 4, 5	Town of Fairfax	New (2023)	$500,000 Town funding, BAAQMD, PGE	1-3 years High	Add PV panels, battery storage and back-up, bi-directional power supply; BAAQMD, PGE rebates, Town funding
F-10	Seismic Retrofit of Pavilion Facility	Earthquake/ 1, 2, 4, 5	Town of Fairfax	Existing (2018)	$3,000,000 BRIC, Town Funding	2-4 years Medium	Seismically retrofit facility, improve ADA access, roof replacement,
F-11	Conduct Periodic Testing of emergency sirens and early warning systems including Nixle	Flooding/ 1, 2, 4, 5	Fairfax, Ross Valley Fire Protection District	Existing (2018)	Neglible cost to Town of Fairfax	1-3 years High	System is regularly tested and pre-season meetings held to discuss use and operations at least annually
F-12	Seismically retrofit/Renovate Town owned Women's Club (Council Chambers)	Earthquake/ 1, 2, 4, 5	Town of Fairfax	Existing (2018)	$350,000 BRIC, Town Funding	2-4 years Medium	Identified as a need, no design efforts completed to date
F-13	Seek Grant Funding for vegetation removal along roadways and roadside collection/chipping of hazardous vegetation within the Wildlife Urban Interface (WUI)	Wildfire/ 1, 2, 4, 5	Fairfax, Ross Valley Fire Protection District, Marin Wildfire Prevention Authority	Existing (2018)	$100,000 Marin Wildfire Protection Authority (MWPA)	1-3 years High	MWPA offers grants to locals and Town regularly engages with RVFD on projects on Town owned/managed parcels
F-14	Prepare GIS storm water map of the watershed to determine the water flow and design a culvert system appropriate to the volume and flow of peak runoff. Complete the identification of existing culverts and the need for new ones.	Flooding/ 1, 2, 4, 5	Town of Fairfax	New (2023)	$300,000 for design; $2.5 Million for improvements ARPA, Town funding, Marin County Storm Water Pollution Protection	1-6 years Medium	Currently in progress on multiple projects on design and evaluation
F-15	Enhance Community facilities to support the socially vulnerable population during extreme weather events.	Severe Weather - Heat 1, 2, 4, 5	Town of Fairfax , Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, CDAA, Private Local Grants	1 - 2 years/ High	

Table 26: Town of Fairfax Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
F-16	Vegetation Management around at risk PG&E power lines and electrical line undergrounding projects by PG&E.	Wildfire, Drought, Severe Weather – Heat & Wind 1, 2, 4, 5,	Town of Fairfax , Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	

Table 94: Town of Fairfax Current Hazard Mitigation Actions

3.6 Progress in Local Mitigation Efforts

This plan has been created as a "living" document with input from the population and professionals within the Town of Fairfax. Based on the planning meetings and the progress monitored by the steering committee members several mitigation actions were accomplished since the last planning cycle. Table 25 provides a brief description of the progress made in the local mitigation efforts and the plan for those mitigation actions that were not completed or are ongoing.

The planning team for the Town of Fairfax identified and prioritized the mitigation actions as detailed in Table 26, based on the risk assessment and in accordance with the process outline in Section 3, Mitigation Strategy, of the base plan. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. General processes and information on plan implementation and maintenance of this MJHMP by all participating jurisdictions is included in Section 4.0: Plan Review, Evaluation, and Implementation.

3.7 Project Implementation

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning, capital facilities planning, emergency management, hazard specific planning, and that relevant information from those sources is also used in hazard mitigation. This section identifies where such integration is already in place from the 2018 MJHMP, and where the 2023 MJHMP will be used for further integration.

The planning team for the Town of Fairfax will maintain this plan and will serve as a lead staff for grant project applications on Town projects selected for application under the Hazard Mitigation Assistance grant programs.

An important implementation mechanism that is highly effective and low-cost is incorporation of the hazard mitigation plan recommendations and their underlying principles into town plans and mechanisms. Where possible the Town of Fairfax will use existing plans and/or programs to implement hazard mitigation actions. Mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and development. As described in this plan's capability assessment, the Town of Fairfax already implements policies and programs to reduce losses to life and property from hazards. This plan builds upon the momentum developed through previous and related planning efforts and mitigation programs and recommends implementing actions, where possible, through these other program mechanisms. These existing mechanisms include Integration opportunities for the 2023 Marin County OA MJHMP:

Town General Plan - Integrates hazard mitigation through the consideration of hazards most likely to impact the Town. These hazards are considered in the Safety Element, Housing Element and Open Space Element.

Town Emergency Operations Plans – Integrates hazard mitigation through the consideration of the Town's planned response to hazards most likely to impact the Town.

County, City and Town Ordinances - Integrates hazard mitigation through the consideration of plans and policies outlined in the capability assessments in the jurisdictional annexes.

Flood/Storm Water Management/Master Plans - Integrates hazard mitigation through the consideration of strategies to reduce flood risk and storm water management for the protection of life and property.

Community Wildfire Protection Plan - Integrates hazard mitigation through the consideration of strategies to reduce fire hazard and the risk of catastrophic wildfires in the WUI, while promoting the protection and enhancement of the county's economic assets and ecological resources.

The successful implementation of this mitigation strategy will require review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. A few examples of incorporation of the MJHMP into existing planning mechanisms include:

1) As recommended by Assembly Bill 2140, each community should adopt (by reference or incorporation) this MJHMP into the Safety Element of their General Plans. Evidence of adoption (by formal, certified resolution) shall be provided to CalOES and FEMA
2) Integration of flood actions identified in this mitigation strategy with the actions and implementation priorities established in existing Flood Management Programs
3) Using the risk assessment information to update the hazards section in the County, City and Town Emergency Operations Plans

Efforts should continuously be made to monitor the progress of mitigation actions implemented through these other planning mechanisms and, where appropriate, their priority actions should be incorporated into updates of this hazard mitigation plan.

3.8 Future Development Trends

In the Marin County OA, new housing construction continues to exacerbate the high proportion of detached, single-family housing. In 2020, 96 percent of construction permits issued countywide were for single-family units. In 2020, 61 percent of existing residential buildings are single-family detached units in the Marin County OA. In 2015 and 2017, 100 percent of construction permits issued were for single-family homes, making the 2020 figure of 96 percent the third highest in proportion of single-family unit construction permits issued in the last seven years, but the greatest number of permits in a year is consistently issued for the construction of this type of housing.

Historic development patterns in Fairfax created a town with a distinct center, providing a good public transit hub within walking and bicycling distance of most of the town's inhabitants. Fairfax has retained a village-like quality, with distinct neighborhoods, and large areas of surrounding visible open space.

The Town's General Plan seeks to preserve these qualities by providing policies and programs to guide future development. Interestingly, modern humanistic trends in urban development support many of the planning choices made by the Town over the last hundred years. The

current town center creates a lively mixture of businesses and residences and supports a wide variety of transportation choices.

The Land Use Element conveys a sense of the uniqueness of Fairfax; the Town's robust, villagelike land use characteristics, as seen in the small businesses, quaint neighborhoods and busy streets where many residents bicycle and walk. Framing and dominating the town is its natural setting – a perceived vast open space of oak-studded hills to the north and west, and the forested shoulders of the Coastal Range to the south. Fairfax is a special place, loved by residents as well as visitors.

One of the greatest problems facing the Marin County OA relates to population growth. Traditional solutions to that problem can be seen on the land in the form of compromise, if not complete loss, of natural areas; it can be seen in skies that are not as blue in the day and have fewer stars in the night; and it can be heard in the increase in traffic sounds and the decrease of natural sounds or the distance that sound travels. Where and how growth is accommodated in Fairfax is of paramount importance in crafting the Land Use Element.

In addition to the economic pressures of development in desirable Marin and Bay Area, the pressures to develop Fairfax for housing human growth are tremendous. Fairfax is required by the State to provide affordable housing (108 units required as of July 2010) as its share of California's population growth. The other end of the scale could be something so personal as a parent's hope of seeing their children live out their lives here, or a homeowner who wants to add a second unit to house a relative or offset rising costs. How Fairfax will address these demands is guided by the Land Use Element.

SECTION 4.0: PLAN REVIEW, EVALUATION, AND IMPLEMENTATION

The strategies presented are deemed appropriate and effective by recommendation of the Town of Fairfax.

4.1 PLAN ADOPTION

Upon submission to the California Office of Emergency Services (CalOES) for review, and subsequent approval by the Federal Emergency Management Agency (FEMA), the Marin County OA MJHMP will be presented to local government for formal adoption. As appropriate, the adopted plan and accompanying Town of Fairfax Community Profile will then be incorporated into local general plans for integration into organizational policy.

4.2 PLAN MONITORING

The process of hazard mitigation does not end with the completion, approval, and adoption of the Marin County OA MJHMP and the Town of Fairfax Community Profile. Within the lifespan of these documents (five years), local government along with community-based organizations will ensure that the mitigation goals and strategies identified are monitored, that plan administration will continue under a collaborative and cooperative umbrella, and that the document itself will be properly maintained.

The Marin County OEM, as lead coordination agency for hazard mitigation planning within the Marin County OA and will assist and support the ongoing collaborative efforts of the Town of Fairfax, through the established hazard mitigation Steering Committee. Specific plan maintenance activities by the Marin County OEM and the Town of Fairfax may include:

- Distribution of the MJHMP and Community Profile to all interested parties, including both written and digital formats
- Monitoring of the Town of Fairfax mitigation project activities and dissemination of status reports
- Generation of reports relative to plan status, project management, and revision updates to executive leadership
- Preparations for plan eventual revision and updating

4.3 PLAN EVALUATION

Upon approval and adoption by the Town of Fairfax, the prioritized mitigation strategies will be further developed for funding and implementation by the lead agencies. The plan describes the potential sources of hazard mitigation funding, and general procedures to obtain that funding.

The mitigation strategies represented and adopted within this plan are recommendations only, and must be approved and funded in order to be implemented as official mitigation solutions. Ultimately, it is the responsibility of jurisdictional and agency officials within the Marin County OA to undertake project implementation based upon identified mitigation strategies, funding availability, and local need when it arises. The Marin County OEM will meet with the hazard mitigation Steering Committee, including the Town of Fairfax, to evaluate the plan after each update meeting.

4.4 PLAN UPDATE

During the five-year update cycle, the Marin County OEM will hold tri-annual update meetings with the hazard mitigation Steering Committee, including the Town of Fairfax, and local stakeholders to discuss revisions to the plan. The Marin County OEM and the Town of Fairfax will continue to hold public meetings after the first and third update meetings annually and will continue to invite public participation in the update process via updated public surveys.

5. City of Larkspur Community Profile

Marin County Multi-Jurisdictional Hazard Mitigation Plan 2023

This page is intentionally blank.

ACKNOWLEDGEMENTS

The City of Larkspur would like to thank those collaborators and partners who participated in the planning and development of this document.

The official Marin County Operational Area (OA) Multi-Jurisdictional Hazard Mitigation Plan (MJHMP) Steering Committee provided the oversight and dedication to this project that was required, and without their commitment, this project would not be possible.

As with any working plan, this document represents planning strategies and guidance as understood as of the date of this plan's release. This plan identifies natural hazards and risks and identifies the hazard mitigation strategy to reduce vulnerability and make the communities of the City of Larkspur more disaster resistant and sustainable.

SECTION 1.0: INTRODUCTION

1.1 INTRODUCTION

The City of Larkspur, Community Profile has been prepared in conjunction with the Marin County Operational Area (OA) Multi-Jurisdictional Hazard Mitigation Plan (MJHMP), establishing an inter-jurisdictional process for the development and implementation of effective hazard mitigation strategies in association with identified hazards that pose real or potential threats to the City of Larkspur.

1.2 PLANNING PROCESS

The majority of the Marin County OA is unincorporated sparsely populated rural and protected lands. Most of the 262,000 county population, both incorporated and unincorporated, is concentrated in the Eastern portion of the county. There are a total of 11 incorporated jurisdictions within Marin County. The Marin County OA MJHMP Steering Committee and broader Planning Team approached the development of the Marin County OA MJHMP and the associated jurisdictional and district profiles from a coordinated and collaborative planning and public engagement unity of effort.

The Steering Committee felt a unified effort, led by the County Office of Emergency Management (OEM), would be the most effective approach for this planning process. This approach allowed the small jurisdictions and districts with limited staffing and resources to take advantage of the combined efforts of the County and other jurisdictions to reach a broader segment of each of their own populations and do so in a way to ensure greater equity and inclusion of the public in this planning process. Extensive and coordinated public outreach was done involving all participating jurisdictions and districts with an eye towards equity, inclusion, openness, accessibility, and ensuring they meet the population where they live, work, or recreate to provide the public convenience of access and ease of participation in this planning process.

The Marin County OA is very different from most California Counties in that the populated portion of the County where the jurisdictions and district's planning areas are located has the same climate, similar topography, and are exposed to many of the same hazards. Only three jurisdictions, Larkspur, Ross, and San Anselmo, are not coastal jurisdictions and are not impacted by Tsunami or Sea Level Rise.

This unity of effort approach allowed the Steering Committee to establish a more robust Planning Team representing local, countywide, regional, state, and federal stakeholders servicing the Marin County OA planning area. These stakeholders were in a unique position to provide informed and specific information and recommendations on hazard mitigation goals and actions, as well as population needs and social vulnerability for each of the jurisdictional and district planning areas. This united effort allowed the planning team to attend fewer meetings than they would have been required to attend if they were required to attend separate meetings for each participating jurisdiction and district. The reduced number of meetings allowed the planning team the opportunity and time to provide more detailed and thoughtful contributions to the planning effort.

In addition to providing representation on the coordinated Marin County OA MJHMP Steering Committee, the City of Larkspur involved additional internal planning team members to support the broader planning process. The City of Larkspur jurisdictional representatives for the

coordinated Marin County OA MJHMP Steering Committee and the Planning Team Members are represented below.

1.2.1 Steering Committee Members (Jurisdictional Representatives)

Primary Point of Contact
Julian Skinner, Public Works Director
Telephone: 415-927-5017
E-mail: jskinner@cityoflarkspur.org

Alternate Point of Contact
Alex Othon, Senior Planner
Telephone: 415-927-5026
E-mail: aothon@cityoflarkspur.org

This annex was developed by the primary point of contact with assistance from the members of the local mitigation planning team listed in Table 1 and Table 2.

Table 95: City of Larkspur Local Hazard Mitigation Planning Team Members

This 2023 Marin County Operational Area (OA) MJHMP is a comprehensive update of the 2018 Marin County OA MJHMP. The planning area and participating jurisdictions and organizations were defined to consist of the unincorporated County of Marin, five special districts, and the eleven incorporated jurisdictions to include the City of Larkspur. All participating jurisdictions are within the geographical boundary of the Marin County OA and have jurisdictional authority within this planning area.

The Steering Committee led the planning process based on the contribution and input from the whole community stakeholders who identified the community's concerns, values, and priorities. The Steering Committee met and reviewed the mitigation recommendations and strategies identified within this plan. Each participating local jurisdiction established a mechanism for the development and implementation of jurisdictional mitigation projects, as identified within this plan and associated locally specific supporting documents. As deemed necessary and appropriate, participating jurisdictions will organize local mitigation groups to facilitate and administer internal activities.

The Steering Committee assisted with the planning process in the following ways:

- Attending and participating in the Steering Committee meetings.
- Identification of potential mitigation actions.

- Updating the status of mitigation actions from the 2018 Marin County OA MJHMP.
- Collecting and providing other requested data (as available).
- Making decisions on plan process and content.
- Reviewing and providing comments on plan drafts; including annexes.
- Informing the public, local officials, and other interested stakeholders about the planning process and providing opportunity for them to be involved and provide comment.
- Coordinating, and participating in the public input process.
- Coordinating the formal adoption of the plan by the governing boards.

1.2.2 Steering Committee Planning Process

The Steering Committee met monthly to develop the plan. Email notifications were sent out to each Steering Committee member to solicit their participation in the Steering Committee meetings. The meetings were conducted using a Zoom platform videoconferencing. Meeting attendees signed in using the chat feature to record their attendance.

The Steering Committee agreed to make and pass plan-based general policy recommendations by a vote of a simple majority of those members present. The Steering Committee will also seek input on future hazard mitigation programs and strategies from the mitigation planning team by focusing on the following:

- Identify new hazard mitigation strategies to be pursued on a state and regional basis and review the progress and implementation of those programs already identified.
- Review the progress of the Hazard Mitigation program and bring forth community input on new strategies.
- Coordinate with and support the efforts of the Marin County OEM to promote and identify resources and grant money for implementation of recommended hazard mitigation Strategies within local jurisdictions and participating public agencies.

During the planning process, the Steering Committee communicated through videoconferencing, face-to-face meetings, email, telephone conversations, and through the County website. The County website included information for all stakeholders on the MJHMP update process. Hannah Tarling of the Marin County OEM and Preparative Consulting established a Microsoft 365 SharePoint folder which allowed the Steering Committee members and Marin OEM and Preparative Consulting to share planning documents and provide a format for the planning partners to submit completed documents and access other planning related documents and forms. Draft documents were also posted on this platform and the Marin County OEM website so that the Steering Committee members and the public could easily access and review them.

1.2.3 Coordination with Stakeholders and Agencies

Opportunities for involvement in the planning process must be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other private and nonprofit interests (44 CFR, Section 201.6(b)(2)).

Early in the planning process, the Marin County and City of Larkspur Steering Committee reached out to the following Local and Regional Agencies involved in hazard mitigation activities to invite

them to participate in this planning process as a member of the Planning Team. These individuals work with Marin County and the City of Larkspur communities and could provide subject matter expertise and relevant information to the planning process regarding the community history, hazard risk, vulnerability, and impact, mitigations efforts, community needs, demographics, and social vulnerability, economic concerns, ecology, and other community services and needs.

The Marin County and City of Larkspur Steering also determined that data collection, risk assessment analyses, mitigation strategy development, and plan approval would be greatly enhanced by inviting other local, state and federal agencies and organizations to participate in the process. Based on their involvement in hazard mitigation planning, their landowner status in the County, the City of Larkspur and/or their interest as a neighboring jurisdiction, representatives from the following groups were invited to participate on the Planning Team:

Eighty-five planning partners participated in this update, as listed in Table 2.

Table 96: 2023 MJHMP Local Planning Team Members

Several opportunities were provided for the groups listed above to participate in the City of Larkspur's planning process. At the beginning of the planning process, invitations were extended to these groups to actively participate on the Planning Team. Participants from these groups assisted in the process by attending several videoconferencing meetings where hazard vulnerability and risk were discussed along with hazard mitigation strategies and actions. Planning Team members provided data and other applicable information directly as requested in meetings, emails, telephone calls, videoconferencing, worksheets, or through data contained on their websites or as maintained by their offices. This information was used to develop hazard vulnerability and risk profiles along with mitigation actions.

These key agencies, organizations, and advisory groups received meeting announcements, agendas, and minutes by e-mail throughout the plan update process. They supported the effort by attending meetings or providing feedback on issues. All the agencies were provided with an opportunity to comment on this plan update and were provided with a copy of the plan to review and offer edits and revisions. They were also provided access to the Marin County OEM hazard mitigation plan website to review all planning documents and hazard mapping tools.

Each was sent an e-mail message informing them that draft portions of the plan were available for review. In addition, the complete draft plan was sent to the California Governor's Office of Emergency Services (Cal OES) and FEMA Region IX for a pre-adoption review to ensure program compliance.

In addition, through the public meetings conducted at the beginning of the planning process, members of the planning team, the public, and other key stakeholders were invited to participate in the planning process through public outreach activities.

Further as part of the public outreach process, all planning areas engaged in public outreach and education by providing information on their website or though press releases directing the public to the main Marin County OEM website that provided coordinated and detailed public information of the planning process and how the public could participate. All planning areas were invited to attend the public meetings and to review and comment on the plan prior to submittal to Cal OES and FEMA. Additional public outreach action is detailed in the 1.2.4 PUBLIC ENGAGEMENT section of this annex.

The following planning meetings were held with the planning team:

1.2.4 PUBLIC ENGAGEMENT

Early discussions with the Marin County OEM established the initial plan for public engagement to ensure a meaningful and inclusive public process with a focus on equity and accessible to the whole community. The Public Outreach efforts mirrored the Planning Team approach with a unified effort, led by the County OEM, involving all participating jurisdictions and districts. Public outreach for this plan update began at the beginning of the plan development process with a detailed press release informing the community of the purpose of the hazard mitigation planning process for the Marin County OA planning area and to invite the public to participate in the process.

Public involvement activities for this plan update were conducted by the County and all participating jurisdictions and districts and included press releases; website postings; a community survey; stakeholder and public meetings; and the collection of public and stakeholder comments on the draft plan which was posted on the County website. Information provided to the public included an overview of the mitigation status and successes resulting from implementation of the 2018 plan as well as information on the processes, new risk assessment data, and proposed mitigation strategies for the plan update.

Equity and Whole Community Approach

The Marin County OEM and the Steering Committee prioritized equity and engagement of the whole community in the development of the Marin County OA MJHMP by establishing a framework with key actions for each step of the planning process. Elements of the equity approach included:

Engaging hard-to-reach populations

This effort was to ensure the greatest equity and access to the public to enable participation in the process. The Marin County OEM outreach strategy is to “meet people where they are.” The Town Hall meetings were conducted at different familiar locations within the county where people could easily access them and were conducted on both a weekday and weekend, and in the evening and during the daytime. The meetings were offered in-person with a virtual

broadcast using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. After the meeting, Marin County OEM uploaded the recorded meeting to their website to allow the public on demand access to the meeting.

Translation and Interpretation Services

The survey and outreach materials were provided in both English and Spanish to improve accessibility among populations with limited English proficiency. The website uses Google Translate for accessibility in multiple languages. Interpretation services were offered for both town hall meetings. Each town hall meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

Three stakeholder and public meetings were held, two at the beginning of the plan development process and one prior to finalizing the updated plan. Where appropriate, stakeholder and public comments and recommendations were incorporated into the final plan, including the sections that address mitigation goals and strategies. Specifically, public comments were obtained during the plan development process and prior to plan finalization.

All press releases and website postings are on file with the Marin County OEM. Public meetings were advertised in a variety of ways to maximize outreach efforts to both targeted groups and to the public at large. Advertisement mechanisms for these meetings and for involvement in the overall MJHMP development process include:

- Development and publishing of an MJHMP public outreach article
- Providing press releases to local newspapers and radio stations
- Posting meeting announcements on the local County MJHMP website
- Email to established email lists
- Personal phone calls

The public outreach activities were conducted with participation from and on behalf of all jurisdictions participating in this plan.

The Steering Committee has made the commitment to periodically bring this plan before the public through public meetings and community posting so that citizens may make input as strategies and implementation actions change. Public meetings will continue to be held twice a year after the first and third MJHMP meetings. Public meetings will continue to be stand-alone meetings but may also follow a council meeting or other official government meeting. The public will continue to be invited to public meetings via social media messaging, newspaper invitations, and through the website for each jurisdiction participating in the plan. Each jurisdiction is responsible for assuring that their citizenry is informed when deemed appropriate by the Steering Committee.

WEBSITE

At the beginning of the plan update process, Marin County OEM established a hazard mitigation website https://emergency.marincounty.org/pages/lhmp on behalf of all the planning areas to ensure consistent messaging and information, to keep the public posted on plan development milestones, and to solicit relevant input. The website also provided information on signing up for Alert Marin, provided detailed information about the hazard mitigation process and plan

development, provided a URL and QR code link to the survey in both English and Spanish, and provided information about upcoming town hall meetings. (See Figure 1)

The site's address was publicized in all press releases, surveys and public town hall meetings. Each planning partner also established a link on their own agency website. Larkspur provided a link on the city's website https://www.ci.larkspur.ca.us/158/Other-Citywide-Plans. Information on the plan development process, the Steering Committee, a link to the Hazard Mitigation survey, and drafts of the plan were made available to the public on the site. The County of Marin intends to keep a website active after the plan's completion to keep the public informed about successful mitigation projects and future plan updates.

Figure 189: Marin County OEM MJHMP Website

PUBLIC MEETINGS

Two separate Marin County OAMJHMP Public Town Hall Meeting were conducted at different locations within the County, on different days of the week and during different times of the day. This effort was to ensure the greatest equity and access by the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." Each Town Hall Meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

The first Town Hall Meeting was conducted on Thursday, April 13, 2023, from 6:00 pm to 7:30 pm, at the Marin County Board of Supervisors Chambers, Marin County Civic Center, 3501 Civic Center Drive, Room #330 San Rafael, CA 94903. The in-person meeting was also broadcast virtually using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. Each of the jurisdictions participating in the MJHMP released a Press Release on their respective websites announcing the Public Town Hall Meeting and providing the date, time, and URL link to the Zoom Meeting for the public to log in and attend the Zoom Meeting. Marin County OEM also posted a notice for the Public Town Hall Meeting

on their Facebook account. At the conclusion of the presentation, a question and answer session was held to answer questions from the attendees.

The second Town Hall Meeting was conducted on Saturday, April 29, 2023, from 10:00 am to 11:30 am, at the Marin County Health and Wellness Center, 3240 Kerner Ave. Rooms #109 and #110 San Rafael, CA. 94903. The meeting followed the same format as the first and hosted the same access level of equity and accessibility.

The Marin County OA MJHMP Public Town Hall Meeting was recorded and downloaded from Zoom and made available to all of the jurisdictions and districts to place on their websites and local Access TV for the public to view.

Meeting participants were also invited to complete the Hazard Mitigation Survey and were provide the URL link to the Survey Monkey website to complete the survey.

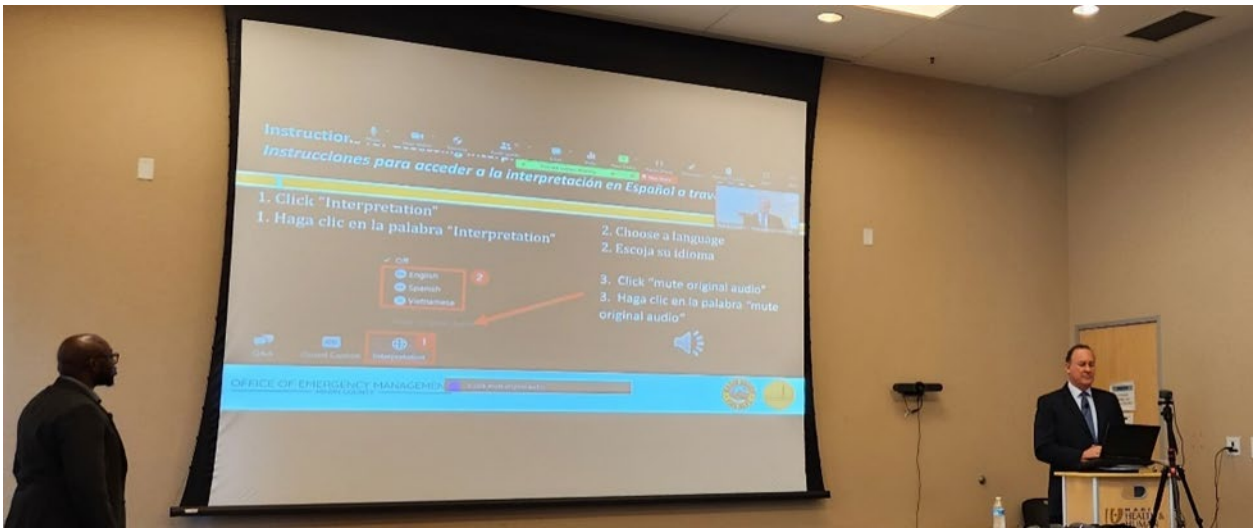

Figure 190: Marin County OA MJHMP Public Town Hall Meeting

SOCIAL MEDIA

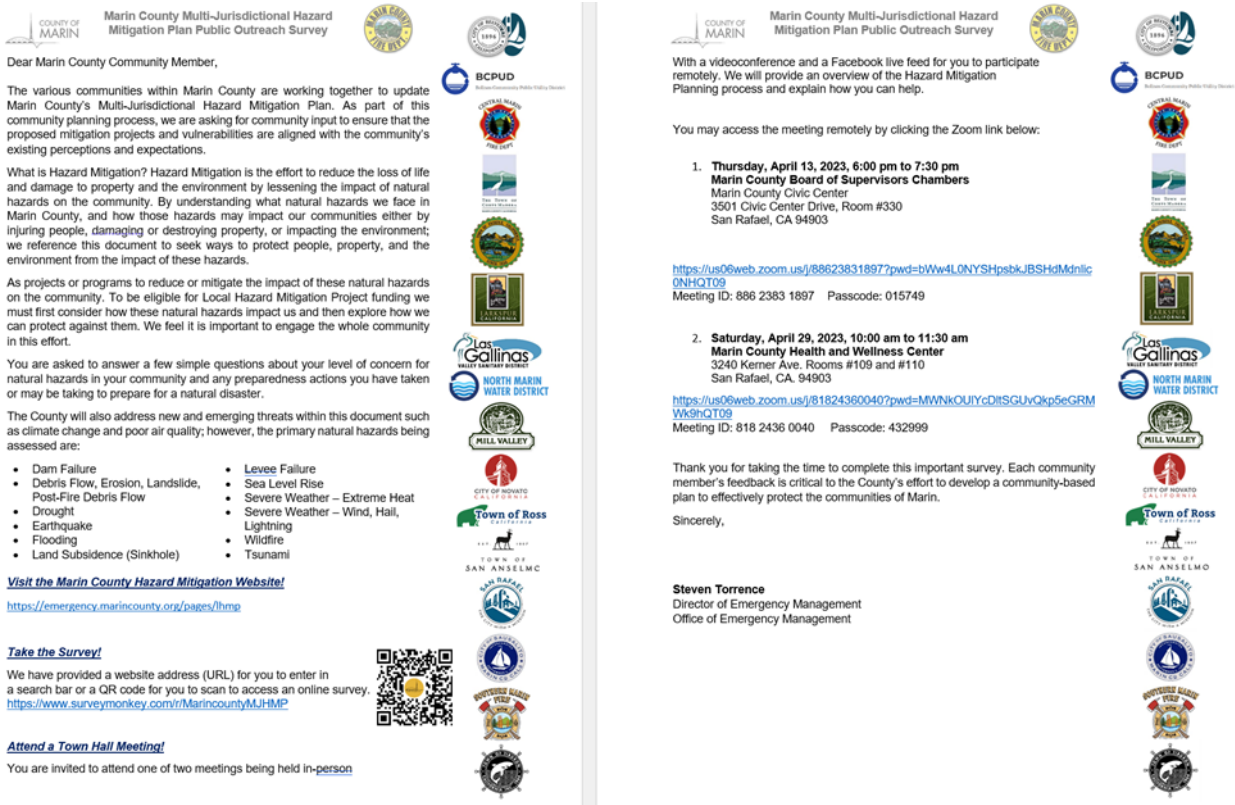
The Marin County OA utilized several forms of social media to reach residents and customers. Information about the Hazard Mitigation Planning process was communicated to the public via Facebook, Twitter, and local access TV. Residents and customers were invited to complete the Hazard Mitigation Plan survey which was accessible via an attached URL or QR Code and provide feedback on potential hazard mitigation projects or programs.

The results of the survey were provided to each of the planning partners and used to support the jurisdictional annex process. Each planning partner was able to use the survey results to help identify actions as follows:

- Gauge the public's perception of risk and identify what citizens are concerned about.
- Identify the best ways to communicate with the public.
- Determine the level of public support for different mitigation strategies.
- Understand the public's willingness to invest in hazard mitigation.

PRESS RELEASES

Press releases were distributed over the course of the plan's development as key milestones were achieved and prior to each Marin County OA MJHMP Public Town Hall Meeting. All press releases were made available to the community in both English and Spanish.



Marin County Multi-Jurisdictional Hazard Mitigation Plan Public Outreach Survey

Dear Marin County Community Member,

The various communities within Marin County are working together to update Marin County's Multi-Jurisdictional Hazard Mitigation Plan. As part of this community planning process, we are asking for community input to ensure that the proposed mitigation projects and vulnerabilities are aligned with the community's existing perceptions and expectations.

What is Hazard Mitigation? Hazard Mitigation is the effort to reduce the loss of life and damage to property and the environment by lessening the impact of natural hazards on the community. By understanding what natural hazards we face in Marin County, and how those hazards may impact our communities either by injuring people, damaging or destroying property, or impacting the environment; we reference this document to seek ways to protect people, property, and the environment from the impact of these hazards.

As projects or programs to reduce or mitigate the impact of these natural hazards on the community. To be eligible for Local Hazard Mitigation Project funding we must first consider how these natural hazards impact us and then explore how we can protect against them. We feel it is important to engage the whole community in this effort.

You are asked to answer a few simple questions about your level of concern for natural hazards in your community and any preparedness actions you have taken or may be taking to prepare for a natural disaster.

The County will also address new and emerging threats within this document such as climate change and poor air quality; however, the primary natural hazards being assessed are:

- Dam Failure
- Debris Flow, Erosion, Landslide, Post-Fire Debris Flow
- Drought
- Earthquake
- Flooding
- Land Subsidence (Sinkhole)
- Levee Failure
- Sea Level Rise
- Severe Weather – Extreme Heat
- Severe Weather – Wind, Hail, Lightning
- Wildfire
- Tsunami

Meeting ID: 818 2436 0040 Passcode: 432999

Thank you for taking the time to complete this important survey. Each community member's feedback is critical to the County's effort to develop a community-based plan to effectively protect the communities of Marin.

Sincerely,

Steven Torrence
Director of Emergency Management
Office of Emergency Management

Figure 191: Hazard Mitigation Plan Public Outreach Press Release

SURVEY

A hazard mitigation plan survey (see Figure 4) was developed by the Steering Committee and made available to the public in both English and Spanish. The survey was used to gauge household preparedness for natural hazards and the level of knowledge of tools and techniques that assist in reducing risk and loss from natural hazards. This survey was designed to help identify areas vulnerable to one or more natural hazards. The answers to its ten questions helped guide the Steering Committee in defining our hazards, and selecting goals, objectives, and mitigation strategies. The survey was available on the hazard mitigation plan website, advertised in press releases, and at town hall meetings. Finally, the survey and the process of public input was advertised throughout the course of the planning process. The survey was available to the public on March 13, 2023, and closed on June 12, 2023. At the conclusion of the planning process 293 surveys were completed by the public.

Public Comments Considered by the Planning Team

The Planning Team used the following information gathered from the Public Outreach Survey to inform decisions regarding hazard mitigation strategies, actions, and priorities.

- Climate Change, Wildfire, and Drought were the top hazards of concern for the public.

- Text messages, mail, and the County website were the preferred methods for receiving hazard mitigation information.
- 48% of respondents expressed that they were “Very Much” concerned and 31% were “Moderately” concerned that a natural disaster could impact their home or place of residence.
- 85% of respondents own their own home.
- 99% of respondents have access to the internet.

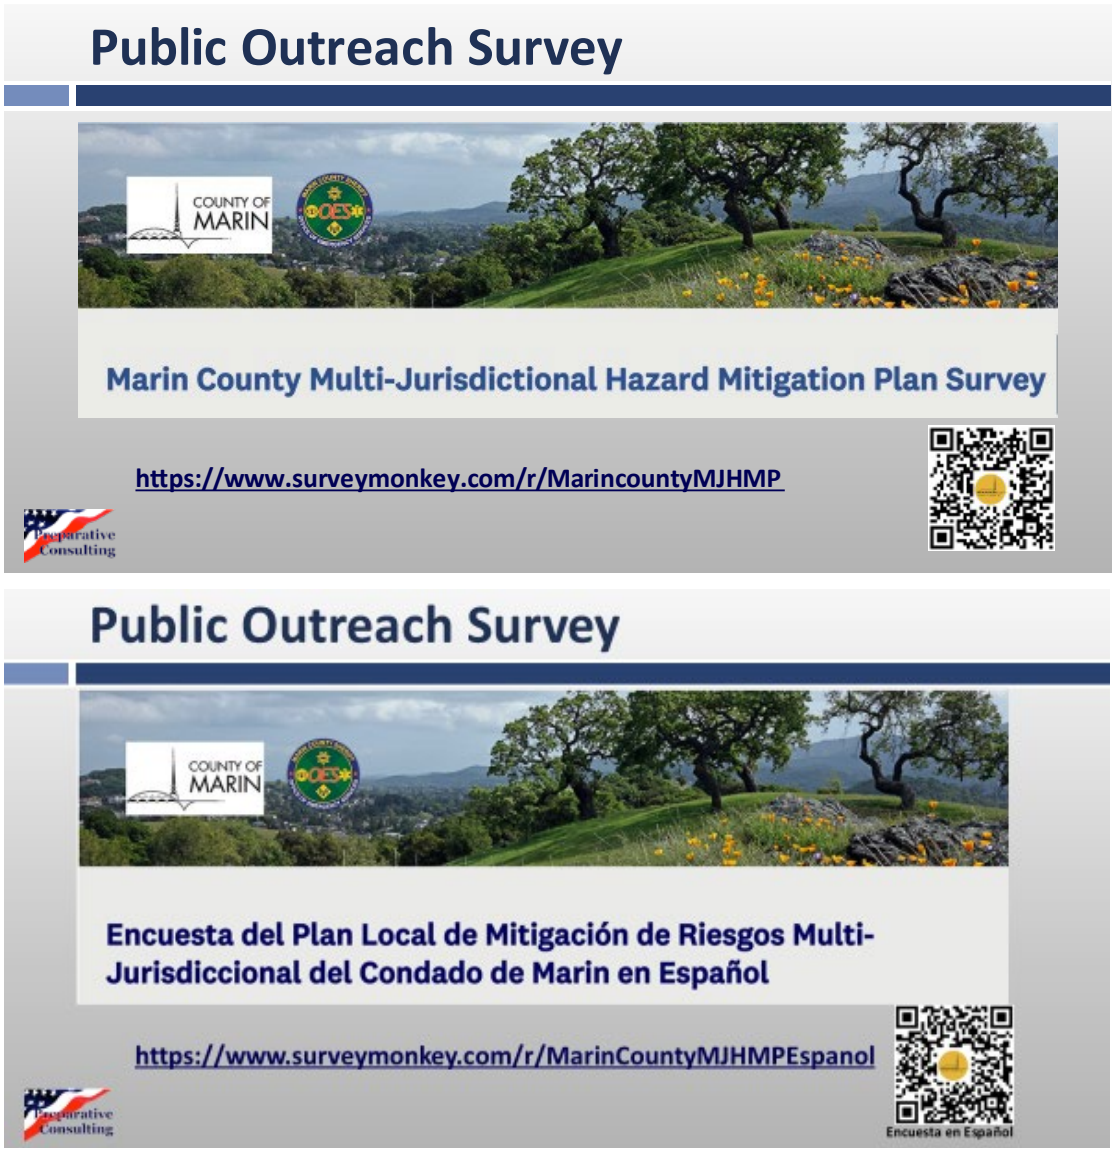

Figure 192: Hazard Mitigation Plan Survey

PUBLIC COMMENT ON THE PLAN

To solicit public feedback on the draft plan, Marin OEM engaged in a multi-faceted approach intended to reach as many Marin residents as possible, including members of the community who are under-served and under-represented. All members of the community had the opportunity to provide initial comments on the plan during a two-week period from Wednesday, December 4, 2023, to Wednesday, December 18, 2023. Although the initial comment period was listed as two weeks, the public could submit comments indefinitely via the County's website to support the County's continuous improvement efforts. The base plan, as well as city, town and special district annexes, were available for download on emergency.marincounty.org (include photos). The website additionally asked for feedback in a survey in English and Spanish (include photos), the survey was designed to establish where that person lives or works, their top hazards of concern, elicit feedback on the plan and offer a place for them to share projects to reduce risk in their community. The survey collected responses from the community in English and in Spanish.

The website and survey were shared through traditional and social media (photos) The Marin Independent Journal (Marin IJ) used the press release to write an article (hopefully; include photos). Social media accounts were updated four times with an initial ask, two reminders, and a closing announcement. The Marin OEM Public Information Officer coordinated with the Marin County Public Information Officers (MAPIO) working group to distribute information to partner jurisdictions (city, town, and special districts) to share this information on their social media sites and with the communities in the area.

To reach those who may not be engaged digitally, the planning team worked with Marin County Community Response Teams, (CRTs are a collaboration of non-profit organizations supporting underrepresented communities in four zones) to conduct outreach with half-sheet flyers in English and Spanish to share in the 4 CRT zones (southern Marin, north Marin, west Marin, San Rafael). These half sheets were also shared county-wide at libraries, including in areas not covered by CRTs, like at the Fairfax library. CRTs are designed to reach Marin's traditionally underserved and underrepresented communities, so by conducting outreach through this method, we were able to inform residents who may not have been engaged otherwise, including residents in Marin City, West Marin, and the Canal District of San Rafael.

After December 18, 2023, the various participating jurisdiction and district profiles remained on the Marin County OEM website for public comments. The City of Larkspur had an additional 14-day comment period for the City of Larkspur Community Profile where their profile was posted on the City website for final public comment from January 29 – February 5, 2024.

The 14-day public comment period gave the public an opportunity to comment on the draft plan update prior to the plan's submittal to Cal OES. Comments received on the draft plan are available upon request. All comments were reviewed by the planning team and incorporated into the draft plan as appropriate.

Public Comments Considered by the Planning Team

The Marin County OEM posted the draft Hazard Mitigation Plan and hazard mitigation actions on their website and solicited public comments on the content. The City of Larkspur

distributed press releases directing the community to the Marin County OEM website to review the draft plans. The Planning Team gathered public comments and information on the Marin County OEM website regarding proposed and current Hazard Mitigation Actions. The Planning Team used the comments and suggestions to inform decisions regarding hazard mitigation strategies, actions, and priorities. Most comments included ideas for hazard mitigation projects and comments on the effectiveness of current mitigation projects. These comments were used to revise the proposed hazard mitigation actions which resulted in the final list of hazard mitigation actions listed in 3.5 Hazard Mitigation Actions.

1.3 Overview and History

Larkspur is on the ancestral lands of the Coast Miwok People, including the Coast Miwok Tribal Council of Marin and the Federated Indians of Graton Rancheria. For more than 10,000 years, Coast Miwok people have lived along the shorelines of Marin County and continue to live in the county and beyond today. Stewards of the land, they managed the local watershed where creek and ocean resources were most abundant. The Miwok lost their land, first to the Mexican Californios and subsequently the American settlers who followed the “rush” for gold and the establishment of the state in 1850. An 1834 Mexican land grant to Irish immigrant John Reed included the area of Larkspur. Much of the area of Larkspur was logged in the 1840’s to supply lumber to San Francisco and the building of Presidio. Two sawmills were built to float logs down Corte Madera Creek to San Francisco Bay. Further growth was spurred by the formation of the North Pacific Coast Railroad Company railroad, with a railroad station being built in Larkspur. C.W. Wright and his American Land and Trust Company purchased much of present-day Larkspur in 1896, subdividing the land and piping in water. Wright’s wife Georgina named the City of Larkspur after she mistakenly identified the native lupine as Larkspur. C.W. Wright laid out the city in 1887 and the first post office opened in 1891. Larkspur quickly became a weekend destination for visitors from San Francisco, and a hotel, bathhouse, grocery store, and several retail shops were built. The City of Larkspur was officially incorporated on March 1st, 1908. Larkspur's Downtown Historic District, known also as Old Downtown Larkspur, was listed on the National Register of Historic Places in 1982. The city currently has a total area of 3.2 square miles and lies just inland of San Francisco Bay with hilly terrain on the southwest side.

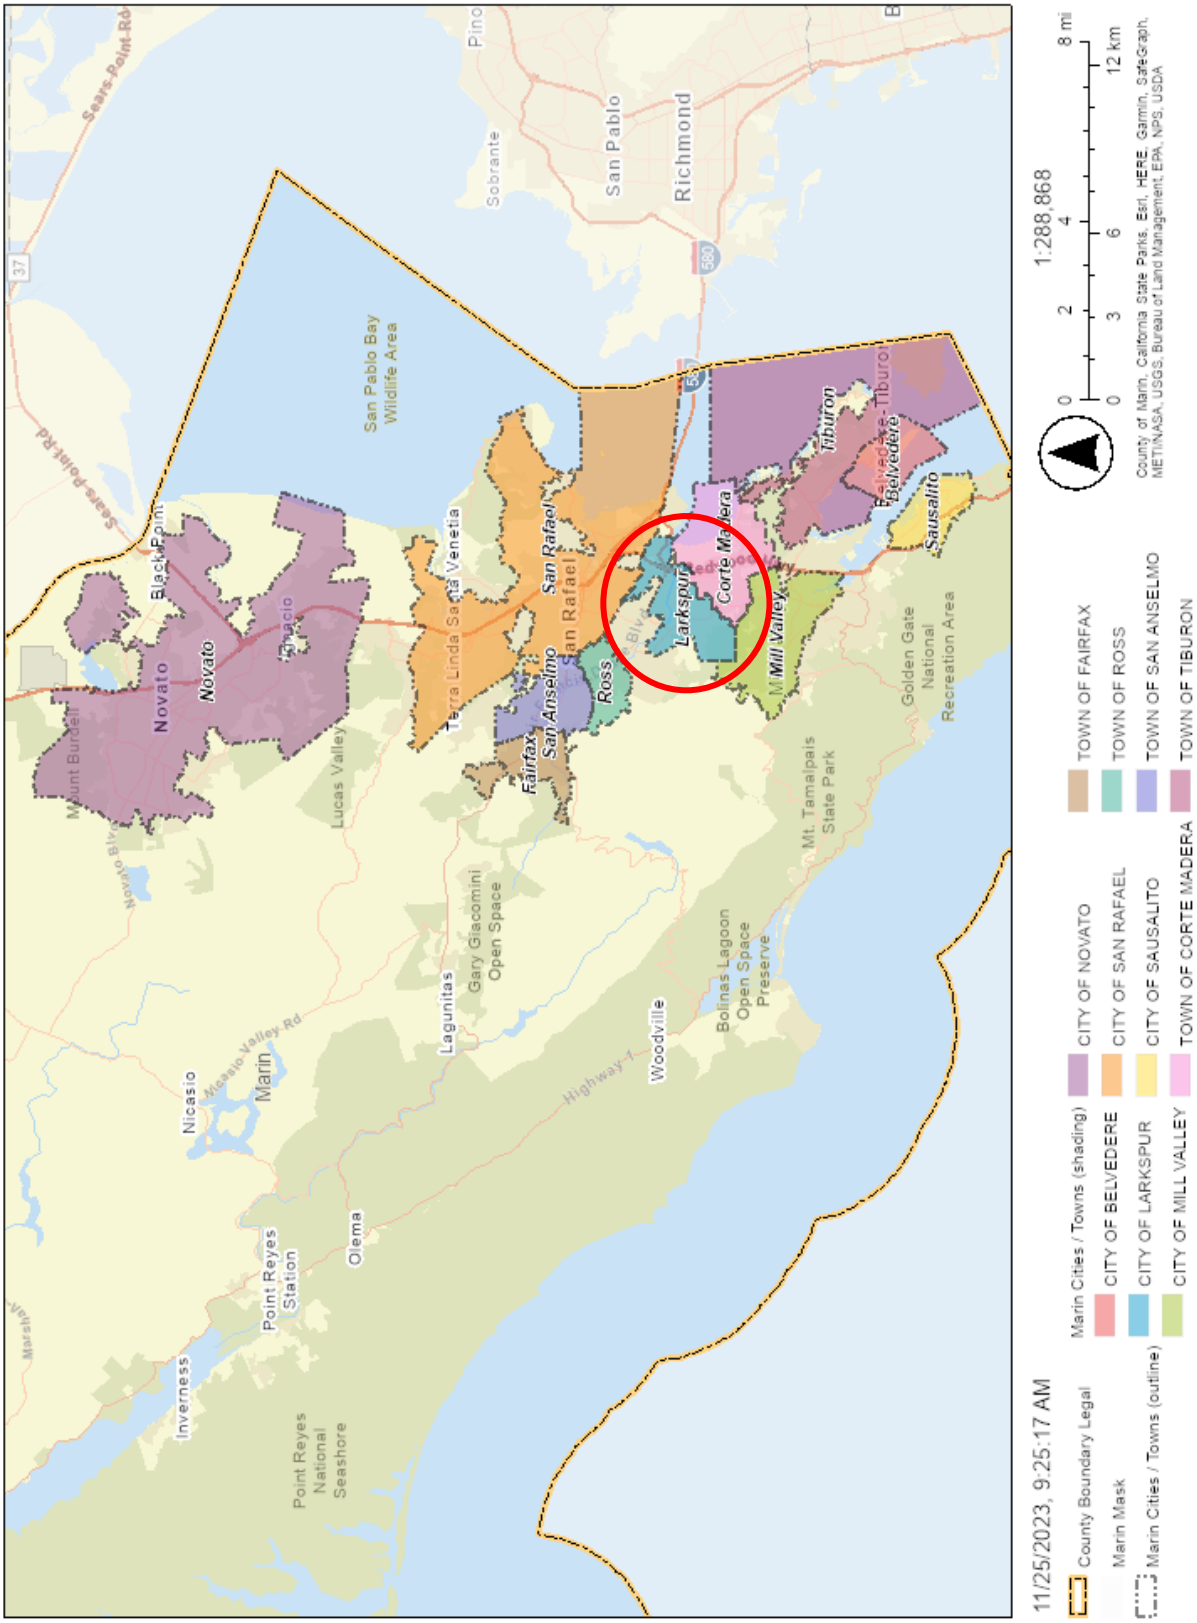

Figure 193: Map of City of Larkspur in Marin County

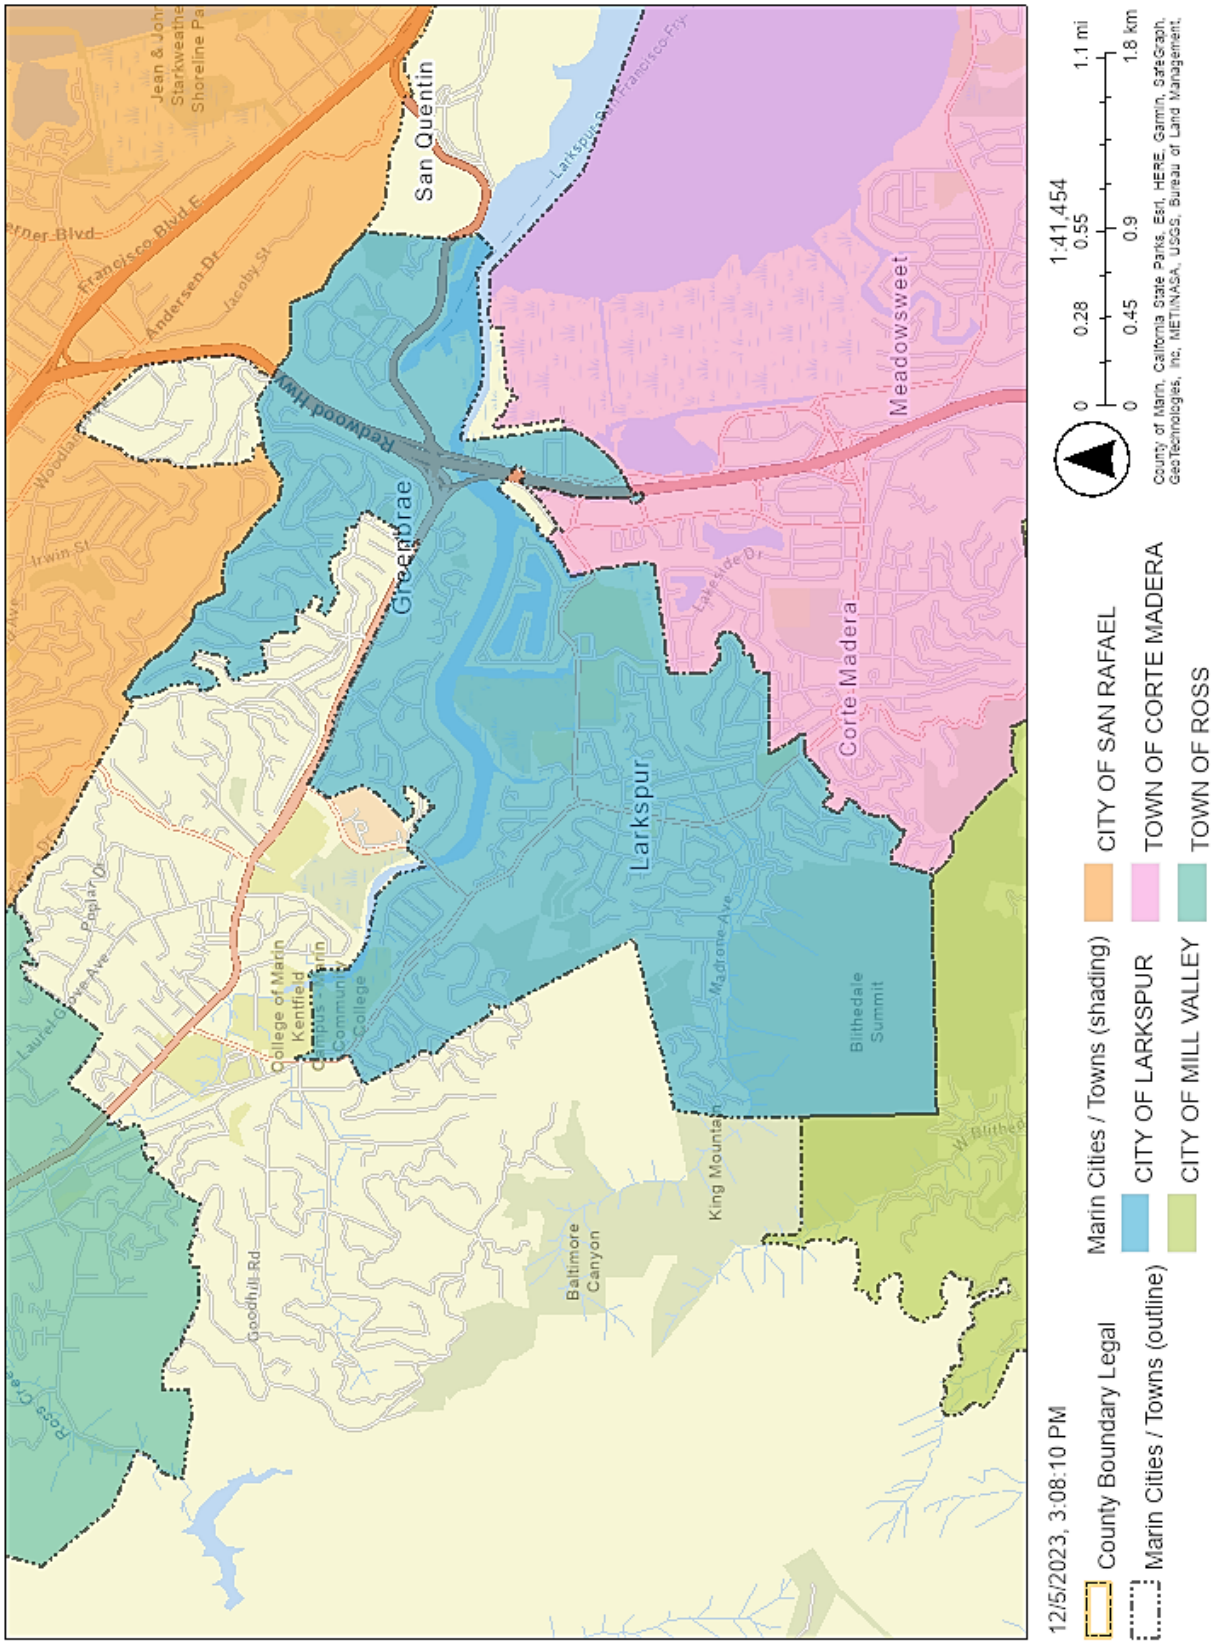

Figure 194: Map of the City of Larkspur
Source: Marin County OEM

1.4 GOVERNMENT

The City of Larkspur is governed by an elected five-person City Council responsible for passing local ordinances, approving the city budget, and setting strategic priorities for the city. The city council elects a mayor and vice mayor each year from its membership, the executive head of the city; and appoints a City Manager, the administrative head of the city. The city consists of 6 departments: Administration, Community Development (Building and Planning), Finance, Library, Public Works, and Recreation.

The City Council assumes responsibility for the adoption of this plan; and the City Manager will oversee its implementation.

In 2018, the City of Larkspur and the Town of Corte Madera formed the Central Marin Fire Department, a Joint Powers Authority to provide fire protection.

In 1980 the city merged its police department with the neighboring town of Corte Madera to become the Twin Cities Police Authority, which subsequently merged in 2013 with the police department of San Anselmo to form the Central Marin Police Authority. The Central Marin Police Authority has 50 full-time employees (42 sworn) and provides police services to approximately 35,000 residents.

1.5 WEATHER AND CLIMATE

The City of Larkspur is approximately 43 feet (13 m) above sea level. In the City of Larkspur, the summers are long, comfortable, arid, and mostly clear and the winters are short, cold, wet, and partly cloudy. Over the course of the year, the temperature typically varies from 48.9°F to 61.3°F and is rarely below 43°F or above 73.1°F. The difference in precipitation between the driest month and the wettest month is 8 inches. The annual rainfall is 43 inches. The month of highest relative humidity is February (80%). The month with the lowest relative humidity is June (69%). The month which sees the most rainfall is January. The driest month of the year is July.

	January	February	March	April	May	June	July	August	September	October	November	December
Avg. Temperature °C (°F)	9.4 °C (48.9) °F	10.2 °C (50.3) °F	11.3 °C (52.4) °F	12.3 °C (54.1) °F	14 °C (57.2) °F	15.9 °C (60.7) °F	16.3 °C (61.3) °F	16.7 °C (62) °F	16.8 °C (62.3) °F	15.3 °C (59.6) °F	12.2 °C (53.9) °F	9.6 °C (49.4) °F

1.6 DEMOGRAPHICS

The California Department of Finance shows an overall estimated decrease in the population of the Marin County OA and the City of Larkspur since the last plan update in 2018. Of the total estimated 257,135 residents of the Marin County OA in 2022 based on the 2020 U.S. Census Survey, 190,148 residents live in the incorporated county and 66,987 residents live in the unincorporated county.

The City of Larkspur had an estimated population of 12,396 in 2018. 2020 U.S. Census Survey estimated the City's population at 13,064. However, revised estimates for 2022 estimated the population to decrease to 12,797 population.

Table 4: City of Larkspur Estimated Jurisdictional Population				
Jurisdiction	Population 2022 (Estimate)	Population 2020	Population 2018 (Estimate)	Percent Change 2018-2022
Marin County OA	257,135	262,321	262,179	-1.92%
City of Larkspur	12,797	13,064	12,396	3.13%

Table 98: City of Larkspur Estimated Jurisdictional Population
Source: California Department of Finance

According to the U.S. Census, the population of the City of Larkspur is 13,064 as of 2020.

Table 5 shows the population growth comparison of the State of California, County of Marin and the City of Larkspur between 2010 – 2020.

Table 5: Population Change of The City of Larkspur				
Jurisdiction	Total Population		Change, 2010-2020	
	April 1, 2010	April 1, 2020	Number	Percent
California	37,253,956	39,538,223	2,284,267	6.1%
Marin County OA	252,409	262,321	9,912	3.9%
Larkspur, City	12,396	13,064	668	3.13%

1.7 Social Vulnerability and Risk

The California Governor's Office of Emergency Services (Cal OES) has initiated the "Prepare California" grant program focused on building community resilience amongst vulnerable individuals living in the areas of the state most susceptible to natural disasters. The Prepare California Initiative is aimed at reducing long-term risks from natural disasters by investing in local capacity building and mitigation projects designed to protect communities.

Prepare California leverages funds approved in Governor Gavin Newsom's 2021-22 State Budget and is designed to unlock federal matching funds for community mitigation projects that vulnerable communities would otherwise be unable to access. This program is intended for communities that are the most socially vulnerable and at the highest risk for future natural hazard events. The state identified communities by prioritizing California census tracts according to their estimated hazard exposures and social vulnerability.

The National Risk Index is a dataset and online tool to help illustrate the United States communities most at risk for 18 natural hazards: Avalanche, Coastal Flooding, Cold Wave, Drought, Earthquake, Hail, Heat Wave, Hurricane, Ice Storm, Landslide, Lightning, Riverine Flooding, Strong Wind, Tornado, Tsunami, Volcanic Activity, Wildfire, and Winter Weather.

For purposes of this plan the following National Risk Index (NRI) hazards are profiled in support of eight of the twelve Marin County OA MJHMP Hazards. NRI data was not available for Dam Failure, Land Subsidence, Levee Failure, or Sea Level Rise.

Table 8: NRI Hazards and Marin County OA MJHMP Hazards	
NRI Hazards	Marin County OA MJHMP Hazards
Earthquake	Earthquake
Riverine Flooding	Flooding
Coastal Flooding	Flooding
Wildfire	Wildfire
Landslide	Debris Flow
Drought	Drought
Heat Wave	Severe Weather -Extreme Heat
Tsunami	Tsunami
Strong Wind	Severe Weather – Wind, Tornado

Table 102: NRI Hazards and Marin County OA MJHMP Hazards
Source: FEMA National Risk Index 2023

The National Risk Index leverages available source data for Expected Annual Loss due to these 18 hazard types, Social Vulnerability, and Community Resilience to develop a baseline relative risk measurement for each United States county and Census tract. These measurements are calculated using average past conditions, but they cannot be used to predict future outcomes for a community. The National Risk Index is intended to fill gaps in available data and analyses to better inform federal, state, local, tribal, and territorial decision makers as they develop risk reduction strategies.

Calculating the Risk Index

Risk Index scores are calculated using an equation that combines scores for Expected Annual Loss due to natural hazards, Social Vulnerability and Community Resilience:
Risk Index = Expected Annual Loss × Social Vulnerability ÷ Community Resilience

Hazard Type Risk Index

Hazard type Risk Index scores are calculated using data for only a single hazard type, and reflect a community's Expected Annual Loss value, community risk factors, and the adjustment factor used to calculate the risk value.

Table 9 illustrates the NRI Hazard Type Risk Index for Larkspur Census Tract 1200.02.

Table 9: NRI Hazard Type Risk Index for Larkspur Census Tract 1200.02

Hazard Type	EAL Value	Social Vulnerability	Community Resilience	CRF	Risk Value	Score
Earthquake	$2,068,514	Relatively Low	Very High	0.95	$1,975,315	96.1
Riverine Flooding	$640,184	Relatively Low	Very High	0.95	$611,340	97.2
Coastal Flooding	$80,651	Relatively Low	Very High	0.95	$77,017	95.7

Social Vulnerability in Larkspur and the Marin County OA

Most socially vulnerable residents in the Marin County OA reside in parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and the unincorporated areas of Marin City and Santa Venetia. This aligns with what the County knows about Marin residents. However, discrepancy lies in the western, more rural area of the county. West Marin is comprised of seven villages, and other populated areas, that are distanced from the centralized resources in the eastern part of the county. At three local elementary school in West Marin (2022-2023 school year), students eligible for free and reduced lunch program are, 62%, 41%, and 52%, a reflection of the financial capacity of local families. West Marin is home to many farms that may employ and house underrecognized workers that may not have taken part in a census survey, what the SVI is calculated from. In the fourth quarter of FY 2021/22 the bus routes traveling to West Marin (Rural Routes) were the only service category to have increased in ridership since pre-COVID (increase 0.1%; Marin Transit, 2022) showing the reliance of West Marin residents on public transportation; however, this data continues to adjust based upon the increase in alternate methods of mass transportation. Considering this, the County of Marin acknowledges that unique social factors in West Marin require different approaches than other parts of the County.

The median income for a household in the City was $135,260 and the per capita income for the City was $94,909. Approximately 1.5 percent of families and 7.7 percent of the population were below the poverty line (2020 data, U.S. Census Bureau). While one of the three census tracts reflect a Relatively High Social Vulnerability Index in the City, the other two reflect a Very Low and Relatively Low Social Vulnerability Index. The area of the Relatively High Social Vulnerability Index is the 0.3 square mile area in Greenbrae known as the Bon Air Hill neighborhood. It is developed with primarily multi-family apartment buildings, condominium units, 297-unit senior living facility, one nursing home facility, shopping center and office and other commercial uses. There are 2,023 housing units in the area and 3,812 residents. The median age is 56.8, which is 10% higher than Larkspur and 20% higher than Marin County. The area is 65% White, 12% Asian and 14% Hispanic. The median and per capita income in this tract are lower than other areas of Larkspur ($85,739 and $69,672), with a 9.8% poverty rate.

1.8 Economy and Tax Base

Table 12 shows income by household in The City of Larkspur as of 2019.

Table 12: Household Income for The City of Larkspur as of 2021

Household Income	Number	Percent
Total Households	6,213	-
Less than $10,000	261	4.2
$10,000 to $14,999	87	1.4
$15,000 to $24,999	261	4.2
$25,000 to $34,999	360	5.8
$35,000 to $49,999	522	8.4

$50,000 to $74,999	603	9.7
$75,000 to $99,999	466	7.5
$100,000 to $149,999	888	14.3
$150,000 to $199,999	559	9.0
$200,000 or more	2,199	35.4
Median household income (dollars)	$135,260	
Mean household income (dollars)	$197,818

1.10 HISTORICAL PROPERTIES

The City of Larkspur has approximately one hundred and thirty listed historically significant homes, public buildings, or landmarks. To inventory these resources, the HMPC collected information from a number of sources:

- California Department of Parks and Recreation Office of Historic Preservation (OHP) OHP is responsible for the administration of federally and state mandated historic preservation programs to further the identification, evaluation, registration, and protection of California's irreplaceable archaeological and historical resources. OHP administers the National Register of Historic Places, the California Register of Historical Resources, California Historical Landmarks, and the California Points of Historical Interest programs.
- City of Larkspur Chamber of Commerce.
- City of Larkspur website.

As defined by the National Environmental Policy Act (NEPA), any property over 50 years of age is considered a potential historic resource and is potentially eligible for the National or California Register. Thus, in the event that the property is to be altered, or has been altered, as the result of a major federal action, the property must be evaluated under the guidelines set forth by NEPA. Structural mitigation projects are considered alterations for the purpose of this regulation. Similar regulations exist for buildings under the California Environmental Quality Act (CEQA)

The city maintains the list of locally historic structures on its website https://www.ci.larkspur.ca.us/DocumentCenter/View/411/Historic-Resources-Inventory?bidId= .

Table 15: Historic Sites In The City of Larkspur Listed on State or National Registry

Name/Landmark State Plaque Number	National Register (NR)	State Landmark	California Register	Date Listed (NR)	Jurisdiction
Alexander-Acacia Bridge	X			1/5/1984	Larkspur

Source: California Office of Historic Preservation and the National Register of Historic Places

SECTION 2.0: HAZARD IDENTIFICATION AND RISK ASSESSMENT

The City of Larkspur identified hazards that affect the city and developed natural hazard profiles based upon the countywide risk assessment, past events and their impacts. Figure 14 shows the top hazards that the Jurisdiction is at risk from according to the hazard mitigation Steering Committee.

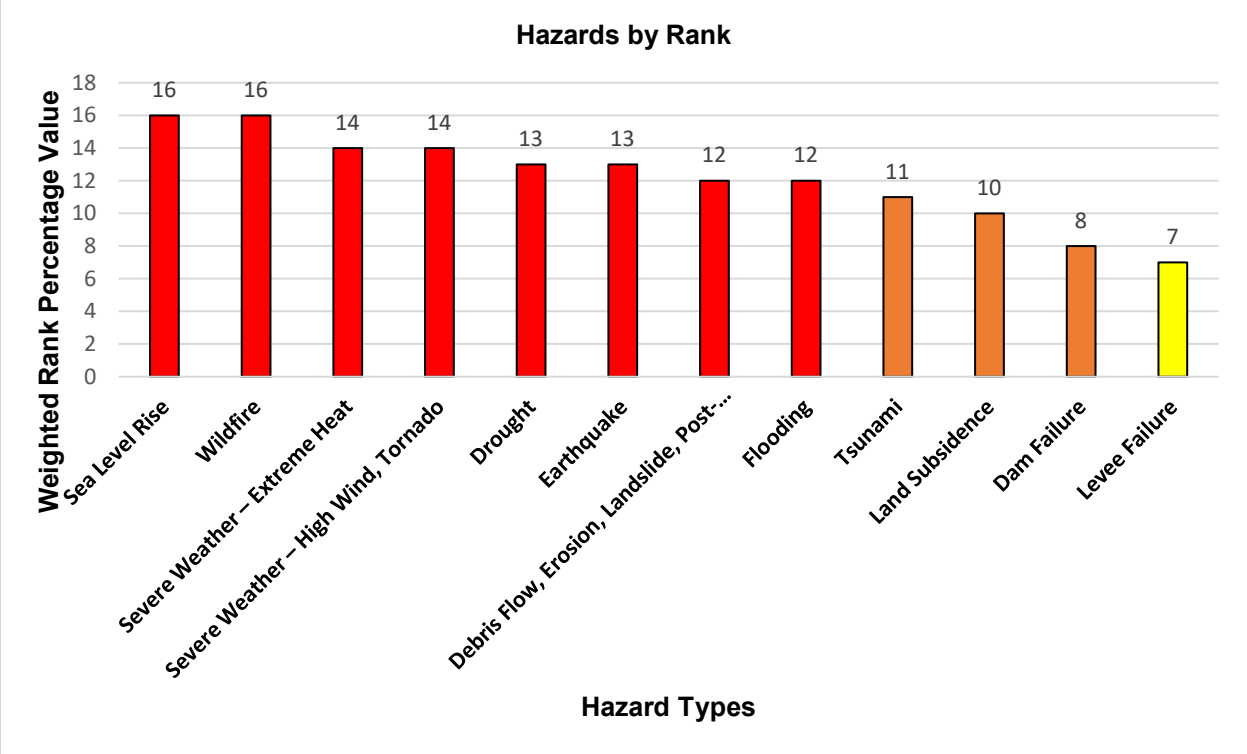

Figure 202: City of Larkspur Risk Assessment – Planning Team Top Hazards

Figure 15: Risk Rank Categorization	
Risk Level	**Risk Numerical Score**
High Risk	**12 - 16**
Serious Risk	**8 - 11**
Moderate Risk	**4 - 7**
Low Risk	**1 - 3**

Figure 203: Hazard Risk Categorization

Each Marin County OA MJHMP participating jurisdiction and organization reviewed and approved the Top Hazards identified by the Planning Team. Each participating jurisdiction and district then completed a more complex assessment tool to further develop their hazard assessment and prioritization.

The planning process used the available FEMA tools to evaluate all the possible threats faced. The primary tool selected was the Hazard Assessment and Prioritization Tool. This matrix allowed the participating jurisdiction or organization to assess their own level of vulnerability and

mitigation capability. Each participating Jurisdiction and organization assessed the top hazards for:

- Probability/ Likelihood of Future Events
- Geographic Extent
- Magnitude/ Severity
- Climate Change Influence
- Significance

Probability/ Likelihood of Future Events

- **Unlikely:** Occurs in intervals greater than 100 years - Less than 1% probability of occurrence in the next year or a recurrence interval greater than 100 years.
- **Occasional:** Occurring every 11 to 100 years - 1-10% probability of occurrence in the next year or a recurrence interval of 11 to 100 years.
- **Likely:** Occurring every 1 to 10 years - 10-90% probability of occurrence in the next year or recurrence interval of 1 to 10 years.
- **Highly Likely:** Occurring almost every year - 90-100% probability of occurrence in the next year or a recurrence interval of less than 1 year.

Geographic Extent

- **Negligible:** Less than 10% of the planning area
- **Limited:** 10-25% of the planning area
- **Significant:** 25-75% of planning area
- **Extensive:** 75-100% of planning area

Magnitude/ Severity

- **Weak:** Limited classification on scientific scale, slow speed of onset or short duration of event, resulting in little to no damage.
- **Moderate:** Moderate classification on scientific scale, moderate speed of onset or moderate duration of event, resulting in some damage and loss of services for days.
- **Severe:** Severe classification on scientific scale, fast speed of onset or long duration of event, resulting in devastating damage and loss of services for weeks or months.
- **Extreme:** Extreme classification on scientific scale, immediate onset or extended duration of event, resulting in catastrophic damage and uninhabitable conditions.

Table 16: Select Hazards Magnitude and Severity Scale					
Hazard	**Scale/Index**	**Weak**	**Moderate**	**Severe**	**Extreme**
Drought	Palmer Drought Severity Index	+1.99 to -1.99	-2.00 to -2.99	-3.00 to -3.99	-4.00 and below
Earthquake	Modified Mercalli	I to IV	V to VII	VIII	IX to XII
	Richter Magnitude	2,3	4,5	6	7,8
Tornado	Fujita Tornado Damage Scale	FO	F1, F2	F3	F4, F5

Table 110: Select Hazards Magnitude/ Severity Scale or Index

Climate Change Influence

- **Low:** Minimal potential impact
- **Medium:** Moderate potential impact
- **High:** Widespread potential impact

Significance

- **Low:** Minimal potential impact - Two or more criteria fall in lower classifications, or the event has a minimal impact on the planning area. This rating is sometimes used for hazards with a minimal or unknown record of occurrences or for hazards with minimal mitigation potential.
- **Medium:** Moderate potential impact - The criteria fall mostly in the middle ranges of classifications and the event's impacts on the planning area are noticeable but not devastating. This rating is sometimes used for hazards with a high extent rating but very low probability rating.
- **High:** Widespread potential impact - The criteria consistently fall in the high classifications and the event is likely/highly likely to occur with.

2.1 CLIMATE CHANGE

The County of Marin and associated jurisdictions profiled jointly recognize that the earth's climate is forcibly being augmented due to humans' reliance on fossil fuels and non-natural resources which pose negative impacts on the earth's climate. Reliance on fossil fuels and non-natural products results in the climate shifting to include unseasonable temperatures, more frequent and intense storms, prolonged heat and cold events, and a greater reliance on technological advancements to maintain the wellbeing of community members and balance of the environment. The forced adaptation to climatic shifts is necessary for the County and jurisdictions to understand and include with these assessments.

Locally to Marin, drought and rain events have already had devastating impacts to critical infrastructure, agriculture, and water resources; and globally, unseasonable temperatures have been identified as the cause for enhanced wildfires, severe droughts, ice sheets and glaciers disappearing, and persons emigrating from their countries due to a lack of sustainable, local resources. Melting land ice contributes additional water to the oceans and as ocean temperatures rise the water expands, both of which contribute to increase rates of sea level rise. Marin is bordered on the west by the Pacific Ocean and on the east by San Francisco Bay, making it particularly vulnerable to flooding and erosion caused by sea level rise.

The cause of current climate change is largely human activity, burning fossil fuels, natural gas, oil, and coal. Burning these materials releases greenhouse gases into Earth's atmosphere. Greenhouse gases trap heat from the sun's rays inside the atmosphere causing Earth's average temperature to rise. This rise in the planet's temperature was formerly called, "global warming", but climate change has shown to include both intense heat and cold shifts. The warming of the planet impacts local and regional climates. Throughout Earth's history, climate has continually changed; however, when occurring naturally, this is a slower process that has taken place over hundreds and thousands of years. The human influenced climate change that is happening now is occurring at an abnormally faster rate with devastating results.

GLOBAL OBSERVED AND PROJECTED IMPACTS AND RISKS

Source: Intergovernmental Panel on Climate Change, Headline Statements from the Summary for Policymakers, 2022

- Human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability.
- Global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans.
- Beyond 2040 and depending on the level of global warming, climate change will lead to numerous risks to natural and human systems.
- The magnitude and rate of climate change and associated risks depend strongly on near-term mitigation and adaptation actions, and projected adverse impacts and related losses and damages escalate with every increment of global warming.
- Multiple climate hazards will occur simultaneously, and multiple climatic and non-climatic risks will interact, resulting in compounding overall risk and risks cascading across sectors and regions.

FUTURE TRENDS/ IMPACTS

Source: Study Confirms Climate Models are Getting Future Warming Projections Right – Climate Change: Vital Signs of the Planet (nasa.gov)

Global Warming

- If global warming transiently exceeds 1.5°C in the coming decades or later, then many human and natural systems will face additional severe risks.
- An estimated 60% of today's methane emissions are the result of human activities. The largest sources of methane are agriculture, fossil fuels, and decomposition of landfill waste.
- The concentration of methane in the atmosphere has more than doubled over the past 200 years. Scientists estimate that this increase is responsible for 20 to 30% of climate warming since the Industrial Revolution (which began in 1750).
- According to the most recent National Climate Assessment, droughts in the Southwest and heat waves (periods of abnormally hot weather lasting days to weeks) are projected to become more intense, and cold waves less intense and less frequent.
- The last eight years have been the hottest years on record for the globe.

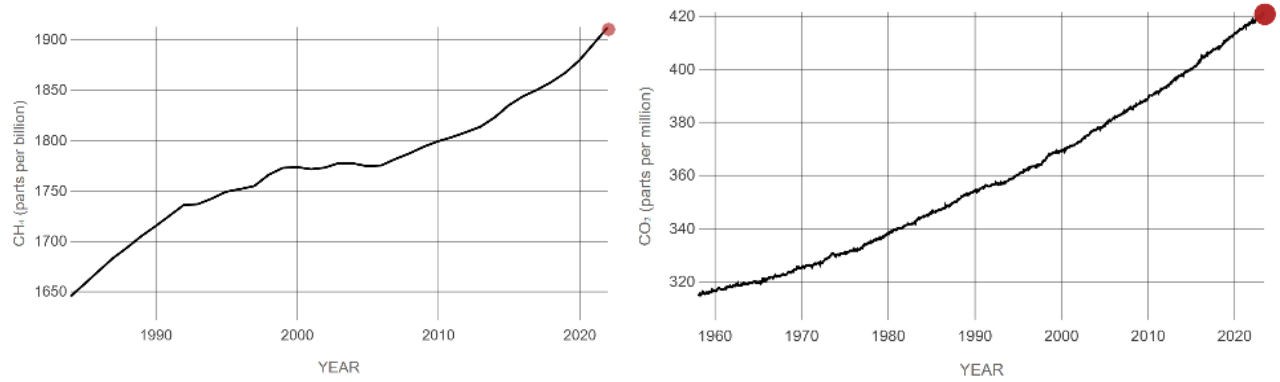

Figure 204: NASA Global Temperature Change CO2 Gas
Source: NASA Global Climate Change, 2022

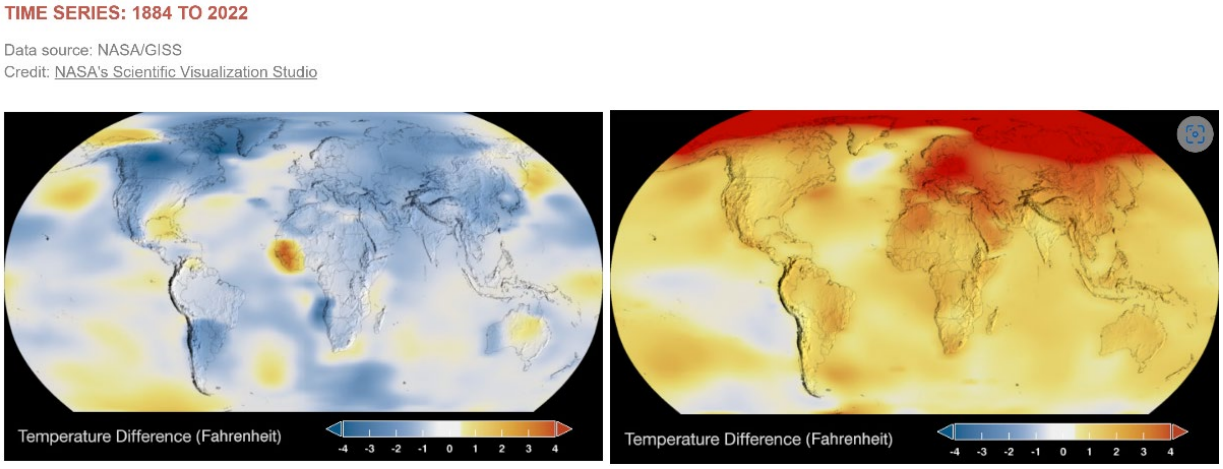

Figure 205: NASA Global Temperature Change 1884 to 2022
Source: NASA Global Climate Change, 2022

Drought

- A NASA-led study in 2022 concluded that the 22-year-long megadrought in southwestern US was the driest the territory had experienced in at least 1,200 years and was expected to persist through at least 2022.

Sea Level Rise

- Global sea levels are rising as a result of human-caused global warming, with recent rates being unprecedented over the past 2,500-plus years.
- U.S. Sea Level Likely to Rise 1 to 6.6 Feet by 2100.
- Global sea level has risen about 8 inches (0.2 meters) since reliable record-keeping began in 1880. By 2100, scientists project that it will rise at least another foot (0.3 meters), but possibly as high as 6.6 feet (2 meters) in a high-emissions scenario.

- Sea ice cover in the Arctic Ocean is expected to continue decreasing, and the Arctic Ocean will very likely become essentially ice-free in late summer if current projections hold. This change is expected to occur before mid-century.
- An indicator of changes in the Arctic sea ice minimum over time. Arctic sea ice extent both affects and is affected by global climate change.

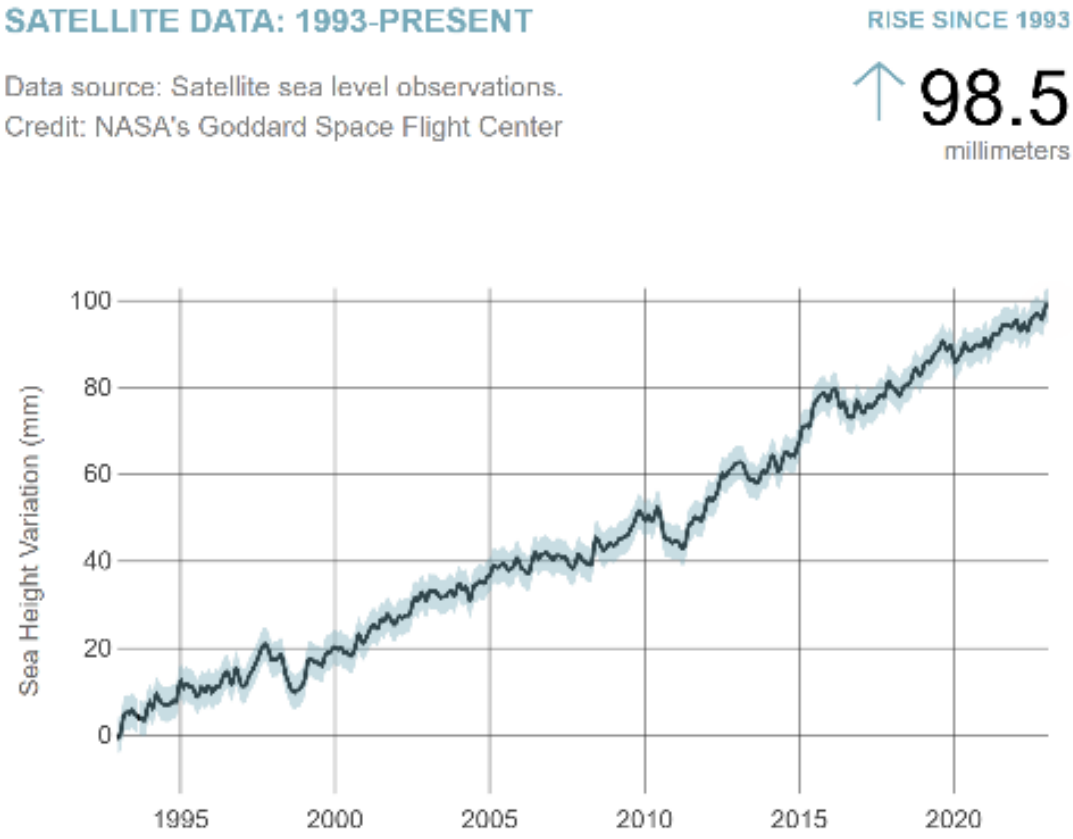

Figure 206: NASA Global Temperature Change Sea Level
Source: NASA Global Climate Change, 2022

Wildfire

- Warming temperatures have extended and intensified wildfire season in the West, where long-term drought in the region has heightened the risk of fires.
- Scientists estimate that human-caused climate change has already doubled the area of forest burned in recent decades. By around 2050, the amount of land consumed by wildfires in Western states is projected to further increase by two to six times.
- Even in traditionally rainy regions like the Southeast, wildfires are projected to increase by about 30%.

Flooding (Precipitation)

- Climate change is having an uneven effect on precipitation (rain and snow) in the United States, with some locations experiencing increased precipitation and flooding, while others suffer from drought.

- On average, more winter and spring precipitation is projected for the northern United States, and less for the Southwest, over this century.
- Projections of future climate over the U.S. suggest that the recent trend toward increased heavy precipitation events will continue. This means that while it may rain less frequently in some regions (such as the Southwest), when it does rain, increased intensity of rain fall may occur and may become more common.

Extreme Cold

- The length of the frost-free season, and the corresponding growing season, has been increasing since the 1980s, with the largest increases occurring in the western United States.

According to the California Natural Resource Agency (CNRA), climate change is already affecting California and is projected to continue to do so well into the foreseeable future. Current and projected changes include increased temperatures, sea level rise, a reduced winter snowpack, altered precipitation patterns, and more frequent storm events. Over the long term, reducing greenhouse gases can help make these changes less severe, but the changes cannot be avoided entirely. Unavoidable climate impacts result in a variety of secondary consequences including detrimental impacts on human health and safety, economic continuity, ecosystem integrity and provision of basic services. Climate change is being profiled in the 2023 Marin County OA MJHMP as a standalone hazard while addressing each of the other natural hazards. The Marin County OA is considering climate change issues when identifying future mitigation actions.

California is experiencing a climate crisis that is increasingly taking a toll on the health and well-being of its people and on its unique and diverse ecosystems. Every Californian has suffered from the effects of record high temperatures, dry winters, prolonged drought, and proliferating wildfires in recent years. California's biodiversity is threatened as alterations to habitat conditions brought about by a changing climate are occurring at a pace that could overwhelm the ability of plant and animal species to adapt.

Indicators of Climate Change in California
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

- Since 1895, annual average air temperatures in California have increased by about 2.5 degrees Fahrenheit (°F). Warming occurred at a faster rate beginning in the 1980s.
- Recent years have been especially warm: Eight of the ten warmest years on record occurred between 2012 and 2022; 2014 was the warmest year on record.
- Of all the Western states, California endured the hottest temperatures for the longest time, driving the average statewide temperature to the second warmest over the past 128 years.
- Extreme heat ranks among the deadliest of all climate-driven hazards in California, with physical, social, political, and economic factors effecting the capacity of individuals, workers, and communities to adapt, and with the most severe impacts often on communities who experience the greatest social and health inequities.
- Glaciers have essentially disappeared from the Trinity Alps in Northern California
- In 2020, wildfire smoke plumes were present in each county for at least 46 days.

- The 2022 fire season saw more fires than the previous fire season along with continued extreme drought and heat conditions.
- The drought, begun in 2019, was the third statewide drought declared in California since 2000.
- This drought has been marked by extreme swings; the state received record-breaking amounts of precipitation in October and December 2021 that were offset by the driest January, February, and March 2022 dating back more than 100 years. The year 2023 opened with California simultaneously managing both drought and flood emergencies.
- A series of storms in late December 2022 and early January 2023 broke rural levees, disrupted power, flooded roads, downed trees, and eroded coastal land.
- Sea level rise accelerates coastal erosion, worsens coastal flooding during large storms and peak tidal events, and impacts important infrastructure positioned along our state's 1,100-mile coast.
- The western drought which impacted all of California and the western United States was nearly lifted due to unseasonably heavy rains in late 2022 and early 2023.

Climate Change in the Marin County Operational Area

Climate change is already having significant impacts across California. Temperatures are warming, heat waves are more frequent, and precipitation has become increasingly variable. Climate change will continue to alter Marin County OA ecosystems as a result of rising temperatures, changes in precipitation, and sea level rise, which will increase the severity and occurrence of natural hazards across the Marin County OA well into the future. Coastal cooling processes that keep temperatures down, such as fog, will continue to decrease. Rising temperatures will exacerbate drought conditions and raise the potential for significant wildfires and associated smoke as vegetation becomes drier and tree mortality increases. Forested woodlands that play a major role in carbon reduction will gradually transition into chaparral and shrublands. There will be more extreme storms and weather events, including expanded heat waves and increased rain events with changes in precipitation. Significant rain events will lead to an increase in flooding and the potential for severe landslides. Shoreline communities will become inundated with sea level rise, storm surge, and high tide events. Marshlands and wetlands that act as natural storm barriers will disappear as they transition into open water.

Notable impacts from climate change that are already evident in the Marin County OA and surrounding region as identified in a 2020 Marin County Civil Grand Jury Report include:

- From 1895-2018, the average temperature in Marin County increased by 2.3 degrees Fahrenheit.
- Over the past century, sea level rise in the San Francisco Bay Area rose by eight inches and has accelerated rapidly since 2011.
- The threat of wildfires in 2019 was so severe that Pacific Gas and Electric shut off electric power to the County for multiple days.

Climate change will continue to affect homes, businesses, infrastructure, utilities, transportation systems and agriculture across the Marin County OA. The risk to socially vulnerable populations will increase as they feel the immediate impacts of climate change more significantly and are less able to adapt to climate change and recover from its impacts.

The Marin County OA has adopted numerous planning initiatives and mitigation measures to help combat the effects of climate change across the OA. The Marin Climate Energy Partnership (MCEP), which is a partnership program of Marin County jurisdictions, the County, and Marin County regional agencies, adapted a model Climate Action Plan (CAP) that is intended to support countywide implementation efforts and is currently being used to update additional climate action plans for other jurisdictions in Marin County. The CAP supports the Climate Action Plan for the unincorporated County, which was completed in 2020. The MCEP also collects data and report on progress in meeting each County jurisdictions' individual greenhouse gas emission targets. In June 2023, the City of Larkspur published the Greenhouse Gas Inventory for Community Emissions for the Year 2021. Marin County OA jurisdictions have already met their greenhouse reduction goals for 2020 and are about halfway to meeting the statewide goal to reduce emissions 40% below 1990 levels by the year 2030. Marin County also formed a Sea Level Marin Adaptation Response Team in 2018 and had a Sea Level Rise Vulnerability Assessment and associated Adaptation Report completed for the County and each of its jurisdictions in 2017 as part of their Bay Waterfront Adaptation and Vulnerability Evaluation. Additional Marin County OA climate change mitigation initiatives

include Marin Clean Energy, Electrify Marin, the Marin Solar Project, the Marin Energy Watch Partnership, Resilient Neighborhoods, and Drawdown: Marin.

2.2 HAZARDS

Of the hazards profiled in the Marin County OA MJHMP, those noted in the table are specific for the City of Larkspur as per the planning team.

Table 17: Hazard Risk Assessment						
Hazard	Probability/ Likelihood of Future Events	Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Dam Failure	Unlikely	Limited	Severe	Low	Low	**8.00**
Debris Flow	Likely	Limited	Severe	Medium	Medium	**12.00**
Drought	Occasional	Extensive	Moderate	High	Medium	**13.00**
Earthquake	Occasional	Extensive	Extreme	None	High	**13.00**
Flooding	Occasional	Limited	Severe	High	Medium	**12.00**
Land Subsidence	Occasional	Limited	Moderate	Medium	Medium	**10.00**
Levee Failure	Unlikely	Negligible	Moderate	Medium	Low	**7.00**
Sea Level Rise	Highly Likely	Limited	Extreme	High	High	**16.00**
Severe Weather – Extreme Heat	Likely	Extensive	Moderate	High	Medium	**14.00**
Severe Weather – Wind, Tornado	Likely	Extensive	Moderate	High	Medium	**14.00**
Tsunami	Occasional	Limited	Extreme	None	High	**11.00**
Wildfire	Likely	Significant	Extreme	High	High	**16.00**

2.2.1 DAM FAILURE

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped and fail. Overtopping is the primary cause of earthen dam failure in the United States.

Dam failure is the uncontrolled release of impounded water from behind a dam. Flooding, earthquakes, blockages, landslides, lack of maintenance, improper operation, poor construction, vandalism, and terrorism can all cause a dam to fail. Dam failure causes downstream flooding that can affect life and property. Dam failures can result from any one or a combination of the following causes:

- Earthquake
- Inadequate spillway capacity resulting in excess overtopping flows
- Internal erosion caused by embankment or foundation leakage, or piping or rodent activity

- Improper design
- Improper maintenance
- Negligent operation
- Failure of upstream dams on the same waterway

Water released by a failed dam generates tremendous energy and can cause a flood that is catastrophic to life and property. A catastrophic dam failure could challenge local response capabilities and require evacuations to save lives. Impacts to life safety will depend on the warning time and the resources available to notify and evacuate the public. Major loss of life could result as well as potentially catastrophic effects to roads, bridges, and homes. Electric generating facilities and transmission lines could also be damaged and affect life support systems in communities outside the immediate hazard area. Associated water supply, water quality and health concerns could also be an issue. Factors that influence the potential severity of a full or partial dam failure are the amount of water impounded; the density, type, and value of development and infrastructure located downstream; and the speed of failure.

In general, there are three types of dams: concrete arch or hydraulic fill, earth and rockfill, and concrete gravity. Each type of dam has different failure characteristics. A concrete arch or hydraulic fill dam can fail almost instantaneously, where the flood wave builds up rapidly to a peak then gradually declines. An earth-rockfill dam fails gradually due to erosion of the breach, where a flood wave will build gradually to a peak and then decline until the reservoir is empty. A concrete gravity dam can fail instantaneously or gradually with a corresponding buildup and decline of the flood wave.

The California Department of Water Resources (DWR) Division of Safety of Dams (DSOD) has jurisdiction over impoundments that meet certain capacity and height criteria. Embankments that are less than six feet high and impoundments that can store less than 15 acre-feet are non-jurisdictional. Additionally, dams that are less than 25 feet high can impound up to 50 acre-feet without being jurisdictional. The Cal DWR DSOD assigns hazard ratings to large dams within the State. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in three categories that identify the potential hazard to life and property:

- **High hazard** indicates that a failure would most probably result in the loss of life
- **Significant hazard** indicates that a failure could result in appreciable property damage
- **Low hazard** indicates that failure would result in only minimal property damage and loss of life is unlikely

Since 1929, the state has supervised all non-federal dams in California to prevent failure for the purpose of safeguarding life and protecting property. Supervision is carried out through the state's Dam Safety Program under the jurisdiction of DWR. The legislation requiring state supervision was passed in response to the St. Francis Dam failure and concerns about the potential risks to the general populace from a number of water storage dams. The law requires:

- Examination and approval or repair of dams completed prior to August 14, 1929, the effective date of the statute.
- Approval of plans and specifications for and supervision of construction of new dams and the enlargement, alteration, repair, or removal of existing dams.
- Supervision of maintenance and operation of all dams under the state's jurisdiction.

The 1963 failure of the Baldwin Hills Dam in Southern California led the Legislature to amend the California Water Code to include within state jurisdiction both new and existing off-stream storage facilities.

Dams and reservoirs subject to state supervision are defined in California Water Code §6002 through §6004, with exemptions defined in §6004 and §6025. In administering the Dam Safety Program, DWR must comply with the provisions of the California Environmental Quality Act (CEQA). As such, all formal dam approval and revocation actions must be preceded by appropriate environmental documentation.

In 1972, Congress moved to reduce the hazards from the 28,000 non-federal dams in the country by passing Public Law 92-367, the National Dam Inspection Act. With the passage of this law, Congress authorized the U.S. Army Corps of Engineers (USACE) to inventory dams located in the United States. The action was spurred by two disastrous earthen dam failures during the year, in West Virginia and South Dakota, that caused a total of 300 deaths.

The Water Resources Development Act of 1986 (P.L 99-662) authorized USACE to maintain and periodically publish an updated National Inventory of Dams (NID). The Water Resources Development Act of 1996 (P.L. 104-303), Section 215, re-authorized periodic updates of the NID by USACE.

There is one dam located in Larkspur at Tubb Lake. The City could be impacted by a failure of this dam or the Phoenix Lake Dam in the unincorporated County of Marin. The Phoenix Lake Dam and Phoenix Lake are located directly adjacent to the western border of the Town of Ross (see Figure 20). The dam has storage of 612-acre feet of water that could be released down Ross Creek and into Corte Madera Creek through Larkspur in the event of a full sunny-day dam failure. Where Corte Madera Creek opens up at the College of Marin along Larkspur's boundary with Kentfield, water could extend out to College Avenue with a depth of five feet in some areas of the College campus making it susceptible to flooding. While floodwaters would mostly stay confined to Corte Madera Creek as it traverses through Larkspur, floodwaters could extend up several tributaries of the creek on its south side around Piper Park and Riviera Circle along lower Larkspur Creek and the High Canal. Homes along Boardwalk One are susceptible to flooding and could be inundated in several feet of water approximately 35 minutes after the dam fails. After Corte Madera Creek passes Highway 101, homes on the south side of Corte Madera Creek are susceptible to flooding and could be inundated with floodwaters up to several feet approximately 40 minutes after the dam fails. Dozens of homes along Corte Madera Creek and its tributaries including Larkspur Creek have docks which could be damaged or destroyed in the event of a dam failure, depending on flood velocity. None of the critical facilities in Larkspur with the exception of the College of Marin are at risk of flooding from a dam failure.

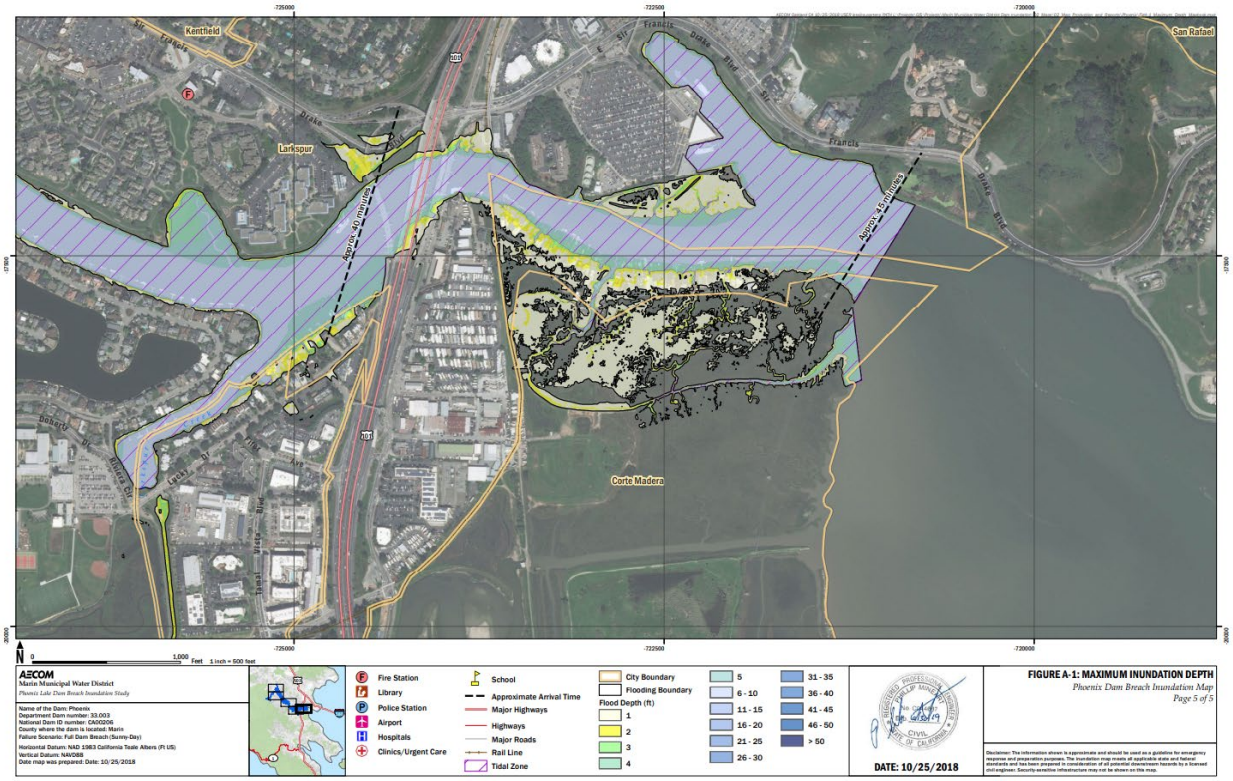

Figure 211: Phoenix Lake Dam Inundation Area – Larkspur East
Source: California Department of Water Resources

There is no record of a failure of any regulated dam located in the Marin County OA. On December 29, 2022, Phoenix Lake hit capacity after recent rains and the dam saw some spillover with no impacts.

Climate Change and Future Development Considerations

Most dams in the United States are aging and are at significant risk from increased storm events as a result of climate change. The average dam age in the United States is 60 years, and more than 8,000 dams in the United States including the Phoenix Lake Dam are over 90 years old. More than 200 U.S. dams have failed in bad weather since 2000. As the climate warms, rain events are predicted to become more intense. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in reservoirs across the Marin County OA, placing increased stress on its dams and increasing the potential for a dam failure. As development increases in the populated areas of the Marin County OA downstream of its dams, particularly in the inundation area of the Phoenix Lake Dam, the potential for significant impacts to residents and infrastructure will only increase. This area includes part of Larkspur. Future development along Corte Madera Creek, lower Larkspur Creek and the High Canal could expose additional people and structures to risk of a dam failure.

2.2.2 DEBRIS FLOWS

For the purposes of the Marin County OA MJHMP, debris flows are classified as landslides (including rockslides) and mud flows.

A landside is the breaking away and gravity-driven downward movement of hill slope materials, which can travel at speeds ranging from fractions of an inch per year to tens of miles per hour depending on the slope steepness and water content of the rock/soil mass. Landslides range from the size of an automobile to a mile or more in length and width and, due to their sheer weight and speed, can cause serious damage and loss of life. The rate of a landslide is affected by the type and extent of vegetation, slope angle, degree of water saturation, strength of the rocks, and the mass and thickness of the deposit. Some of the natural causes of this instability are earthquakes, weak materials, stream and coastal erosion, and heavy rainfall. In addition, certain human activities tend to make the earth materials less stable and increase the chance of ground failure. These activities include extensive irrigation, poor drainage or groundwater withdrawal, removal of stabilizing vegetation and over-steepening of slopes by undercutting them or overloading them with artificial fill. These activities can cause slope failure, which normally produce landslides.

Landslide material types are often broadly categorized as either rock or soil, or a combination of the two for complex movements. Rock refers to hard or firm bedrock that was intact and in place prior to slope movement. Soil, either residual or transported material, means unconsolidated particles. The distinction between rock and soil is most often based on interpretation of geomorphic characteristics within landslide deposits, but can also be inferred from geologic characteristics of the parent material described on maps or in the field. Landslide movements are also based on the geomorphic expression of the landslide deposit and source area, and are categorized as falls, topples, spreads, slides, or flows. Falls are masses of soil or rock that dislodge from steep slopes and free fall. Topples move by the forward pivoting of a mass around an axis below the displaced mass. Lateral spreads move by horizontal extension and shear or tensile fractures. Slides displace masses of material along one or more discrete planes and can either be rotational or transitional. Flows mobilize as a deforming, viscous mass without a discrete failure plane.

Natural conditions that contribute to landslide include the following:

- Degree of slope
- Water (heavy rain, river flows, or wave action)
- Unconsolidated soil or soft rock and sediments
- Lack of vegetation (no stabilizing root structure)
- Previous wildfires and other forest disturbances
- Earthquake

In addition, many human activities tend to make the earth materials less stable and, thus, increase the chance of ground movement. Human activities contribute to soil instability through grading of steep slopes or overloading them with artificial fill, by extensive irrigation, construction of impermeable surfaces, excessive groundwater withdrawal, and removal of stabilizing vegetation.

Another hazard related to landslide and erosion is the fall of a detached mass of rock from a cliff

or down a very steep slope (rockfall). Weathering and decomposition of geological materials produce conditions favorable to rockfalls. Other causes include ice wedging, root growth, or ground shaking (earthquake). Destructive landslides and rockfalls usually occur very suddenly with little or no warning time and are short in duration.

Landslides can cause high mortality and injuries from rapidly flowing water and debris. The most common cause of death in a landslide is trauma or suffocation by entrapment. Broken power, water, gas or sewage pipes can also result in injury or illness in the population affected, such as water-borne diseases, electrocution or lacerations from falling debris. People affected by landslides can also have short- and long-term mental health effects due to loss of family, property, livestock or crops. Landslides can also greatly impact the health system and essential services, such as water, electricity or communication lines.

Landslide susceptibly can be characterized by looking at both slope class and rock strength. Landslide susceptibility classes express the generalization that on very low slopes, landslide susceptibility is low even in weak rock, and that landslide susceptibility increases with slope and in weaker rocks. Very high landslide susceptibility includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks. Figure 24 shows landslide susceptibility classes.

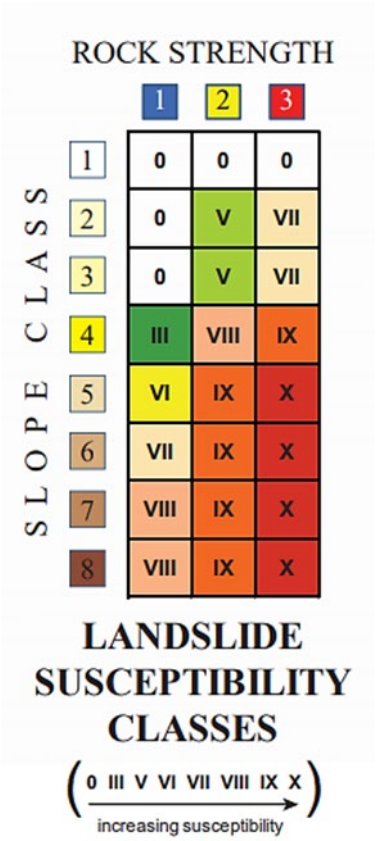

Figure 212: Landslide Susceptibility Classes
Source: USGS

A mud flow is a general term for a mass-movement landform and process characterized by a flowing mass of fine-grained earth material with a high degree of fluidity. Heavy rainfall, snowmelt, or high levels of groundwater flowing through cracked bedrock may trigger a

movement of soil or sediments. Floods and debris flows may also occur when strong rains on hill or mountain slopes cause extensive erosion and/or what is known as "channel scour". Some broad mud flows are rather viscous and therefore slow; others begin very quickly and continue like an avalanche. Mud flows are composed of at least 50% silt and clay-sized materials and up to 30% water.

The point where a muddy material begins to flow depends on its grain size and the water content. Fine grainy material or soil has a smaller friction angle than a coarse sediment or a debris flow, but falling rock pieces can trigger a material flow, too. When a mud flow occurs it is given four named areas, the 'main scarp', in bigger mud flows the 'upper and lower shelves', and the 'toe'. See Figure 25 for the typical areas of a mud flow, with shelves (right) and without (left). The main scarp will be the original area of incidence, the toe is the last affected area(s). The upper and lower shelves are located wherever there is a large dip (due to mountain or natural drop) in the mud flow's path. A mud flow can have many shelves.

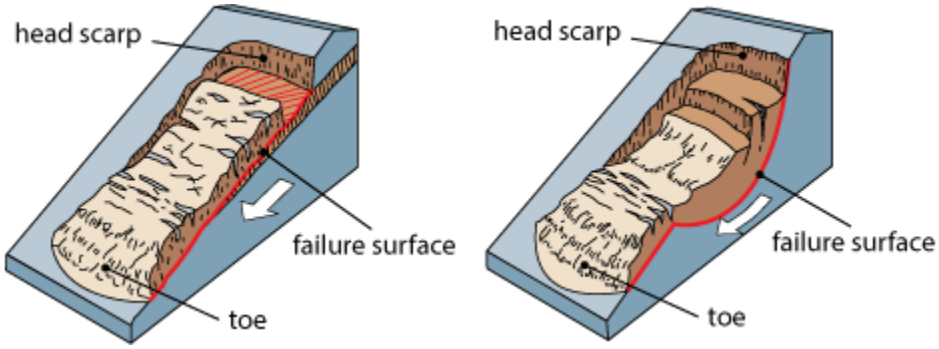

Figure 213: Mud Flow Areas
Source: Washington Department of Natural Resources

If large enough, mud flows can devastate villages and country-sides. Mud flows are common in mountain areas prone to wildfire, where they have destroyed many homes built on hillsides without sufficient support after fires destroy vegetation holding the land. The area most generally recognized as being at risk of a dangerous mud flow are:

- Areas where wildfires or human modification of the land have destroyed vegetation
- Areas where landslides have occurred before
- Steep slopes and areas at the bottom of slopes or canyons
- Slopes that have been altered for construction of buildings and roads
- Channels along streams and rivers
- Areas where surface runoff is directed

Three major groups of geologic materials underlie Larkspur. Sedimentary rock of the Franciscan Formation is the bedrock beneath the ridges and slopes forming Larkspur's northern and southern boundaries and Bon Air Hill. A large part of the Franciscan Formation underlying Larkspur is Franciscan melange, a mix of rock types embedded in crushed rock materials. Melange has highly erratic slope stability characteristics. Most of Larkspur west of Magnolia Avenue; north of Corte Madera Creek and Highway 101; and around Baltimore Park is extremely susceptible to landslides due to the steepness of the terrain. A landslide in Larkspur could occur anywhere in the city where the terrain may be susceptible to soil movement. These areas primarily consist of numerous winding and dead end streets and hundreds of hillside homes that may sustain damage from soil movement. Most of the downtown and commercial

area of Larkspur around Magnolia Avenue lies in an area of low to no landslide susceptibility. Most of the critical facilities in Larkspur lie outside a landslide susceptibility area but part of the Redwood High School and the Tamalpais of Marin Greenbrae skilled nursing facility lie areas of moderate to high landslide susceptibility. The commercial area north of Sir Francis Drake Boulevard across from the Larkspur Ferry Terminal lies in an area of moderate to high landslide susceptibility. Part of Highway 101 north of Sir Francis Drake Boulevard lies in an area of high landslide susceptibility and is protected by a retaining wall on the west side. A landslide closing the highway could cause traffic challenges in Larkspur.

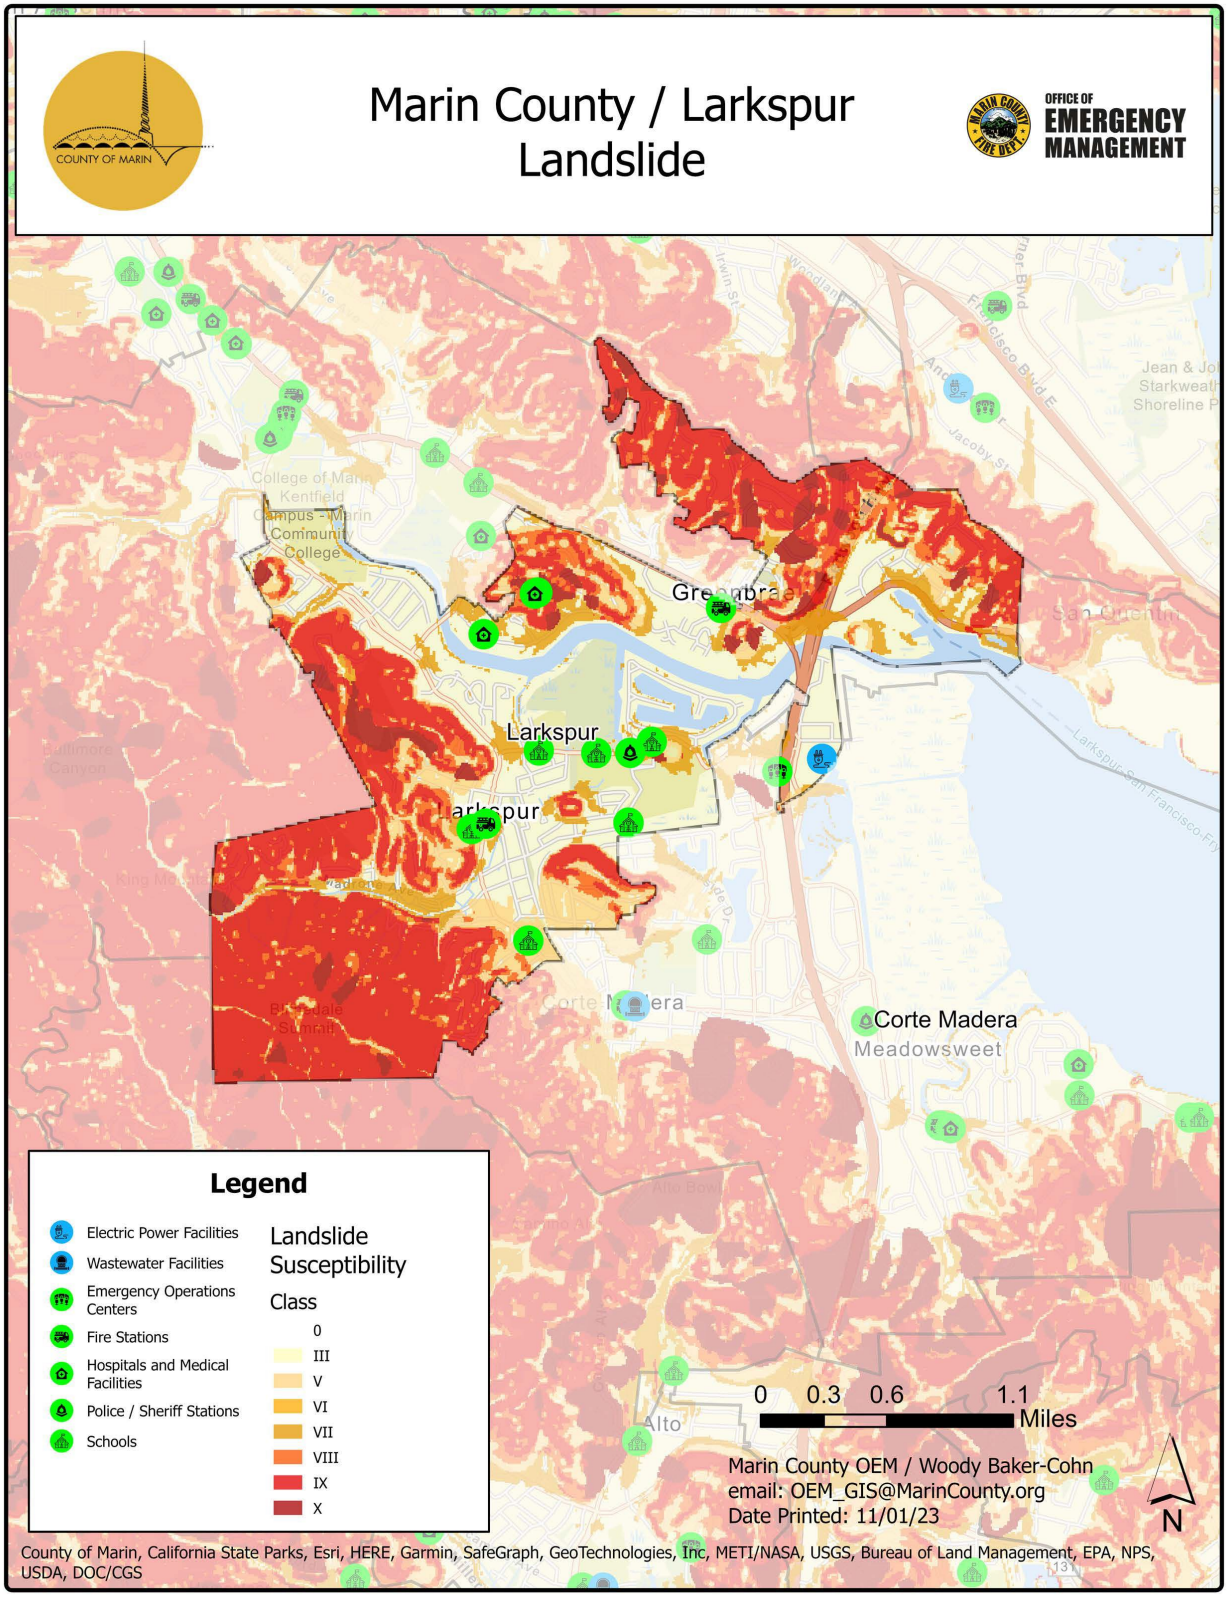

Figure 214: City of Larkspur Debris Flow Critical Facilities and Infrastructure
Source: Marin County OEM

Transportation challenges may be of particular concern with a landslide in the City, particularly in the hilly and mountainous residential areas around the city west of Magnolia Avenue. Ingress and egress into these areas may be impacted by a landslide.

Earthquakes also have the potential to cause soil instabilities throughout this area. Wildfires and subsequent rain events in the Blithedale Summit Open Space Preserve, the King Mountain Open Space Preserve and any of the open space above Larkspur may contribute to soil instabilities and pose a risk to properties and infrastructure in the city. Erosion from the watersheds that drain into Corte Madera Creek and Larkspur Creek can add to soil instability and could contribute to debris flows down the creeks, destroying bridges and other road infrastructure and spreading out in the alluvial fan where Corte Madera and Larkspur Creeks converge near Highway 101. Homes and businesses along the creeks, including along Madrone Avenue and Magnolia Avenue, are particularly susceptible to debris flow. Fingers of alluvial stream deposits (clay, sand, silt, and gravel) extend down the hillsides in swales and creek beds to gently sloping alluvial fans and floodplains. These soils were eroded from the steep slopes and transported by flooding streams. The older area of Larkspur downtown and the nearby residential neighborhoods lie in a wide flat alluvial valley. Occasional erosion-resistant hills or knolls such as Palm Hill and some of its small neighbors protrude above the otherwise flat plain. Bay Mud lies in a broad band between Magnolia Avenue on the south and Sir Francis Drake Boulevard on the north (excluding Bon Air Hill). The older Bay mud reaches a thickness of 40 feet at the mouth of Corte Madera Creek. Bay mud is an unconsolidated jelly-like material that is both highly compressible, and subject to lateral flow when loads are placed on it. Landslides in Larkspur as a result of an earthquake may cause damage to homes and roads as a result of shifting soils, effecting ingress and egress in the hilly and mountainous residential areas of the city where there are numerous windy and dead-end roads. Many hillsides in Larkspur are unstable in their natural state, and even minor changes in the shape of the land surface could create major landslide problems.

On 1/22/1995, a rocky hillside in Larkspur weakened by a series of rainstorms gave way, burying two cars and damaging five others. No one was injured. The hillside was behind an apartment complex that sits on a former rock quarry site. City workers estimated that 400 to 1,000 cubic feet of mud slid into the building's parking lot.

During the winter storms of 1982, landslides (debris avalanches) in Larkspur produced over 10,000 cubic yards of soil, rock, and debris. Slope movements resulted in several million dollars in damage to homes, roads, and other improvements. On 1/3–1/5/1982 a severe storm caused a mudslide in the Madrone Canyon neighborhood, damaging or destroying four or more homes.

There have been no recorded debris flows in Larkspur since the last plan update.

Climate Change and Future Development Considerations

Extreme storm events and more frequent wildfires as a result of climate change have the potential to increase the amount and severity of landslides, including disastrous debris flows. Climate change is leading to more volatile precipitation patterns around the world with very dry stretches punctuated by storms that drop large amounts of rain in a short amount of time. Landslides in wetter regions of California, including the Marin County OA, move on average faster and farther downhill during rainy periods compared to drought years, according to a 2022

study by the American Geophysical Union (AGU)[15], showing the increased potential for landslides in the Marin County OA in rainy years. As development increases in the numerous canyons and around the many open spaces of the Marin County OA, the potential for significant impacts from a landslide and/or mudflow increases. Further development of the residential areas of southern and western Larkspur that have a higher landslide susceptibility will expose more people and property to landslide risk. With increased wildfire potential as a result of climate change, more residents in southern and western Larkspur could be susceptible to post-fire debris flows. This includes areas around Larkspur Creek. Future development should take into account the movement of mud and debris in waterways after a major rain event. Adequate space adjacent to susceptible waterways should be maintained free of development to allow for the passage of mud and debris, and catchment basins should be built in these areas to help capture any excess mud and debris.

2.2.3 DROUGHT

A drought is a deficiency in precipitation over an extended period, usually a season or more, resulting in a water shortage causing adverse impacts on vegetation, animals, and/or people. It is a normal recurrent feature of climate that occurs in virtually all climate zones, from very wet to very dry. Drought is a temporary aberration from normal climatic conditions and can thus vary significantly from one region to another. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Drought is a complex issue involving many factors—it occurs when a normal amount of moisture is not available to satisfy an area's usual water-consuming activities.

There are several types of drought which can often be defined regionally based on their effects:

- Meteorological drought is usually defined by a period of below average water supply, based on the degree of dryness (in comparison to normal or average) and the duration of the dry period. Drought onset generally occurs with a meteorological drought.
- Agricultural drought occurs when there is an inadequate water supply to meet the needs of the state's crops and other agricultural operations such as livestock. Agricultural drought links various characteristics of meteorological (or hydrological) drought to agricultural impacts, focusing on precipitation shortages, soil water deficits, reduced ground water or reservoir levels needed for irrigation.
- Hydrological drought is defined as deficiencies in surface and subsurface water supplies. It is generally measured as stream flow, snowpack, and as lake, reservoir, and groundwater levels. Hydrological drought usually occurs following periods of extended precipitation shortfalls.
- Socioeconomic drought occurs when a drought impacts health, well-being, and quality of life, or when a drought starts to have an adverse economic impact on a region.

[15] Landslide Sensitivity and Response to Precipitation Changes in Wet and Dry Climates. https://agupubs.onlinelibrary.wiley.com/doi/10.1029/2022GL099499

Drought can occur in all areas of Larkspur and Marin, though its effects would be most felt in the hillside and mountainous areas where the risk of wildfire may increase. Dry trees throughout the City may become a safety hazard to the public due to falling trees or its limbs.

Climate Change and Future Development Considerations

Climate change increases the odds of worsening drought. Warmer temperatures enhance evaporation, which reduces surface water and dries out soils and vegetation. This makes periods with low precipitation in the summer drier than they would be in cooler conditions. Climate also alters the timing of water availability as warmer winter temperatures cause less precipitation to fall. During droughts, communities in the Marin County OA including Larkspur may have limited access to water for household use, including drinking, cooking, cleaning, and watering plants, as well as for agriculture, transportation, and power generation. Drought may lead to higher water costs, rationing, or even the decimation of important water sources like wells in the Marin County OA. As more people move into the Marin County OA and the Larkspur, additional strain will be placed on the OA's water supply. Drought can affect livestock and crops in the Marin County OA, impacting its economy. Drought can increase the occurrence and severity of wildfires and tree mortality in the Marin County OA including in the open spaces in and around Larkspur. Impacts to residents and infrastructure from wildfire as a result of drought will increase as more development occurs in the mountainous areas of the Marin County OA including Larkspur where wildfires are more likely to occur. Drought also has the potential to dry out the marshlands along Corte Madera Creek and its tributaries and along the shoreline of Larkspur, increasing the chances of brush fires there. Future development in this area and in the mountainous areas of Larkspur could expose people to drier summer conditions that could increase their vulnerability to wildfire. Drought also increases the amount of carbon dioxide in the atmosphere, including by decreasing land productivity, which reduces the amount of vegetation storing carbon dioxide. In addition, increases in drought-related wildfire and soil erosion can release carbon dioxide sequestered in trees and plants back into the atmosphere. This will only worsen climate change for the Marin County OA into the future. When considering future development, the Marin County OA including Larkspur can help prepare for both future droughts and climate change by practicing and promoting water conservation and enhancing water efficiency throughout landscapes, city plans, and water infrastructure. The Marin County OA can also identify alternative water supplies, create drought emergency plans, and encourage farmers to plant drought-resistant crops.

2.2.4 EARTHQUAKE

Earthquakes are sudden rolling or shaking events caused by movement under the earth's surface. Earthquakes happen along cracks in the earth's surface, called fault lines, and can be felt over large areas, although they usually last less than one minute.

The amount of energy released during an earthquake is usually expressed as a magnitude and is currently measured by seismologists on the Moment Magnitude (Mw Scale). The Mw Scale was developed to succeed the previously used Richter Scale and is measured on a scale of zero to ten with increasing values reflecting increasing intensity.

The other commonly used measure of earthquake severity is intensity, which is an expression of the amount of shaking at any given location on the ground service. Intensity is most commonly measured on the Modified Mercalli Intensity (MMI) Scale (see Figure 27).

Intensity	Shaking	Description/Damage
I	Not felt	Not felt except by a very few under especially favorable conditions.
II	Weak	Felt only by a few persons at rest,especially on upper floors of buildings.
III	Weak	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Light	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Moderate	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Strong	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Very strong	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Severe	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Violent	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	Extreme	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.

Figure 215: Modified Mercalli Intensity Scale
Source: USGS

Figure 28 gives intensities (measured on the MMI scale) that are typically observed at locations near the epicenter or earthquakes of different magnitudes.

Richter Magnitude Scale	Typical Maximum Modified Mercalli Intensity Scale
1.0 – 2.9	I
3.0 – 3.9	II – III
4.0 – 4.9	IV – V
5.0 – 5.9	VI – VII
6.0 – 6.9	VII – IX
7.0 or higher	VIII or higher

Figure 216: Mercalli Scale vs. Magnitude
Source: USGS

The extent of ground shaking also depends in large part on how soft the underlying soil is. Soft soils amplify ground shaking (see Figure 29). This was observed during the 1989 Loma Prieta Earthquake when the most significant damages experienced in San Francisco were in the Marina District, which was built on fill.

Soil type A	Vs > 1500 m/sec	Includes unweathered intrusive igneous rock. Occurs infrequently in the bay area. We consider it with type B (both A and B are represented by the color blue on the map). Soil types A and B do not contribute greatly to shaking amplification.
Soil type B	1500 m/sec > Vs > 750 m/sec	Includes volcanics, most Mesozoic bedrock, and some Franciscan bedrock. (Mesozoic rocks are between 245 and 64 million years old. The Franciscan Complex is a Mesozoic unit that is common in the Bay Area.)
Soil Type C	750 m/sec > Vs > 350 m/sec	Includes some Quaternary (less than 1.8 million years old) sands, sandstones and mudstones, some Upper Tertiary (1.8 to 24 million years old) sandstones, mudstones and limestone, some Lower Tertiary (24 to 64 million years old) mudstones and sandstones, and Franciscan melange and serpentinite.
Soil Type D	350 m/sec > Vs > 200 m/sec	Includes some Quaternary muds, sands, gravels, silts and mud. Significant amplification of shaking by these soils is generally expected.
Soil Type E	200 m/sec > Vs	Includes water-saturated mud and artificial fill. The strongest amplification of shaking due is expected for this soil type.

Figure 217: Soil Types
Source: USGS

An earthquake fault is defined as “a fracture or fracture zone in the earth’s crust along which there has been displacement of the sides relative to one another.” For the purpose of planning, there are two types of faults, active and inactive. Active faults have experienced displacement in historic time, suggesting that future displacement may be expected. Inactive faults show no evidence of movement in recent geologic time, suggesting that these faults are dormant.

Two types of fault movement represent possible hazards to structures in the immediate vicinity of the fault: fault creep and sudden fault displacement. Fault creep, a slow movement of one side of a fault relative to the other, can cause cracking and buckling of sidewalks and foundations even without perceptible ground shaking. An earthquake could occur anywhere in and around Larkspur due to the number of active faults within and near the Marin County OA.

Earthquake Shake Intensity

The colors on Figures 30 and 31 represent the level of ground shaking intensity of a potential future earthquake. The result is expressed as the level of ground shaking (**expressed as a percentage of gravity**) that on average occurs every 500 years.

This map shows the expected relative intensity of ground shaking and damage in California from anticipated future earthquakes. The shaking potential is calculated as the level of ground motion that has a 2% chance of being exceeded in 50 years, which is the same as the level of ground-shaking with about a 2500 year average repeat time. The relatively long-period (1.0 second) earthquake shaking is shown here. Long period-shaking affects tall, relatively flexible buildings, but also correlates well with overall earthquake damage.

Earthquake Shaking Potential Maps for California depict expected intermediate period (1s or 1hz) ground motions with 2% exceedance probability in 50 years.

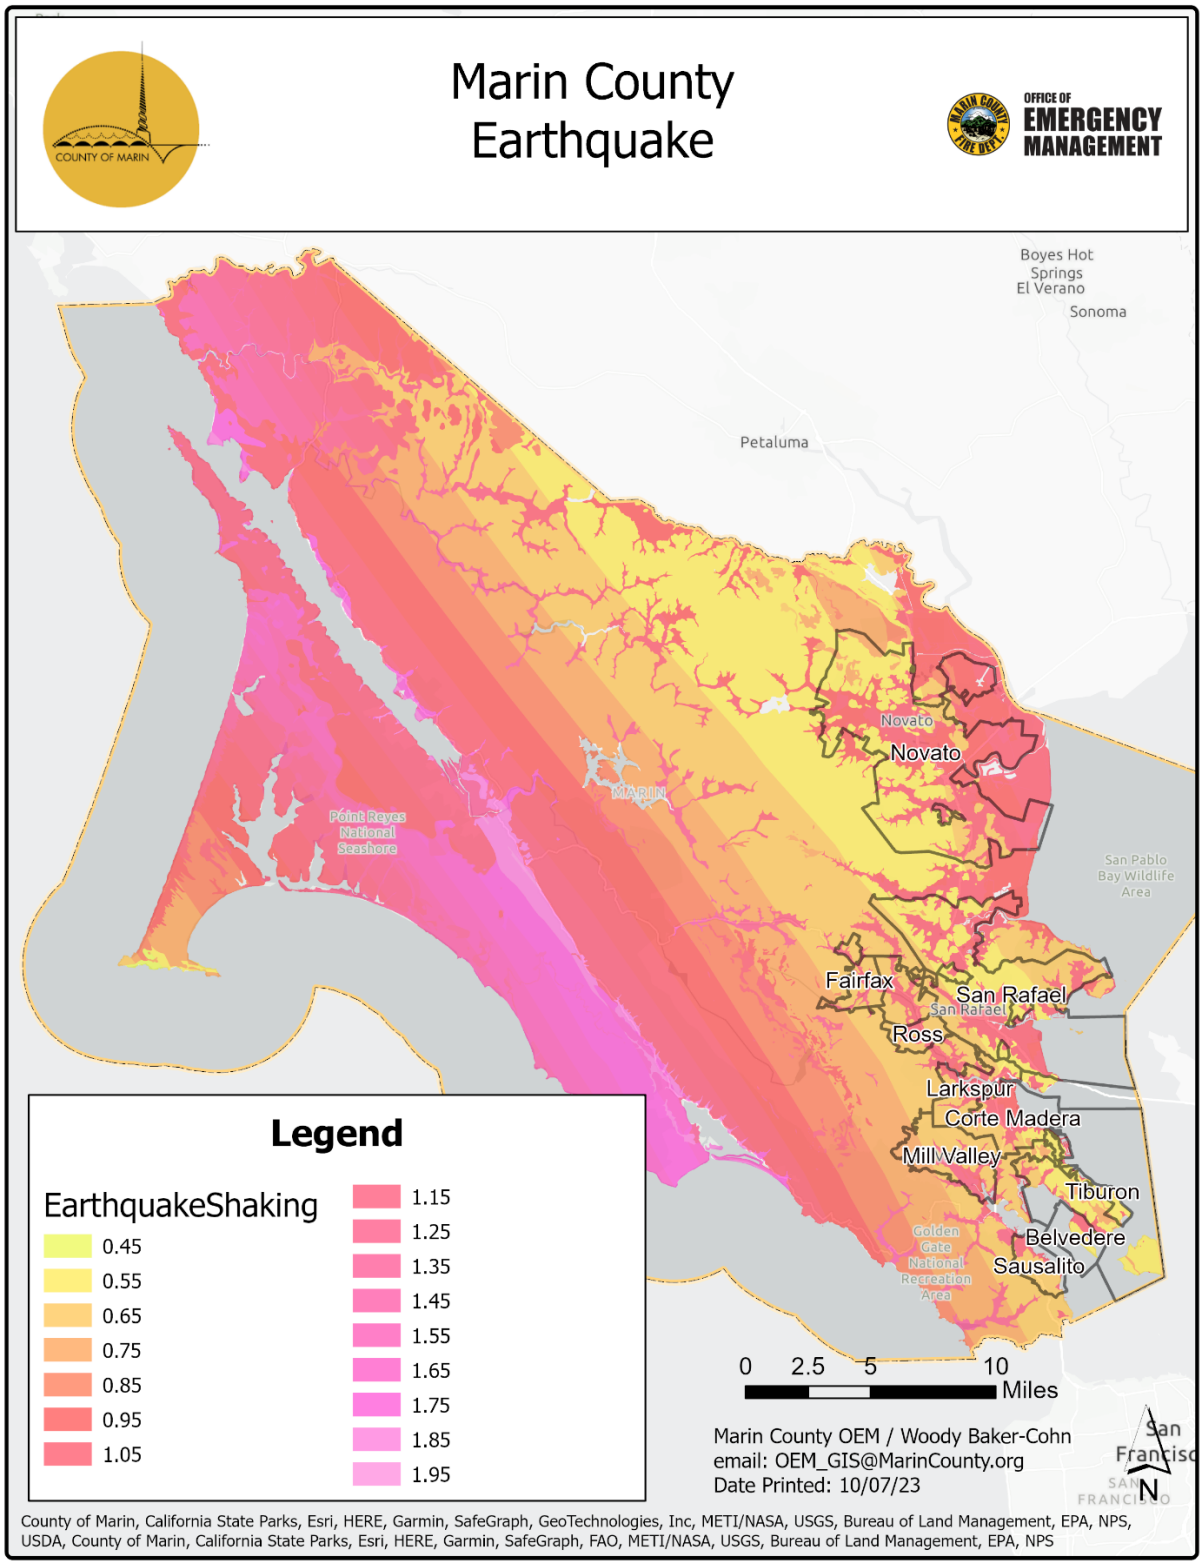

Figure 218: Marin County OA Earthquake Impact and Fault Lines
Source: Marin County OEM

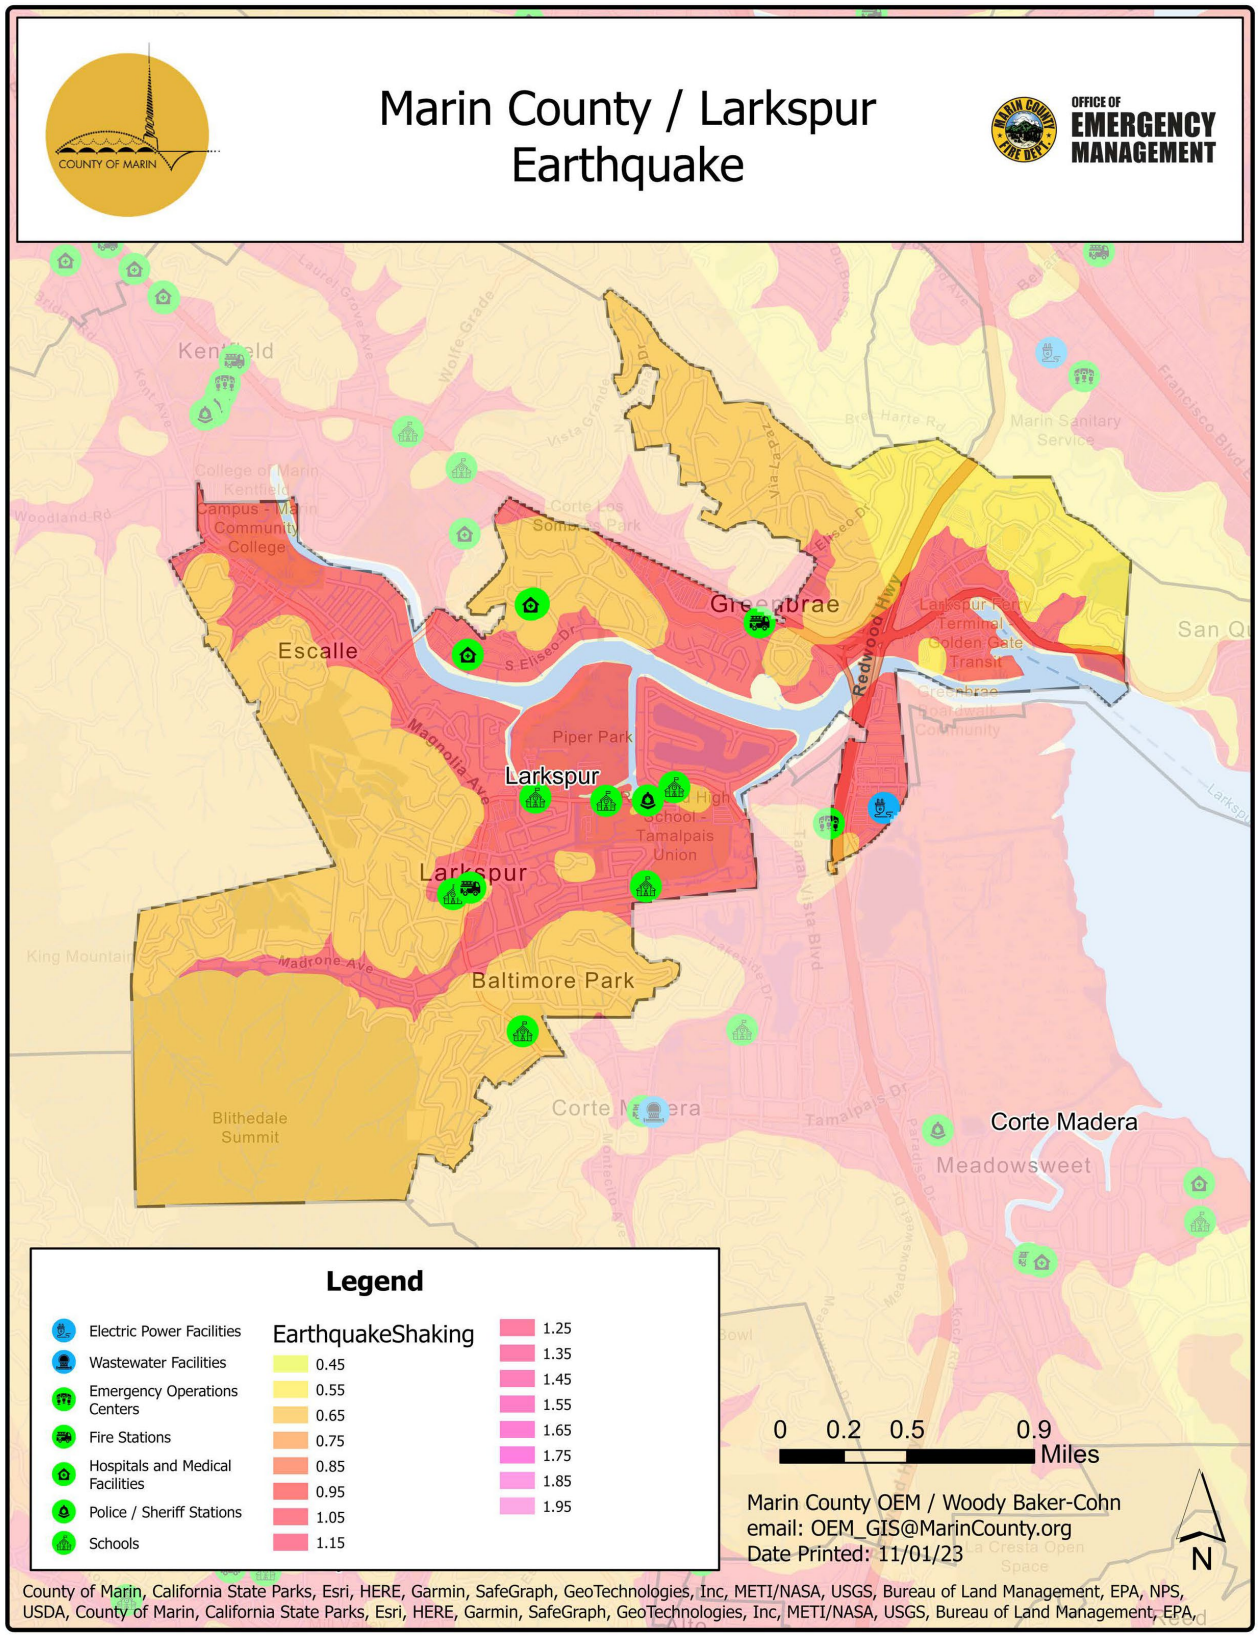

Figure 219: City of Larkspur Earthquake Critical Facilities and Infrastructure
Source: Marin County OEM

Larkspur is located directly between the San Andreas and Hayward faults. A moderate to extreme earthquake originating from either of these major faults or any of the other faults in the region may have major impacts to the City. There is increased risk of earthquake shaking and liquefaction in certain parts of Larkspur, particularly in the area of the city along Larkspur Creek and Corte Madera Creek, including around Highway 101 where Corte Madera Creek empties into San Francisco Bay and where superficial deposits and fill are more prevalent. This area has greater development density and includes hundreds of residences, part of downtown, and most of the primary commercial areas of the city including the major shopping centers north of Sir Francis Drake Boulevard. All of the City's critical facilities, with the exception of the Larkspur City Hall, Larkspur Fire Station #15 and the Tamalpais of Marin Greenbrae skilled nursing facility lie areas of moderate earthquake shaking susceptibility. Unreinforced masonry buildings in the downtown area could suffer moderate to severe damage from an earthquake. Larkspur has identified 15 unreinforced masonry buildings scattered through the area south of Corte Madera Creek. Although several are located downtown, most downtown buildings, including City Hall, are wood frame. Falling debris could endanger those in the vicinity of these older buildings. "Pancaking" of these older structures during business hours may entrap many people. The City's densely settled alluvial lowlands south of Corte Madera Creek have a potential for heavy damage. According to a scenario developed under the Earthquake Preparedness Program of the California Division of Mines and Geology, a major earthquake (8.3 magnitude on either the San Andreas or Hayward Fault), in addition to damaging buildings, can be expected to topple the Highway 101 freeway overpass at Sir Francis Drake Boulevard and buckle pavement on Highway 101 and Magnolia Avenue through Larkspur. The earthquake could set off landslides along Sir Francis Drake Boulevard leaving Greenbrae separated from the rest of Larkspur for up to 24 hours. Bon Air Road and Doherty Drive could also collapse from liquefaction and settlement. Utility lines carrying water, gas, and sewage could be ruptured by landslides and sudden settlement. If fires break out, emergency response teams could encounter serious difficulties in fighting them if water lines are broken and landslides block access roads.

Larkspur hasn't yet experienced a significant earthquake. The Marin County OA was sparsely populated at the time of the 1906 San Francisco Earthquake, and the effects across the County were relatively minimal. Likewise, the 1989 Loma Prieta Earthquake caused minimal impacts across the Marin County OA as the epicenter of the quake was further south in Santa Cruz County. Smaller earthquakes with minimal to no impacts are routinely felt in Larkspur.

Climate Change and Future Development Considerations

There is no direct link between climate change and seismic activity that could impact the Marin County OA including Larkspur, so climate change is not expected to cause any changes to the frequency or intensity of seismic shaking. According to a 2018 study by the Institute of Physics (IOP)[16], climate change could result in "isostatic rebounds," or a sudden upward movement of the crust because of reduced downward weight caused by glaciers. As glaciers are known to melt when overall global temperatures increase, climate change could indirectly lead to an increase in seismicity in the Marin County OA including Larkspur. Climate change could also impact earthquakes felt in the Marin County OA as droughts can further deteriorate existing fault lines and pumping groundwater can put further pressure on the earth's crust. Future development in the populated areas of Marin County OA where seismic shaking and subsidence are more prevalent could exacerbate the impacts of an earthquake. This includes the lowlands

[16] An Enhanced Seismic Activity Observed Due to Climate Change: Preliminary Results from Alaska. https://iopscience.iop.org/article/10.1088/1755-1315/167/1/012018

of Larkspur downtown and along its creek beds and marshlands where the risk of subsidence and subsequent earthquake shaking are higher. Future development in these areas could expose more people and infrastructure to earthquake shaking as a result of climate change.

2.2.5 FLOODING

Flooding is the rising and overflowing of a body of water onto normally dry land. Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. The area adjacent to a channel is the floodplain. Floodplains are illustrated on inundation maps, which show areas of potential flooding and water depths. In its common usage, the floodplain most often refers to that area that is inundated by the 100-year flood, the flood that has a one percent chance in any given year of being equaled or exceeded. The 100-year flood is the national minimum standard to which communities regulate their floodplains through the National Flood Insurance Program. The 200-year flood is one that has 0.5% chance of being equaled or exceeded each year. The 500-year flood is the flood that has a 0.2 percent chance of being equaled or exceeded in any given year. The potential for flooding can change and increase through various land use changes and changes to land surface, which result in a change to the floodplain. A change in environment can create localized flooding problems inside and outside of natural floodplains by altering or confining natural drainage channels. These changes are most often created by human activity such as construction of bridges or channels. In areas where flow contains high sediment load, such as Easkoot Creek in Stinson Beach (due to an active landslide upstream), the flow carrying capacity of the channel may be reduced dramatically during a single flood event. Coastal floodplains may also change over time as waves and currents alter the coastline (especially wetlands) and sea levels rise.

Flooding can occur in several ways:

Riverine flooding – Riverine flooding, defined as when a watercourse exceeds its “bank-full” capacity, generally resulting from prolonged rainfall, or rainfall that is combined with snowmelt and/or already saturated soils from previous rain events. This type of flood occurs in river systems whose tributaries may drain large geographic areas and include one or more independent river basins. The onset and duration of riverine floods may vary from a few hours to many days and is often characterized by high peak flows combined with a large volume of runoff. Factors that directly affect the amount of flood runoff include precipitation amount, intensity of rainfall and distribution of overland flow, the amount of soil moisture, seasonal variation in vegetation, snow depth, and water-resistance of the surface due to urbanization and geomorphology. In the Marin County OA, riverine flooding can occur anytime from November through April and is largely caused by intense and continued rains, sometimes combined with snowmelt, increased discharges from upstream dams, and intense flow from tributary streams. These intense storms can overwhelm the local waterways as well as the integrity of flood control structures such as culverts and bridges. Flooding is more severe when antecedent rainfall has resulted in saturated soil conditions. The warning time associated with slow rise riverine floods assists in life and property protection.

Flash flooding – Flash flooding describes localized floods of great volume and short duration. This type of flood usually results from a heavy rainfall on a relatively small drainage area. Precipitation of this sort usually occurs in the winter and spring. Flash floods often require

immediate evacuation within the hour and thus early threat identification and warning is critical for saving lives.

Localized/Stormwater flooding – Localized flooding problems are often caused by flash flooding, severe weather, or an unusual amount of intense rainfall. Flooding from these intense weather events usually occurs in areas experiencing an increase in runoff from impervious surfaces associated with development and urbanization as well as inadequate storm drainage systems.

Tidal flooding – Tidal flooding develops when high tides exceed either the top of bank elevation of tidal sloughs and channels, or the crest of bay levees. An especially high tide event that occurs during alignment of the gravitational pull between the sun and the moon, causing tidal water levels to rise to higher-than normal levels. King tides are normal, predictable events that occur semi-annually during winter months. Typically storms in which high tides coincide with peak stormwater flow may be damaging to municipal infrastructure and private property.

The area is also at risk of flooding resulting from levee failures and dam failures. Dam failure flooding is discussed separately in the Dam Failure Section of this document; levee failure flooding is discussed separately in the Levee Failure Section of this document. Regardless of the type of flood, the cause is often the result of severe weather and excessive rainfall, either in the flood area or upstream reach.

A weather pattern called the “Atmospheric River” contributes to the flooding potential of the area. An Atmospheric River brings warm air and rain to the West. A relatively common weather pattern brings southwest winds to the Pacific Northwest or California, along with warm, moist air. The moisture sometimes produces many days of heavy rain, which can cause soil saturation, extensive flooding and other impacts such as landslides. The warm air also can melt the snowpack in the mountains, which further aggravates the flooding potential. In the colder parts of the year, the warm air can be cooled enough to produce heavy, upslope snow as it rises into the higher elevations of the Sierra Nevada or Cascades. Forecasters and others on the West Coast often used to refer to this warm, moist air as the “Pineapple Express” because it comes from around Hawaii where pineapples are grown. A diagram of an atmospheric river event is shown in Figure 32.

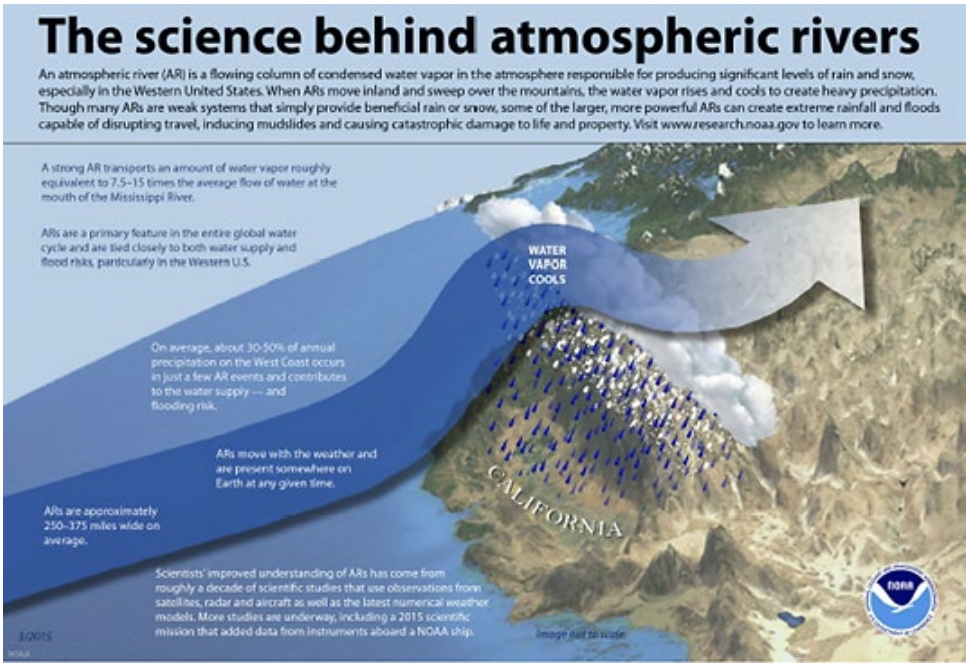

Figure 220: Diagram of an Atmospheric River Event
Source: NOAA

The Marin County OA is susceptible to various types of flood events. In coastal areas, flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Other types of flooding in Marin include isolated ponding and stormwater overflow. Isolated ponding is when pools form on the ground and can occur in any area that doesn't drain effectively – for example, in a natural depression in the landscape. Stormwater overflow is when storm drains back up. Stormwater drainage systems quickly convey rainwater through underground culverts (pipes) to creeks and the Bay. When the storm drains are obstructed or broken or when the water bodies to which they lead are already full, water backs up onto the streets and into the riparian area surrounding the drainage way. Although stormwater overflow and isolated ponding also occur throughout the County, the effects are typically not widespread or significantly damaging.

Many developed and undeveloped Larkspur lands are subject to flooding due to a combination of factors, including periodic heavy winter rainfalls, tidal fluctuations, and potential for tsunami due to seismic activity. Larkspur has numerous drainage basins which lead to major creeks that drain to San Francisco Bay. Flooding in Larkspur generally results from a combination of creek flooding along Corte Madera Creek and Larkspur Creek as well as from high tides and storm runoff in low-lying areas along San Francisco Bay. Both sides of Corte Madera Creek and the lowland areas, particularly the alluvial fan area where Corte Madera and Larkspur Creek converge near Highway 101, are in the 100-year floodplain and could be susceptible to flooding. Historically, most of Larkspur's flooding has occurred in this area south of Corte Madera Creek and west of Highway 101. This area includes hundreds of homes, most of the College of Marin, Tamiscal High School, the Central Marin Police Authority, part of Redwood High School, San Andreas High School and the PG&E Greenbrae Substation. Part of Highway 101, Lucky Drive and Doherty Drive lie in the 100-year floodplain and could be susceptible to flooding. The Madrone Canyon and downtown areas along Larkspur Creek and several areas along Magnolia Avenue and Sir Francis Drake Boulevard near Corte Madera Creek are in 500-year floodplain and could be susceptible to flooding. This area includes hundreds of homes, most of downtown, several commercial shopping centers, the Larskpur City Hall and Fire Stations #15

and #16, the St. Patricks School, the South Marin Rehabilitation Center and part of Redwood High School. Most of the main thoroughfares in Larkspur, including Magnolia Avenue, Sir Francis Frak Boulevard and Highway 101 lie in the 500-year floodplain and could be susceptible to flooding. A major flooding event in Larkspur could cause significant transportation challenges for the city.

Source: County of Marin/FEMA DFIRM

Floodwaters can be deep enough to drown people and move fast enough to sweep people and vehicles away, lift buildings off foundations, and carry debris that smashes into buildings and other property. Flood waters can cause significant erosion which can lead to slope instability, severely damaging transportation and utility infrastructure by undermining foundations or washing away pavement. If water levels rise high enough to get inside buildings, flooding can cause extensive damage to personal property and the structure itself. Flood events that develop very quickly are especially dangerous because there may be little advance warning. Flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Tide elevations within San Francisco Bay have the potential to

significantly impact the Larkspur storm drain system. Larkspur already sees flooding from king tides in San Francisco Bay and this is only expected to increase with sea level rise and climate change. Larkspur areas subject to frequent tidal flooding in the past are predominantly former marshlands (Bay Mud areas) that have previously been filled for urban expansion purposes.

On 11/8/2022, a storm caused flooding on Highway 101 near Larkspur, affecting travel.

On 2/13/2019, an atmospheric river event caused flooding in Larkspur. Major flooding occurred at the Lucky Drive exit on Highway 101.

On 2/8/2017, an atmospheric river event contributed to flooding in Larkspur, inundating roads and parking lots. Flooding was reported on Sir Francis Drake Boulevard at the Bon Air Shopping Center and on Bon Air Road at Magnolia Avenue. Residential flooding was reported along West Baltimore Avenue in the Madrone Canyon area. The Larkspur-Corte Madera, school district canceled classes as did the North Bridge Academy and St. Patrick School.

Figure 222: 2017 Larkspur Flooding at the BonAir Shopping Center
Source: ABC 7

On 12/14/2012, rainfall caused Corte Madera Creek to overflow its bank in some places. Residents at the Larkspur Marina neighborhood and Larkspur Plaza Drive both had to negotiate ponds in front of their homes. King tides contributed to the flooding.

Significant flood damage occurred in 1955, 1958, 1973, and 1982. The flood of late December 1955 caused serious damage in the Heather Gardens neighborhood where many families had to be evacuated by rowboat. Torrential rainfall in April 1958, and two back-to-back storms in January 1973, also caused severe flooding in Larkspur. The January 1982 storm was the worst in the state since 1955. In Marin County, 12 inches of rain fell in 36 hours. Unlike the earlier floods in Larkspur, the greatest loss of property was due to mudslides. Four homes, two in Madrone Canyon and two in the Murray Park area, were destroyed, as well as eight apartments at Skylark. Public and private damage was estimated at $3 million.

Figure 223: 1973 Flooding on Highway 101 in Larkspur
Source: County of Marin Public Works

Climate Change and Future Development Considerations

Climate change is expected to affect California's precipitation patterns, which are likely to influence future flood events. A 2017 study[17] found that the number of very intense precipitation days in California is projected to more than double by the end of the century, increasing 117 percent, making it likely that flood events will become more frequent in the Marin County OA including Larkspur. Climate change is expected to alter rainfall patterns in Northern California, including the Marin County OA. As the climate warms, rain events are predicted to become more intense. The Marin County OA including Larkspur will likely experience more rain inundation events that lead to flooding and increase the potential threat of dam and levee failure, tree mortality, and other potential hazards. Sea level rise as a result of climate change will exacerbate the impacts of tidal flooding in the lowland areas of the Marin County OA including the shoreline areas of Larkspur. Future development in these areas will expose more people and infrastructure to the effects of flooding. Development in the marshland area of Larkspur would expose additional people and infrastructure to flooding as marshlands act as a natural buffer to storm surge. Development along Corte Madera Creek, Larkspur Creek and the High Canal would expose more people, structures and infrastructure including major roads to creek flooding and storm surge from Corte Madera Creek as a result of climate change.

[17] Precipitation in a Warming World: Assessing Projected Hydro-Climate Changes in California and other Mediterranean Regaions. https://www.nature.com/articles/s41598-017-11285-y

2.2.6 LAND SUBSIDENCE

Land subsidence is a gradual settling or sudden sinking of the Earth's surface owing to subsurface movement of earth materials. The principal causes are aquifer-system compaction, drainage of organic soils through groundwater pumping, underground mining, hydro-compaction, natural compaction, sinkholes, and thawing permafrost. More than 80 percent of the identified subsidence in the United States is a consequence of underground water exploitation. The increasing development of land and water resources threatens to exacerbate existing land-subsidence problems and initiate new ones.

Sinkholes can form in three primary ways. Dissolution sinkholes form when dissolution of the limestone or dolomite is most intensive where the water first contacts the rock surface. Aggressive dissolution also occurs where flow is focused in preexisting openings in the rock, such as along joints, fractures, and bedding planes, and in the zone of water-table fluctuation where groundwater is in contact with the atmosphere. See Figure 36 for a picture and description of how dissolution sinkholes form.

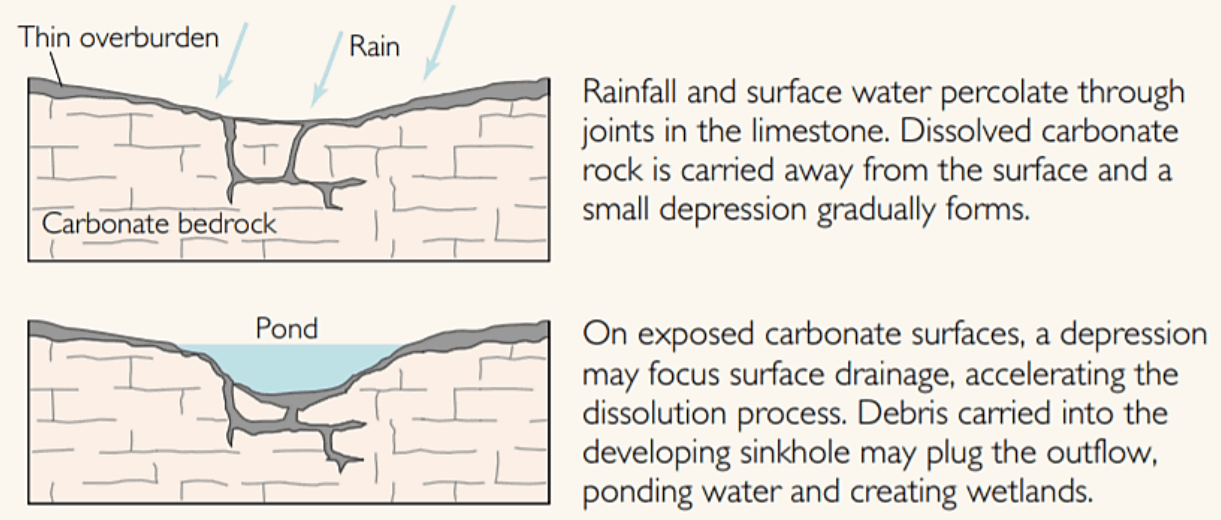

Figure 224: Dissolution Sinkhole Formation
Source: USGS

Cover-subsidence sinkholes tend to develop gradually where the covering sediments are permeable and contain sand. In areas where cover material is thicker, or sediments contain more clay, cover-subsidence sinkholes are relatively uncommon, are smaller, and may go undetected for long periods. See Figure 37 for a picture and description of how cover-subsidence sinkholes form.

Subsidence can also occur in bay mud areas which are prevalent around San Francisco Bay. Bay Mud, which has very little strength, can move and shift over long periods of time and is also affected by other natural events such as earthquakes, storm activities, water pressure and composition. Older construction of buildings placed on fill material on Bay Mud are susceptible to differential settlement which affects the service life of the structures as well as utilities, roadways and other infrastructure that supports these areas. The Marinship area and other low elevation areas built on bay mud have experienced significant differential settlement over time.

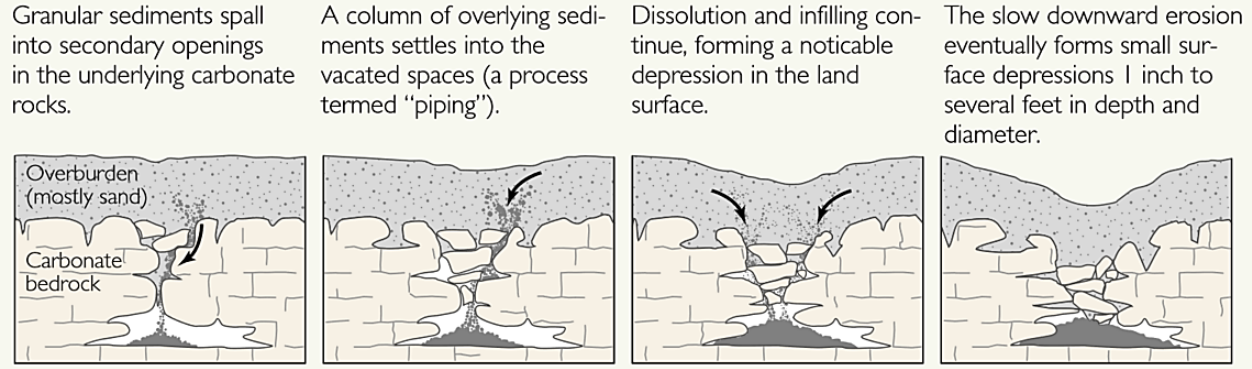

Figure 225: Cover-Subsidence Sinkhole Formation
Source: USGS

Cover-collapse sinkholes may develop abruptly over a period of hours and cause catastrophic damages. They occur where the covering sediments contain a significant amount of clay. Over time, surface drainage, erosion, and deposition of sediment transform the steep-walled sinkhole into a shallower bowl-shaped depression. See Figure 38 for a picture and description of how cover-collapse sinkholes form.

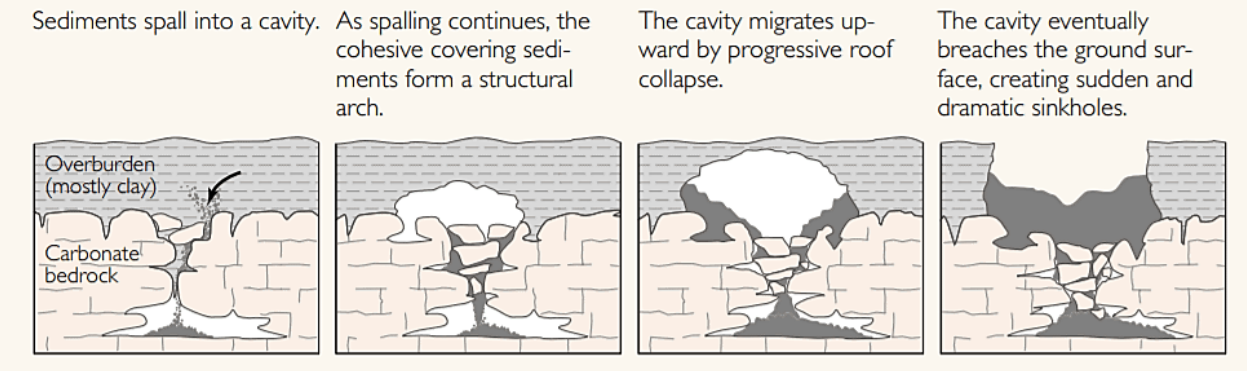

Figure 226: Cover-Collapse Sinkhole Formation
Source: USGS

New sinkholes have been correlated to land-use practices, especially from groundwater pumping and from construction and development practices that cause land subsidence. Sinkholes can also form when natural water-drainage patterns are changed and new water-diversion systems are developed. Some sinkholes form when the land surface is changed, such as when industrial and runoff-storage ponds are created. The substantial weight of the new material can trigger an underground collapse of supporting material, thus causing a sinkhole.

The overburden sediments that cover buried cavities in the aquifer systems are delicately balanced by groundwater fluid pressure. The water below ground helps to keep the surface soil in place. Groundwater pumping for urban water supply and for irrigation can produce new sinkholes in sinkhole-prone areas. If pumping results in a lowering of groundwater levels, then underground structural failure, and thus, sinkholes, can occur.

Larkspur is at risk from land subsidence, in the form of liquefaction and settlement, Areas susceptible to liquefaction and settlement in Larkspur are those underlain by saturated, loosely compacted granular materials such as old stream beds (alluvium). Large areas of former bay

mud marshlands in Larkspur have been artificially filled over the years. Land subsidence and sinkholes would most likely occur in the lowland areas of Larkspur along San Francisco Bay where superficial deposits and fill are more prevalent. This includes the marshland area along both sides of Corte Madera Creek, the area east of the Marin Municipal Water District Facilities near Redwood High School and the area around the Larkspur Ferry Terminal north of the mouth of Corte Madera Creek. There are dozens of residences, several schools and numerous commercial buildings in areas of increased land subsidence susceptibility. These areas could anticipate increased rates of subsidence as bay waters saturate the soil from below. Land subsidence could have numerous impacts for Larkspur, including the settling of businesses and homes as well as the shifting of roadways and utility infrastructure that run through the City.

Subsidence and differential settlement have occurred in Larkspur near Corte Madera Creek. Differential (or uneven) settlement may occur in poorly consolidated soils during earthquake shaking or over time.

There have been no major sinkholes recorded in Larkspur, though Larkspur's 75-100 year old storm drains are aging and deteriorating rapidly. Many have not been repaired in over 25 years and are starting to create sinkholes.

Climate Change and Future Development Considerations

Climate change could indirectly influence land subsidence as more severe and prolonged periods of drought may encourage more groundwater withdrawals. In coastal areas like the Marin County OA including Larkspur, land subsidence leads to higher sea levels and increased flood risk. The rate of land subsidence could increase across the Marin County OA including the lowland areas of Larkspur as a result of climate change. The impacts of land subsidence on infrastructure, including roads and underground utilities, in Larkspur could increase with future development in the lowland populated areas of the city where land subsidence is more likely to occur.

2.2.7 Levee Failure

Levee failure is the overtopping, breach or collapse of the levee. Levees can fail in the event of an earthquake, internal erosion, poor engineering/construction or landslides, but levees most commonly fail as a result of significant rainfall or very high tides. During a period of heavy rainfall, the water on the water-body side of the levee can build up and either flow over the top ("overtopping") or put pressure on the structure causing quickening seepage and subsequent erosion of the earth. The overflow of water washes away the top portion of the levee, creating deep grooves. Eventually the levee weakens, resulting in a breach or collapse of the levee wall and the release of uncontrollable amounts of water. Figure 39 shows a levee and the multiple ways it can fail.

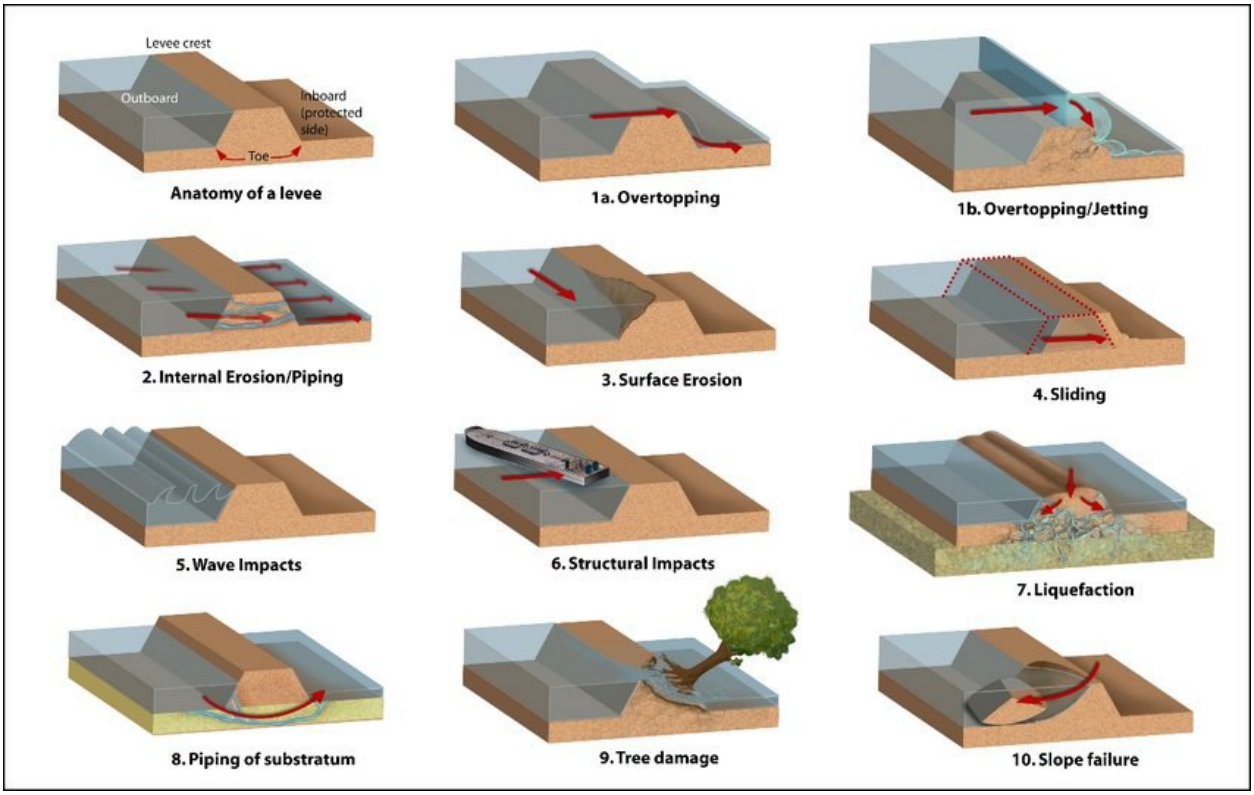

Figure 227: Levee Failure Mechanisms
Source: University of California

The City of Larkspur has three levees. The Corte Madera Creek levee is 0.67 miles long with an undocumented height and protects dozens of residences between Magnolia Avenue and Corte Madera Creek north of Bon Air Road. Around 304 people and 107 buildings with an estimated property value of $68.5 million are at risk from failure of the Corte Madera Creek levee. Marin County Levee 11 is 0.19 miles long with an undocumented height and protects numerous residences near Redwood High School from flooding. Around 131 people and 20 buildings with an estimated property value of $15.1 million are at risk from failure of the Marin County Levee 11. Marin County Levee 32 is 0.15 miles long with an undocumented heigh an it protects Remillard Park between the mouth of Corte Madera Creek and Sir Francis Drake Boulevard. There are no people or buildings at risk from a failure of the Marin County Levee 32.

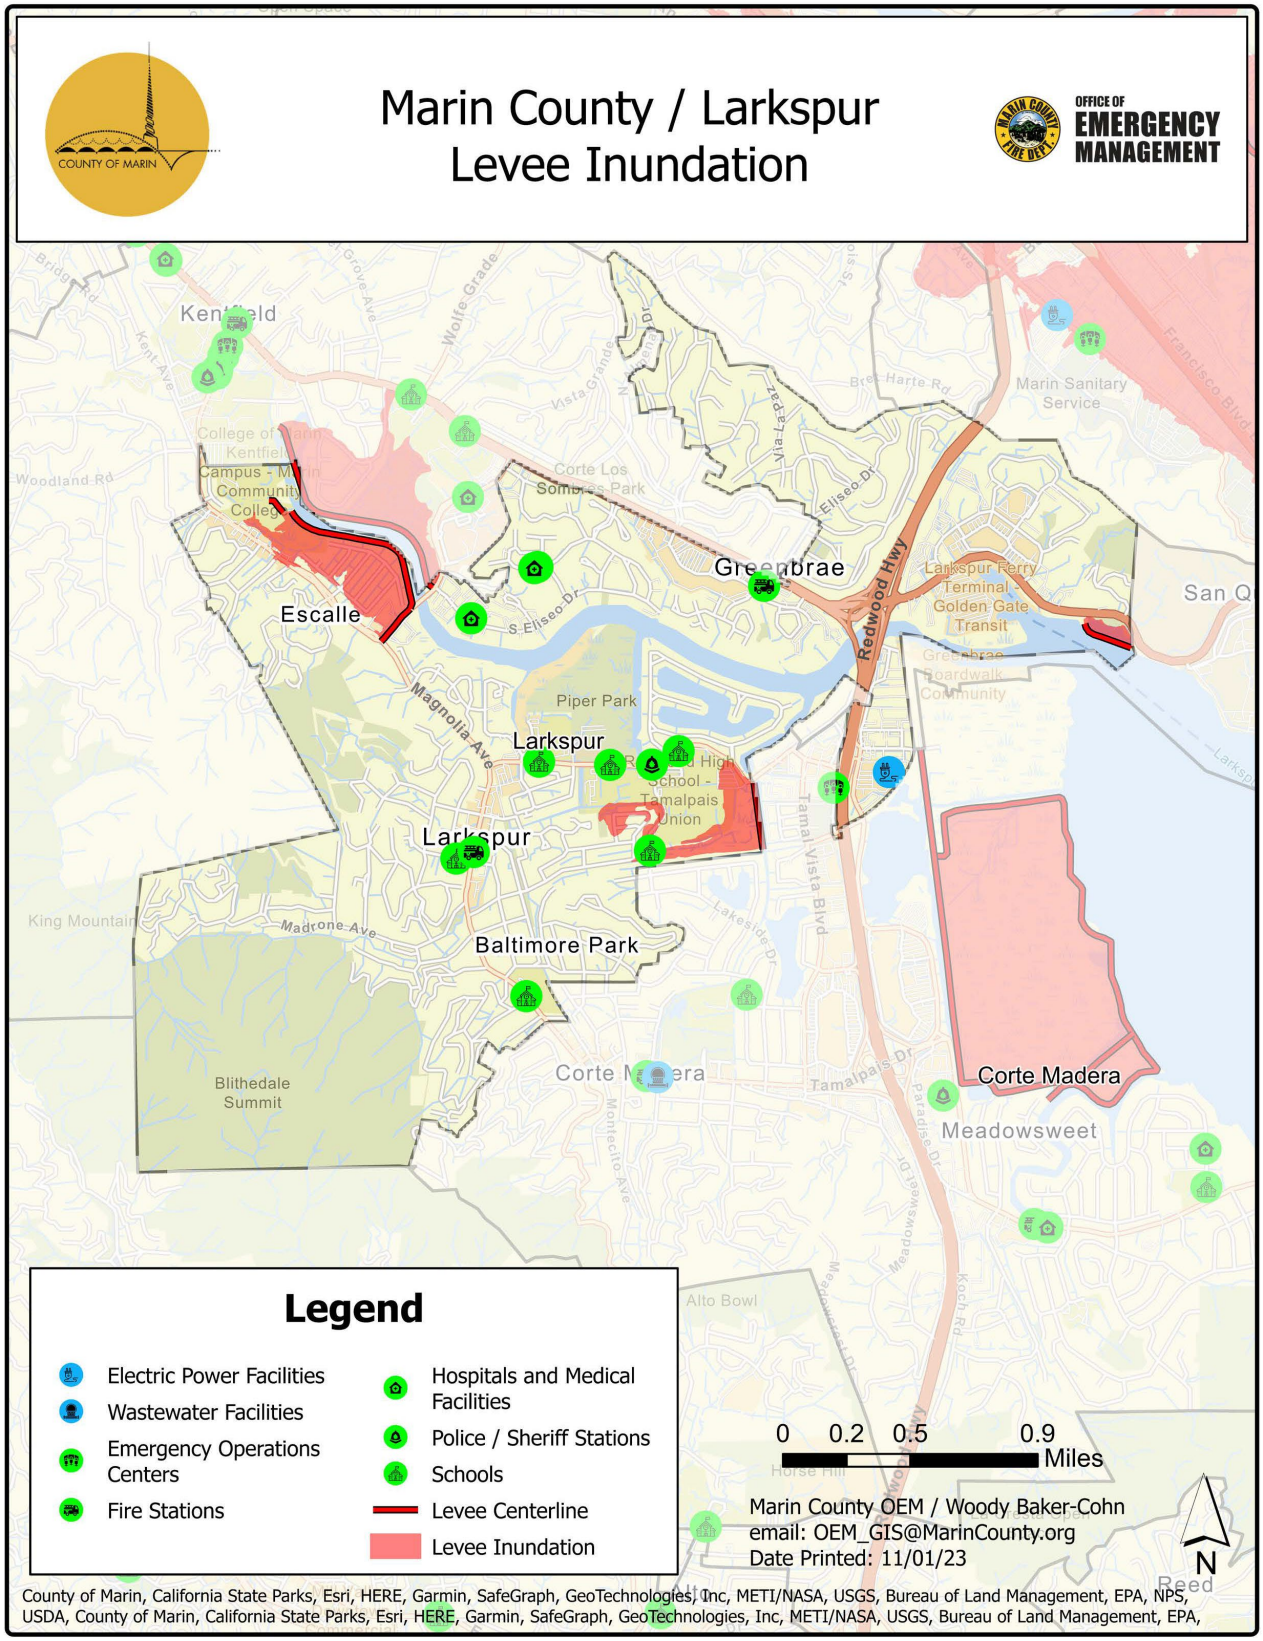

Figure 228: City of Larkspur Levee failure Critical Facilities and Infrastructure
Source: Marin County OEM

There have been no failures of any of the levees in Larkspur.

Climate Change and Future Development Considerations

Climate change is expected to lead to an increase in the frequency and severity of major storm events, which can place added strain on levee systems. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in leveed areas across the Marin County OA including in Larkspur, increasing the potential for a levee failure. Rising seas will lead to increased stress on the levees around the Marin County OA shoreline including in Larkspur, particularly during a major tidal event and potential tsunami. As development increases in the populated areas of Larkspur protected by its levees, particularly along Corte Madera Creek and around its marshlands, the potential for significant impacts to residents and infrastructure will only increase.

2.2.8 Sea Level Rise

Climate change is the distinct change in measures of weather patterns over a long period of time, ranging from decades to millions of years. More specifically, it may be a change in average weather conditions such as temperature, rainfall, snow, ocean and atmospheric circulation, or in the distribution of weather around the average. While the Earth's climate has cycled over its 4.5-billion-year age, these natural cycles have taken place gradually over millennia, and the Holocene, the most recent epoch in which human civilization developed, has been characterized by a highly stable until recently.

The Marin County OA MJHMP is concerned with human-induced climate change that has been rapidly warming the Earth at rates unprecedented in the last 1,000 years. Since industrialization began, the burning of fossil fuels (coal, oil, and natural gas) at escalating quantities has released vast amounts of carbon dioxide and other greenhouse gases responsible for trapping heat in the atmosphere, increasing the average temperature of the Earth. Secondary impacts include changes in precipitation patterns, the global water cycle, melting glaciers and ice caps, and rising sea levels. According to the Intergovernmental Panel on Climate Change (IPCC), climate change will "increase the likelihood of severe, pervasive and irreversible impacts for people and ecosystems" if unchecked.

Through changes to oceanic and atmospheric circulation cycles and increasing heat, climate change affects weather systems around the world. Climate change increases the likelihood and exacerbates the severity of extreme weather – more frequent or intense storms, floods, droughts, and heat waves. Consequences for human society include loss of life and injury, damaged infrastructure, long-term health effects, loss of agricultural crops, disrupted transport and freight, and more. Climate change is not a discrete event but a long-term hazard, the effects of which communities are already experiencing.

Climate change adaptation is a key priority of the State of California. The 2013 State of California Multi- Hazard Mitigation Plan stated that climate change is already affecting California. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In

addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Rising sea levels are considered a secondary effect of climate change due to warming ocean temperatures and melting glacial ice sheets into the ocean. The California coast has already seen a rise in sea level of four to eight inches over the 20th century due to climate change. Sea level rise impacts can be exacerbated during coastal storms, which often bring increased tidal elevations called “storm surge.” The large waves associated with such storm surges can cause flooding in low-lying areas, erosion of coastal wetlands, saltwater contamination of drinking water, disruption of septic system operations, impacts on roads and bridges, and increased stress on levees. In addition, rising sea levels results in coastal erosion as shoreline sediment is re-deposited back into the ocean. Evidence shows that winter storms have increased in frequency and intensity since 1948 in the North Pacific, increasing regional wave heights and water levels during storm events.

According to the 2017 “Rising Seas in California, An Update on Sea-Level Rise Science” report Marin County may experience impacts from Sea Level Rise over defined periods of time, to include long-term changes (second half of this century and beyond), and short- to mid-term projections (within the next two or three decades).

Most of Larkspur that lies in the 100-year floodplain is at risk of sea level rise, including along Corte Madera Creek and in the lowland areas at the convergence of Corte Madera Creek and Larkspur Creek near Highway 101. These areas may experience between one and six feet of inundation based on the latest predictions of sea level rise in the next 100 years. Numerous commercial areas, hundreds of residences, the Redwood High School, the Tamiscal High School, the San Andreas High School, the Central Marin Police Authority, the South Marin Rehabilitation Center and the PG&E Greenbrae substation lie in areas of Larkspur susceptible to sea level rise. Several main thoroughfares including Highway 101 and Sir Francis Drake Boulevard also lie in this area and already experience tidal flooding. The 2017 Marin Shoreline Sea Level Rise Vulnerably Assessment estimates that Larkspur could anticipate impacts to over 12,000 people and over 1,200 living units with $2 billion in assessed property value as a result of a 100-year sea level rise scenario and including storm surge. In the near-term, 132 acres of the city could be exposed to sea level rise. In the long-term, 379 acres of the city could be exposed to sea level rise; and 544 acres could be exposed with an additional 100-year storm surge. This third of the area of Larkspur is essential to accessing Larkspur, schooling, recreation, and emergency services. The Golden Gate Bridge District’s (GGBHTD) Larkspur site and hydraulic ferry facility may not be able to withstand near-term high tides. The several hundred thousand gallons of reserve fuel at the Larkspur Ferry Terminal could be vulnerable in the long-term. Housing along Corte Madera Creek canals, sloughs, and lagoons could be vulnerable in the near- to medium-terms. This includes, Boardwalk One, multi-family on Larkspur Plaza, the southern portion of Heatherwood Gardens, and housing west of S. Eliseo Drive. The elevated over marsh homes on Boardwalk One may be more adaptable than homes on solid foundations elsewhere. Industrial and commercial sites east of Highway 101 could be vulnerable in the near term with a storm surge, and to high tides in the medium-term along Redwood Highway. Floodwaters could move up Corte Madera Creek and could reach into neighborhoods, impacting streets in low elevation areas at Bon Air Road and west of the creek. Bon Air road is a critical route to area hospitals and has experienced flooding as recent as 2017 with up to one and one half feet of water at the Bon Air Bridge. These roads enable commuters,

school children, and emergency vehicles to travel to, from, and within the community. Riviera Circle homes could be vulnerable to sea level rise in the long-term, and storm surges and subsidence sooner. The Hillview neighborhood, while already vulnerable to stormwater back-ups, is vulnerable to sea level rise during a 100-year storm surge in the long-term, as is the Edgewater complex and buildings extending up Magnolia Avenue towards Kentfield. The Corte Madera/Larkspur Pathway could be compromised along Corte Madera Creek. Several schools along Doherty Drive could be vulnerable in the medium- to long-term. Stormwater infrastructure along the Corte Madera Creek, and its tributaries, could be burdened in the medium- to long-term. Access to and from Larkspur using Highway 101 already floods during storms. The route is vulnerable to tidal flooding in the long-term. The Central Marin Police Department could be surrounded by flood waters. Piper Park, a historic land fill and current community sports facility and marsh habitat could be vulnerable in the long-term to sea level rise and 100-year storm surge. Larkspur's most vulnerable assets interface with Corte Madera Creek and its tributaries as they enter San Francisco Bay. Some buildings on the creek already suffer from subsidence and have undergone repairs. The low-lying area along Doherty Drive could be vulnerable by the long-term and is highly susceptible to bay surges and stormwater flows. Much of Larkspur developed flat lands were marshy before the water was channeled and land filled. This area is vulnerable to flooding and subsidence. Larkspur Landing, a critical center for commuting and commerce, could also flood. Industrial parcels east of Highway 101 on the shoreline already flood seasonally and could continue to suffer from storms over the next fifteen years. Residential development along Corte Madera Creek could experience tidal flooding in the near- and medium terms. In the long-term, tidal flooding could impact fifteen percent of residential parcels in Larkspur. Multi-family parcels could also see flooding on Larkspur Plaza Drive. Fifty mobile homes, some of the County of Marin's limited affordable housing, could flood tidally at Mean Higher High Water Mark in the long-term and face storm flooding in the medium-term. Larkspur contains a high number of potentially vulnerable buildings relative to other communities in the study area.

Source: Marin County OEM

Climate Change and Future Development Considerations

The two major causes of global sea level rise are thermal expansion of warming oceans and the melting of land-based glaciers and polar ice caps. Climate change is affecting natural and built systems around the world, including the California coast. In the past century, average global temperature has increased about 1.4°F, and average global sea level has increased 7 to 8 inches. Sea level rise in the San Francisco Bay Area is projected to increase by eight inches MHW in 2050 and could reach 4.5 to eight feet by 2021 if greenhouse gas emissions aren't reduced.

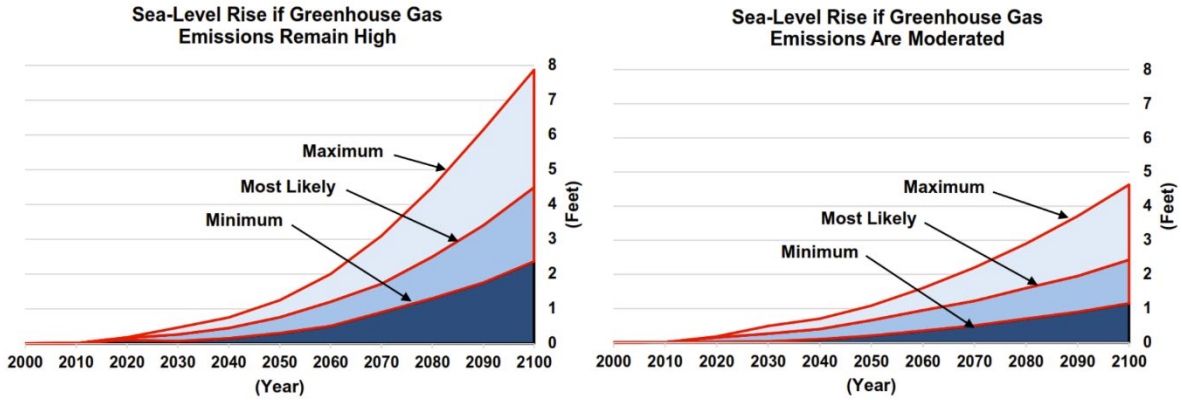

Figure 230: Projections of Sea Level Rise in the San Francisco Bay Area, 2000-2100
Source: 2019–2020 Marin County Civil Grand Jury, Climate Change: How Will Marin Adapt?

While the Marin County OA shoreline including around Larkspur already experiences regular erosion, flooding, and significant storm events, sea level rise will exacerbate these natural processes, leading to significant social, environmental, and economic impacts. The third National Climate Assessment cites strong evidence that the cost of doing nothing exceeds the costs associated with adapting to sea level rise by 4 to 10 times. Sea level rise will continue to affect the Marin County OA including Larkspur with increased tidal flooding and storm surge during severe weather events, and future development along the Marin County OA shoreline including around Larkspur will only amplify these impacts. Sea level can also lead to increased land subsidence and the potential of levee failure. The impacts of a tsunami would also be magnified with rising seas. Future development in the coastal and lowland areas of Larkspur will put more people and property at risk from flooding as a result of sea level rise. Roads and utility infrastructure across Larkspur will continue to become inundated.

2.2.9 Severe Weather – Extreme Heat

Extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. A heat wave is an extended period of extreme heat, often with high humidity. When relative humidity is factored in, the temperature can feel much hotter as reflected in the Heat Index (see Figure 43):

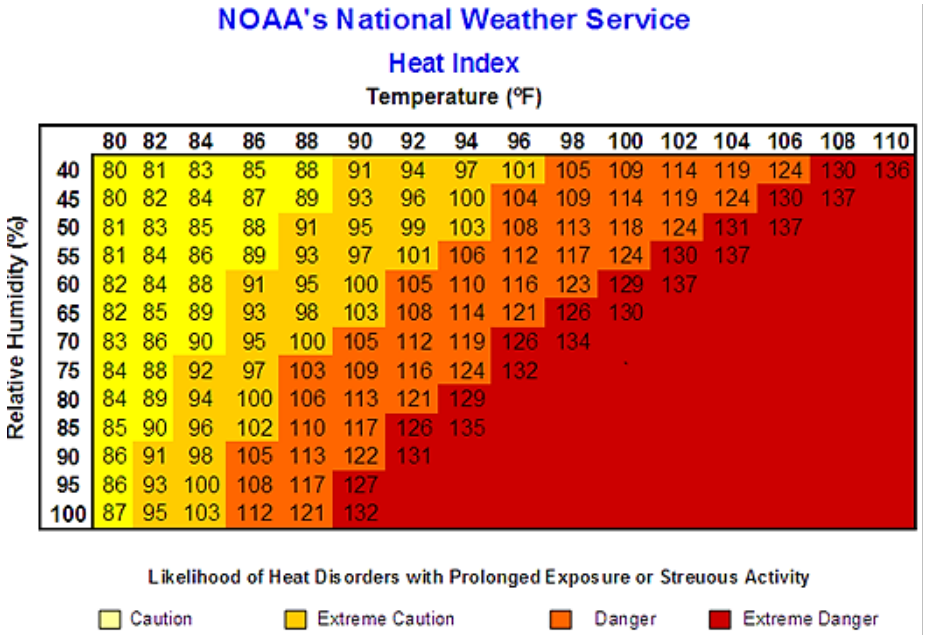

Figure 231: Heat Index
Source: NOAA

Heat kills by taxing the human body beyond its abilities. In a normal year, about 1,300 Americans succumb to the demands of summer heat. Heat is the leading weather-related cause of mortalities in the US. In 2006, California reported a high of 204 heat related deaths, with 98 reported in 2017 and 93 deaths reported in 2018.

Extreme heat has the potential to impact all areas of Larkspur and would be felt more in areas where there is a widespread presence of concrete and asphalt, which stores heat longer. This includes most of the downtown and commercial area of the city along Magnolia Avenue and Sir Francis Drake Boulevard. Heat waves can cause power outages and can sicken people who are exposed to high temperatures too long, particularly infants and the elderly.

In September 2022 the Marin County OA including the City of Larkspur experienced an Extreme Heat Event with temperatures exceeding 107 degrees.

Climate Change and Future Development Considerations

The primary effect of climate change is warmer average temperatures. The annual average daily high temperatures in California are expected to rise by 2.7°F by 2040, 5.8°F by 2070, and 8.8°F by 2100 compared to observed and modeled historical conditions. At the current rate, annual average temperatures in the Marin County OA region and Bay Area will likely increase by approximately 4.4 degrees by 2050 and 7.2 degree by the end of the century unless significant efforts are made to reduce greenhouse emotions according to California's latest climate change assessment.

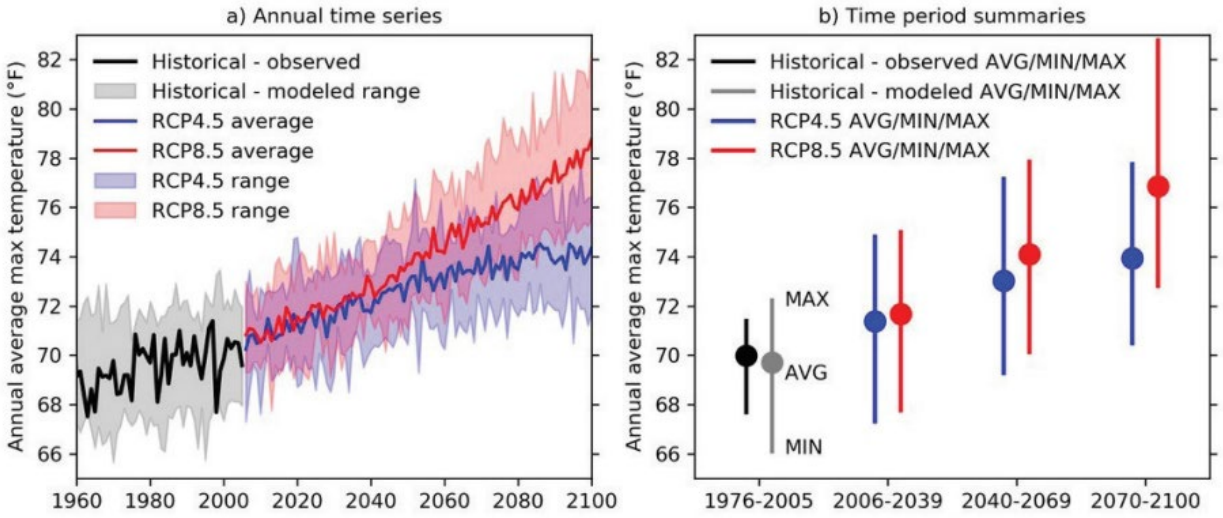

Figure 232: Annual Average Temperatures in the San Francisco Bay Area, 2000-2100
Source: California Climate Change Assessment (Fourth Edition)

As climate change accelerates in the 21st century, it is anticipated that extreme heat events will become more frequent and intense across the Marin County OA including in Larkspur. There will be increased residential and business needs for cooling and addressing heat-related issues. These effects would primarily be felt in the lowland areas of Larkspur where heat builds in developed areas. Heat waves also tax the energy grid. Future development in the Marin County OA including Larkspur could exacerbate the impacts from heat related events, particularly in electricity provision and water delivery. Increased temperatures will also lead to an increase in the occurrence and severity of wildfires across the Marin County OA including Larkspur as conditions become hotter and drier. These effects will primarily be felt in the mountainous and marshlands areas of Larkspur where hotter and drier conditions are more apt to lead to wildfires. Future development near the many open spaces around Larkspur could expose more people and infrastructure to the threat of a major wildfire as a result of increasing temperatures.

2.2.10 Severe Weather – High Wind & Tornado

High Wind

High wind is defined as a one-minute average of surface winds 40 miles per hour or greater lasting for one hour or longer, or winds gusting to 58 miles per hour or greater regardless of duration that are either expected or observed over land. These winds may occur as part of a seasonal climate pattern or in relation to other severe weather events such as thunderstorms. The Beaufort scale is an empirical measure that relates wind speed to observed conditions on land and is a common measure of wind intensity (see Figure 45).

Beaufort number	Description	Wind speed		Land conditions
		kts	km/h	
0	Calm	< 1	< 1	Calm. Smoke rises vertically.
1	Light air	1 – 2	1 – 5	Wind motion visible in smoke.
2	Light breeze	3 – 6	6 – 11	Wind felt on exposed skin. Leaves rustle.
3	Gentle breeze	7 – 10	12 – 19	Leaves and smaller twigs in constant motion.
4	Moderate breeze	11 – 15	20 – 28	Dust and loose paper raised. Small branches begin to move.
5	Fresh breeze	16 – 20	29 – 38	Branches of a moderate size move. Small trees begin to sway.
6	Strong breeze	21 – 26	39 – 49	Large branches in motion. Whistling heard in overhead wires. Umbrella use becomes difficult. Empty plastic garbage cans tip over.
7	High wind, Moderate gale, Near gale	27 – 33	50 – 61	Whole trees in motion. Effort needed to walk against the wind. Swaying of skyscrapers may be felt, especially by people on upper floors.
8	Gale, Fresh gale	34 – 40	62 – 74	Some twigs broken from trees. Cars veer on road. Progress on foot is seriously impeded.
9	Strong gale	41 – 47	75 – 88	Some branches break off trees, and some small trees blow over. Construction/temporary signs and barricades blow over. Damage to circus tents and canopies.
10	Storm, Whole gale	48 – 55	89 – 102	Trees are broken off or uprooted, saplings bent and deformed. Poorly attached asphalt shingles and shingles in poor condition peel off roofs.
11	Violent storm	56 – 63	103 – 117	Widespread vegetation damage. Many roofing surfaces are damaged; asphalt tiles that have curled up and/or fractured due to age may break away completely.
12	Hurricane	≥ 64	≥ 118	Very widespread damage to vegetation. Some windows may break; mobile homes and poorly constructed sheds and barns are damaged. Debris may be hurled about.

Figure 233: Beaufort Wind Scale
Source: NOAA

Windstorms in the Marin County OA are typically straight-line winds. Straight-line winds are generally any thunderstorm wind that is not associated with rotation (i.e., is not a tornado). It is these winds, which can exceed 100 mph, which represent the most common type of severe weather and are responsible for most wind damage related to thunderstorms.

Larkspur is susceptible to high winds during summer months when high temperatures in the central valley tend to pull in colder temperature air from the Pacific Ocean in the form of fog and winds. Some areas of Larkspur have the are named “Hurricane Gultch” which are areas where the wind associated with the marine layer rolls over the upper hillsides and proceeds to impact properties, trees and infrastructure in the city.

Tornado

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a

thunderstorm. Tornadoes are the most powerful storms that exist, and damage paths can be in excess of one mile wide and 50 miles long. The Enhanced Fujita Scale (see Figure 46) is commonly used to rate the intensity of tornadoes in the United States based on the damages that they cause.

Enhanced Fujita Scale	
EF-0	65-85 mph winds
EF-1	86-110 mph winds
EF-2	111-135 mph winds
EF-3	136-165 mph winds
EF-4	166-200 mph winds
EF-5	>200 mph winds

Figure 234: Enhanced Fujita Scale
Source: NOAA

Tornadic waterspouts are tornadoes that form over water or move from land to water. They have the same characteristics as a land tornado. They are associated with severe thunderstorms, and are often accompanied by high winds and seas, large hail, and frequent dangerous lightning.

Figure 235: Waterspout Formation
Source: MarineInsights

All of Larkspur is susceptible to storms and damage from wind, though the hilly and mountainous areas around the City have increased susceptibility due to a higher presence of trees. There are numerous windy and dead-end roads in these areas where a downed tree could hinder access. Larkspur is unlikely to experience a tornado due to its terrain but it could experience a waterspout originating from San Francisco Bay. Drought coupled with high winds which frequently occur may increase the susceptibility of trees toppling and falling branch damages to property. Fallen trees may damage homes and other facilities. Power lines may be impacted by fallen trees and wind, causing power outages.

On 3/14/2023, a wild storm ripped through Larspur knocking down multiple trees.

On 10/21/2021, an atmospheric river event with strong winds caused power outages to more than 2,500 people in Larkspur.

On 1/17/2019, winds toppled a massive ginko tree in Larkspur. Nobody was injured.

On 1/14/2013, a redwood tree around 120-foot tall and about 5 feet in diameter at the base fell across West Baltimore Avenue and onto a home near Magnolia Avenue. The tree broke through the roof of the two-story home and pressed down onto the first story, bending walls. The tree also knocked down electrical lines that serve 70 homes in the neighborhood, 30 of

which remained without power by late afternoon. The base of the tree may have been rotted out.

Figure 236: Fallen Tree from 2013 Storm in Larkspur
Source: SF Gate

Climate Change and Future Development Considerations

It is anticipated that the atmospheric rivers that deliver storms to Northern California may intensify because of climate change. This increase in storm intensity may bring more intense winds and potential tornados to Northern California, including the Marin County OA and Larkspur. Significant wind events and tornados can topple trees, particularly those that may be saturated, or drought stressed as a result of climate change. An increase in fallen trees in Larkspur as a result of increased storms due to climate change can lead to an increase in power outages. Future development in any of the forested areas of Larkspur with high tree cover including in the southern and western mountainous residential areas will increase the effects of severe wind events.

2.2.11 TSUNAMI

Tsunamis consist of waves generated by large disturbances of the sea floor, which are caused by volcanic eruptions, landslides or earthquakes. Shallow earthquakes along dip slip faults are more likely to be sources of tsunami than those along strike slip faults. The West Coast/Alaska Tsunami Warning Center (WC/ATWC) is responsible for tsunami warnings. Tsunamis are often incorrectly referred to as tidal waves. They are actually a series of waves that can travel at speeds averaging 450 (and up to 600) miles per hour with unusual wave heights. Tsunamis can reach the beach before warnings are issued.

A tsunami experienced by Larkspur would most likely occur from an earthquake, the location of which would determine the amount of time that the tsunami waves would reach the City. A tsunami would be expected to reach approximately 10 feet in San Francisco Bay near Larkspur. The wave run-up would generally be confined to the area east of the railroad crossing on Corte

Madera Creek. Tideland areas and filled ground near or below sea level could be inundated. The lowland area of Larkspur along Corte Madera Creek and around the convergence of Corte Madera Creek and Larkspur Creek near Highway 101 lie in a tsunami hazard area. Numerous commercial areas, hundreds of residences, the Redwood High School, the Tamiscal High School, the San Andreas High School, the Central Marin Police Authority, the South Marin Rehabilitation Center and the PG&E Greenbrae substation lie in areas of Larkspur susceptible to a tsunami. Sections of Magnolia Avenue, Sir Francis Drake Boulevard and Highway 101 lie in a tsunami hazard area. Flooding of any of these major throughfares in a tsunami event could cause major transportation challenges in the City.

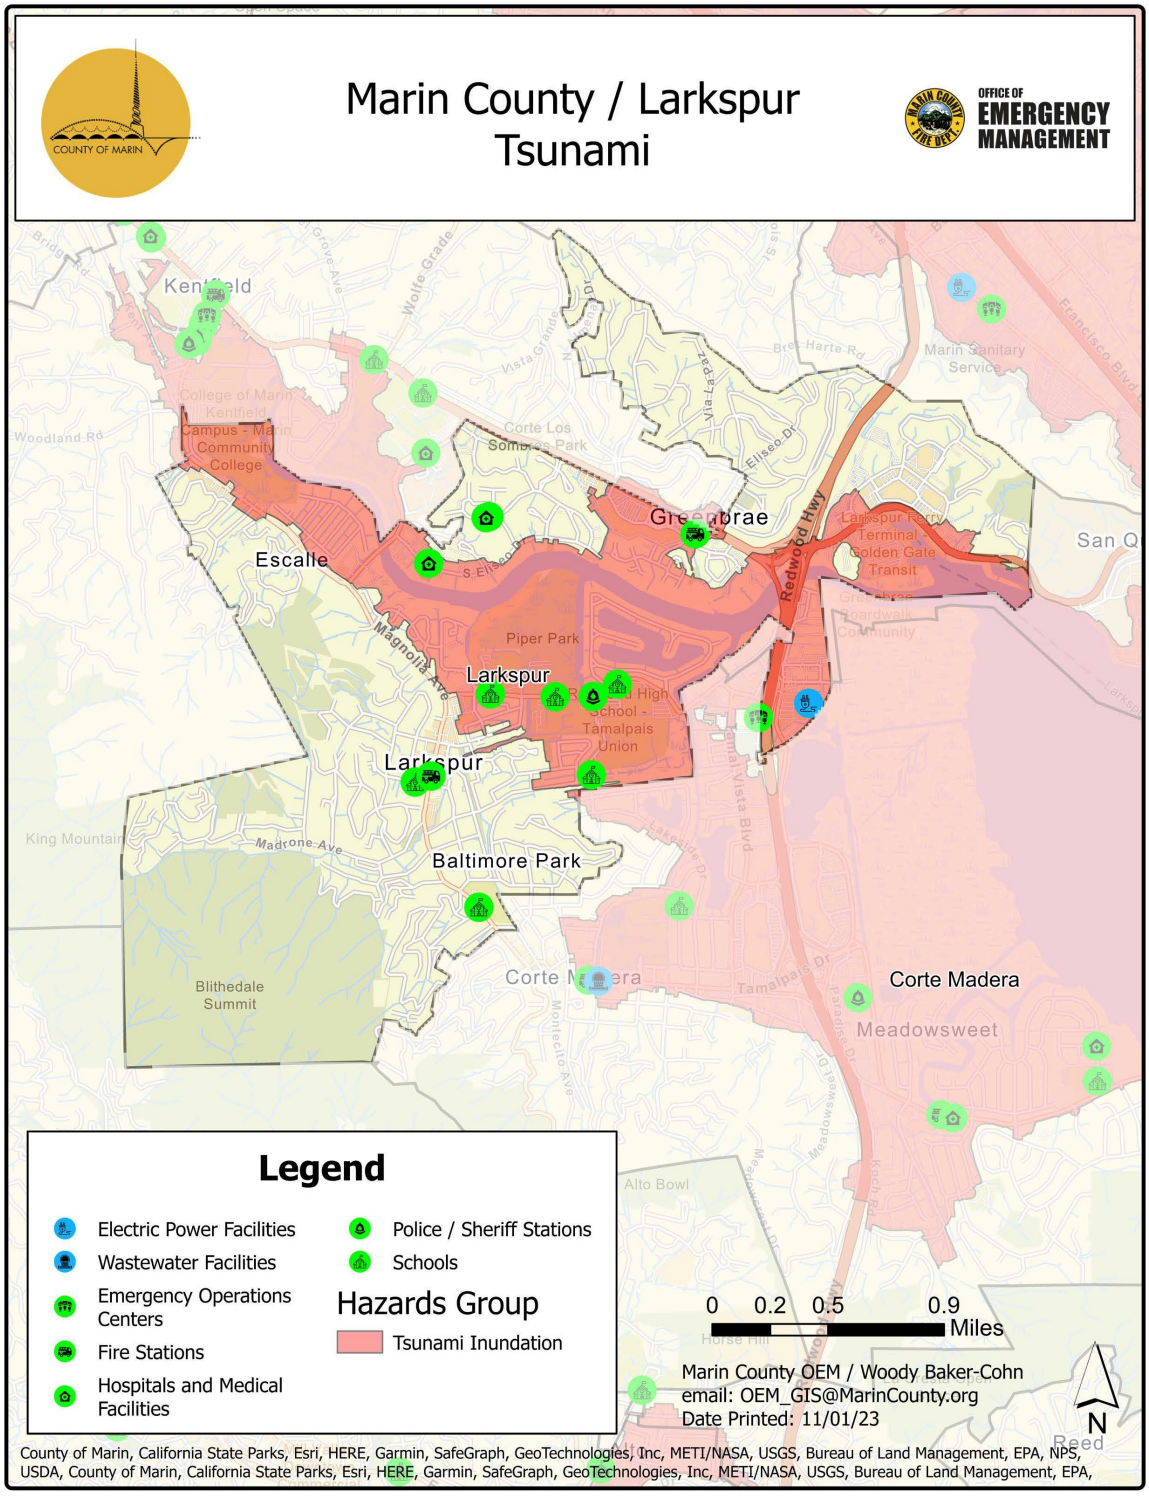

Figure 237: City of Larkspur Tsunami Critical Facilities and Infrastructure
Source: Marin County OEM

Larkspur has experienced minor tsunamis in the past. Nevertheless, major tsunamis may occur in Larkspur. Flooding from a tsunami may be similar to king tide flooding already experienced by the City with the exception that a tsunami occurs in a shorter time frame and may impact the

City's bayside systems. Roadways and city infrastructure may become inundated with salt water, causing transportation issues and utility disruptions.

Climate Change and Future Development Considerations

The biggest threat to tsunamis is sea level rise which is a direct result of climate change. Sea level rise can make tsunamis worse than they already are because higher sea levels allow for tsunamis to travel further inland and cause even more damage. Sea level rise results in more vulnerable coastlines which make coastal communities even more vulnerable to an incoming tsunami as the natural buffer to absorb the energy of an incoming tsunami will cease to exist. This is particularly true in the Marin County OA including Larkspur, where a large segment of the developed population lies in an area vulnerable to sea level rise. Furthermore, it has been theorized that ocean warming, caused by climate change, can impact the tectonic plates that rest below large bodies of water. Ultimately, this can result in more geological activities and worse tsunamis. Climate change has also affected ocean patterns, which could eventually lead to tsunamis distributing themselves across the ocean and impacting areas that are currently not susceptible to a tsunami. Tsunamis as a result of climate change and associated sea level rise will exacerbate the impacts of flooding in the lowland areas of the Marin County OA including Larkspur. This is particularly true along Corte Madera Creek and its tributaries and around the marshland areas of Larkspur where additional storm surge as a result of a larger tsunami could cause greater impacts. Future development in these areas will expose more people and infrastructure to the effects of flooding in the Marin County OA as tsunami inundation areas expand with climate change. Development in marshland in Larkspur would expose additional people and infrastructure to flooding as marshlands act as a natural buffer to a tsunami. Flooding could be exacerbated in areas where levees could fail along Corte Madera Creek and along the shoreline of Larkspur as a result of high wave heights associated with a more significant tsunami.

2.2.12 WILDFIRE

A wildfire is a fire that occurs in an area of combustible vegetation. The three conditions necessary for a wildfire to burn are fuel, heat, and oxygen. Fuel is any flammable material that can burn, including vegetation, structures, and cars. The more fuel that exists and the drier that fuel is, the more intense the fire can be. Wildfires can be started naturally through lightning or combustion or can be set by humans. There are many sources of human-caused wildfires including arson, power lines, a burning campfire, an idling vehicle, trains, and escaped controlled burns. On average, four out of five wildfires are started by humans. Uncontrolled wildfires fueled by wind and weather can burn acres of land and everything in their path in mere minutes and can reach speeds up to 15 miles per hour or faster depending upon wind speed and ember distribution. On average, more than 100,000 wildfires burn 4 to 5 million acres of land in the United States every year. Although wildfires can occur in any state, they are most common in the Western states including California where heat, drought, and thunderstorms create perfect wildfire conditions.

Wildfires are of primary concern when they occur in the Wildland Urban Interface (WUI), which is defined as areas where homes are built near or among lands prone to wildfire. Even relatively small acreage fires may result in disastrous damages. Most structures in the WUI are not destroyed from direct flame impingement, but from embers carried by wind. The damages can be widely varying, but are primarily reported as damage to infrastructure, built environment, and injuries to people.

The pattern of increased damages is directly related to increased urban spread into historical forested areas that have wildfire as part of the natural ecosystem and climate change. Many WUI fire areas have long histories of wildland fires that burned only vegetation in the past. However, with new development, a wildland fire following a historical pattern may now burn these newly developed areas. WUI fires can occur where there is a distinct boundary between the built and natural areas or where development or infrastructure has encroached or is intermixed in the natural area. WUI fires may include fires that occur in remote areas that have critical infrastructure easements through them, including electrical transmission towers, railroads, water reservoirs, communications relay sites or other infrastructure assets.

Consequently, wildland fires that burn in natural settings with little or no development are part of a natural ecological cycle and may actually be beneficial to the landscape. Century old policies of fire exclusion and aggressive suppression have given way to better understanding of the importance fire plays in the natural cycle of certain forest types.

Warning times are usually adequate to ensure public safety, provided that evacuation recommendations and orders are heeded in a timely manner. While in most cases wildfires are contained within a week or two of outbreak, in certain cases, they have been known to burn for months, or until they are completely extinguished by fall rains.

Wildfire poses the greatest risk to human life and property in the Marin County OA's densely populated WUI, which holds an estimated 69,000 living units. The Marin County OA is home to 23 communities listed on CAL FIRE's Communities at Risk list, with approximately 80% of the total land area in the county designated as having moderate to very high fire hazard severity ratings. The county has a long fire history with many large fires over the past decades, several of which have occurred in the WUI. To compound the issue, national fire suppression policies and practices have contributed to the continuous growth (and overgrowth) of vegetation resulting in dangerously high fuel loads. The Community Wildfire Protection Plan (CWPP) provides a scientifically based assessment of wildfire threat in the WUI of the Marin County OA.

Fire protection in California is the responsibility of either the federal, state, or local government depending upon the location of the incident. On federally owned land, or federal responsibility areas (FRA), fire protection is provided by the federal government, and or in partnership with local agreements. In state responsibility areas (SRA), CAL FIRE typically provides fire protection. However, in some counties CAL FIRE contracts with county fire departments to provide protection of the SRA – this is the case in the Marin County OA, where CAL FIRE contracts with Marin County Fire Department (MCFD). Local responsibility areas (LRA) include incorporated cities and cultivated agriculture lands, and fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

CAL FIRE contracts with MCFD to provide wildland fire protection and associated fire prevention activities for lands designated by the State Board of Forestry as SRA. The MCFD is responsible for the protection of approximately 200,000 acres of SRA within the county and is the primary agency that handles wildland fires. MCFD also provides similar protection services to approximately 100,000 acres of FRA in the Golden Gate National Recreation Area (GGNRA), the Muir Woods National Monument, and the Point Reyes National Seashore.

Figure 50 indicates the federal responsibility areas, state responsibility areas and local responsibility areas in the Marin County OA.

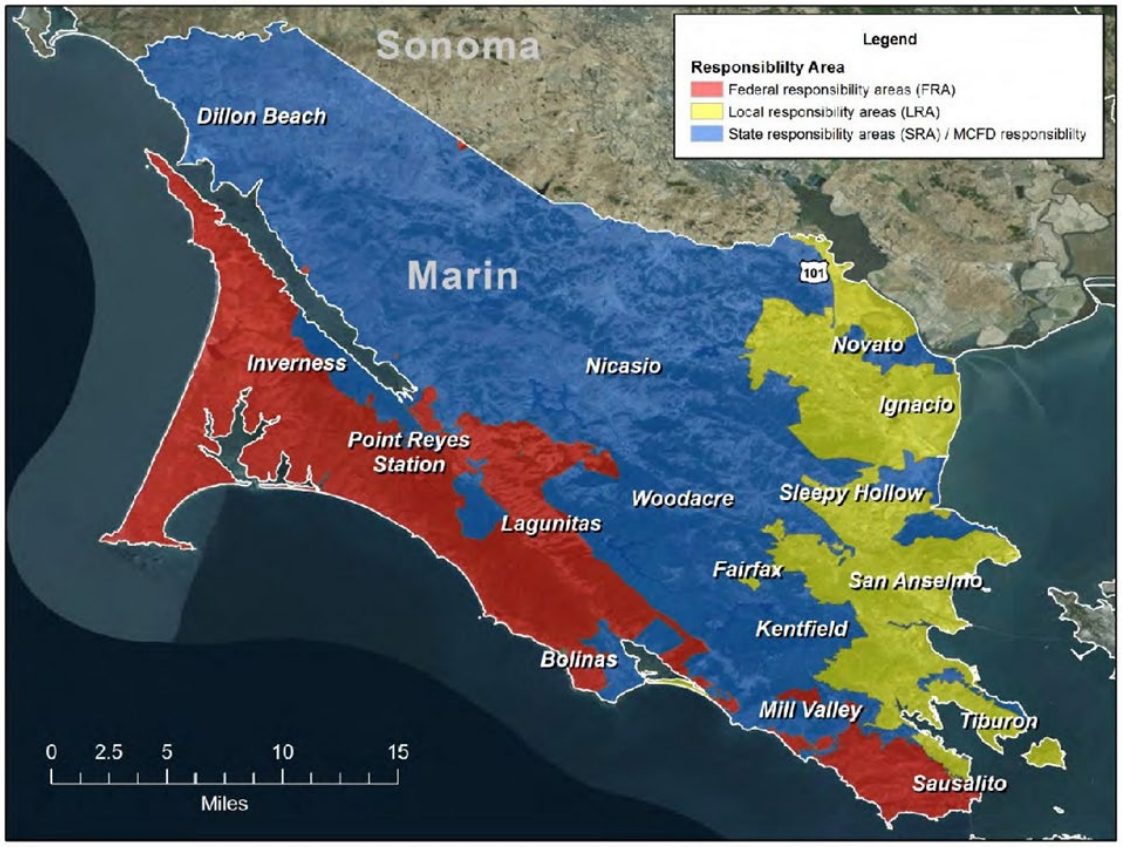

Figure 238: Federal, State and Local Responsibility Areas in the Marin County OA
Source: Marin Community Wildfire Protection Plan

The mix of weather, diverse vegetation and fuel characteristics, complex topography, and land use and development patterns in the Marin County OA are important contributors to the fire environment. The MCFD Woodacre Emergency Command Center (ECC) currently manages the data from four Remote Automated Weather Stations (RAWS) for predicting fire danger utilizing the National Fire Danger Rating System (NFDRS) during the fire season. The RAWS are located in Woodacre, Middle Peak, Barnabe, Big Rock and a new station will be coming online in Novato.

The Marin County OA is bounded by the cool waters of the Pacific Ocean to the west, the San Francisco and Richardson Bays to the southeast, the San Pablo Bay to the east, and Sonoma County agricultural lands to the north. The combination of these large bodies of water, location in the mid-latitudes, and the persistent high pressure over the eastern Pacific Ocean results in several micro-climates. Weather in the OA consists of warm, dry summers and cool, wet winters. The climate in early fall and late spring is generally similar to the summer, and late fall is similar to winter. Spring is generally cool, but not as wet as the winter. While these general weather conditions are fairly representative of the typical Marin County OA weather, complex topography, annual variability of weather patterns, and less frequent and transient weather patterns are important to fire conditions.

In the late spring through early fall, the combination of frequent and strong high-pressure systems (known as the Pacific High) over California combined with the cool waters of the ocean/bays results in persistent fog and low clouds along the coast (including over the southern Marin County OA near the San Francisco Bay) with winds. The fog often penetrates into the inland valleys of the northern and central Marin County OA, especially during overnight hours. At the coastline, mist from fog can keep the land surfaces modestly moist while inland land surfaces above the fog or inversion are often very dry.

The Pacific High that persists from late spring through early fall over the eastern Pacific, combined with a thermal low pressure over the Central Valley of California, results in an almost continuous sea breeze. These winds usher in cool and moist air and can be strong at times (15 to 25 mph), especially over the ridge tops and through northwest to southeast lying valleys, including San Geronimo/Ross, Hicks, Lucas Valleys, and Mill Valley and the Marin Headlands. These westerly winds are usually highest in the afternoon, decrease in the evening, and are light overnight before increasing again in the late morning/early afternoon.

Occasionally in the summer and more often in the fall, the Pacific High moves inland and centers over Oregon and Idaho, while low pressure moves from the Central Valley of California to southern California and Arizona. The resulting north-to-south pressure gradient can be strong enough to retard the typical sea breeze and can even result in winds blowing from the land to the ocean (offshore winds). As the offshore winds move air from the Central Valley to the coastal areas of California, the air descends and compresses, which greatly warms and dries the air. Under these “Diablo” wind conditions, temperatures in the Marin County OA can reach 100°F in the inland areas and even 80°F at the coast, and relative humidity can be very low. In addition, wind speeds can be high (20 to 40 mph), gusty and are often much faster over the mountains and ridge tops such as Mt. Tamalpais, Loma Alta, Marin Headlands and Mt. Burdell compared to low-lying areas. Wind speeds can be high over the ridges and mountains at all times of day under this “offshore” wind pattern and are often much slower or even calm at night in low-lying areas because nighttime cooling decouples the aloft winds from the surface winds. It is during these Diablo wind events that there is a high potential for large, wind-driven fires should there be an ignition. Historically, the largest and most destructive fires have occurred during these offshore (also known as Foehn) wind events including the Angel Island and the Vision fires which were located in West Marin.

A few times per year in the summer and early fall, monsoonal flow from Mexico may bring in moist and unstable air over central and northern California, which can result in thunderstorms with or without precipitation. With the otherwise dry summer conditions, lightning from this type of weather pattern can ignite fires. These monsoonal flow patterns are usually only one to two-day events.

Beginning in late November and lasting through the end of March, the Pacific High moves south and weakens, allowing storms that originate in the Gulf of Alaska to move over California.

These storms bring precipitation and, at times, strong winds out of the south. Each storm usually results in one fourth inch to several inches of rain over a day or so. Near Mt. Tamalpais, rainfall amounts are enhanced by orographic lifting, resulting in higher rain amounts in the Kentfield and Fairfax areas compared to the rest of the county. Typically, after the first rain in November, the cool weather and occasional storm keeps the ground wet through late Spring. However, in some years, significant rain does not occur until later in the year (e.g., early-to-late

December) and there can be several weeks without any storms and rain. During storms, temperatures are usually mild.

When there are no storms over California, a land-breeze typically forms (i.e., winds blowing from the Central Valley to the Pacific Ocean). These winds can reach 30 mph, and travel through the southeast to northwest lying valleys, over low-lying ridges such as the Marin Headlands, and through the Golden Gate. These winds are usually highest in the mid-morning hours and decrease in the afternoon as the Central Valley warms during the day. The winds are associated with cold and modestly moist air.

In late February/early March through late April, the Pacific High strengthens and moves north, and storms impacting the county become less frequent. During this time of year there is often a low-pressure area over the desert in southwest California. The combination of the Pacific High to the north and low-pressure to the southwest results in strong winds blowing from the northwest to the southeast. Like the sea breeze, these winds bring in cool, moist air and are usually highest in the afternoon hours. Because of winter and spring rains, the land is wet and there is little danger of wildland fire despite the strong winds and only occasional precipitation. There is often little coastal fog this time of year.

Vegetation, which is also known as fuel, plays a major role in fire behavior and potential fire hazards. A fuel's composition, including moisture level, chemical make-up, and density, determines its degree of flammability. Of these, fuel moisture level is the most important consideration. Generally, live trees contain a great deal of moisture while dead logs contain very little. The moisture content and distribution of fuels define how quickly a fire can spread and how intense or hot it may become. High moisture content will slow the burning process since heat from the fire must first eliminate moisture.

In addition to moisture, a fuel's chemical makeup determines how readily it will burn. Some plants, shrubs, and trees such as chamise and eucalyptus (both present in the Marin County OA) contain oils or resins that promote combustion, causing them to burn more easily, quickly, and intensely.

Finally, the density of a fuel influences its flammability; when fuels are close together but not too dense, they will ignite each other, causing the fuel to spread readily. However, if fuels are so close that air cannot circulate easily, the fuel will not burn freely.

The Marin County OA has extensive topographic diversity that supports a variety of vegetation types. Marin County's OA has significant changes in topography with steep vegetated slopes which can also add to the ability of the fuel to further expand a wildfire.

Environmental factors, such as temperature, precipitation, soil type, aspect, slope, and land use history, all help determine the existing vegetation at any given location. In the central and eastern parts of the county, north facing slopes are usually densely wooded from lower elevations to ridge peaks with a mixture of mostly hardwood tree species such as coast live oak, California bay, Pacific madrone, and other oak species. Marshlands are also present throughout the county; once ignited marsh fires can be difficult to contain and extinguish.

Grasslands with a mixture of native and nonnative annual and perennial plant species occur most often in the northern and western parts of the county due to a combination of soil type, lower rainfall, and a long history of ranching. The southern and western facing slopes tend to

have a higher percentage of grasslands, which in turn have the potential to experience higher rates of fire spread. Grassland fires are dangerous even without extreme fire weather scenarios due to the rapid rate of fire spread; in some cases, fires spread so quickly that large areas can burn before response resources are able to arrive.

In the west portion of the county closer to the coast, where precipitation is higher and marine influence is greater, most areas are densely forested with conifer species (i.e., Bishop pine, Douglas-fir, and coast redwood) and associated hardwood species. Chaparral vegetation also occurs in parts of the county, especially on steeper south and west facing slopes. This mix of densely forested areas mixed with chaparral results in higher fuel loads and potentially higher fire intensity. Expansion of the residential community into areas of heavier vegetation has resulted in homes existing in close proximity to dense natural foliage; these homes are often completely surrounded by highly combustible or tall vegetation, increasing the potential that wildland fires could impact them.

As part of the development of the Marin Community Wildfire Protection Plan (CWPP), an updated vegetation map layer was created using the most recent vegetation information available from a variety of state and local data sources.

Vegetation distribution in the Marin County OA is characterized by approximately 20 different types of vegetation which have been classified into 15 fire behavior fuel models.

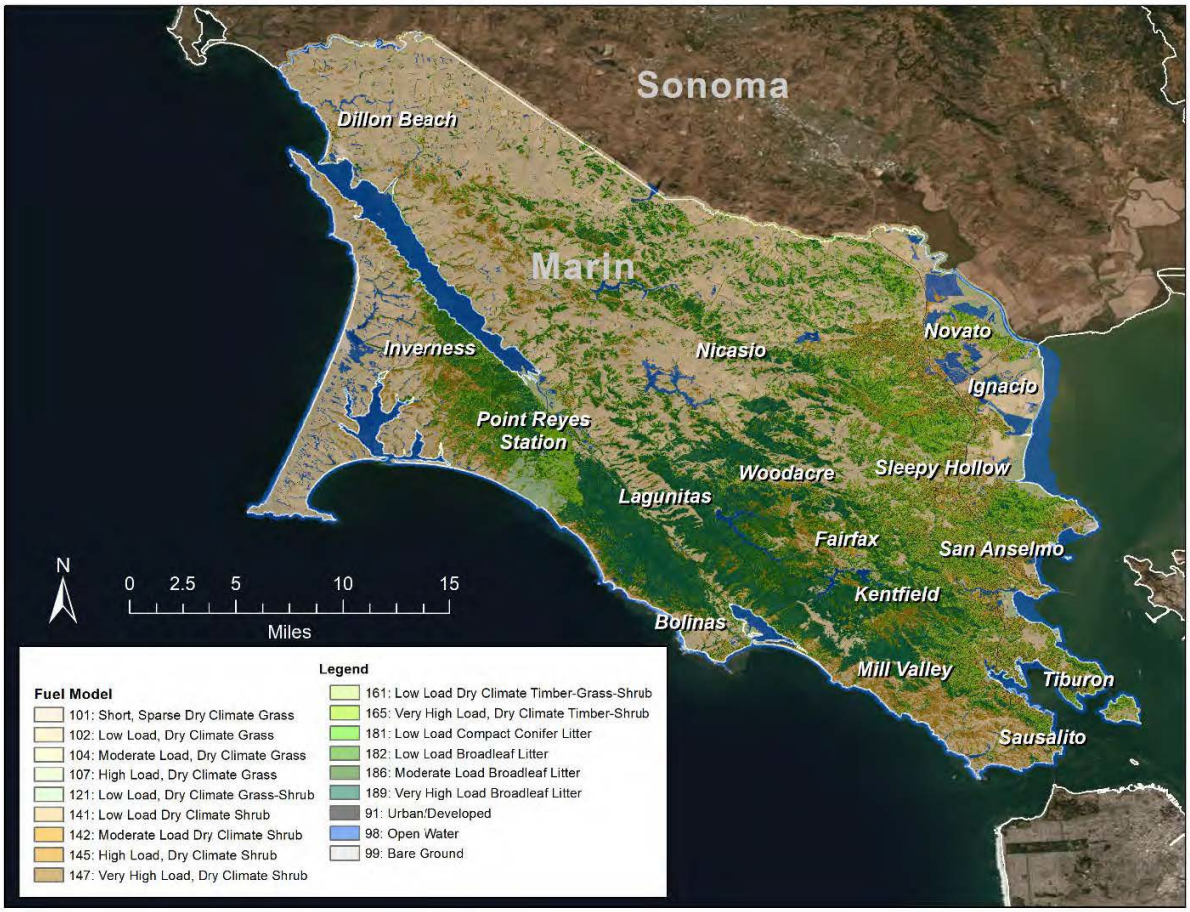

Figure 239: Fuel Model Map for the Marin County OA
Source: Unknown

Insect infestations and plant diseases, such as California oak mortality syndrome (sudden oak death), are increasing and threaten to change the structure and overall health of native plant communities in the Marin County OA. Sudden oak death has no known cure and is a concern since this specific disease can impact vegetation through Marin including the WUI; this syndrome is caused by the fungus-like Phytophthora ramorum, which has led to widespread mortality of several tree species in California since the mid-1990s; the tanoak (Lithocarpus densiflorus) in particular, appears to have little or no resistance to the disease. Sudden oak death has resulted in stands of essentially dead trees with very low fuel moistures.

Studies examining the impacts of sudden oak death on fire behavior indicate that while predicted surface fire behavior in sudden oak death stands seems to conform to a common fuel model already in use for hardwood stands, the very low moisture content of dead tanoak leaves may lead to crown ignitions more often during fires of “normal” intensity.

Two other plant diseases prevalent in the Marin County OA are pitch canker (which affects conifers such as Bishop pine and other pine species), and madrone twig dieback (which affects Pacific madrones). Pitch canker is caused by the fungus Fusarium circinatum (F. subglutinans, F. sp. pini), which enters the tree through wounds caused by insects. While some trees do recover, most infected trees are eventually killed by the fungus. Management of this disease largely focuses on containment to reduce the fungus spreading to other trees. Pitch canker is a particular issue in the NPS lands of Pt. Reyes National Seashore, where many acres of young Bishop Pines that were seeded on the Inverness Ridge by the Mount Vision Fire of 1995 have been infected.

These dead and dying trees have created large swaths of land with dense and dry fuel loads. Madrone twig dieback is caused by the native fungus Botryosphaeria dothidea and appears to be getting worse throughout the county due to drought effects on Pacific madrones. Three additional threats to trees common to the Marin County OA include:

- Bark and ambrosia beetles (Monarthrum dentiger and monarthrum scutellare), which target oak and tanoak trees. Sudden oak death may be exacerbating the effects of beetle infestations which prey on trees already weakened by this disease.
- Root rot, caused by oak root fungus (Armillaria mellea), is primarily associated with oaks and other hardwoods but also attacks conifers. These fungal infestations cause canopy thinning and branch dieback and can kill mature trees. As with the beetle infestations, sudden oak death may be exacerbating the effects of root rot fungus in the county forests.
- Velvet-top fungus (Phaeolus schweinitzii) is a root rot fungus affecting Douglas-fir and other conifers, with the infection typically occurring through a wound.

Topography characterizes the land surface features of an area in terms of elevation, aspect, and slope. Aspect is the compass direction that a slope faces, which can have a strong influence on surface temperature, and more importantly on fuel moistures. Both elevation and aspect play an important role in the type of vegetation present, the length of the growing season, and the amount of sunlight absorbed by vegetation. Generally, southern aspects

receive more solar radiation than northern aspects; the result is that soil and vegetation on southern aspects is warmer and dryer than soil and vegetation on northern aspects. Slope is a measure of land steepness and can significantly influence fire behavior as fire tends to spread more rapidly on steeper slopes. For example, as slope increases from 20 – 40%, flame heights can double and rates of fire spread can increase fourfold; from 40 – 60%, flame heights can become three times higher, and rates of spread can increase eightfold.

The Marin County OA is topographically diverse, with rolling hills, valleys and ridges that trend from northwest to southeast. Elevation throughout the county varies considerably, with Mt. Tamalpais' peak resting at 2,574 feet above sea level and many communities at or near sea level. Correspondingly, there is considerable diversity in slope percentages. The San Geronimo Valley slopes run from level (in the valley itself) to near 70%. Mt. Barnabe has slopes that run from 20 to70%, and Throckmorton ridge has slopes that range in steepness from 40 – 100%. These slope changes can make fighting fires extremely difficult.

In the WUI where natural fuels and structure fuels are intermixed, fire behavior is complex and difficult to predict. Research based on modeling, observations, and case studies in the WUI indicates that structure ignitability during wildland fires depends largely on the characteristics and building materials of the home and its immediate surroundings.

The dispersion of burning embers from wildfires is the most likely cause of home ignitions. When embers land near or on a structure, they can ignite near-by vegetation or accumulated debris on the roof or in the gutter. Embers can also enter the structure through openings such as an open window or vent and could ignite the interior of the structure or debris in the attic.

Wildfire can further ignite structures through direct flame contact and/or radiant heat. For this reason, it is important that structures and property in the WUI are less prone to ignition by ember dispersion, direct flame contact, and radiant heat.

About 50 percent of the land area in Larkspur is at risk from wildland fires. Significant portions of the city are in a designated wildland-urban interface WUI zone bordering the Blithedale Summit Open Space Preserve and the King Mountain Open SpacePreserve. Some of the land is open space, but developed hillsides are also at risk. Like the rest of Marin County, Larkspur's periodically arid climate, combined with extensive areas of grass and brush-covered open space and variable topography, create an ever-present threat of wildland fire. Many homes located in high-risk fire areas were built of combustible building materials or with stilt and pole construction. The latter allows suspended floor areas to trap heat, increasing opportunities to ignite the homes.

Public Safety Power Shutoff (PSPS) Events

As a result of the 2017 Northern California Wildfires, the 2018 Camp Fire in Butte County and other wildfires caused by power line infrastructure, Pacific Gas & Electric (PG&E) began initiating Public Safety Power Shutoff (PSPS) events in their service areas (including the Marin County OA) to help prevent the start of future wildfires. PG&E will, and have, initiate a PSPS if conditions indicate potentially dangerous weather conditions in fire-prone areas due to strong winds, low humidity, and dry vegetation. During these events, PG&E will proactively turn off power in high fire risk areas to reduce the threat of wildfires. The most likely electric lines to be considered for a public safety power outage will be those that pass-through areas that have been designated by the California Public Utilities Commission (CPUC) High Fire-Threat District

at elevated (Tier 2) or extreme risk (Tier 3) for wildfire. Customers outside of these areas could have their power shut off if their community relies upon a line that passes through a high fire-threat area or an area experiencing severe weather. PG&E will consider numerous factors and analyze historical data to help predict the likelihood of a wildfire occurring, and closely monitoring weather watch alerts from the National Weather Service (NWS). These factors generally include, but are not limited to:

- A Red Flag Warning declared by the National Weather Service
- Low humidity levels, generally 20 percent and below
- Forecasted sustained winds generally above 25 mph and wind gusts in excess of approximately 45 mph, depending on location and site-specific conditions such as temperature, terrain and local climate
- Condition of dry material on the ground and live vegetation (moisture content)
- On-the-ground, real-time observations from PG&E's Wildfire Safety Operations Center and field crews

Pacific Gas & Electric Company (PG&E) operates a total of 1,179 miles of overhead electricity transmission and distribution lines in the Marin County OA. Overhead electricity lines and poles can be damaged or downed under severe weather conditions, particularly severe wind conditions, which increases the potential for wildfire ignition. 52 percent of PG&E's overhead distribution lines and 41 percent of its overhead transmission lines are located in CPUC-identified High-Fire Threat Districts subject to elevated or extreme fire risk. PG&E is currently planning and implementing safety measures to prevent wildfires and reduce the impacts of Public Safety Power Shutoff (PSPS) events on communities in the Marin County OA and throughout California.

These measures include installing weather stations; installing high-definition cameras; installing sectionalizing devices on its overhead lines to separate the grid into smaller sections; hardening the system by installing stronger power poles, covering lines, and undergrounding lines in targeted areas; creating temporary microgrids to provide electricity during PSPS events; and enhancing existing vegetation management activities. From 2018 to July 2021, PG&E hardened three miles of overhead lines, installed 68 transmission and distribution sectionalizing devices, completed enhanced vegetation management on approximately 51 of overhead line miles, installed 28 weather stations, and installed 12 high-definition cameras in the Marin County OA. PG&E has also begun undergrounding several overhead transmission lines throughout California.

A PSPS event has occurred in Larkspur and other areas of Marin in years past. While PG&E continues to address safety issues with their systems by installing equipment that can segregate their system in order to continue to provide power to their customers wildfires from overhead electrical systems. While wildfires can start anywhere, the high fuels high winds and high abundance of fuels above the jurisdictional boundary of Larkspur may be the most likely location for a wildfire to occur.

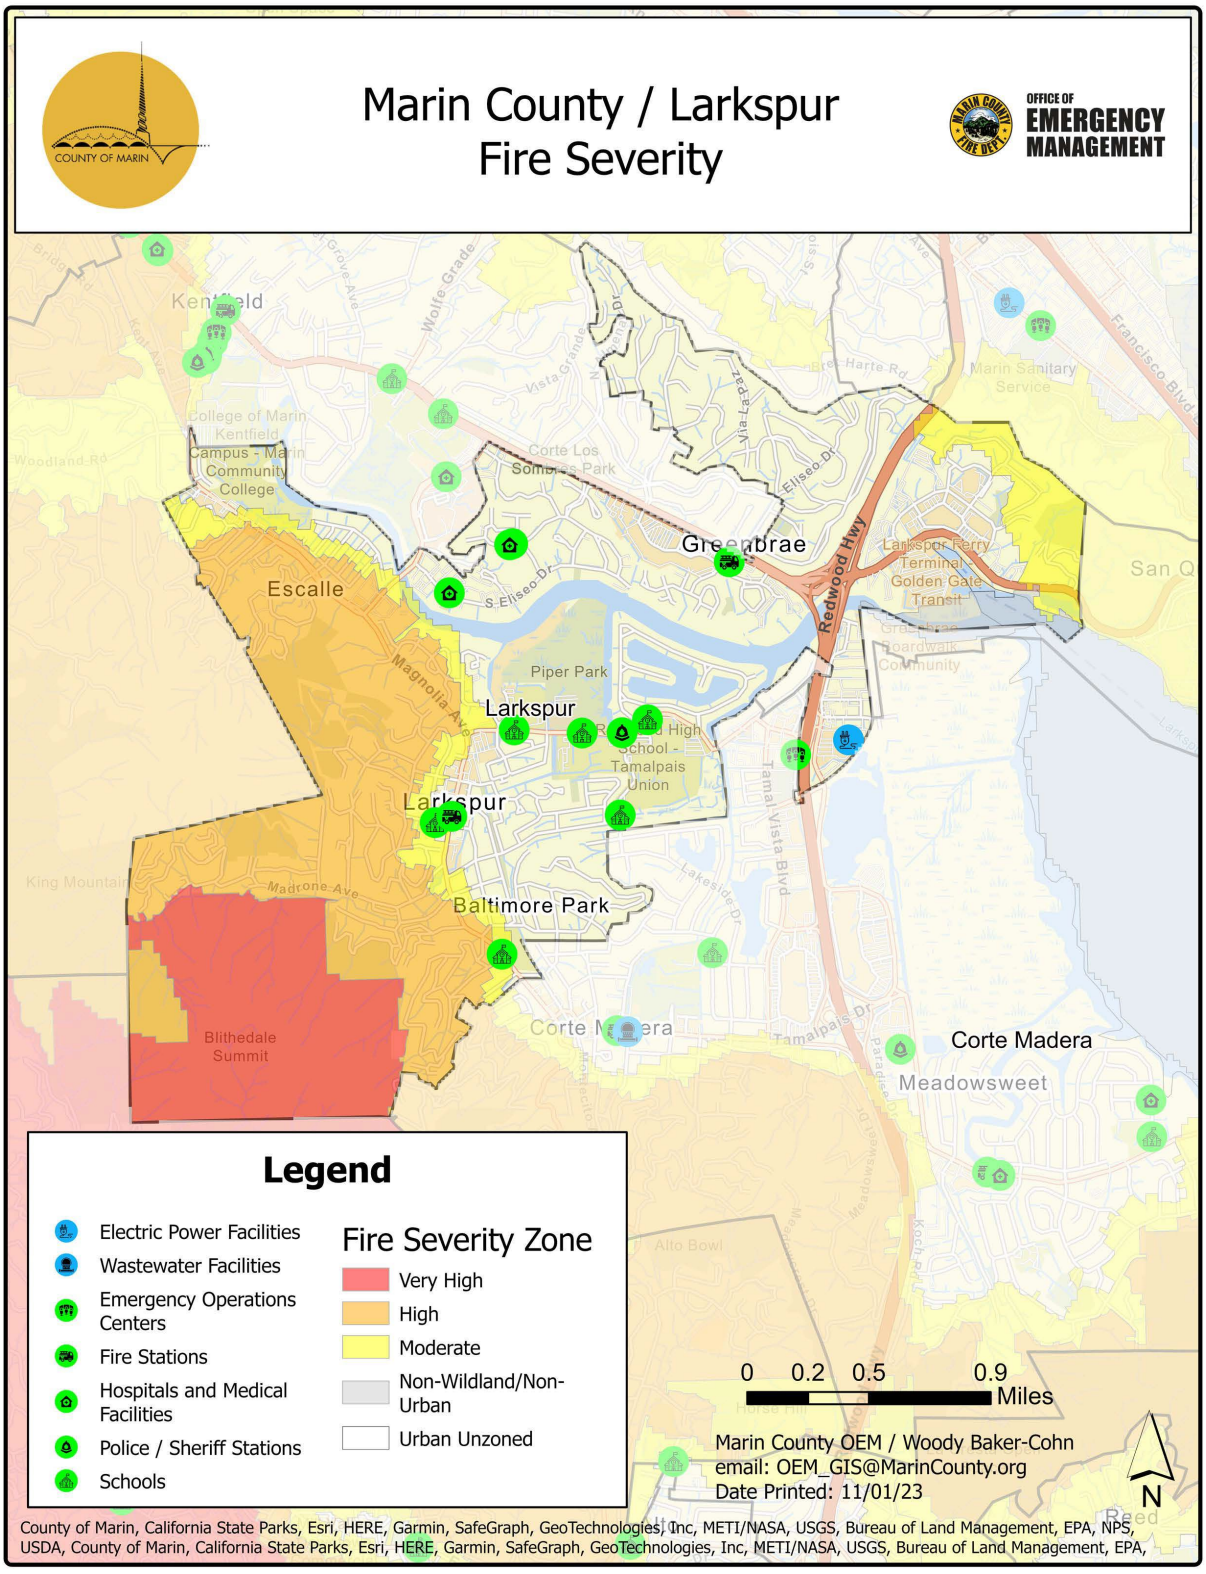

Figure 240: City of Larkspur Wildfire Critical Facilities and Infrastructure
Source: Marin County OEM

A handful of homes in Larkspur on the northern edge of the Blithedale Summit Open Space Preserve are the only structures in Larkspur in a Very High FHSZ and are at a higher risk of wildfire. The mountainous areas around the Blithedale Summit Open Space Preserve and the King Mountain Open Space Preserve extending primarily to Magnolia Avenue lie in a High FHSZ. This area includes numerous residential communities with hundreds of homes and consists mostly of windy and dead-end roads that could hinder an evacuation and access. There are no critical facilities in this area. A fringe of moderate FHSZ borders the high FHSZ. There are dozens of homes, numerous businesses and the Marin Primary and Middle School that lie in this area and could be susceptible to wildfire. Most of downtown Larkspur does not lie in a FHSZ but borders a moderate FHSZ. A section of Larkspur north of Sir Francis Drake Boulevard near Larkspur Miwok Park lies in a moderate FHSZ. All of Larkspur could be impacted by a Public Safety Power Shutoff (PSPS) event and/or suffer poor air quality from smoke as a result of a wildfire in the Marin County OA or the surrounding region. As wildland areas around Larkspur become drier due to climate change, the risk of a wildfire occurring and impacting the city may continue to increase. Brush fires in the city may increase over time as parks, and other open spaces including marshlands experience drier conditions.

On 6/13/2020, an arsonist set six brush fires in Larkspur and Corte Madera that were quickly contained. One fire sparked off Citron Fire Road in Larkspur's Blue Rock neighborhood, burning half an acre and spurring authorities to evacuation 20 nearby homes on Cedar Avenue and Opal Street. A short time later, two more brush fires broke out, on Larkspur Plaza Drive and on Rose Lane. No injuries were reported and no structures were damaged by the fires

Figure 241: 2020 City of Larkspur Arson Fires
Source: Central Marin Fire

In 1909, Larkspur was threated by a raging wildfire emanating from the slopes of Mt. Tamalpais and burning in Madrone Canyon. The cause of the fire was unknown, but the common belief is that it was due to the carelessness of campers.

Climate Change and Future Development Considerations

Climate change can lead to an increase in wildfire events. Climate change has been a key factor in increasing the risk and extent of wildfires in the western United States. Changes in climate create warmer, drier conditions. Increased drought, and a longer fire season are boosting these increases in wildfire risk.

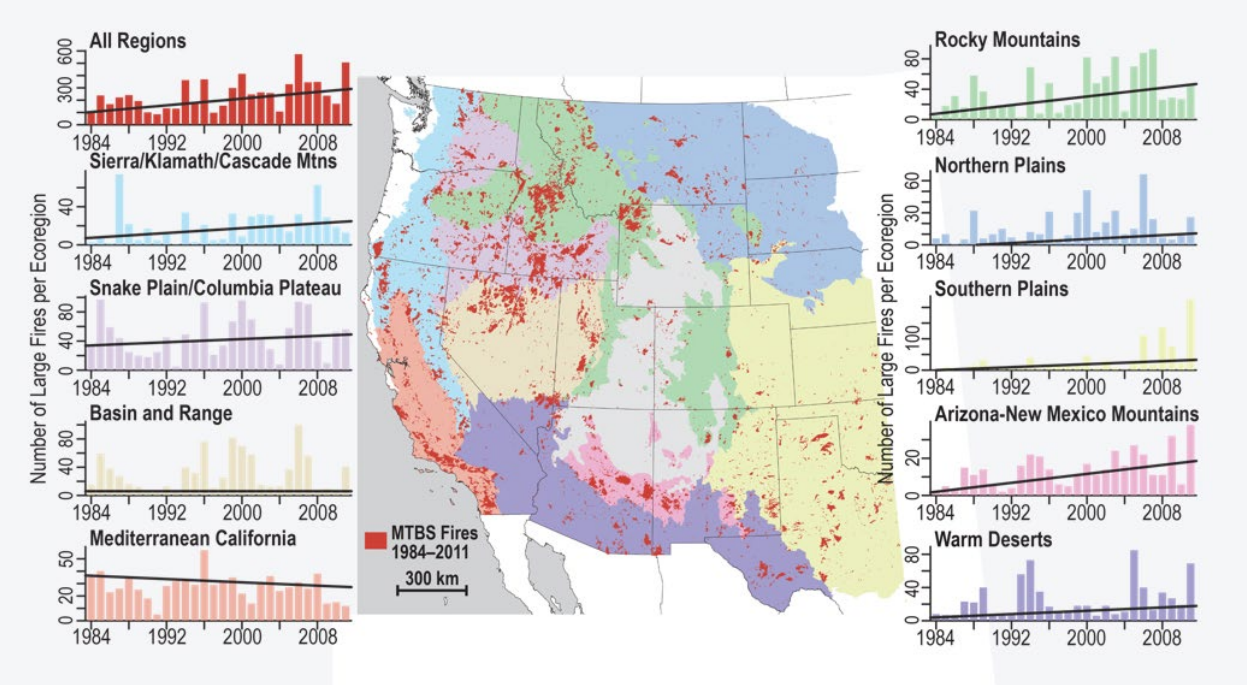

Figure 242: Trends in the Annual Number of Large Wildfires in the United States
Source: Fourth Climate Change Assessment, 01/04/23

As summer conditions in Northern California become hotter and drier due to climate change, the occurrence and severity of wildfires will only increase. The Marin County OA including Larkspur is particularly susceptible to these future impacts of climate change on wildfire, as the OA's climate has generally been wet enough historically to avoid major wildfires. Extreme heat events and high wind events could cause electrical systems to become overloaded and fail, sparking wildfires. An increase in wildfires as a result of climate change could lead to more significantly burned areas that could contribute to debris flows after a significant storm event, particularly in the open space areas around Larkspur. Future development in the WUI throughout Larkspur will expose more people and property to the impacts of a potentially significant wildfire. The growing number of people in the Larkspur WUI can increase risk to life, property and public health as a result of a wildfire. Future development around the Larkspur marshlands would expose more people to the effects of brush fires as the marshlands dry out in the summer due to climate change.

SECTION 3.0: MITIGATION STRATEGY

3.1 CHANGES IN DEVELOPMENT

Larkspur is a community with a high quality of life, a healthy environment, and a renowned school system. Larkspur neighborhoods grew as a post-war working-class suburb following early development as a summer resort surrounded by steep hills and water. According to the California Department of Finance, the City of Larkspur had 6,469 housing units in 2023. The 2020 housing stock was made up of 40.8 percent detached Single-Family Homes, 6.6 percent attached Single-Family Homes, 7.6 percent Multifamily Housing of Two to Four Units, 40.5 percent Multifamily Housing of Five-Plus Units, and 4.5 percent Mobile Homes. Generally, in Larkspur, the share of the housing stock that is detached single family homes is below that of other jurisdictions in the region.

Larkspur's layout and infrastructure date largely from the late 1800s through the 1960s. It faces formidable infrastructure challenges including, $20-$30 million dollars to repair storm drains, $12-$18 million to repair or rebuild the City Hall, and $12-$14 million to repair and restore its fire station. Climate change has evolved assets such as forests, hills, and shorefront locations into environmental liabilities.

Since 2000, Larkspur's population has increased by approximately 2 percent, which is below the rate for the Bay Area region as a whole, at 14.8 percent. From 1990 to 2000, the population increased by 8.5 percent. During the first decade of the 2000s the population decreased by 0.7 percent. In the most recent decade, the population increased by 2.7 percent.

The Plan Bay Area 2050 Final Blueprint forecasts that the nine-county Bay Area will add 1.4 million new households between 2015 and 2050. For the eight-year time frame covered by the 2023-2031 General Plan Housing Element Update, the Department of Housing and Community Development (HCD) has identified the region's housing need as 441,176 units. On January 12, 2022, the Association of Bay Area Government's adopted allocated 979 housing units to Larkspur, including 291 units for very low-income households, 168 units for low-income households, 145 units for moderate-income households, and 375 units for above moderate-income households. The City of Larkspur is planning for household growth in four general areas of the City to accommodate the City's share of the Regional Housing Need. As detailed in the "Climate Change and Future Development Considerations" section of each hazard profile, development in Ross has occurred and will continue to occur throughout the town in areas prone to all of its identified hazards. Increased growth in these areas may increase the vulnerability of people and structures to these hazards.

Table 20: City of Larkspur Projected Growth Areas

Area	# of Units	# of Parcels	Project Date	Acres	Fire Severity Zone	Flood Zone
Greenbrae	50	2	2023-2031	1.66	Low	X
Larkspur Landing	576	7	2023-2031	20.93	Low	X
Central and Downtown Larkspur	266	11	2023-2031	8.85	Moderate and low	X and AE
Cost Plus Plaza Area	196	1	2023-2031	5.45	Low	AE
Total	**1,221**	**21**		**36.9**		

Table 114: City of Larkspur Future Growth Areas

3.2 CAPABILITY ASSESSMENT

The overall priorities in the City of Larkspur have not changed since the 2018 MJHMP update. However, the strategies in which to support the overall City priorities have changed and are reflected in the sections below. There were many projects that were either ongoing day-to-day business activities or were response related that were completed or deleted from the 2018 MJHMP project list and not carried over to this plan update. Several actions were completed and new projects were added to coincide with the changes in priorities, progress in local mitigation efforts and changes in development.

Capabilities are the programs and polices currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. The capability assessment identifies the local planning mechanisms where information from the 2018 MJHMP is incorporated and where updated hazard mitigation information from this 2023 MJHMP will be incorporated once approved.

3.2.1 REGULATORY CAPABILITIES

The legal and regulatory capabilities include existing ordinances and codes that affect the City's physical or built environment. Examples of legal and/or regulatory capabilities can include: a jurisdiction's building codes, zoning ordinances, subdivision ordnances, special purpose ordinances, growth management ordinances, site plan review, general plans, capital improvement plans, economic development plans, emergency response plans, and real estate disclosure plans. The table below lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place.

Table 21: Legal and Regulatory Capabilities

Plans	Yes/No Latest Update	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
General Plan/ Master Plan	Y 1990	Larkspur is in process of finalizing an update to its General Plan, which is scheduled for adoption in 2023. The General Plan outlines the City's long-term strategic goals, policies and programs that affect the City's growth and development such as land use, transportation, streets and sidewalks, utilities & infrastructure, parks, housing and neighborhoods, recreation and community facilities, commercial services and products, the environment, public health and safety, and flooding. Chapter 7, Community Health and Safety, addresses many of the hazards addressed in this plan.
Strategic Plan	N	
Capital Improvements Plan	Y 2023	Every year, City staff develops a Five-Year Capital Improvement Program (CIP) for council consideration, which serves as a multi-year planning tool to coordinate the financing and scheduling of major projects to improve and maintain its infrastructure. The CIP directs construction activities for City owned facilities and infrastructure for the next five years. Mitigation actions may involve construction of new or upgraded facilities and infrastructure.
Economic Development Plan	N	

Local Emergency Operations Plan		These plans inform priority mitigation actions and programs.
Continuity of Operations Plan	Y	
Flood Mitigation Plan (FMP)	Y 1993	The city of Larkspur enforces floodplain management regulations in special flood hazards identified by the Federal Insurance Administration, through the Federal Emergency Management Agency. These regulations address the construction, location, extension, conversion or alteration of structures or land in special flood hazard zones, including both new development and modifications to existing uses and structures. The ordinance regulates and restricts development in flood-prone areas to promote the public health, safety and general welfare, to minimize public and private losses due to flood conditions in specific areas, and to minimize the need for rescue and relief efforts associated with flooding and generally undertaken at the expense of the general public.
Engineering Studies for Streams	Y	The City's 100-year flood mitigation plan with the County of Marin includes mitigation strategies and actions.
Open Space Management Plan	N	
Regional Transportation Plan (RTP)	Y 2021	Plan Bay Area 2050
Stormwater Management Plan/Program	Y 2015	The City enforces regulations for best management practices during development as well as permanent and ongoing erosion control measures to minimize off-site stormwater flow and buildup of sedimentation and other obstacles in drainage ways. The city identifies drainage ways and watercourses as public easements and provides standards for the protection, maintenance, enhancement and restoration of streams and waterways in a manner which preserves the conveyance of stormwater run-off and enhances their ecological integrity and resource functions and value.
Community Wildfire Protection Plan	Y	The City is part of the Marin County Wildfire Protection Plan, which includes mitigation strategies and actions.
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y 2022	The City has a Climate Action Plan.
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	The City adopted the most recent State of California approved Uniform Building Code, including the Residential Building Code and Wildland-Urban Interface (WUI) standards to safeguard life, health, property, and public welfare by providing enhanced fire resistance for exterior treatments and new roof coverings in high fire hazard zones. The Seismic Safety Code contains

		structural requirements to insure structural integrity during seismic and other hazardous events and prevent personal injury, loss of life and substantial structural damage. The City requires the undergrounding of utilities in the case of new construction and major remodels. The City has also adopted the International Property Maintenance Code to provide for the abatement of unsafe and/or uninhabitable buildings.
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	
Fire department ISO rating:	Y	The Central Marin Fire Department has an ISO rating of 2. It is adequately enforced.
Site plan review requirements		
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Municipal Code	Y	The Municipal Code includes several sections that address hazard mitigation. The city adopts the current California Building Code which applies to all construction activity within the City boundaries. The California Building Code is comprised of 11parts that incorporate public health, safety, energy, green building and access standards used in the design and construction of all buildings. The new code provisions will allow the City to utilize the latest technologies, advances in construction standards and seismic design for the use in new residential and commercial construction and in remodels.
Zoning ordinance	Y	The Zoning Ordinance implements the General Plan by establishing specific regulations for development. It includes standards for where development can be located, how buildings must be sized, shaped, and positioned, and what types of activities can occur in an area. Mitigation actions that pertain to new or substantially redeveloped buildings can be adopted into the Zoning Ordinance.
Subdivision Regulations; Municipal Code Chapter 17	Y	The city's subdivision ordinance establishes standards to regulate the division of land and also establishes standards to restrict the creation of building sites in areas where flooding, lack of adequate access or services, or other conditions may create hazards to life or property. The regulations promote public health, safety and general welfare and minimize public and private losses due to hazardous conditions in specific areas and insure that reasonable caution is taken to preclude loss or damage to life and property.
Slope & Hillside Ordinance; Municipal Code Chapter 18.34	Y	The slope and hillside ordinance reduces densities and impervious construction in steep hillside areas. The ordinance provides a higher standard of review at the planning phase to address potential for hazards and environmental degradation related to slope failure, increased erosion, sedimentation, storm water run-off, fire hazards, loss of vegetation, excessive grading, visual intrusion of structures, and potential for traffic hazards.

		The ordinance serves to protect public health, safety and general welfare and minimize public expense for long-term maintenance of slope areas resulting from over-development in hillside areas.
Floodplain ordinance	Y	The City has adopted FEMA regulations in Chapter 15.18 of the Municipal Code
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	Urban Runoff Pollution Prevention Ordinance Chapter 9.11 Grading Permits Chapter 15.20 Weed Abatement Chapter 9.26
Flood insurance rate maps	Y	Yes
Elevation Certificates	Y	Yes
Acquisition of land for open space and public recreation uses	Y	Yes
Erosion or sediment control program	Y	Yes

Table 115: City of Larkspur Legal and Regulatory Capabilities

City of Larkspur General Plan or Master Plan

California Government Code 65300 requires that every City and County in the state have a General Plan. The City of Larkspur General Plan was adopted in 1990. The City is currently preparing an update of the plan that was prepared over a 13-year period that included an extensive public review process. The General Plan is the most important policy and planning document in the city and is used by virtually every department. The General Plan is the City's statement of its vision for the future. The General Plan contains policies covering every aspect of the City: land use (how land can be developed), circulation, noise, air quality, housing, open space and conservation, and health and safety.

City of Larkspur specific goals and policies related to mitigation of natural hazards are as follows:

Table 22: City of Larkspur General Plan	
Goal/Policy/ Program	**Explanation**
Land Use Element	
Goal	LU-14: Protection of persons and property from environmental hazards such as wildland fires and flooding due to sea level rise
Policy	Policy LU-14.1: Limit the exposure of existing and proposed development to environmental hazards.
Program	Action Program LU-14.1.a: Maintain updated Seismic Hazards, Slope Stability, Fire Hazard, Noise Exposure, and Floodplain maps. Consult hazard maps to determine whether a proposed project is located in a high-risk area. Action Program LU-14.1.b: Provide environmental hazard information to property owners at City Hall and on the City's website. Action Program LU-14.1.c: Provide information for property owners at City Hall and on the City's website regarding best practices for reducing risk of exposure to environmental

Table 22: City of Larkspur General Plan	
Goal/Policy/ Program	**Explanation**
	hazards. Action Program LU-14.1.d: During project review, require use of building materials that reduce exposure to environmental hazards (e.g., fire-resistant roofing material). Action Program LU-14.1.e: Continue to review projects for compliance with seismic safety building standards established in the International Building Code, or any subsequent code adopted by the City.
Conservation and Open Space Element	
Goal	Goal ENV-4: Sufficient open space to meet the health and safety needs of Larkspur residents
Policy	Policy ENV-4.1: Avoid developing open space that contains hazards, including earthquake fault zones, unstable slopes or soils, flood plains, sea level rise, and areas required for the protection and enhancement of air quality.
Program	Action Program ENV-4.1.a: Implement the policies and action programs addressing environmental hazards listed under Goals SAF-3 (natural hazards), SAF-4 (flood hazards), SAF-5 (seismic and geologic hazards), and SAF-6 (fire hazards).
Public Safety	
Goal	PREPAREDNESS SAF-1: A community fully informed about natural hazards and the methods to avoid or mitigate the effects of these hazards SAF-2: Planned, coordinated response to all disasters SAF-3: No new development in areas prone to natural hazards without adequate mitigation FLOOD HAZARDS SAF-4: Protection of life and property of Larkspur residents from the risk of flood damage SEISMIC AND GEOLOGIC HAZARDS SAF-5: Reduced risks of personal injury and property damage associated with seismic activity and geologic hazards FIRE HAZARDS SAF-6: Protection of Larkspur residents and property from fire hazards SAF-7: Adequate suppression response to wildfires and structural fires HAZARDOUS MATERIALS SAF-8: Protection from exposure to hazardous materials
Policy	Numerous policies
Program	Numerous programs
Public Facilities Element	
Goal	FAC-6: Public buildings that meet current and future demands for safety and public use
Policy	Policy FAC-6.1: Renovate public buildings to conform to seismic safety requirements, space needs, and use of new technology, while respecting the historic value and integrity of existing historic structures.
Program	Action Program FAC-6.1.a: Rehabilitate City Hall and Fire Station #15 to comply with seismic safety standards and capacity improvement needs. Action Program FAC-6.1.b: Explore the decommissioning and re-use of Fire Station #15 pursuant to consolidation of the Larkspur and Corte Madera Fire Departments and regionalization of fire services in the Ross Valley.

Table 116: City of Larkspur General Plan
Source: City of Larkspur General Plan

3.2.2 Administrative and Technical Capabilities

The administrative and technical capability identifies the city personnel responsible for activities related to mitigation and loss prevention. Many positions are full time and/or filled by the same person.

Table 23: Administrative and Technical Capabilities

Administrative	Yes/No	Is coordination effective?
Administrative Services	Y	Administrative Services Department handles finance and purchasing, budgeting, risk management, information technology, and business licensing for the community. The department may be responsible for implementing mitigation actions related to the department's scope.
Planning Commission	Y	Planning Commission reviews most new structures and major improvements to existing structures.
Hazard Mitigation Planning Committee	Y	The City participates in the Marin County Multi-Jurisdictional Hazard Mitigation Planning Committee that meets quarterly to review and manage Hazard Mitigation projects and programs.
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Central Marin Fire Department fire hazard reduction program
Mutual aid agreements	Y	
Technical	Yes/No	Has capability been used to assess/mitigate risk in the past?
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Utilizes the emergency warning systems through the EAS system as their primary warning capability. Utilizes the emergency warning systems through telephone notification utilizing reverse 911.
Hazard data and information	N	
Grant writing	N	
Hazus analysis	N	
Staff/Personnel Resources	Yes/No Full Time/ Part Time	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y/FT	Yes
Floodplain Administrator	Y/FT	Yes
Emergency Manager	N	
Community Planner	N	
Civil Engineer	N	

GIS Coordinator	N	
Community Development Staff	Y/FT	Develops and maintains the General Plan, including the Safety Element. Develops area plans based on the General Plan, to provide more specific guidance for the development of more specific areas. Reviews private development projects and proposed capital improvements projects and other physical projects involving property for consistency and conformity with the General Plan.
City Planning, Building, and	Y/FT	• Conducts comprehensive planning activities, including preparation of the General Plan. • Develops and enforces zoning regulations. • Prepares CEQA documents. • Verifies compliance with Uniform Building Code through checking plans, issuing permits, and inspections. • Oversee flood plain management program, including flood elevation determinations and flood-proof construction. • Coordinates development review with public works, fire, polices, and outside agencies. • Conducts site inspections to enforce permit and code compliance. Leads damage assessments and documentation during emergency.
Public Works Staff	Y/FT	Public Works Department is responsible for City-owned infrastructure, including streets, bike lanes and sidewalks, storm drains, traffic signals, and streetlights. Mitigation actions involving new or retrofitted public infrastructure, as well as those related to water conservation, fall within the purview of the Public Works Department
Police Department Staff	Y/FT	The Central Marin Police Authority conducts emergency preparedness activities for the community. Mitigation activities related to emergency preparedness can be implemented by the Police Department.
Fire Department Staff	Y/FT	Larkspur Fire Department protects the city and portions of unincorporated Greenbrae from the effects of fire and other hazardous conditions and supports implementation of mitigation actions that reduce the risk of wildfire. Larkspur also has a volunteer fire department and manages its vegetation management program

Table 117: City of Larkspur Administrative and Technical Capabilities
Source: **City of Larkspur**

3.2.3 FISCAL CAPABILITIES

The fiscal capability assessment shows specific financial and budgetary tools available to the jurisdictions such as community development block grants; capital improvements project funding; authority to levy taxes for specific purposes; fees for water, sewer, gas, or electric services; impact fees for homebuyers or developers for new development; ability to incur debt through general obligations bonds; and withholding spending in hazard-prone areas.

Table 24: City of Larkspur Fiscal Capabilities		
Financial	Yes/No	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	There is no standalone 'Capital Improvement Project' funding – the City receives grants and other funding as listed below and allocates these funds to the CIP for large projects
Authority to levy taxes for specific purposes	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Fees for water, sewer, gas, or electric services	N	The city does not own or manage these utilities
Impact fees for new development	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Storm water utility fee	N	The City has a minimal runoff fee that is used for cleanwater activities only. The City does not have a storm water utility fee. The ability to charge a storm water utility fee is relatively new. The City anticipates that if other jurisdictions are successful in establishing and defending the legality of such fees then the CIty may consider in the future.
Incur debt through general obligation bonds and/or special tax bonds	Y	Bond funding has been used in the past but not for mitigation projects. This could possibly be explored to fund future mitigation activities.
Incur debt through private activities	N	
Community Development Block Grant	Y	Funding has not been used in the past for mitigation but could possibly fund future mitigation activities.
Other federal funding programs	Y	The City has received federal funding in the past but not for mitigation. This could possibly be a funding source for future mitigation activities.
State funding programs	Y	The City has received state funding in the past but not for mitigation. This could possibly be a funding source for future mitigation activities.

Table 118: City of Larkspur Fiscal Capabilities
Source: **City of Larkspur**

3.2.4 COMMUNITY OUTREACH

The outreach and partnerships capability assessment shows outreach and public education programs available to the City of Larkspur and the City of Larkspur partnerships utilized to promote those programs.

Table 25: City of Larkspur Community Outreach		
Outreach and Partnerships	Yes/No	Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	Yes
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	Yes
Natural disaster or safety related school programs	Yes	Yes
StormReady certification	No	
Firewise Communities certification	No	
Community Rating System	No	
Public-private partnership initiatives addressing disaster-related issues	Y	The Get Ready program, developed in Marin County, is a free 2-hour course provided to the community. The course is designed to help residents plan for an emergency with a family plan, evacuation checklist, and strategies to keep residents and their families safe. (https://readymarin.org/get-ready/)

Table 119: City of Larkspur Community Outreach
Source: **City of Larkspur**

3.2.5 Participation in the National Flood Insurance Program

Given the flood hazard in the planning area, an emphasis will be placed on continued compliance with the National Flood Insurance Program (NFIP). Detailed below is a description of Larkspur's flood management program to ensure continued compliance with the NFIP.

Larkspur has participated in the Regular Phase of the NFIP since 1974. Since then, the City has administered floodplain management regulations that meet or exceed the minimum requirements of the NFIP. The Community Rating System (CRS) is designed to recognize floodplain management activities that are above and beyond the NFIP's minimum requirements. Larkspur is not currently a CRS participant.

Table 26: City of Larkspur NFIP Status

NFIP Topic	Comments
Insurance Summary	
How many NFIP policies are in the community? What is the total premium and coverage?	462 Total Coverage $127,418,000 Total Written Premium + Federal Policy Fee $434,694
How many claims have been paid in the community? What is the total amount of paid claims? How many of the claims were for substantial damage?	127 claims for $1,620,025.03. No claims were for substantial damage.
How many structures are exposed to flood risk within the community? *"flood risk" is defined as the 1% annual chance flood (100-year flood. Numbers are from overlay of FEMA SFHA and building stock data.	534
Describe any areas of flood risk with limited NFIP policy coverage	None
Staff Resources	
Is the Community Floodplain Administrator or NFIP Coordinator certified?	No
Is floodplain management an auxiliary function?	No
Provide an explanation of NFIP administration services (e.g., permit review, GIS, education or outreach, inspections, engineering capability)	The City reviews all development within the floodplain, has GIS maps, provides information to the public
What are the barriers to running an effective NFIP program in the community, if any?	None
Compliance History	
Is the community in good standing with the NFIP?	Yes
Are there any outstanding compliance issues (i.e., current violations)?	No
When was the most recent Community Assistance Visit (CAV) or Community Assistance Contact (CAC)?	02/24/2010

Is a CAV or CAC scheduled or needed?	No
Regulation	
When did the community enter the NFIP?	1974
Are the FIRMs digital or paper?	Paper and digital
Do floodplain development regulations meet or exceed FEMA or State minimum requirements? If so, in what ways?	Exceed by requiring one foot of freeboard
Provide an explanation of the permitting process.	Floodplain permits are reviewed by the building department. City requests appraisals or elevation certificates prior to issuing permits, as required.
Community Rating System (CRS)	
Does the community participate in CRS?	No
What is the community's CRS Class Ranking?	N/A
What categories and activities provide CRS points and how can the class be improved?	N/A
Does the plan include CRS planning requirements	N/A

Table 120: City of Larkspur NFIP Status
Source: FEMA, City of Larkspur

NFIP Insurance Coverage Details

The City of Larkspur joined the NFIP on June 14, 1974. NFIP insurance data provided by a National Flood Insurance Program Insurance Specialist indicates that as of October 2, 2023, there were 462 policies in force in the City of Larkspur with $434,694 in premiums, resulting in $127,418,000 of insurance in force. There have been 127 closed paid losses totaling $1,620,025. Nine of the claims were considered substantial damage losses. Of these losses, 31 sites area in A01-30 and AE Zones, 15 were in A Zones, and 24 were in B, C and X Zones. Of the 70 Closed Paid Loss sites, 66 were associated with pre-FIRM structures and 7 with post-FIRM structures. There were 20 repetitive loss structures in the City. 17 were in A zones, and 3 were in B, C, or X zones. These repetitive loss structures account for $550,125 of the total losses in the City of Larkspur. There were no severe repetitive loss properties in the City.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 20
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 0
- Number of Repetitive-Loss Properties or Severe-Repetitive-Loss Properties that have been mitigated: 0
- Repetitive Loss (RL) Residential Structures: 20
- Repetitive Loss (RL) Non-Residential Structures: 0
- Severe Repetitive Loss (SRL) Residential Structures: 0
- Severe Repetitive Loss (SRL) Non-Residential Structures: 0

3.3 MITIGATION GOALS

44 CFR Requirement § 201.6(c)(3)(i) [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long - term vulnerabilities to the identified hazards.

The information developed from the risk assessment was used as the primary basis for developing mitigation goals and objectives. Mitigation goals are defined as general guidelines explaining what each jurisdiction wants to achieve in terms of hazard and loss prevention.

Hazard Risk Prioritization
↓
Mitigation Goals & Objectives
↓
Mitigation Project Identification
↓
Mitigation Project Implementation

Goal statements are typically long-range, policy-oriented statements representing jurisdiction-wide visions. Objectives are statements that detail how each jurisdiction's goals will be achieved, and typically define strategies or implementation steps to attain identified goals. Other important inputs to the development of jurisdiction-level goals and objectives include performing reviews of existing local plans, policy documents, and regulations for consistency and complementary goals, as well as soliciting input from the public.

The following represents overarching strategic goals associated with the identification and eventual implementation of appropriate and meaningful hazard mitigation efforts in relation to prioritized hazards and threats confronting the Marin County OA. These goals form the basis for specific supporting process objectives and are shown from the highest priority, at the top of the list, to those of lesser importance.

The establishment of hazard mitigation goals represents both individual and collective strategies that have been mutually agreed upon by the Steering Committee and have changed with the 2023 MJHMP update. Objectives were added to Goals 2 and 5. Eventually, these goals have been adopted by the Marin County OA and its participating jurisdictions as the guiding policy behind local hazard mitigation efforts, in conjunction with other associated principles.

Goals were defined for the purpose of this mitigation plan as broad-based public policy statements that:

- Represent basic desires of the community;
- Encompass all aspects of community, public and private;
- Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;
- Are future-oriented, in that they are achievable in the future; and
- Are time-independent, in that they are not scheduled events.

Goals are stated without regard to implementation. Implementation cost, schedule, and means are not considered. Goals are defined before considering how to accomplish them so that they are not dependent on the means of achievement. Goal statements form the basis for objectives

and actions that will be used as means to achieve the goals. Objectives define strategies to attain the goals and are more specific and measurable.

Goal 1: Minimize risk and vulnerability of the community to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, and environment in the Marin County OA.

- Minimize economic and resource impacts and promote long-term viability and sustainability of resources throughout the Marin County OA.
- Minimize impact to both existing and future development.
- Provide protection for public health.
- Prevent and reduce wildfire risk and related losses.

Goal 2: Provide protection for critical facilities, infrastructure, utilities, and services from hazard impacts.

- Incorporate defensible space and reduce hazard vulnerability.
- Develop redundancies in utilities and services.
- Enhance resilience through enhanced construction.

Goal 3: Improve public awareness, education, and preparedness for hazards that threaten our communities.

- Enhance public outreach and participation in the Alert Marin Emergency Notification System.
- Enhance public outreach, education, and preparedness program to include all hazards of concern.
- Increase public knowledge about the risk and vulnerability to identified hazards and their recommended responses to disaster events, including evacuation and sheltering options.
- Provide planning and coordination for "At-Risk" populations.
- Provide planning and coordination for companion animals, livestock, and other animal populations.
- Increase community awareness and participation in hazard mitigation projects and activities.

Goal 4: Increase communities' capabilities to be prepared for, respond to, and recover from a disaster event.

- Improve interagency (local, state, federal) emergency coordination, planning, training, and communication to ensure effective community preparedness, response and recovery.
- Enhance collaboration and coordination of disaster-related plans, exercises, and training with local, state, and federal agencies, neighboring communities, private partners, and volunteers.
- Enhance the use of shared resources/Develop a strong mutual aid support system.
- Create and maintain a fully functional, interoperable radio and communication system with all regional public safety partners.

Goal 5: Maintain FEMA Eligibility/Position the communities for grant funding.

- Review hazard events and ongoing hazard mitigation projects annually.
- Assess the need to pursue or adjust hazard mitigation projects after significant hazard events.

Goal 6: Reduce exposure to High Hazard Dams that pose an unacceptable risk to the public.

- Improve alert and warning systems to provide residents downstream of a High Hazard Dam to receive timely warning to evacuation when threatened by potential or imminent dam failure.
- Enhance overall community preparedness to respond and evacuate a potential or imminent dam failure.
- Increase public awareness of the risk posed by High Hazard Dams and the potential for relocation of housing outside a possible inundation zone.
- Prioritize High Hazard Dam Mitigation projects and programs.

3.4 Status of Previous Mitigation Actions

Table 27 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 27: Status of Previous Hazard Mitigation Actions

Action Number / Name	Completed	Ongoing	Not Started	Still Relevant	Included in Updated Action Plan
City Hall Seismic Upgrade EQ-1				X	X
Fire Station Seismic Upgrade Eq2, WF-1				X	X
Fire Station Expansion EQ-3, WF-2				X	X
Upgrade Storm Drain System FL-1, SW-1		X		X	X
Trash Pumps FL-5, FL-6, FL-7		X		X	X
Flood Mitigation Plan FL-9				X	X
High Fire Zone Assessment Program WF-2		X		X	X

Table 121: Status of Previous Hazard Mitigation Actions
Source: City of Larkspur

"Still Relevant" indicates that the project or program was first proposed in the 2018 MJHMP and remains still relevant to the current 2023 MJHMP hazard vulnerabilities.

3.5 Hazard Mitigation Actions

The 2023 Marin County OA MJHMP was revised to reflect progress in local mitigation efforts. Mitigation projects were selected for each hazard and for the City of Larkspur based off the hazard risk assessment. The projects are supported by the mitigation goals and objectives, and are ranked using the following criteria; approximate cost, timeframe of completion, whether the project requires City Council regulatory action, and an assumption as to whether or not the project would be subject to CEQA or NEPA requirements. Funding sources are identified for all projects. All projects consider new, future, and existing development. Project worksheets are used by the Planning Team and Steering Committee to describe criteria for each project.

A cost benefit review process will be completed for each project that will be submitted during a given fiscal year. The general priorities of the cost benefit risk analysis will focus on projects that are lifesaving, life safety, property protection and lastly environmental protection. A ratio of at least one dollar of benefit for each dollar invested will be considered the minimum cost benefit ratio for any projects submitted within the City of Larkspur.

The City of Larkspur maintains project worksheets with detailed descriptions of each project. A summary of each project is found in the table below.

Table 28 lists the Current Hazard Mitigation Actions for the City of Larkspur.

.

Table 28: City of Larkspur Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
L-1	Marin Emergency Radio Authority (MERA) Upgrades. MU-13 Protect Infrastructure and Critical Facilities	All Hazards/ 1, 2, 3, 4, 5	Marin County and City of Larkspur.	Existing (2018)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	Ongoing - 1-2 years/ High	
L-2	Update public safety components of the General Plan. MU-4 Adopt Development Regulations in Hazard Areas	All Hazards/ 1, 2, 4, 5	City of Larkspur, Community Development	Existing (2018)	Cost: General Funds	1 – 3 years/ High	An updated General Plan is under consideration for adoption.
L-3	Encourage participation in Alert Marin and other community alert & warning systems to ensure the public is aware of any potential emergencies.	All Hazards, Dam Failure 1, 2, 3, 4, 5,	City of Larkspur Marin County	New (2023)	Cost: General Funds	Ongoing/ Low	Continue to encourage residents to participate in Alert Marin with an emphasis on properties at risk from all hazards.
L-4	Regularly review and update the City's Emergency Management Plan	All Hazards/ 3, 4, 5	City of Larkspur, Marin County, Fire Districts	New (2023)	Cost TBD: General Funds, HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	Action Program SAF-2.1.a: Regularly review and update, as necessary, the City's Emergency Management Plan to coordinate with emergency plans of other governmental agencies and respond to changing conditions. Incorporate the likelihood of sea level rise and extreme heat and storm events.
L-5	Enhance and promote community and individual emergency preparedness.	All Hazards/ 3, 4, 5	City of Larkspur, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	Action Program SAF-1.1.a: Implement, promote, and support the expansion of the Community Emergency Response, Training (CERT), the GET Ready, and the Neighborhood Response Group (NRG) programs (and any successor programs), for City staff, residents, businesses, schools, and neighborhood groups that

Table 28: City of Larkspur Current Hazard Mitigation Actions

No.	Mitigation Actions	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
							address emergency response protocols and procedures, disaster risk education, and self–sufficiency.
L-6	Vegetation Management Plan to include the removal of exotic, invasive, and hazardous species and replacing them with native, safer vegetation. WF-9 Implement a Fuels Management Program, ET-1 Reduce Urban Heat.	Wildfire, Debris Flow, Drought, Severe Weather – Heat & Wind 1, 2, 4, 5,	City of Larkspur, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	Reduces the chance of a wildland fire igniting a structure(s). Supports environmental restoration by using native plants resistant to fire, debris flow, drought, and wind.
L-7	Vegetation Management around at risk PG&E power lines and electrical line undergrounding projects by PG&E.	Wildfire, Drought, Severe Weather – Heat & Wind 1, 2, 4, 5,	City of Larkspur,, Marin County, Fire Districts	New (2023)	Cost TBD: HMGP, BRIC, Fire Safe Marin, Private Local Grants	1 - 2 years/ High	
L-8	City Hall Seismic Upgrade EQ-1	Earthquake/ 1, 2, 4, 5	City of Larkspur,	Existing (2018)	Cost TBD: HMGP, BRIC, General Fund	Ongoing - 1-2 years/ High	
L-9	Fire Station Seismic Upgrade Eq2, WF-1	Earthquake/ 1, 2, 4, 5	City of Larkspur,	Existing (2018)	Cost TBD: HMGP, BRIC, General Fund	Ongoing - 1-2 years/ High	
L-10	Fire Station Expansion EQ-3, WF-2	Earthquake/ 1, 2, 4, 5	City of Larkspur,	Existing (2018)	Cost TBD: HMGP, BRIC, General Fund	Ongoing - 1-2 years/ High	
L-11	Upgrade Storm Drain System FL-1, SW-1	Flooding, Tsunami, Sea Level Rise, Levee, Dam Failure 1,2,4, 5, 6	City of Larkspur,	Existing (2018)	Cost TBD: HMGP, BRIC, CDAA, FMA, General Fund	Ongoing - 1-2 years/ High	
L-12	Flood Mitigation Plan FL-9	Flooding, Tsunami,	City of Larkspur,	Existing (2018)	Cost TBD: HMGP, BRIC, CDAA,	Ongoing	

Table 28: City of Larkspur Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
		Sea Level Rise, Levee, Dam Failure 1,2,4, 5, 6			FMA, General Fund	Ongoing - 1-2 years/ High	
L-13	High Fire Zone Assessment Program WF-2	Wildfire/ 1, 2, 4, 5	City of Larkspur, Marin County, Central Marin Fire District	Existing (2018)	Cost TBD: HMGP, BRIC, Fire Safe Marin, General Fund	Ongoing - 1-2 years/ High	
L-14	Assess Vulnerability to Landslides and Land Subsidence	Debris Flow, Land Subsidence/ 1, 2, 4, 5	City of Larkspur	Existing	Cost: TBD General Funds	Ongoing - 1-5 years/ Low	Review landslides and Land subsidence to date and geological data to determine areas at risk of future landslides or land subsidence.

Table 122: City of Larkspur Current Hazard Mitigation Actions

3.6 Progress in Local Mitigation Efforts

This plan has been created as a "living" document with input from the population and professionals within the City of Larkspur. Based on the planning meetings and the progress monitored by the steering committee members several mitigation actions were accomplished since the last planning cycle. Table 27 provides a brief description of the progress made in the local mitigation efforts and the plan for those mitigation actions that were not completed or are ongoing.

The planning team for the City of Larkspur identified and prioritized the mitigation actions as detailed in Table 28, based on the risk assessment and in accordance with the process outline in Section 3, Mitigation Strategy, of the base plan. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. General processes and information on plan implementation and maintenance of this LHMP by all participating jurisdictions is included in Section 4.0: Plan Review, Evaluation, and Implementation.

3.7 Plan Integration

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning, capital facilities planning, emergency management, hazard specific planning, and that relevant information from those sources is also used in hazard mitigation. This section identifies where such integration is already in place from the 2018 MJHMP, and where the 2023 MJHMP will be used for further integration.

The planning team for the City of Larkspur will maintain this plan and will serve as a lead staff for grant project applications on City projects selected for application under the Hazard Mitigation Assistance grant programs.

An important implementation mechanism that is highly effective and low-cost is incorporation of the hazard mitigation plan recommendations and their underlying principles into city plans and mechanisms. Where possible the City of Larkspur will use existing plans and/or programs to implement hazard mitigation actions. Mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and development. As described in this plan's capability assessment, the City of Larkspur already implements policies and programs to reduce losses to life and property from hazards. This plan builds upon the momentum developed through previous and related planning efforts and mitigation programs and recommends implementing actions, where possible, through these other program mechanisms. These existing mechanisms include Integration opportunities for the 2023 Marin County OA MJHMP:

City General Plan - Integrates hazard mitigation through the consideration of hazards most likely to impact the City. These hazards are considered in the Safety Element, Housing Element and Open Space Element.

City Emergency Operations Plans – Integrates hazard mitigation through the consideration of the City's planned response to hazards most likely to impact the City.

County, City and Town Ordinances - Integrates hazard mitigation through the consideration of plans and policies outlined in the capability assessments in the jurisdictional annexes.

Flood/Storm Water Management/Master Plans - Integrates hazard mitigation through the consideration of strategies to reduce flood risk and storm water management for the protection of life and property.

Community Wildfire Protection Plan - Integrates hazard mitigation through the consideration of strategies to reduce fire hazard and the risk of catastrophic wildfires in the WUI, while promoting the protection and enhancement of the county's economic assets and ecological resources.

The successful implementation of this mitigation strategy will require review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. A few examples of incorporation of the MJHMP into existing planning mechanisms include:

10. As recommended by Assembly Bill 2140, each community should adopt (by reference or incorporation) this MJHMP into the Safety Element of their General Plans. Evidence of adoption (by formal, certified resolution) shall be provided to CalOES and FEMA
11. Integration of flood actions identified in this mitigation strategy with the actions and implementation priorities established in existing Flood Management Programs
12. Using the risk assessment information to update the hazards section in the County, City and Town Emergency Operations Plans

Efforts should continuously be made to monitor the progress of mitigation actions implemented through these other planning mechanisms and, where appropriate, their priority actions should be incorporated into updates of this hazard mitigation plan.

3.8 Future Development Trends

The overall aim is to preserve and enhance Larkspur's unique physical and natural setting, and its largely residential character, while accommodating suitable new development. This includes protecting Larkspur's hillsides and creeks, and the vegetation, views, and general peacefulness associated with these natural characteristics. This City also seeks to enhance the attractiveness and viability of existing commercial areas, while encouraging neighborhood serving businesses and protecting the integrity of the existing commercial areas, particularly the historic Downtown. It also includes the protection of existing and future development from natural hazards, such as wildfires, landslides, and sea level rise and associated flooding.

One of the community's most valued features in Larkspur is its beautiful natural setting, which includes creek and marsh habitats, protected open space areas, and vistas of Mount Tamalpais. Future development should not impact Larkspur's sensitive environmental resources. Conversely, the City recognizes the safety risks posed by environmental hazards, such as flooding, earthquakes, and sea level rise, which may affect existing and proposed residential and commercial development in the next twenty years. The City aims to avoid or minimize impacts of development on the environment, as well as impacts of the environment on development to the greatest extent possible. The Land Use goals, policies, and programs seek to address these issues, as well as any unforeseen impacts on the physical development of the City over the next twenty years.

SECTION 4.0: PLAN REVIEW, EVALUATION, AND IMPLEMENTATION

The strategies presented are deemed appropriate and effective by recommendation of the City of Larkspur.

4.1 PLAN ADOPTION

Upon submission to the California Office of Emergency Services (CalOES) for review, and subsequent approval by the Federal Emergency Management Agency (FEMA), the Marin County OA MJHMP will be presented to local government for formal adoption. As appropriate, the adopted plan and accompanying City of Larkspur Community Profile will then be incorporated into local general plans for integration into organizational policy.

4.2 PLAN MONITORING

The process of hazard mitigation does not end with the completion, approval, and adoption of the Marin County OA MJHMP. During the five-year lifespan the Marin County and City of Larkspur plan, the County, cities, towns and special districts, along with community-based organizations will ensure that the mitigation goals and strategies identified are exercised and monitored under a collaborative and cooperative umbrella, and that the document itself is properly maintained.

The Marin County Office of Emergency Management, as lead coordinating agency for hazard mitigation planning within the Marin County OA, leads the Marin Operational Area Hazard Mitigation Working Group that meets quarterly to review and manage the plan, projects, and programs. The City of Larkspur is a participating member of the Marin Operational Area Hazard Mitigation Working Group. The City of Larkspur Public Works Director will monitor and update the City of Larkspur Annex to the Marin County OA MJHMP.

The review will identify changing community priorities, updated or new planning documents and the progress or status of the mitigation actions as detailed in the mitigation strategy. Additional questions to complete the review will be considered as follows:

- Do the goals address current and expected conditions?
- Are the goals and objectives consistent with changes in the local, state, and federal policy?
- Status updates on all mitigation actions?
- Have the hazards or risks changed?
- Are current resources appropriate for implementing the MJHMP?
- Have the outcomes occurred as expected?
- Is the County and jurisdictions or districts participating in the plan implementation process as expected?

The Working Group is a subgroup of the Marin Disaster and Citizens Corps Council. During the five-year update cycle, the Marin Operational Area Hazard Mitigation Working Group will have quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. Further, Marin OEM will host an annual one-day mitigation summit to increase engagement and enhance collaboration on the plan and projects. The summit will also have the

goal to educate stakeholders on innovative approaches to mitigation, trends, and new plan requirements. Marin OEM, as the host, will seek subject matter experts, state and federal officials, and representatives from within the Marin OA to speak to mitigation and planning. The knowledge gathered and the coordination facilitated during the summit will be used to update the base plan and annexes.

Marin OEM has the capacity to lead the Working Group and Multi-Jurisdictional Planning with one coordinator assigned with direct maintenance of the plan, a department analyst assigned to support the coordinator with project and grant tracking, and a community preparedness coordinator assigned with conducting regular public outreach on the plan and education on mitigation. Community feedback and integration will continue through outreach events and OEM website, where residents and visitors are invited to provide feedback through a survey, available in English or Spanish.

Specific plan maintenance activities by the Marin County Office of Emergency Management and its participating jurisdictions/special districts may include:

- Hold quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions.
- Annual Hazard Mitigation Summit
- Holding public meetings after the first quarter and third quarter update meetings.
- Maintaining the Marin County OEM Hazard Mitigation Website, which provides the public with the ability to access identified hazard impact maps, location address search capability, and a listing of hazard mitigation actions.
- Monitoring of the Marin County and all participating jurisdiction mitigation project activities and dissemination of status reports.
- Generation of reports relative to plan status, project management, and revision updates to executive leadership.
  Preparations for the plan's future revision and updating.

4.3 Plan Evaluation

Upon approval and adoption by the City of Larkspur, the prioritized mitigation strategies will be further developed for funding and implementation by the lead agencies. The plan describes the potential sources of hazard mitigation funding, and general procedures to obtain that funding.

The mitigation strategies represented and adopted within this plan are recommendations only and must be approved and funded in order to be implemented as official mitigation solutions. Ultimately, it is the responsibility of jurisdictional and agency officials within the Marin County to undertake project implementation based upon identified mitigation strategies, funding availability, and local need when it arises. The Marin County Office of Emergency Management will meet with the Marin Operational Area Hazard Mitigation Working Group, including the City of Larkspur, to evaluate the plan after each update meeting.

4.4 Plan Update

The City of Larkspur Public Works Director will monitor and update the City of Larkspur Annex to the Marin County OA MJHMP. During the five-year update cycle, the City of Larkspur and the Marin County Office of Emergency Management will hold quarterly update meetings with the

Marin Operational Area Hazard Mitigation Working Group and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. The Marin County Office of Emergency Management and all participating jurisdictions and special districts will continue to hold public meetings after the first quarter and third quarter update meetings annually and will continue to invite public participation in the update process via updated public surveys.

6. Las Gallinas Valley Sanitary District Profile

Las Gallinas VALLEY SANITARY DISTRICT

Marin County Multi-Jurisdictional Hazard Mitigation Plan 2023

This page is intentionally blank.

ACKNOWLEDGEMENTS

The Las Gallinas Valley Sanitary District and Preparative Consulting would like to thank those collaborators and partners who participated in the planning and development of this document.

The official Marin County hazard mitigation Steering Committee provided the oversight and dedication to this project that was required, and without their commitment, this project would not be possible.

As with any working plan, this document represents planning strategies and guidance as understood as of the date of this plan's release. This plan identifies natural hazards and risks and identifies the hazard mitigation strategy to reduce vulnerability and make the communities and district of the Las Gallinas Valley Sanitary District more disaster resistant and sustainable.

SECTION 1.0: INTRODUCTION

1.1 INTRODUCTION

The Las Gallinas Valley Sanitary District Profile has been prepared in conjunction with the Marin County Multi-Jurisdictional Hazard Mitigation Plan (MJHMP), establishing an inter-jurisdictional process for the development and implementation of effective hazard mitigation strategies in association with identified hazards that pose real or potential threats to the Las Gallinas Valley Sanitary District.

1.2 PLANNING PROCESS

The majority of Marin County is unincorporated sparsely populated rural and protected lands. Most of the 262,000 county population is consolidated into the Eastern portion of the county. The Marin County MJHMP Steering Committee and broader Planning Team approached the development of the Marin County MJHMP and the associated jurisdictional and district profiles from a coordinated and collaborative planning and public engagement unity of effort.

The Steering Committee felt a unified effort, led by the County Office of Emergency Management (OEM), would be the most effective approach for this planning process. This approach allowed the small jurisdictions and districts with limited staffing and resources to take advantage of the combined efforts of the County and other jurisdictions to reach a broader segment of each of their own populations and do so in a way to ensure greater equity and inclusion of the public in this planning process. Extensive and coordinated public outreach was done involving all participating jurisdictions and districts with an eye towards equity, inclusion, openness, accessibility, and ensuring they meet the population where they live, work, or recreate to provide the public convenience of access and ease of participation in this planning process.

Marin County OA is very different from most California Counties in that the populated portion of the County where the jurisdictions and district's planning areas are located has the same climate, similar topography, and are exposed to many of the same hazards. Only three jurisdictions, Larkspur, Ross, and San Anselmo, are not coastal jurisdictions and are not impacted by Tsunami or Sea Level Rise.

This unity of effort approach allowed the Steering Committee to establish a more robust Planning Team representing local, countywide, regional, state, and federal stakeholders servicing the Marin County planning area. These stakeholders were in a unique position to provide informed and specific information and recommendations on hazard mitigation goals and actions, as well as population needs and social vulnerability for each of the jurisdictional and district planning areas. This united effort allowed the planning team to attend fewer meetings than they would have been required to attend if they were required to attend separate meetings for each participating jurisdiction and district. The reduced number of meetings allowed the planning team the opportunity and time to provide more detailed and thoughtful contributions to the planning effort.

In addition to providing representation on the coordinated Marin County OA Multi-Jurisdictional Hazard Mitigation Plan Steering Committee, the Las Gallinas Valley Sanitary District involved additional internal planning team members to support the broader planning process. The Las Gallinas Valley Sanitary District jurisdictional representatives for the coordinated Marin County OA Multi-Jurisdictional Hazard Mitigation Plans Steering Committee and the Planning Team Members are represented below.

1.2.1 Steering Committee Members (District Representatives)

Primary Point of Contact	Alternate Point of Contact
Dale McDonald, Administrative Services Mgr.	Greg Pease, Safety Manager
Telephone: 415-526-1519	Telephone: 415-526-1513
E-mail Address: dmcdonald@lgvsd.org	E-mail Address: gpease@lgvsd.org

This annex was developed by the primary point of contact with assistance from the members of the local mitigation planning team listed in Table 1.

This 2023 Marin County Operational Area (OA) MJHMP is a comprehensive update of the 2018 Marin County OA MJHMP. The planning area and participating jurisdictions and organizations were defined to consist of unincorporated Marin County, five special districts, and the eleven incorporated jurisdictions to include the Las Gallinas Valley Sanitary District. All participating jurisdictions and districts are within the geographical boundary of Marin County and have jurisdictional authority within this planning area.

The Steering Committee led the planning process based on the contribution and input from the whole community stakeholders who identified the community's concerns, values, and priorities. The Steering Committee met and reviewed the mitigation recommendations and strategies identified within this plan. Each participating local jurisdiction established a mechanism for the development and implementation of jurisdictional mitigation projects, as identified within this plan and associated locally specific supporting documents. As deemed necessary and appropriate, participating jurisdictions will organize local mitigation groups to facilitate and administer internal activities.

The Steering Committee assisted with the planning process in the following ways:

- Attending and participating in the Steering Committee meetings.
- Identification of potential mitigation actions.
- Updating the status of mitigation actions from the 2018 Marin County OA MJHMP.
- Collecting and providing other requested data (as available).
- Making decisions on plan process and content.
- Reviewing and providing comments on plan drafts; including annexes.
- Informing the public, local officials, and other interested stakeholders about the planning process and providing opportunity for them to be involved and provide comment.
- Coordinating, and participating in the public input process.
- Coordinating the formal adoption of the plan by the governing boards.

1.2.2 Steering Committee Planning Process

Beginning in late 2022, members of the Steering Committee agreed to a monthly meeting schedule to identify hazard priorities and review local hazard mitigation strategy recommendations. Email notifications were sent out to each Steering Committee member to solicit their participation in the Steering Committee meetings. The meetings were conducted using a Zoom platform videoconferencing. Meeting attendees signed in using the chat feature to record their attendance.

The Steering Committee agreed to make and pass plan-based general policy recommendations by a vote of a simple majority of those members present. The Steering Committee will also seek input on future hazard mitigation programs and strategies from the mitigation planning team by focusing on the following:

- Identify new hazard mitigation strategies to be pursued on a state and regional basis, and review the progress and implementation of those programs already identified.
- Review the progress of the Hazard Mitigation program and bring forth community input on new strategies.
- Coordinate with and support the efforts of the Marin County OEM to promote and identify resources and grant money for implementation of recommended hazard mitigation Strategies within local jurisdictions and participating public agencies.

During the planning process, the Steering Committee communicated through videoconferencing, face-to-face meetings, email, telephone conversations, and through the County website. The County website included information for all stakeholders on the MJHMP update process. Hannah Tarling of the Marin County Office of Emergency Management and Preparative Consulting established a Microsoft 365 SharePoint folder which allowed the Steering Committee members and Marin OEM and Preparative Consulting to share planning documents and provide a format for the planning partners to submit completed documents and access other planning related documents and forms. Draft documents were also posted on this platform and the Marin County OES website so that the Steering Committee members and the public could easily access and review them.

1.2.3 Coordination with Stakeholders and Agencies

Opportunities for involvement in the planning process must be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other private and nonprofit interests (44 CFR, Section 201.6(b)(2)).

Early in the planning process, the Marin County and LGVSD Steering Committee reached out to the following Local and Regional Agencies involved in hazard mitigation activities to invite them to participate in this planning process as a member of the Planning Team. These individuals work with Marin County and the LGVSD communities and could provide subject matter expertise and relevant information to the planning process regarding the community history, hazard risk, vulnerability, and impact, mitigations efforts, community needs, demographics, and social vulnerability, economic concerns, ecology, and other community services and needs.

The Marin County and LGVSD Steering also determined that data collection, risk assessment analyses, mitigation strategy development, and plan approval would be greatly enhanced by inviting other local, state and federal agencies and organizations to participate in the process. Based on their involvement in hazard mitigation planning, their landowner status in the County, the LGVSD and/or their interest as a neighboring jurisdiction, representatives from the following groups were invited to participate on the Planning Team:

Eighty-five planning partners participated in this update, as listed in Table 1.

85	US Coast Guard	LT William K. Harris	USCG SEC San Francisco

Table 123: 2023 MJHMP Planning Team Members

Several opportunities were provided for the groups listed above to participate in the Las Gallinas Valley Sanitary District's planning process. At the beginning of the planning process, invitations were extended to these groups to actively participate on the Planning Team. Participants from these groups assisted in the process by attending several videoconferencing meetings where hazard vulnerability and risk were discussed along with hazard mitigation strategies and actions. Planning Team members provided data and other applicable information directly as requested in meetings, emails, telephone calls, videoconferencing, worksheets, or through data contained on their websites or as maintained by their offices. This information was used to develop hazard vulnerability and risk profiles along with mitigation actions.

These key agencies, organizations, and advisory groups received meeting announcements, agendas, and minutes by e-mail throughout the plan update process. They supported the effort by attending meetings or providing feedback on issues. All the agencies were provided with an opportunity to comment on this plan update and were provided with a copy of the plan to review and offer edits and revisions. They were also provided access to the Marin County OEM hazard mitigation plan website to review all planning documents and hazard mapping tools.

Each was sent an e-mail message informing them that draft portions of the plan were available for review. In addition, the complete draft plan was sent to the California Governor's Office of Emergency Services (Cal OES) and FEMA Region IX for a pre-adoption review to ensure program compliance.

In addition, through the public meetings conducted at the beginning of the planning process, members of the planning team, the public, and other key stakeholders were invited to participate in the planning process through public outreach activities.

Further as part of the public outreach process, all planning areas engaged in public outreach and education by providing information on their website or though press releases directing the public to the main Marin County OEM website that provided coordinated and detailed public information of the planning process and how the public could participate. All planning areas were invited to attend the public meetings and to review and comment on the plan prior to submittal to Cal OES and FEMA. Additional public outreach action is detailed in the 1.2.4 PUBLIC ENGAGEMENT section of this annex.

The following planning meetings were held with the planning team:

Table 2: Las Gallinas Valley Sanitary District & Marin County MJHMP Planning Meetings

No.	Date	Attendees	Meeting	Planning Meeting Objectives

1.2.4 PUBLIC ENGAGEMENT

Early discussions with the Marin County OEM established the initial plan for public engagement to ensure a meaningful and inclusive public process with a focus on equity and accessible to the whole community. The Public Outreach efforts mirrored the Planning Team approach with a unified effort, led by the County OEM, involving all participating jurisdictions and districts. Public outreach for this plan update began at the beginning of the plan development process with a detailed press release informing the community of the purpose of the hazard mitigation planning process for the Marin County OA planning area and to invite the public to participate in the process.

Public involvement activities for this plan update were conducted by the County and all participating jurisdictions and districts and included press releases; website postings; a community survey; stakeholder and public meetings; and the collection of public and stakeholder comments on the draft plan which was posted on the County website. Information provided to the public included an overview of the mitigation status and successes resulting from implementation of the 2018 plan as well as information on the processes, new risk assessment data, and proposed mitigation strategies for the plan update.

Equity and Whole Community Approach

The Marin County OEM and the Steering Committee prioritized equity and engagement of the whole community in the development of the Marin County OA MJHMP by establishing a framework with key actions for each step of the planning process. Elements of the equity approach included:

Engaging hard-to-reach populations

This effort was to ensure the greatest equity and access to the public to enable participation in the process. The Marin County OEM outreach strategy is to “meet people where they are.” The Town Hall meetings were conducted at different familiar locations within the county where people could easily access them and were conducted on both a weekday and weekend, and in the evening and during the daytime. The meetings were offered in-person with a virtual broadcast using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. After the meeting, Marin County OEM uploaded the recorded meeting to their website to allow the public on demand access to the meeting.

Translation and Interpretation Services

The survey and outreach materials were provided in both English and Spanish to improve accessibility among populations with limited English proficiency. The website uses Google Translate for accessibility in multiple languages. Interpretation services were offered for both town hall meetings. Each town hall meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

Three stakeholder and public meetings were held, two at the beginning of the plan development process and one prior to finalizing the updated plan. Where appropriate, stakeholder and public comments and recommendations were incorporated into the final plan, including the sections that address mitigation goals and strategies. Specifically, public comments were obtained during the plan development process and prior to plan finalization.

All press releases and website postings are on file with the Marin County OEM. Public meetings were advertised in a variety of ways to maximize outreach efforts to both targeted groups and to the public at large. Advertisement mechanisms for these meetings and for involvement in the overall MJHMP development process include:

- Development and publishing of an MJHMP public outreach article
- Providing press releases to local newspapers and radio stations
- Posting meeting announcements on the local County MJHMP website
- Email to established email lists
- Personal phone calls

The public outreach activities were conducted with participation from and on behalf of all jurisdictions participating in this plan.

The Steering Committee has made the commitment to periodically bring this plan before the public through public meetings and community posting so that citizens may make input as strategies and implementation actions change. Public meetings will continue to be held twice a year after the first and third MJHMP meetings. Public meetings will continue to be stand-alone meetings but may also follow a council meeting or other official government meeting. The public will continue to be invited to public meetings via social media messaging, newspaper invitations, and through the website for each jurisdiction participating in the plan. Each jurisdiction is responsible for assuring that their citizenry is informed when deemed appropriate by the Steering Committee.

WEBSITE

At the beginning of the plan update process, Marin County OEM established a hazard mitigation website https://emergency.marincounty.org/pages/lhmp on behalf of all the planning areas to ensure consistent messaging and information, to keep the public posted on plan development milestones, and to solicit relevant input. The website also provided information on signing up for Alert Marin, provided detailed information about the hazard mitigation process and plan development, provided a URL and QR code link to the survey in both English and Spanish, and provided information about upcoming town hall meetings. (See Figure 1)

The site's address was publicized in all press releases, surveys and public town hall meetings. Each planning partner also established a link on their own agency website. Information on the plan development process, the Steering Committee, a link to the Hazard Mitigation survey, and drafts of the plan were made available to the public on the site. Marin County intends to keep a website active after the plan's completion to keep the public informed about successful mitigation projects and future plan updates.

Figure 243: Marin County OEM MJHMP and LGVSD Website

PUBLIC MEETINGS

Two separate Marin County MJHMP Public Town Hall Meeting were conducted at different locations within the County, on different days of the week and during different times of the day. This effort was to ensure the greatest equity and access by the public to enable participation in the process. The Marin County OEM outreach strategy is to “meet people where they are.” Each Town Hall Meeting included, live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slide.

The first Town Hall Meeting was conducted on Thursday, April 13, 2023, from 6:00 pm to 7:30 pm, at the Marin County Board of Supervisors Chambers, Marin County Civic Center, 3501 Civic Center Drive, Room #330 San Rafael, CA 94903. The in-person meeting was also broadcast virtually using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. Each of the jurisdictions participating in the MJHMP released a Press Release on their respective websites announcing the Public Town Hall Meeting and providing the date, time, and URL link to the Zoom Meeting for the public to log in and attend the Zoom Meeting. Marin County OEM also posted a notice for the Public Town Hall Meeting on their Facebook account. At the conclusion of the presentation, a question and answer session was held to answer questions from the attendees.

The second Town Hall Meeting was conducted on Saturday, April 29, 2023, from 10:00 am to 11:30 am, at the Marin County Health and Wellness Center, 3240 Kerner Ave. Rooms #109 and #110 San Rafael, CA. 94903. The meeting followed the same format as the first and hosted the same access level of equity and accessibility.

The Marin County MJHMP Public Town Hall Meeting was recorded and downloaded from Zoom and made available to all of the jurisdictions and districts to place on their websites and local Access TV for the public to view.

Meeting participants were also invited to complete the Hazard Mitigation Survey and were provide the URL link to the Survey Monkey website to complete the survey.

Figure 244: Marin County OEM MJHMP Public Town Hall Meeting

SOCIAL MEDIA

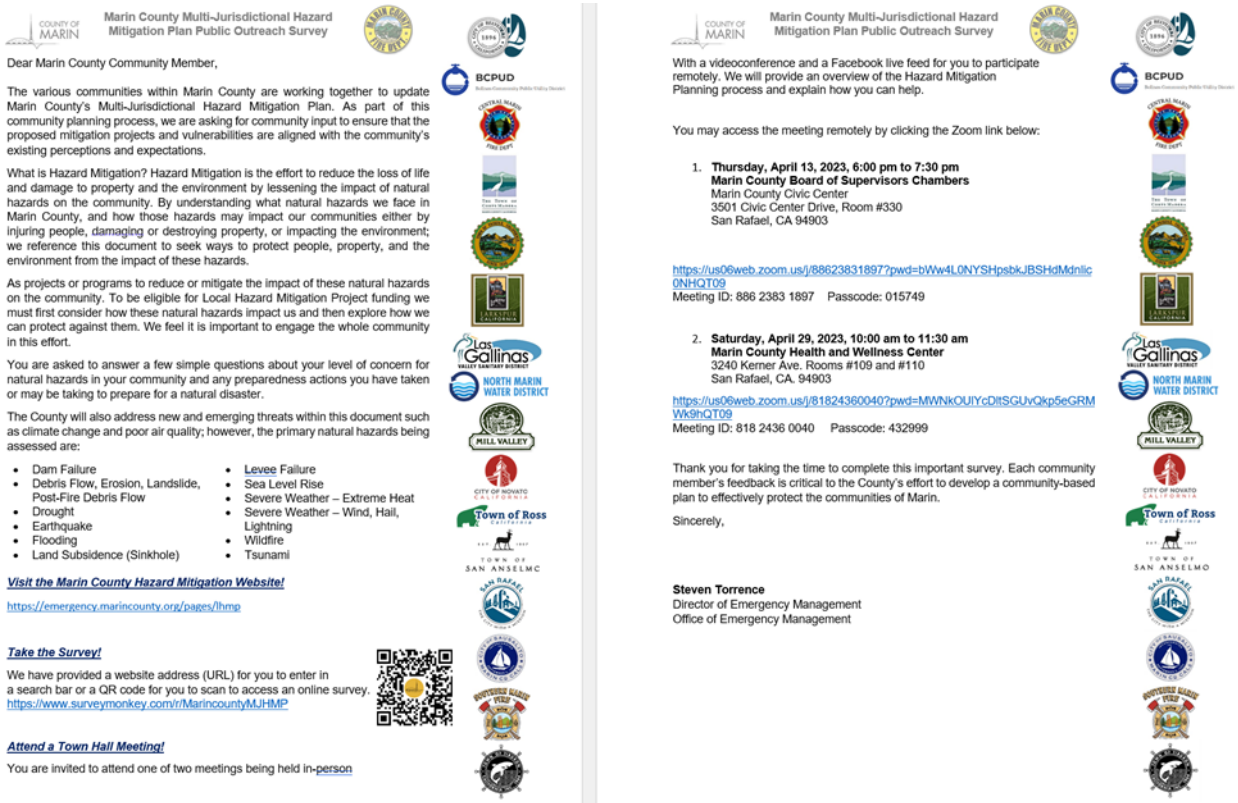
Marin County and its participating jurisdictions utilized several forms of social media to reach residents and customers. Information about the Hazard Mitigation Planning process was communicated to the public via Facebook, Twitter, and local access TV. Residents and customers were invited to complete the Hazard Mitigation Plan survey which was accessible via an attached URL or QR Code and provide feedback on potential hazard mitigation projects or programs.

The results of the survey were provided to each of the planning partners and used to support the jurisdictional annex process. Each planning partner was able to use the survey results to help identify actions as follows:

- Gauge the public's perception of risk and identify what citizens are concerned about.
- Identify the best ways to communicate with the public.
- Determine the level of public support for different mitigation strategies.
- Understand the public's willingness to invest in hazard mitigation.

PRESS RELEASES

Press releases were distributed over the course of the plan's development as key milestones were achieved and prior to each Marin County OA MJHMP Public Town Hall Meeting. All press releases were made available to the community in both English and Spanish.



Marin County Multi-Jurisdictional Hazard Mitigation Plan Public Outreach Survey

Dear Marin County Community Member,

The various communities within Marin County are working together to update Marin County's Multi-Jurisdictional Hazard Mitigation Plan. As part of this community planning process, we are asking for community input to ensure that the proposed mitigation projects and vulnerabilities are aligned with the community's existing perceptions and expectations.

What is Hazard Mitigation? Hazard Mitigation is the effort to reduce the loss of life and damage to property and the environment by lessening the impact of natural hazards on the community. By understanding what natural hazards we face in Marin County, and how those hazards may impact our communities either by injuring people, damaging or destroying property, or impacting the environment; we reference this document to seek ways to protect people, property, and the environment from the impact of these hazards.

As projects or programs to reduce or mitigate the impact of these natural hazards on the community. To be eligible for Local Hazard Mitigation Project funding we must first consider how these natural hazards impact us and then explore how we can protect against them. We feel it is important to engage the whole community in this effort.

You are asked to answer a few simple questions about your level of concern for natural hazards in your community and any preparedness actions you have taken or may be taking to prepare for a natural disaster.

The County will also address new and emerging threats within this document such as climate change and poor air quality; however, the primary natural hazards being assessed are:

- Dam Failure
- Debris Flow, Erosion, Landslide, Post-Fire Debris Flow
- Drought
- Earthquake
- Flooding
- Land Subsidence (Sinkhole)
- Levee Failure
- Sea Level Rise
- Severe Weather – Extreme Heat
- Severe Weather – Wind, Hail, Lightning
- Wildfire
- Tsunami

Visit the Marin County Hazard Mitigation Website!

Meeting ID: 818 2436 0040 Passcode: 432999

Thank you for taking the time to complete this important survey. Each community member's feedback is critical to the County's effort to develop a community-based plan to effectively protect the communities of Marin.

Sincerely,

Steven Torrence
Director of Emergency Management
Office of Emergency Management

Figure 245: Hazard Mitigation Plan Public Outreach Press Release

SURVEY

A hazard mitigation plan survey (see Figure 4) was developed by the Steering Committee and made available to the public in both English and Spanish. The survey was used to gauge household preparedness for natural hazards and the level of knowledge of tools and techniques that assist in reducing risk and loss from natural hazards. This survey was designed to help identify areas vulnerable to one or more natural hazards. The answers to its ten questions helped guide the Steering Committee in defining our hazards, and selecting goals, objectives, and mitigation strategies. The survey was available on the hazard mitigation plan website, advertised in press releases, and at town hall meetings. Finally, the survey and the process of public input was advertised throughout the course of the planning process. The survey was available to the public on March 13, 2023, and closed on June 12, 2023. At the conclusion of the planning process 293 surveys were completed by the public.

Public Comments Considered by the Planning Team

The Planning Team used the following information gathered from the Public Outreach Survey to inform decisions regarding hazard mitigation strategies, actions, and priorities.

- Climate Change, Wildfire, and Drought were the top hazards of concern for the public.
- Text messages, mail, and the County website were the preferred methods for receiving hazard mitigation information.
- 48% of respondents expressed that they were “Very Much” concerned and 31% were “Moderately” concerned that a natural disaster could impact their home or place of residence.
- 85% of respondents own their own home.
- 99% of respondents have access to the internet.

Figure 246: Hazard Mitigation Plan Survey

PUBLIC COMMENT ON THE PLAN

To solicit public feedback on the draft plan, Marin OEM engaged in a multi-faceted approach intended to reach as many Marin residents as possible, including members of the community who are under-served and under-represented. All members of the community had the opportunity to provide initial comments on the plan during a two-week period from Wednesday, December 4, 2023, to Wednesday, December 18, 2023. Although the initial comment period was listed as two weeks, the public could submit comments indefinitely via the County's website to support the County's continuous improvement efforts. The base plan, as well as city, town and special district annexes, were available for download on emergency.marincounty.org (include photos). The website additionally asked for feedback in a survey in English and Spanish (include photos), the survey was designed to establish where that person lives or works, their top hazards of concern, elicit feedback on the plan and offer a place for them to share projects to reduce risk in their community. The survey collected responses from the community in English and in Spanish.

The website and survey were shared through traditional and social media (photos) The Marin Independent Journal (Marin IJ) used the press release to write an article (hopefully; include photos). Social media accounts were updated four times with an initial ask, two reminders, and a closing announcement. The Marin OEM Public Information Officer coordinated with the Marin County Public Information Officers (MAPIO) working group to distribute information to partner jurisdictions (city, town, and special districts) to share this information on their social media sites and with the communities in the area.

To reach those who may not be engaged digitally, the planning team worked with Marin County Community Response Teams, (CRTs are a collaboration of non-profit organizations supporting underrepresented communities in four zones) to conduct outreach with half-sheet flyers in English and Spanish to share in the 4 CRT zones (southern Marin, north Marin, west Marin, San Rafael). These half sheets were also shared county-wide at libraries, including in areas not covered by CRTs, like at the Fairfax library. CRTs are designed to reach Marin's traditionally underserved and underrepresented communities, so by conducting outreach

through this method, we were able to inform residents who may not have been engaged otherwise, including residents in Marin City, West Marin, and the Canal District of San Rafael.

After December 18, 2023, the various participating jurisdiction and district profiles remained on the Marin County OEM website for public comments. The LGVSD had an additional 14-day comment period for the LGVSD Community Profile where their profile was posted on the District website for final public comment from January 29 – February 5, 2024.

The 14-day public comment period gave the public an opportunity to comment on the draft plan update prior to the plan's submittal to Cal OES. Comments received on the draft plan are available upon request. All comments were reviewed by the planning team and incorporated into the draft plan as appropriate.

Public Comments Considered by the Planning Team

The Marin County OEM posted the draft Hazard Mitigation Plan and hazard mitigation actions on their website and solicited public comments on the content. The LGVSD distributed press releases directing the community to the Marin County OEM website to review the draft plans. The Planning Team gathered public comments and information on the Marin County OEM website regarding proposed and current Hazard Mitigation Actions. The Planning Team used the comments and suggestions to inform decisions regarding hazard mitigation strategies, actions, and priorities. Most comments included ideas for hazard mitigation projects and comments on the effectiveness of current mitigation projects. These comments were used to revise the proposed hazard mitigation actions which resulted in the final list of hazard mitigation actions listed in 3.5 Hazard Mitigation Actions.

1.3 Overview and History

LGVSD was formed on April 6, 1954, pursuant to the Sanitary District Act of 1923. The original wastewater treatment plant was constructed in 1955 to address health problems from failing septic tanks in Santa Venetia. New development in north San Rafael resulted in annexation of Terra Linda in 1956, followed by other areas including San Rafael Meadows, Marinwood, Lucas Valley, and other communities.

LGVSD is organized as a limited-purpose agency with municipal operations restricted to wastewater, recycled water, and solid-waste collection. Wastewater services are provided through LGVSD's 112-mile collection system that conveys wastewater to the District's own treatment facility before discharge into Miller Creek or used for beneficial purposes through a recycled water program. LGVSD's bio-solids are stored temporarily in lagoons and later disposed of at LGVSD's dedicated land disposal site, a process known as surface disposal.

LGVSD manages the refuse hauling service for the unincorporated areas in its District. The franchise has been awarded to Marin Sanitary Service which provides curbside recycling, solid waste, yard waste and food scraps hauling, and safe hazardous waste disposal services that are helping achieve Marin County's goal of zero waste.

1.4 SERVICE AREA

LGVSD is located in the Las Gallinas Valley between Novato and San Rafael, in Marin County, California and encompasses an approximate 9.4 square mile jurisdictional boundary within east-central Marin County. The District's wastewater treatment and recycling facilities are located on over 400 acres on San Pablo Bay. It is located approximately two miles northeast of the City of San Rafael and 20 miles north of San Francisco. The District currently serves over 32,000 people.

There are three local land use authorities that overlap LGVSD's jurisdictional boundary. The County of Marin is the single largest land use authority in terms of acreage with an estimated 63% of all LGVSD's lands lying within the unincorporated area and marked by the unincorporated communities of Marinwood and Santa Venetia. Another 36% of the jurisdictional boundary falls under the land use jurisdiction of the City of San Rafael and generally encompasses the Terra Linda area. The remainder of the jurisdictional boundary – 1% of the total – extends into the City of Novato and is specific to the Marin Valley Mobile Home Park and an adjacent open-space property. LGVSD lies within two adjacent watersheds, Miller Creek and Gallinas Creek. The District is primarily residential and built out, resulting in a stable customer base. Customers class was 81% residential and 19% commercial in 2022.

Today, LGVSD serves 32,000 customers in the northern San Rafael area and manages approximately 105 miles of collection lines. Boundaries of the facility span approximately 383 acres. In addition to the treatment plant, other aspects of LGVSD include solar generation, a garbage franchise encompassing all areas within the District excluding the City of San Rafael customers, and a multi-faceted reclamation project which includes a freshwater marsh, irrigated pastures, storage ponds and saltwater marsh – all of which are home to area wildlife, and provide access and recreation for the public.

Given the unique low-lying creek and bayside location of the District's service area, strict attention is given to the treatment process and green practices are an ongoing goal of LGVSD. During the summer non-discharge season (no discharge to San Pablo Bay via Miller Creek between May and October), approximately 2/3's of the District's treated water (effluent) is recycled by Marin Municipal Water District (MMWD) and North Marin Water District (NMWD). The LGVSD/MMWD/NMWD recycled water is utilized within the LGVSD boundaries. The remainder of treated effluent is utilized at LGVSD's irrigation pastures.

The LGVSD Secondary Treatment Plant Upgrade and Recycled Water Expansion Project increased capacity in order to better serve the present and future residents. LGVSD provides plant tours, site educational field trips and community outreach activities to raise awareness for pollution prevention, water quality and conservation.

Figure 6 illustrates the Las Gallinas Sanitary District service area in purple and the jurisdictional boundaries of the Cities of Novato and San Rafael in the black dashed lines.

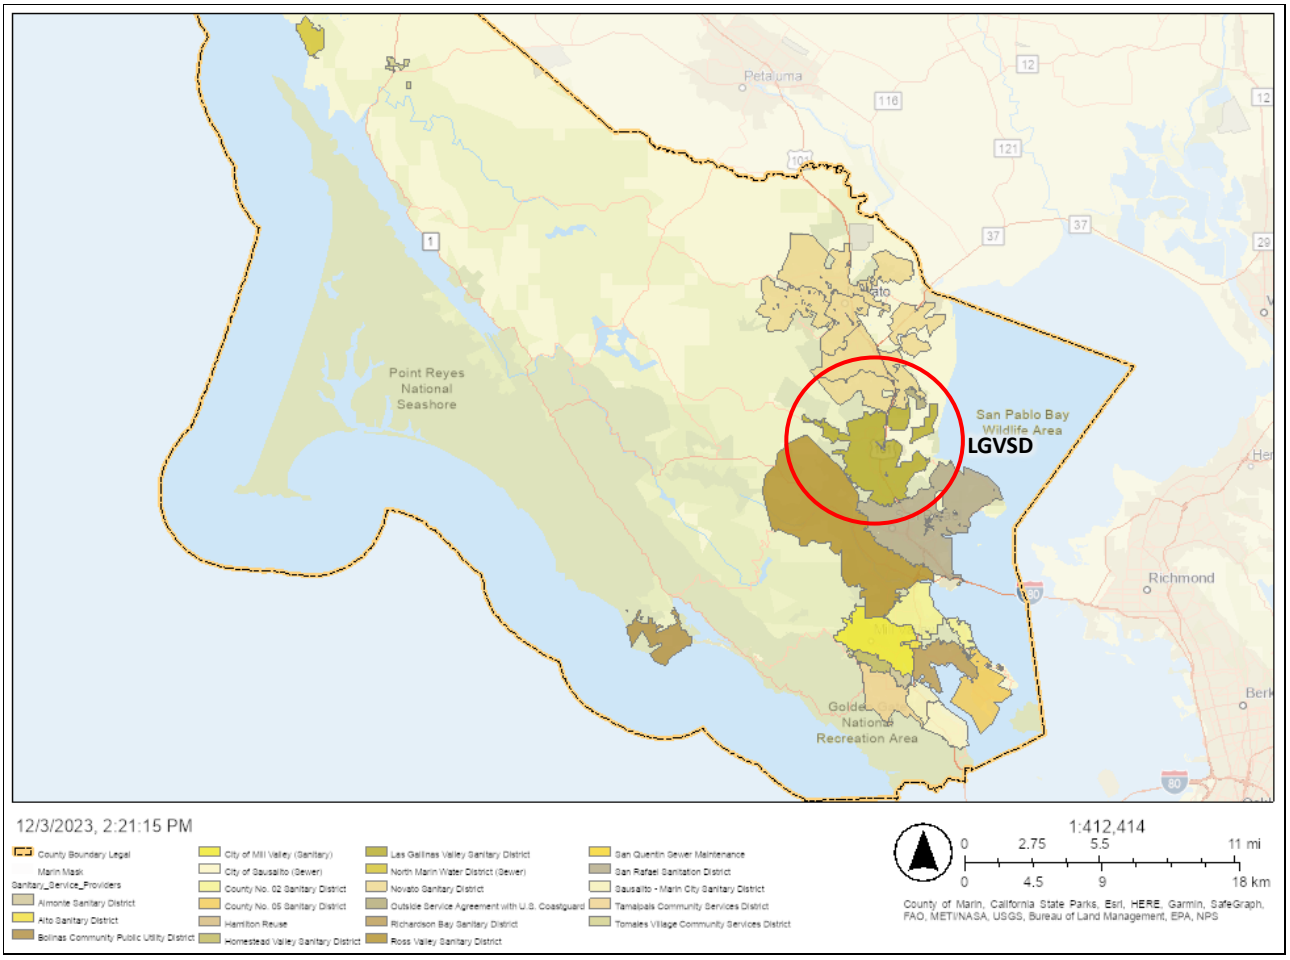

Figure 248: Map of the Las Gallinas Valley Sanitary District and Other Sanitary Districts
Source: Marin County OEM

1.5 ADMINISTRATION

Governance is provided by an independent five-member Board of Directors whose members are elected "at-large" from the District's electorate and serve staggered four-year terms. The individual Board members represent the District on other boards, committees and associations.

LGVSD appoints an at-will General Manager to oversee all District operations. The General Manager presently oversees 29 other full-time employees, which includes four senior management support positions: Administrative Services Manager; Collection Systems Maintenance & Safety Manager; District Engineer; and Plant Manager.

Board Meetings are held the first and third Thursday of every month at 4:00 p.m. at the District Office, 101 Lucas Valley Road, Suite 300 in San Rafael. All board meetings are open to the public, and we encourage attendance and participation by our citizens. The Agenda is posted on the bulletin board located outside the Las Gallinas Valley Sanitary District Administration Building. Current and archived meeting agendas and minutes can be viewed by clicking on the Board Meetings Page on the District's website at www.lgvsd.org.

Las Gallinas Valley Sanitary District is a special district, authorized by the Sanitary District Act of 1923, California Health and Safety Code Sections 6400-6941.9

1.6 FINANCING

LGVSD reports its activities as an Enterprise Fund under the broad category of funds called proprietary funds using the full accrual basis of accounting. Expenditures are tracked by department, with each department delineated by function and specific activity, to provide management and the Board with better cost control measures. At the end of each fiscal year, these costs are combined to arrive at the financial position and results of operations reflected in LGVSD's basic financial statements.

LGVSD maintains restricted funds for capital replacement and expansion purposes. The District budgets for the adequate maintenance of capital equipment and facilities to protect the public investment and ensure achievement of their maximum useful life. The District has a sewer system management plan and prepares and adopts at minimum a 5-Year Capital Improvement Program ("CIP") as part of the rate setting process which identifies and sets priorities for all major capital assets to be acquired, constructed, or replaced by the District. The District prepared a 7-Year CIP in 2023/24 which includes flood and sea-level mitigation projects that have been identified to take place after 2028.

LGVSD's total revenues were $20.6 million in FY 2022/23. Revenue sources include rates and charges (85%), non-operating revenue such as property tax and interest (12%), and connection fees and inter-governmental capital contributions (3%).

LGVSD's expenditures were $30.5 million in FY 2022/23. Of this amount, 15% was spent on services and supplies, 20% on salaries and employee benefits, 15% debt service, 17% towards reserve funding, and 33% on capital outlay including the completion of the Secondary Treatment Plant Upgrade and Recycled Water Expansion Project.

LGVSD adopted several policies on maintaining financial reserves. LGVSD held $11.1 million in cash and investments at the end of FY 2022/23 in five reserve funds. LGVSD maintains four restricted funds which serve a specific purpose and for which use is controlled by State law or inter-agency agreements, with a total of $1.0 million in cash and investments at the end of FY 2022/23.

1.7 WEATHER AND CLIMATE

The Las Gallinas Valley Sanitary District summers are long, comfortable, arid, and mostly clear and the winters are short, cold, wet, and partly cloudy. Over the course of the year, the temperature typically varies from 48°F to 62°F and is rarely below 43°F or above 75°F. The difference in precipitation between the driest month and the wettest month is 5 inches. The annual rainfall is 18 inches. The month of highest relative humidity is February (79 %). The month with the lowest relative humidity is June (66 %). The month which sees the most rainfall is January. The driest month of the year is July.

	January	February	March	April	May	June	July	August	September	October	November	December

1.8 Social Vulnerability and Risk

The California Governor's Office of Emergency Services (Cal OES) has initiated the "Prepare California" grant program focused on building community resilience amongst vulnerable individuals living in the areas of the state most susceptible to natural disasters. The Prepare California Initiative is aimed at reducing long-term risks from natural disasters by investing in local capacity building and mitigation projects designed to protect communities.

Prepare California leverages funds approved in Governor Gavin Newsom's 2021-22 State Budget and is designed to unlock federal matching funds for community mitigation projects that vulnerable communities would otherwise be unable to access. This program is intended for communities that are the most socially vulnerable and at the highest risk for future natural hazard events. The state identified communities by prioritizing California census tracts according to their estimated hazard exposures and social vulnerability.

The National Risk Index is a dataset and online tool to help illustrate the United States communities most at risk for 18 natural hazards: Avalanche, Coastal Flooding, Cold Wave, Drought, Earthquake, Hail, Heat Wave, Hurricane, Ice Storm, Landslide, Lightning, Riverine Flooding, Strong Wind, Tornado, Tsunami, Volcanic Activity, Wildfire, and Winter Weather.

For purposes of this plan the following National Risk Index (NRI) hazards are profiled in support of eight of the twelve Marin County MJHMP Hazards. NRI data was not available for Dam Failure, Land Subsidence, Levee Failure, or Sea Level Rise.

Table 3: NRI Hazards and Marin County MJHMP Hazards	
NRI Hazards	Marin County MJHMP Hazards
Earthquake	Earthquake
Riverine Flooding	Flooding
Coastal Flooding	Flooding
Wildfire	Wildfire

Table 125: NRI Hazards and Marin County MJHMP Hazards
Source: FEMA National Risk Index 2023

The National Risk Index leverages available source data for Expected Annual Loss due to these 18 hazard types, Social Vulnerability, and Community Resilience to develop a baseline relative risk measurement for each United States county and Census tract. These measurements are calculated using average past conditions, but they cannot be used to predict future outcomes for a community. The National Risk Index is intended to fill gaps in available data and analyses to better inform federal, state, local, tribal, and territorial decision makers as they develop risk reduction strategies.

Calculating the Risk Index

Risk Index scores are calculated using an equation that combines scores for Expected Annual Loss due to natural hazards, Social Vulnerability and Community Resilience:
Risk Index = Expected Annual Loss × Social Vulnerability ÷ Community Resilience

Hazard Type Risk Index

Hazard type Risk Index scores are calculated using data for only a single hazard type, and reflect a community's Expected Annual Loss value, community risk factors, and the adjustment factor used to calculate the risk value.

The following Tables and Figures illustrates the NRI Hazard Type Risk Index and the Social Vulnerability Map for the Las Gallinas Valley Sanitary District for the various Census Tracts within their service area.

Table 4: NRI Hazard Type Risk Index Census Tract 1150.00						
Hazard Type	**EAL Value**	**Social Vulnerability**	**Community Resilience**	**CRF**	**Risk Value**	**Score**
Earthquake	$1,405,941	Relatively Low	Very High	0.92	$1,286,817	93.1

Social Vulnerability in Marin County and the Las Gallinas Valley Sanitary District

Most socially vulnerable residents in Marin County OA reside in parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and

the unincorporated areas of Marin City and Santa Venetia. This aligns with what the County knows about Marin residents. However, discrepancy lies in the western, more rural area of the county. West Marin is comprised of seven villages, and other populated areas, that are distanced from the centralized resources in the eastern part of the county. At three local elementary schools in West Marin (2022-2023 school year), students eligible for free and reduced lunch program are, 62%, 41%, and 52%, a reflection of the financial capacity of local families. West Marin is home to many farms that may employ and house underrecognized workers that may not have taken part in a census survey, what the SVI is calculated from. In the fourth quarter of FY 2021/22 the bus routes traveling to West Marin (Rural Routes) were the only service category to have increased in ridership since pre-COVID (increase 0.1%; Marin Transit, 2022) showing the reliance of West Marin residents on public transportation; however, this data continues to adjust based upon the increase in alternate methods of mass transportation. Considering this, the County of Marin acknowledges that unique social factors in West Marin require different approaches than other parts of the County.

Looking to the community resilience index (CRI) results, the data is only calculated at the county-level and compared across the nation. As a whole, Marin County is considered to have a "very high" ability to prepare for anticipated natural hazards, adapt to changing conditions, and withstand and recover rapidly from disruptions when compared to the rest of the U.S. Unfortunately, this metric does not give us the distinct experiences of the diverse communities across Marin.

When the Estimated Annual Loss Index, Social Vulnerability Index, and Community Resilience Index are aggregated as one, final results of the National Risk Index show Marin County as a whole to have "Relatively High" risk, this is due to the financial implications a disaster may have on the county. When broken out by census tract, five tracts are in the highest category ("Very High Risk"), this matches generally with the same tracts that are ranked in as higher social vulnerability; parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and unincorporated areas of Santa Venetia.

However, Marin City is ranked as "Very Low" risk for the National Risk Index. Previous discussion highlighted why the Expected Annual Loss was low, but further discussion is required. As a County, we know Marin City should not be classified as "Very Low" on the NRI. Marin City residents, for example, only have one way in and out of their community and this road floods frequently, making it unsafe to cross and leave the community for work, school, medical resources. Additionally, there is only one "grocery" store, a Target, in Marin City. Both of these elements contribute to the vulnerability of residents as they may be unable to leave or return home and have limited access to groceries, relying on a single store's supply chain. At the local elementary school in Marin City, 47% of students are eligible for free and reduced-price meals (2022–2023 school year), a reflection of the financial capacity of local families. All this means, we can expect the social and built capacity of Marin City to be limited.

Although, customers within the Las Gallinas Valley Sanitary District reside within census tracts that have a Social Vulnerability Index of "Relatively Moderate" to "Very High", the Las Gallinas Valley Sanitary District's ability to serve this community is limited to the sanitary services they provide. Their influence may be realized during an emergency by ensuring the continued delivery of sanitary services which are considered a community lifeline. They may also work with these impacted customers to provide fee relief through local, state, and or federal programs

where appropriate. The majority of socially vulnerable population services are provided through the county, state, and federal government or other non-governmental or volunteer agencies or organizations.

1.9 CRITICAL FACILITIES

Collection System

LGVSD provides wastewater collection and treatment services through its own infrastructure supported by an approximate 112-mile collection system with 28 pump stations leading to an advanced secondary-level treatment facility. The collection system is divided between 105 miles of gravity lines and 7 miles of force mains. There are 2,985 manholes and approximately 52.5 miles of privately owned laterals within the District.

Treatment Plant

The District operates a sewage treatment plant with a permitted dry weather average capacity of 2.92 million gallons per day (MGD). The treatment facility was initially constructed in 1955. Major plant expansions were completed in 1958, 1972, 1984 and most recently in 2023. The latter increased treatment capacity to 3.2 million gallons per day. Treated effluent is discharged to Miller Creek, stored, or further processed by LGVSD's recycled water facility.

Recycled Water

The expanded recycled water treatment facilities located at the LGVSD treatment plant allows the District to produce recycled water year-round to meet increasing demand during the dry months in summer and fall. In the past, recycled water was predominately used during the summer months, which aligned with the District's non discharge period of June through October. The District has a water reclamation project on 385 acres of diked bay lands located to the northeast of the treatment plant. The reclamation area includes a 20-acre wildlife marsh pond, 40 acres of storage ponds, 200 acres of irrigated pasture, and 3.5 miles of public trails which are part of the San Francisco Bay Trail. The ponds that are used to hold treated wastewater and the spray fields allow the District to withhold discharge in summer months to San Francisco Bay via Miller Creek.

LGVSD delivers recycled water effluent to two nearby agencies, Marin Municipal Water District and North Marin Water District, which further treats it so that it can be used for irrigation of landscapes, including golf courses and playing/ recreation fields, dual plumbing for toilet flushing, cooling water uses, and car washes within the District's jurisdictional boundaries.

The following list of facilities has been determined to be critical to the ability of the Las Gallinas Valley Sanitary District to fulfill the requirements of its mission during an emergency:

Table 11: Las Gallinas Valley Sanitary District Critical Facilities

Source: Marin County OEM

SECTION 2.0: HAZARD IDENTIFICATION AND RISK ASSESSMENT

The Las Gallinas Valley Sanitary District identified hazards that affect the District and developed natural hazard profiles based upon the countywide risk assessment, past events and their impacts. Figure 16 shows the top hazards that the Jurisdiction is at risk from according to the hazard mitigation Steering Committee.

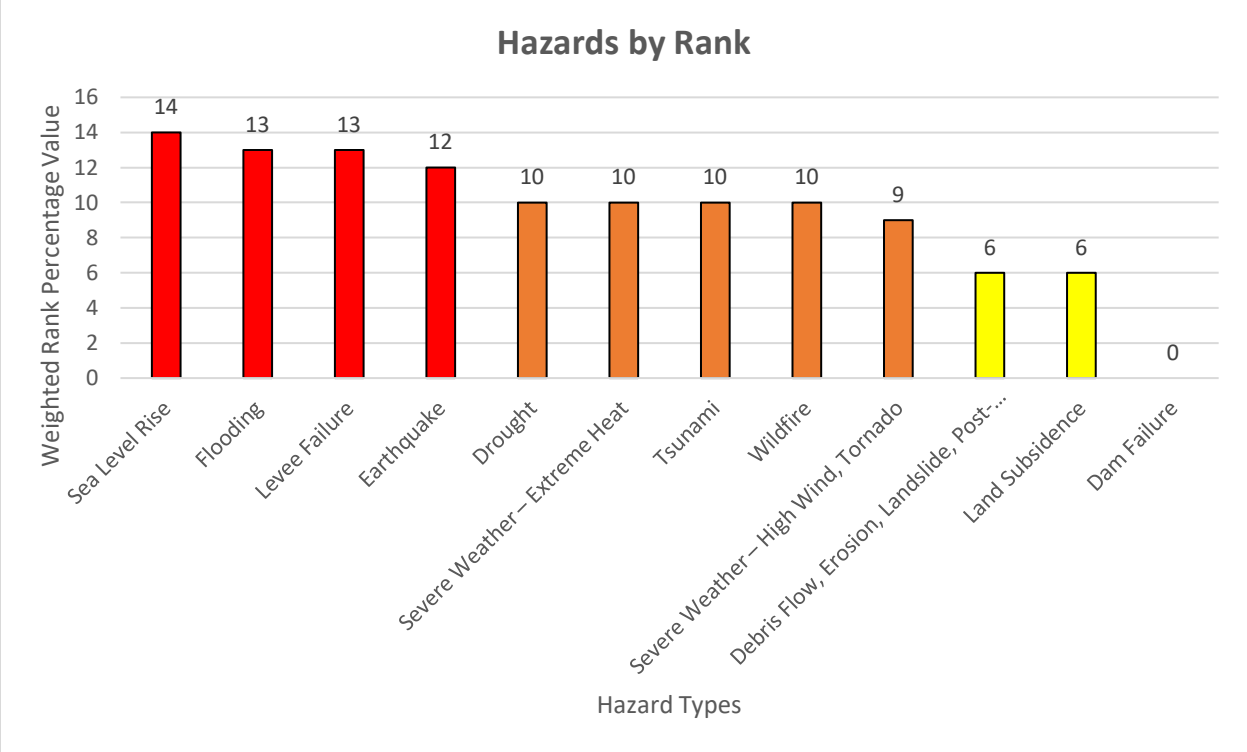

Figure 258: LGVSD Risk Assessment – Planning Team Top Hazards

Figure 17: Risk Rank Categorization	
Risk Level	Risk Numerical Score
High Risk	**12 - 16**
Serious Risk	**8 - 11**
Moderate Risk	**4 - 7**
Low Risk	**1 - 3**

Figure 259: Hazard Risk Categorization

Each Marin County OA MJHMP participating jurisdiction and organization reviewed and approved the Top Hazards identified by the Planning Team. Each participating jurisdiction and organization then completed a more complex assessment tool to further develop their hazard assessment and prioritization.

The planning process used the available FEMA tools to evaluate all the possible threats faced. The primary tool selected was the Hazard Assessment and Prioritization Tool. This matrix allowed the participating jurisdiction or organization to assess their own level of vulnerability and mitigation capability. Each participating Jurisdiction and organization assessed the top hazards for:

- Probability/ Likelihood of Future Events
- Geographic Extent
- Magnitude/ Severity
- Climate Change Influence
- Significance

Probability/ Likelihood of Future Events

- **Unlikely:** Occurs in intervals greater than 100 years - Less than 1% probability of occurrence in the next year or a recurrence interval greater than 100 years.
- **Occasional:** Occurring every 11 to 100 years - 1-10% probability of occurrence in the next year or a recurrence interval of 11 to 100 years.
- **Likely:** Occurring every 1 to 10 years - 10-90% probability of occurrence in the next year or recurrence interval of 1 to 10 years.
- **Highly Likely:** Occurring almost every year - 90-100% probability of occurrence in the next year or a recurrence interval of less than 1 year.

Geographic Extent

- **Negligible:** Less than 10% of the planning area
- **Limited:** 10-25% of the planning area
- **Significant:** 25-75% of planning area
- **Extensive:** 75-100% of planning area

Magnitude/ Severity

- **Weak:** Limited classification on scientific scale, slow speed of onset or short duration of event, resulting in little to no damage.
- **Moderate:** Moderate classification on scientific scale, moderate speed of onset or moderate duration of event, resulting in some damage and loss of services for days.
- **Severe:** Severe classification on scientific scale, fast speed of onset or long duration of event, resulting in devastating damage and loss of services for weeks or months.
- **Extreme:** Extreme classification on scientific scale, immediate onset or extended duration of event, resulting in catastrophic damage and uninhabitable conditions.

Table 12: Select Hazards Magnitude and Severity Scale					
Hazard	**Scale/Index**	**Weak**	**Moderate**	**Severe**	**Extreme**
Drought	Palmer Drought Severity Index	+1.99 to -1.99	-2.00 to -2.99	-3.00 to -3.99	-4.00 and below
Earthquake	Modified Mercalli	I to IV	V to VII	VIII	IX to XII
	Richter Magnitude	2,3	4,5	6	7,8
Tornado	Fujita Tornado Damage Scale	FO	F1, F2	F3	F4, F5

Table 134: Select Hazards Magnitude/ Severity Scale or Index

Climate Change Influence

- **Low:** Minimal potential impact
- **Medium:** Moderate potential impact

- **High:** Widespread potential impact

Significance

- **Low:** Minimal potential impact - Two or more criteria fall in lower classifications, or the event has a minimal impact on the planning area. This rating is sometimes used for hazards with a minimal or unknown record of occurrences or for hazards with minimal mitigation potential.
- **Medium:** Moderate potential impact - The criteria fall mostly in the middle ranges of classifications and the event's impacts on the planning area are noticeable but not devastating. This rating is sometimes used for hazards with a high extent rating but very low probability rating.
- **High:** Widespread potential impact - The criteria consistently fall in the high classifications and the event is likely/highly likely to occur with.

2.1 CLIMATE CHANGE

The County of Marin and associated jurisdictions profiled jointly recognize that the earth's climate is forcibly being augmented due to humans' reliance on fossil fuels and non-natural resources which pose negative impacts on the earth's climate. Reliance on fossil fuels and non-natural products results in the climate shifting to include unseasonable temperatures, more frequent and intense storms, prolonged heat and cold events, and a greater reliance on technological advancements to maintain the wellbeing of community members and balance of the environment. The forced adaptation to climatic shifts is necessary for the County and jurisdictions to understand and include with these assessments.

Locally to Marin, drought and rain events have already had devastating impacts to critical infrastructure, agriculture, and water resources; and globally, unseasonable temperatures have been identified as the cause for enhanced wildfires, severe droughts, ice sheets and glaciers disappearing, and persons emigrating from their countries due to a lack of sustainable, local resources. Melting land ice contributes additional water to the oceans and as ocean temperatures rise the water expands, both of which contribute to increase rates of sea level rise. Marin is bordered on the west by the Pacific Ocean and on the east by San Francisco Bay, making it particularly vulnerable to flooding and erosion caused by sea level rise.

The cause of current climate change is largely human activity, burning fossil fuels, natural gas, oil, and coal. Burning these materials releases greenhouse gases into Earth's atmosphere. Greenhouse gases trap heat from the sun's rays inside the atmosphere causing Earth's average temperature to rise. This rise in the planet's temperature was formerly called, "global warming", but climate change has shown to include both intense heat and cold shifts. The warming of the planet impacts local and regional climates. Throughout Earth's history, climate has continually changed; however, when occurring naturally, this is a slower process that has taken place over hundreds and thousands of years. The human influenced climate change that is happening now is occurring at an abnormally faster rate with devastating results.

GLOBAL OBSERVED AND PROJECTED IMPACTS AND RISKS

Source: Intergovernmental Panel on Climate Change, Headline Statements from the Summary for Policymakers, 2022

- Human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability.
- Global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans.
- Beyond 2040 and depending on the level of global warming, climate change will lead to numerous risks to natural and human systems.
- The magnitude and rate of climate change and associated risks depend strongly on near-term mitigation and adaptation actions, and projected adverse impacts and related losses and damages escalate with every increment of global warming.
- Multiple climate hazards will occur simultaneously, and multiple climatic and non-climatic risks will interact, resulting in compounding overall risk and risks cascading across sectors and regions.

FUTURE TRENDS/ IMPACTS

Source: Study Confirms Climate Models are Getting Future Warming Projections Right – Climate Change: Vital Signs of the Planet (nasa.gov)

Global Warming

- If global warming transiently exceeds 1.5°C in the coming decades or later, then many human and natural systems will face additional severe risks.
- An estimated 60% of today's methane emissions are the result of human activities. The largest sources of methane are agriculture, fossil fuels, and decomposition of landfill waste.
- The concentration of methane in the atmosphere has more than doubled over the past 200 years. Scientists estimate that this increase is responsible for 20 to 30% of climate warming since the Industrial Revolution (which began in 1750).
- According to the most recent National Climate Assessment, droughts in the Southwest and heat waves (periods of abnormally hot weather lasting days to weeks) are projected to become more intense, and cold waves less intense and less frequent.
- The last eight years have been the hottest years on record for the globe.

Drought

- A NASA-led study in 2022 concluded that the 22-year-long megadrought in southwestern US was the driest the territory had experienced in at least 1,200 years and was expected to persist through at least 2022.

Sea Level Rise

- Global sea levels are rising as a result of human-caused global warming, with recent rates being unprecedented over the past 2,500-plus years.
- U.S. Sea Level Likely to Rise 1 to 6.6 Feet by 2100.
- Global sea level has risen about 8 inches (0.2 meters) since reliable record-keeping began in 1880. By 2100, scientists project that it will rise at least another foot (0.3 meters), but possibly as high as 6.6 feet (2 meters) in a high-emissions scenario.

- Sea ice cover in the Arctic Ocean is expected to continue decreasing, and the Arctic Ocean will very likely become essentially ice-free in late summer if current projections hold. This change is expected to occur before mid-century.
- An indicator of changes in the Arctic sea ice minimum over time. Arctic sea ice extent both affects and is affected by global climate change.

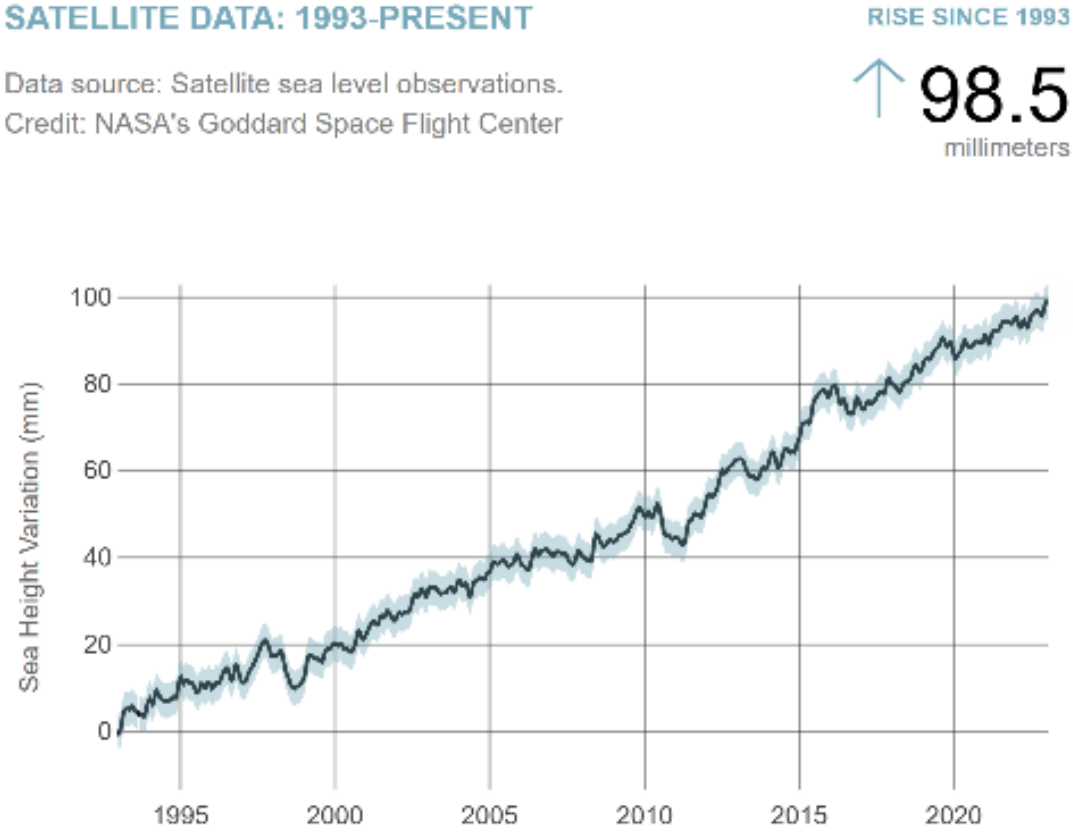

Figure 262: NASA Global Temperature Change Sea Level
Source: NASA Global Climate Change, 2022

Wildfire

- Warming temperatures have extended and intensified wildfire season in the West, where long-term drought in the region has heightened the risk of fires.
- Scientists estimate that human-caused climate change has already doubled the area of forest burned in recent decades. By around 2050, the amount of land consumed by wildfires in Western states is projected to further increase by two to six times.
- Even in traditionally rainy regions like the Southeast, wildfires are projected to increase by about 30%.

Flooding (Precipitation)

- Climate change is having an uneven effect on precipitation (rain and snow) in the United States, with some locations experiencing increased precipitation and flooding, while others suffer from drought.
- On average, more winter and spring precipitation is projected for the northern United States, and less for the Southwest, over this century.

- Projections of future climate over the U.S. suggest that the recent trend toward increased heavy precipitation events will continue. This means that while it may rain less frequently in some regions (such as the Southwest), when it does rain, heavy downpours will be more common.

Extreme Cold

- The length of the frost-free season, and the corresponding growing season, has been increasing since the 1980s, with the largest increases occurring in the western United States.

According to the California Natural Resource Agency (CNRA), climate change is already affecting California and is projected to continue to do so well into the foreseeable future. Current and projected changes include increased temperatures, sea level rise, a reduced winter snowpack, altered precipitation patterns, and more frequent storm events. Over the long term, reducing greenhouse gases can help make these changes less severe, but the changes cannot be avoided entirely. Unavoidable climate impacts result in a variety of secondary consequences including detrimental impacts on human health and safety, economic continuity, ecosystem integrity and provision of basic services. Climate change is being profiled in the 2023 Marin County Hazard Mitigation Plan as a standalone hazard while addressing each of the other natural hazards. Marin County is considering climate change issues when identifying future mitigation actions.

California is experiencing a climate crisis that is increasingly taking a toll on the health and well-being of its people and on its unique and diverse ecosystems. Every Californian has suffered from the effects of record high temperatures, dry winters, prolonged drought, and proliferating wildfires in recent years. California's biodiversity is threatened as alterations to habitat conditions brought about by a changing climate are occurring at a pace that could overwhelm the ability of plant and animal species to adapt.

Indicators of Climate Change in California

Source: 2022 Report: Indicators of Climate Change in California | OEHHA

- Since 1895, annual average air temperatures in California have increased by about 2.5 degrees Fahrenheit (°F). Warming occurred at a faster rate beginning in the 1980s.
- Recent years have been especially warm: Eight of the ten warmest years on record occurred between 2012 and 2022; 2014 was the warmest year on record.
- Of all the Western states, California endured the hottest temperatures for the longest time, driving the average statewide temperature to the second warmest over the past 128 years.
- Extreme heat ranks among the deadliest of all climate-driven hazards in California, with physical, social, political, and economic factors effecting the capacity of individuals, workers, and communities to adapt, and with the most severe impacts often on communities who experience the greatest social and health inequities.
- Glaciers have essentially disappeared from the Trinity Alps in Northern California
- In 2020, wildfire smoke plumes were present in each county for at least 46 days.
- The 2022 fire season saw more fires than the previous fire season along with continued extreme drought and heat conditions.

- The drought, begun in 2019, was the third statewide drought declared in California since 2000.
- This drought has been marked by extreme swings; the state received record-breaking amounts of precipitation in October and December 2021 that were offset by the driest January, February, and March 2022 dating back more than 100 years. The year 2023 opened with California simultaneously managing both drought and flood emergencies.
- A series of storms in late December 2022 and early January 2023 broke rural levees, disrupted power, flooded roads, downed trees, and eroded coastal land.
- Sea level rise accelerates coastal erosion, worsens coastal flooding during large storms and peak tidal events, and impacts important infrastructure positioned along our state's 1,100-mile coast.
- The western drought which impacted all of California and the western United States was nearly lifted due to unseasonably heavy rains in late 2022 and early 2023.

The graph below shows the relative change, in millimeters, in sea levels at Crescent City (1933-2020), San Francisco (1900-2020), and La Jolla (1925-2020).

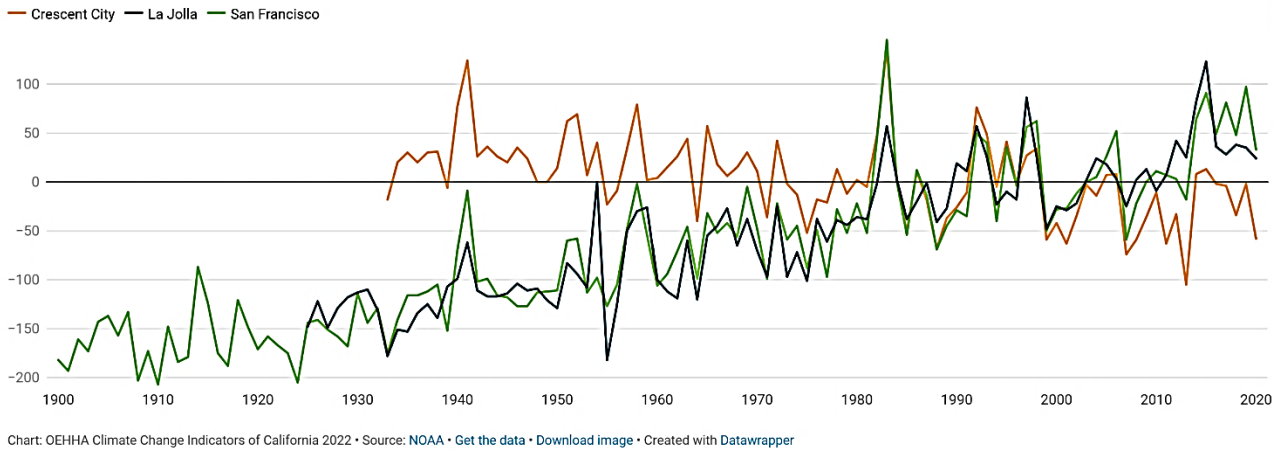

Figure 263: Annual Mean Sea Level Trends

Climate Change in the Marin County Operational Area

Climate change is already having significant impacts across California. Temperatures are warming, heat waves are more frequent, and precipitation has become increasingly variable. Climate change will continue to alter Marin County OA ecosystems as a result of rising temperatures, changes in precipitation, and sea level rise, which will increase the severity and occurrence of natural hazards across the Marin County OA well into the future. Coastal cooling processes that keep temperatures down, such as fog, will continue to decrease. Rising temperatures will exacerbate drought conditions and raise the potential for significant wildfires and associated smoke as vegetation becomes drier and tree mortality increases. Forested woodlands that play a major role in carbon reduction will gradually transition into chaparral and shrublands. There will be more extreme storms and weather events, including expanded heat waves and increased rain events with changes in precipitation. Significant rain events will lead to an increase in flooding and the potential for severe landslides. Shoreline communities will become inundated with sea level rise, storm surge, and high tide events. Marshlands and wetlands that act as natural storm barriers will disappear as they transition into open water. Notable impacts from climate change that are already evident in the Marin County OA and surrounding region as identified in a 2020 Marin County Civil Grand Jury Report include:

- From 1895-2018, the average temperature in Marin County increased by 2.3 degrees Fahrenheit.
- Over the past century, sea level rise in the San Francisco Bay Area rose by eight inches and has accelerated rapidly since 2011.
- The threat of wildfires in 2019 was so severe that Pacific Gas and Electric shut off electric power to the County for multiple days.

Climate change will continue to affect homes, businesses, infrastructure, utilities, transportation systems and agriculture across the Marin County OA. The risk to socially vulnerable populations will increase as they feel the immediate impacts of climate change more significantly and are less able to adapt to climate change and recover from its impacts.

The Marin County OA has adopted numerous planning initiatives and mitigation measures to help combat the effects of climate change across the OA. The Marin Climate Energy Partnership (MCEP), which is a partnership program of Marin County jurisdictions, the County, and Marin County regional agencies, adapted a model Climate Action Plan (CAP) that is intended to support countywide implementation efforts and is currently being used to update additional climate action plans for other jurisdictions in Marin County. The CAP supports the Climate Action Plan for the unincorporated County, which was completed in 2020. The MCEP also collects data and report on progress in meeting each County jurisdictions' individual greenhouse gas emission targets. In October 2022, the County published the Greenhouse Gas Inventory for Unincorporated Community Emissions for the Year 2020. Marin County OA jurisdictions have already met their greenhouse reduction goals for 2020 and are about halfway to meeting the statewide goal to reduce emissions 40% below 1990 levels by the year 2030. Marin County also formed a Sea Level Marin Adaptation Response Team in 2018 and had a Sea Level Rise Vulnerability Assessment and associated Adaptation Report completed for the County and each of its jurisdictions in 2017 as part of their Bay Waterfront Adaptation and Vulnerability Evaluation. Additional Marin County OA climate change mitigation initiatives

include Marin Clean Energy, Electrify Marin, the Marin Solar Project, the Marin Energy Watch Partnership, Resilient Neighborhoods, and Drawdown: Marin.

2.2 HAZARDS

Of the hazards profiled in the Marin County OA MJHMP, those noted in the table are specific for the Las Gallinas Valley Sanitary District as per the planning team.

Table 13: LGVSD Hazard Risk Assessment						
Hazard	Probability/ Likelihood of Future Events	Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Debris Flow	Occasional	Negligible	Weak	Low	Low	**6.00**
Drought	Likely	Limited	None	High	Medium	**10.00**
Earthquake	Occasional	Extensive	Extreme	None	Medium	**12.00**
Flooding	Likely	Significant	Moderate	Medium	High	**13.00**
Land Subsidence	Occasional	Negligible	Weak	Low	Low	**6.00**
Levee Failure	Unlikely	Significant	Severe	High	High	**13.00**
Sea Level Rise	Likely	Significant	Moderate	High	High	**14.00**
Severe Weather – Extreme Heat	Highly Likely	Negligible	Weak	High	Low	**10.00**
Severe Weather – High Wind/Tornado	Likely	Negligible	Weak	Medium	Medium	**9.00**
Tsunami	Unlikely	Extensive	Severe	None	Medium	**10.00**
Wildfire	Likely	Negligible	Moderate	Medium	Medium	**10.00**

2.2.1 Debris Flows

For the purposes of the Marin County OA MJHMP, debris flows are classified as landslides (including rockslides) and mud flows.

A landside is the breaking away and gravity-driven downward movement of hill slope materials, which can travel at speeds ranging from fractions of an inch per year to tens of miles per hour depending on the slope steepness and water content of the rock/soil mass. Landslides range from the size of an automobile to a mile or more in length and width and, due to their sheer weight and speed, can cause serious damage and loss of life. The rate of a landslide is affected by the type and extent of vegetation, slope angle, degree of water saturation, strength of the rocks, and the mass and thickness of the deposit. Some of the natural causes of this instability are earthquakes, weak materials, stream and coastal erosion, and heavy rainfall. In addition, certain human activities tend to make the earth materials less stable and increase the chance of ground failure. These activities include extensive irrigation, poor drainage or groundwater withdrawal, removal of stabilizing vegetation and over-steepening of slopes by undercutting them or overloading them with artificial fill. These activities can cause slope failure, which normally produce landslides.

Landslide material types are often broadly categorized as either rock or soil, or a combination of the two for complex movements. Rock refers to hard or firm bedrock that was intact and in

place prior to slope movement. Soil, either residual or transported material, means unconsolidated particles. The distinction between rock and soil is most often based on interpretation of geomorphic characteristics within landslide deposits, but can also be inferred from geologic characteristics of the parent material described on maps or in the field. Landslide movements are also based on the geomorphic expression of the landslide deposit and source area, and are categorized as falls, topples, spreads, slides, or flows. Falls are masses of soil or rock that dislodge from steep slopes and free fall. Topples move by the forward pivoting of a mass around an axis below the displaced mass. Lateral spreads move by horizontal extension and shear or tensile fractures. Slides displace masses of material along one or more discrete planes and can either be rotational or transitional. Flows mobilize as a deforming, viscous mass without a discrete failure plane.

Natural conditions that contribute to landslide include the following:

- Degree of slope
- Water (heavy rain, river flows, or wave action)
- Unconsolidated soil or soft rock and sediments
- Lack of vegetation (no stabilizing root structure)
- Previous wildfires and other forest disturbances
- Earthquake

In addition, many human activities tend to make the earth materials less stable and, thus, increase the chance of ground movement. Human activities contribute to soil instability through grading of steep slopes or overloading them with artificial fill, by extensive irrigation, construction of impermeable surfaces, excessive groundwater withdrawal, and removal of stabilizing vegetation.

Another hazard related to landslide and erosion is the fall of a detached mass of rock from a cliff or down a very steep slope (rockfall). Weathering and decomposition of geological materials produce conditions favorable to rockfalls. Other causes include ice wedging, root growth, or ground shaking (earthquake). Destructive landslides and rockfalls usually occur very suddenly with little or no warning time and are short in duration.

Landslide susceptibly can be characterized by looking at both slope class and rock strength. Landslide susceptibility classes express the generalization that on very low slopes, landslide susceptibility is low even in weak rock, and that landslide susceptibility increases with slope and in weaker rocks. Very high landslide susceptibility includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks. Figure 22 shows landslide susceptibility classes.

Landslides can cause high mortality and injuries from rapidly flowing water and debris. The most common cause of death in a landslide is trauma or suffocation by entrapment. Broken power, water, gas or sewage pipes can also result in injury or illness in the population affected, such as water-borne diseases, electrocution or lacerations from falling debris. People affected by landslides can also have short- and long-term mental health effects due to loss of family, property, livestock or crops. Landslides can also greatly impact the health system and essential services, such as water, electricity or communication lines.

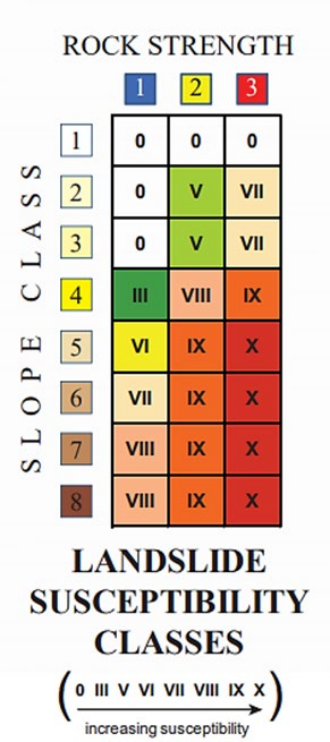

Figure 264: Landslide Susceptibility Classes
Source: USGS

A mud flow is a general term for a mass-movement landform and process characterized by a flowing mass of fine-grained earth material with a high degree of fluidity. Heavy rainfall, snowmelt, or high levels of groundwater flowing through cracked bedrock may trigger a movement of soil or sediments. Floods and debris flows may also occur when strong rains on hill or mountain slopes cause extensive erosion and/or what is known as "channel scour". Some broad mud flows are rather viscous and therefore slow; others begin very quickly and continue like an avalanche. Mud flows are composed of at least 50% silt and clay-sized materials and up to 30% water.

The point where a muddy material begins to flow depends on its grain size and the water content. Fine grainy material or soil has a smaller friction angle than a coarse sediment or a debris flow, but falling rock pieces can trigger a material flow, too. When a mud flow occurs it is given four named areas, the 'main scarp', in bigger mud flows the 'upper and lower shelves', and the 'toe'. See Figure 25 for the typical areas of a mud flow, with shelves (right) and without (left). The main scarp will be the original area of incidence, the toe is the last affected area(s). The upper and lower shelves are located wherever there is a large dip (due to mountain or natural drop) in the mud flow's path. A mud flow can have many shelves.

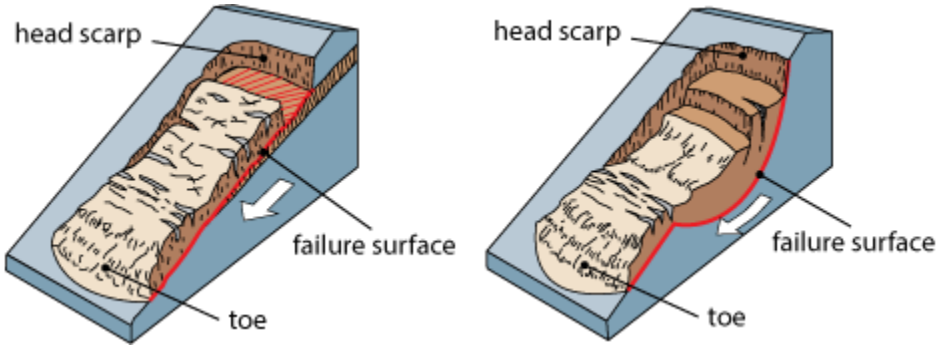

Figure 265: Mud Flow Areas
Source: Washington Department of Natural Resources

If large enough, mud flows can devastate villages and country-sides. Mud flows are common in mountain areas prone to wildfire, where they have destroyed many homes built on hillsides without sufficient support after fires destroy vegetation holding the land. The area most generally recognized as being at risk of a dangerous mud flow are:

- Areas where wildfires or human modification of the land have destroyed vegetation
- Areas where landslides have occurred before
- Steep slopes and areas at the bottom of slopes or canyons
- Slopes that have been altered for construction of buildings and roads
- Channels along streams and rivers
- Areas where surface runoff is directed

A landslide in the LGVSD would most likely occur in any of the open spaces throughout the District where the terrain is steeper and is more susceptible to movement of hill slope materials. Most of the critical facilities in the District lie outside these areas, with the exception of the John Duckett Pump Station which lies in an area of high landslide susceptibility. The McInnis Park Pump Station and the six Captain Cove Pump Stations lie in area with some landslide susceptibility.

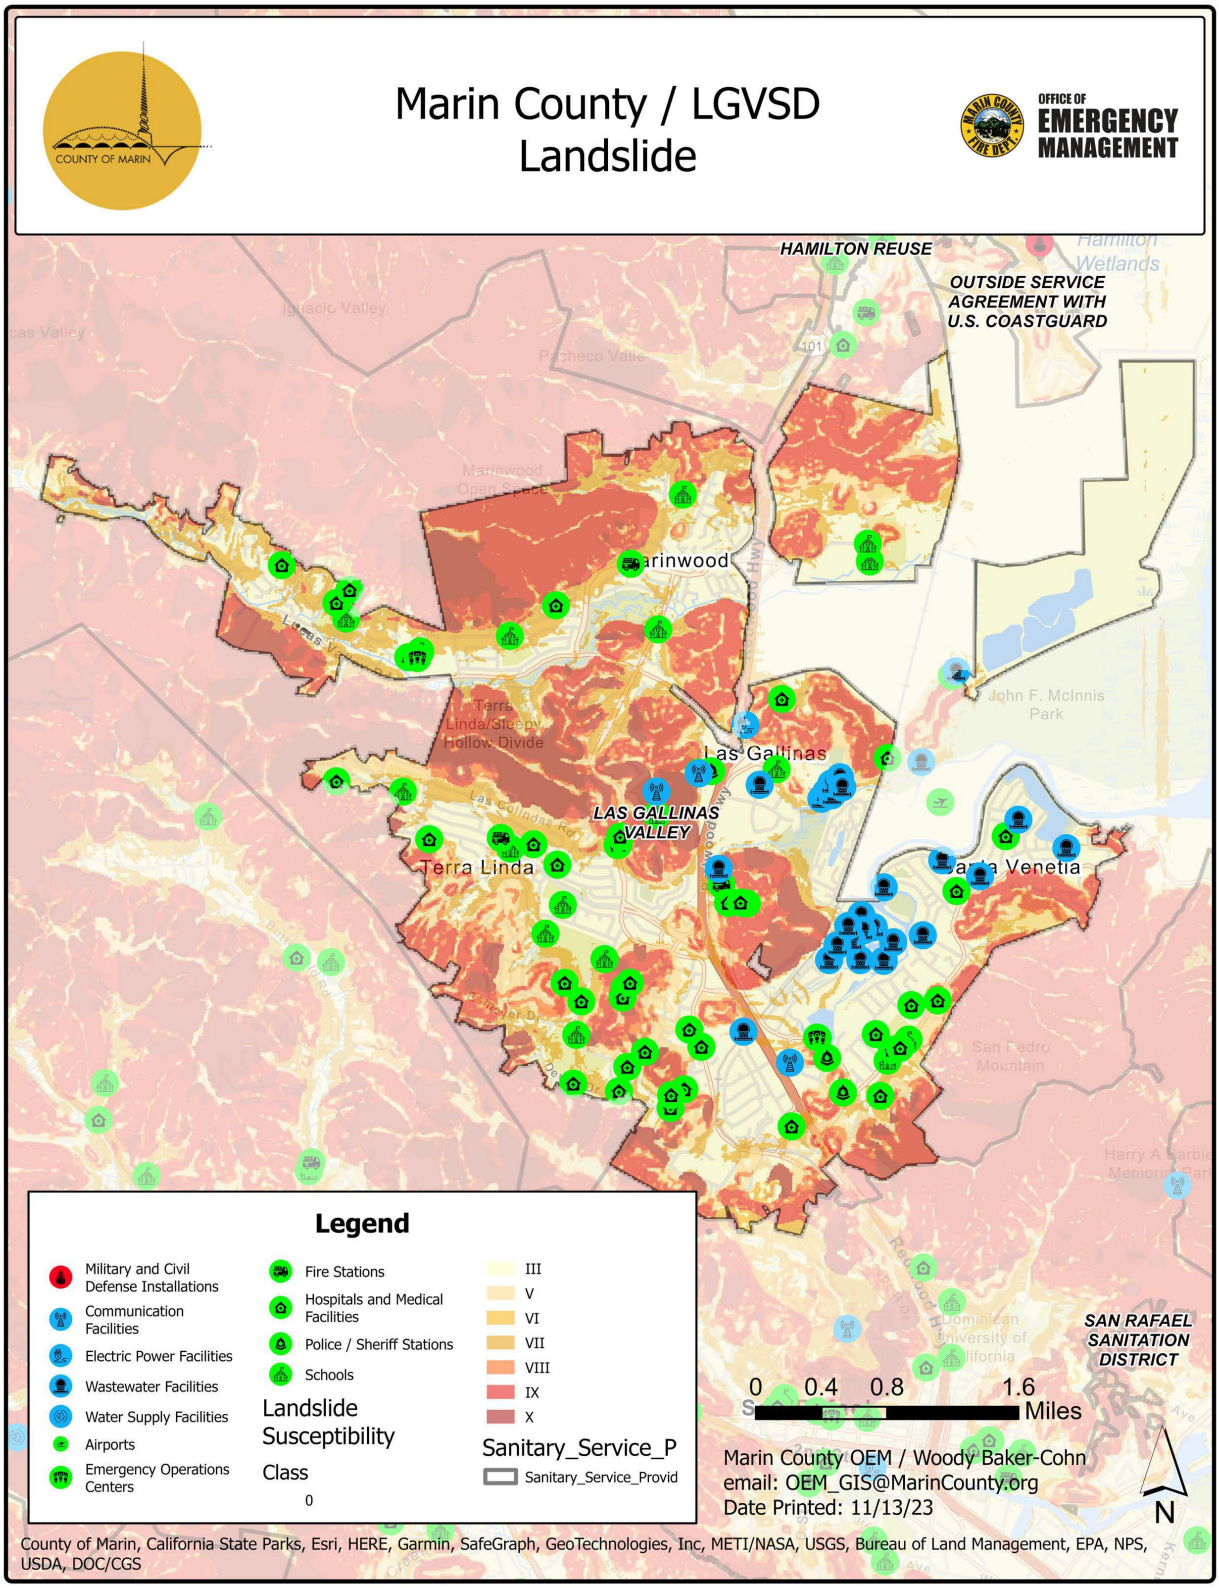

Figure 266: LGVSD Debris Flow Critical Facilities and Infrastructure
Source: Marin County OEM

A landslide having major impacts on any of the critical facilities in the District could affect the provision of District services. An earthquake has the potential to cause landslides throughout this area. A wildfire and subsequent rain event in any of the open spaces in the District could contribute to debris flows throughout the District, including along Gallinas Creek and the South Fork of Gallinas Creek. There have been no recorded debris flows in the District.

Climate Change and Future Development Considerations

Extreme storm events and more frequent wildfires as a result of climate change have the potential to increase the amount and severity of landslides, including disastrous debris flows. Climate change is leading to more volatile precipitation patterns around the world with very dry stretches punctuated by storms that drop large amounts of rain in a short amount of time. Landslides in wetter regions of California, including the Marin County OA, move on average faster and farther downhill during rainy periods compared to drought years, according to a 2022 study by the American Geophysical Union (AGU)[18], showing the increased potential for landslides in the Marin County OA in rainy years. As development increases in the numerous canyons and around the many open spaces of the Marin County OA, the potential for significant impacts from a landslide and/or mudflow increases. Further development of the residential areas of the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent that have a higher landslide susceptibility will expose more people and property to landslide risk. With increased wildfire potential as a result of climate change, more residents in the District service area could be susceptible to post-fire debris flows. This includes Miller Creek in the unincorporated County areas of Lucas Valley and Marinwood. Future development should take into account the movement of mud and debris in waterways after a major rain event. Adequate space adjacent to susceptible waterways should be maintained free of development to allow for the passage of mud and debris, and catchment basins should be built in these areas to help capture any excess mud and debris.

2.2.2 DROUGHT

A drought is a deficiency in precipitation over an extended period, usually a season or more, resulting in a water shortage causing adverse impacts on vegetation, animals, and/or people. It is a normal recurrent feature of climate that occurs in virtually all climate zones, from very wet to very dry. Drought is a temporary aberration from normal climatic conditions and can thus vary significantly from one region to another. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Drought is a complex issue involving many factors—it occurs when a normal amount of moisture is not available to satisfy an area's usual water-consuming activities.

There are several types of drought which can often be defined regionally based on its effects:

- Meteorological drought is usually defined by a period of below average water supply, based on the degree of dryness (in comparison to normal or average) and the duration of the dry period. Drought onset generally occurs with a meteorological drought.

[18] Landslide Sensitivity and Response to Precipitation Changes in Wet and Dry Climates. https://agupubs.onlinelibrary.wiley.com/doi/10.1029/2022GL099499

- Agricultural drought occurs when there is an inadequate water supply to meet the needs of the state's crops and other agricultural operations such as livestock. Agricultural drought links various characteristics of meteorological (or hydrological) drought to agricultural impacts, focusing on precipitation shortages, soil water deficits, reduced ground water or reservoir levels needed for irrigation.
- Hydrological drought is defined as deficiencies in surface and subsurface water supplies. It is generally measured as stream flow, snowpack, and as lake, reservoir, and groundwater levels. Hydrological drought usually occurs following periods of extended precipitation shortfalls.
- Socioeconomic drought occurs when a drought impacts health, well-being, and quality of life, or when a drought starts to have an adverse economic impact on a region.

Drought can occur in all areas of the LGVSD, though its effects would be most felt in the mountainous areas where the risk of wildfire would increase. There are no District critical facilities in these areas. The wetland areas of the District, particularly the marshlands in Las Gallinas and Santa Venetia, could become drier during prolonged period of drought and experience marshland fires that could impact the District's critical facilities. Low water levels due to drought could impact the operability of the District's critical facilities, including its pump stations.

Climate Change and Future Development Considerations

Climate change increases the odds of worsening drought. Warmer temperatures enhance evaporation, which reduces surface water and dries out soils and vegetation. This makes periods with low precipitation in the summer drier than they would be in cooler conditions. Climate also alters the timing of water availability as warmer winter temperatures cause less precipitation to fall. During droughts, communities in the Marin County OA including in the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent may have limited access to water for household use, including drinking, cooking, cleaning, and watering plants, as well as for agriculture, transportation, and power generation. Drought may lead to higher water costs, rationing, or even the decimation of important water sources like wells in the Marin County OA. As more people move into the Marin County OA, including the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent additional strain will be placed on the OA's water supply. Drought can affect livestock and crops in the Marin County OA, impacting its economy. Drought can increase the occurrence and severity of wildfires and tree mortality in the Marin County OA including in the open spaces in and around the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent. Impacts to residents and infrastructure from wildfire as a result of drought will increase as more development occurs in the mountainous areas of the Marin County OA including the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent where wildfires are more likely to occur. Drought also has the potential to dry out the marshlands along the shoreline of the District in the City of San Rafael and the unincorporated County areas of Santa Venetia St. Vincent, increasing the chances of brush fires there. Future development in this area and in the mountainous areas of the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent could expose people to drier summer conditions that could increase

their vulnerability to wildfire. Drought also increases the amount of carbon dioxide in the atmosphere, including by decreasing land productivity, which reduces the amount of vegetation storing carbon dioxide. In addition, increases in drought-related wildfire and soil erosion can release carbon dioxide sequestered in trees and plants back into the atmosphere. This will only worsen climate change for the Marin County OA into the future. When considering future development, the Marin County OA including the LGVSD, the City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent can help prepare for both future droughts and climate change by practicing and promoting water conservation and enhancing water efficiency throughout landscapes, city plans, and water infrastructure. The Marin County OA can also identify alternative water supplies, create drought emergency plans, and encourage farmers to plant drought-resistant crops.

2.2.3 EARTHQUAKE

Earthquakes are sudden rolling or shaking events caused by movement under the earth's surface. Earthquakes happen along cracks in the earth's surface, called fault lines, and can be felt over large areas, although they usually last less than one minute.

The amount of energy released during an earthquake is usually expressed as a magnitude and is currently measured by seismologists on the Moment Magnitude (Mw Scale). The Mw Scale was developed to succeed the previously used Richter Scale and is measured on a scale of zero to ten with increasing values reflecting increasing intensity.

The other commonly used measure of earthquake severity is intensity, which is an expression of the amount of shaking at any given location on the ground service. Intensity is most commonly measured on the Modified Mercalli Intensity (MMI) Scale (see Figure 27).

Intensity	Shaking	Description/Damage
I	Not felt	Not felt except by a very few under especially favorable conditions.
II	Weak	Felt only by a few persons at rest,especially on upper floors of buildings.
III	Weak	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Light	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Moderate	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Strong	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Very strong	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Severe	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Violent	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	Extreme	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.

Figure 267: Modified Mercalli Intensity Scale
Source: USGS

Figure 28 gives intensities (measured on the MMI scale) that are typically observed at locations near the epicenter or earthquakes of different magnitudes.

Richter Magnitude Scale	Typical Maximum Modified Mercalli Intensity Scale
1.0 – 2.9	I
3.0 – 3.9	II – III
4.0 – 4.9	IV – V
5.0 – 5.9	VI – VII
6.0 – 6.9	VII – IX
7.0 or higher	VIII or higher

Figure 268: Mercalli Scale vs. Magnitude
Source: USGS

The extent of ground shaking also depends in large part on how soft the underlying soil is. Soft soils amplify ground shaking (see Figure 29). This was observed during the 1989 Loma Prieta Earthquake when the most significant damages experienced in San Francisco were in the Marina District, which was built on fill.

Soil type A	Vs > 1500 m/sec	Includes unweathered intrusive igneous rock. Occurs infrequently in the bay area. We consider it with type B (both A and B are represented by the color blue on the map). Soil types A and B do not contribute greatly to shaking amplification.
Soil type B	1500 m/sec > Vs > 750 m/sec	Includes volcanics, most Mesozoic bedrock, and some Franciscan bedrock. (Mesozoic rocks are between 245 and 64 million years old. The Franciscan Complex is a Mesozoic unit that is common in the Bay Area.)
Soil Type C	750 m/sec > Vs > 350 m/sec	Includes some Quaternary (less than 1.8 million years old) sands, sandstones and mudstones, some Upper Tertiary (1.8 to 24 million years old) sandstones, mudstones and limestone, some Lower Tertiary (24 to 64 million years old) mudstones and sandstones, and Franciscan melange and serpentinite.
Soil Type D	350 m/sec > Vs > 200 m/sec	Includes some Quaternary muds, sands, gravels, silts and mud. Significant amplification of shaking by these soils is generally expected.
Soil Type E	200 m/sec > Vs	Includes water-saturated mud and artificial fill. The strongest amplification of shaking due is expected for this soil type.

Figure 269: Soil Types
Source: USGS

An earthquake fault is defined as "a fracture or fracture zone in the earth's crust along which there has been displacement of the sides relative to one another." For the purpose of planning there are two types of faults, active and inactive. Active faults have experienced displacement in historic time, suggesting that future displacement may be expected. Inactive faults show no evidence of movement in recent geologic time, suggesting that these faults are dormant.

Two types of fault movement represent possible hazards to structures in the immediate vicinity of the fault: fault creep and sudden fault displacement. Fault creep, a slow movement of one side of a fault relative to the other, can cause cracking and buckling of sidewalks and foundations even without perceptible ground shaking. Sudden fault displacement occurs during an earthquake event and may result in the collapse of buildings or other structures that are found along the fault zone when fault displacement exceeds an inch or two. The only protection against damage caused directly by fault displacement is to prohibit construction in the fault zone.

An earthquake could occur anywhere in and around the LGVSD due to the number of active faults within and near Marin County.

Earthquake Shake Intensity
The colors on Figures 30 and 31 represent the level of ground shaking intensity of a potential future earthquake. The result is expressed as the level of ground shaking (**expressed as a percentage of gravity**) that on average occurs every 500 years.

This map shows the expected relative intensity of ground shaking and damage in California from anticipated future earthquakes. The shaking potential is calculated as the level of ground motion that has a 2% chance of being exceeded in 50 years, which is the same as the level of ground-shaking with about a 2500 year average repeat time. The relatively long-period (1.0 second) earthquake shaking is shown here. Long period-shaking affects tall, relatively flexible buildings, but also correlates well with overall earthquake damage.

Earthquake Shaking Potential Maps for California depict expected intermediate period (1s or 1hz) ground motions with 2% exceedance probability in 50 years.

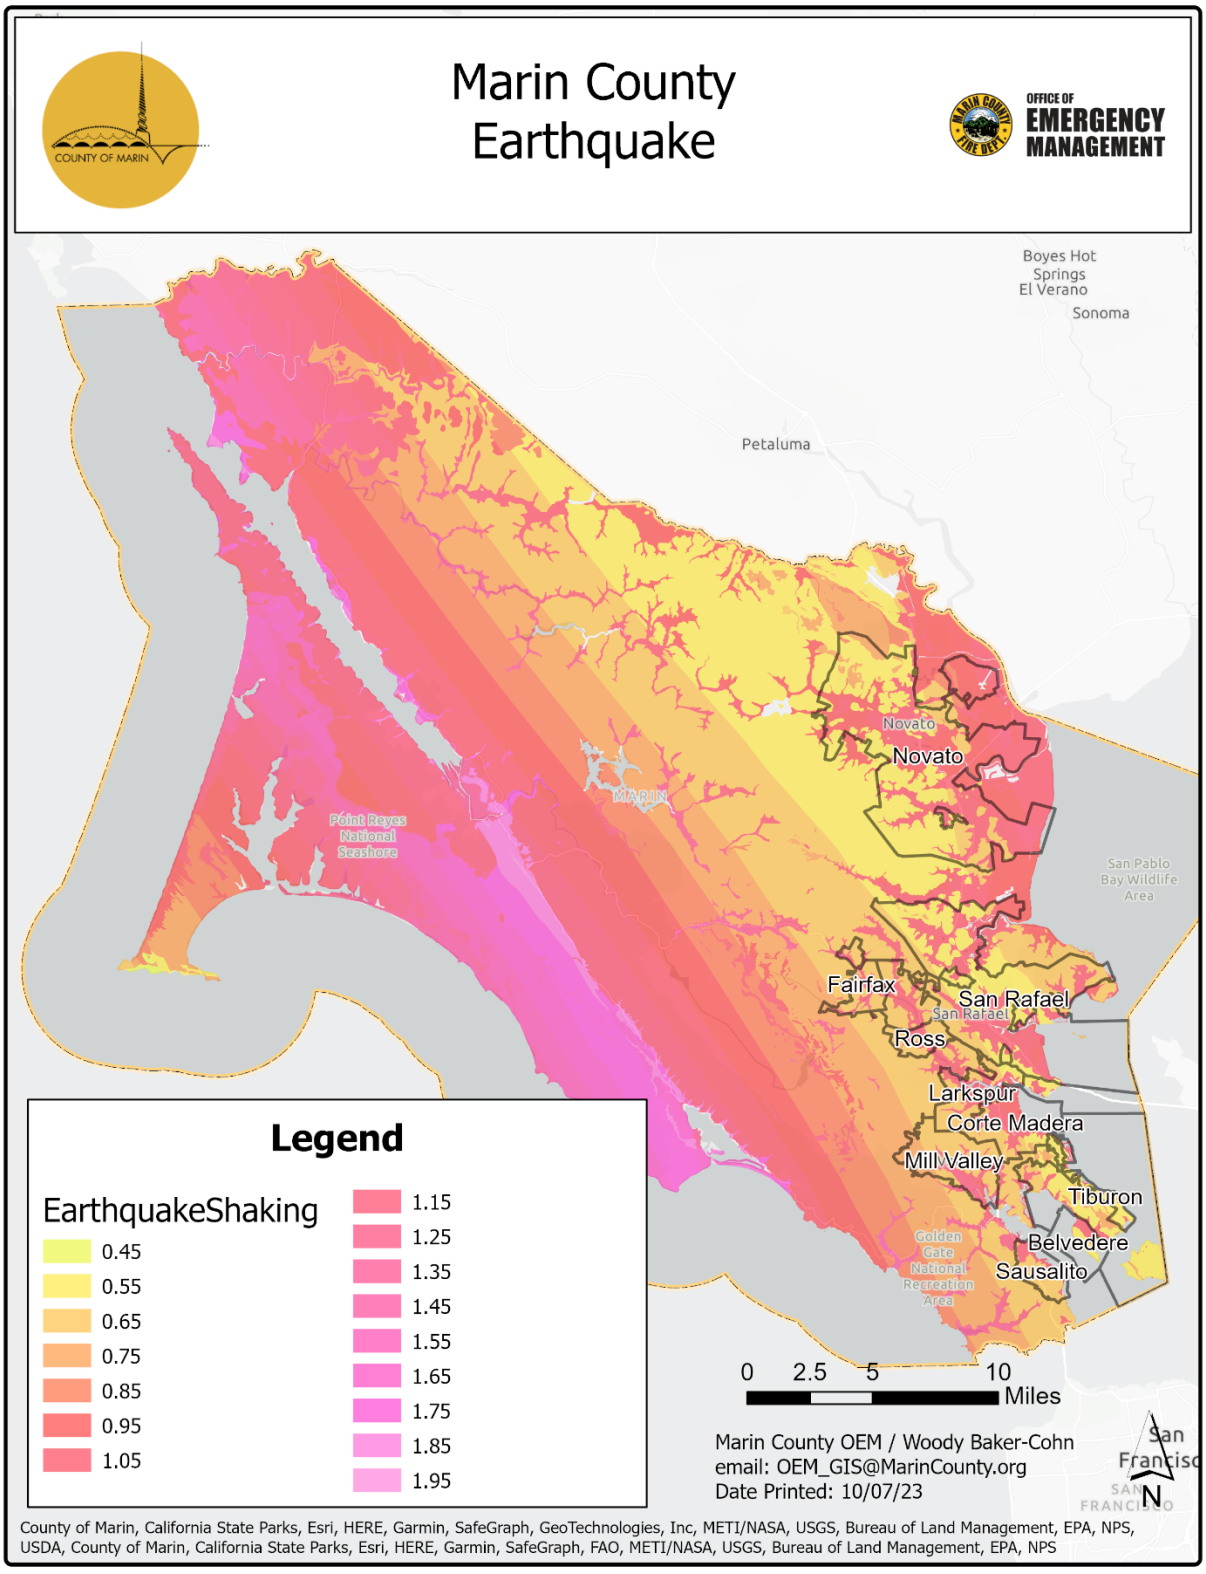

Figure 270: Marin County Earthquake Impact
Source: Marin County OEM

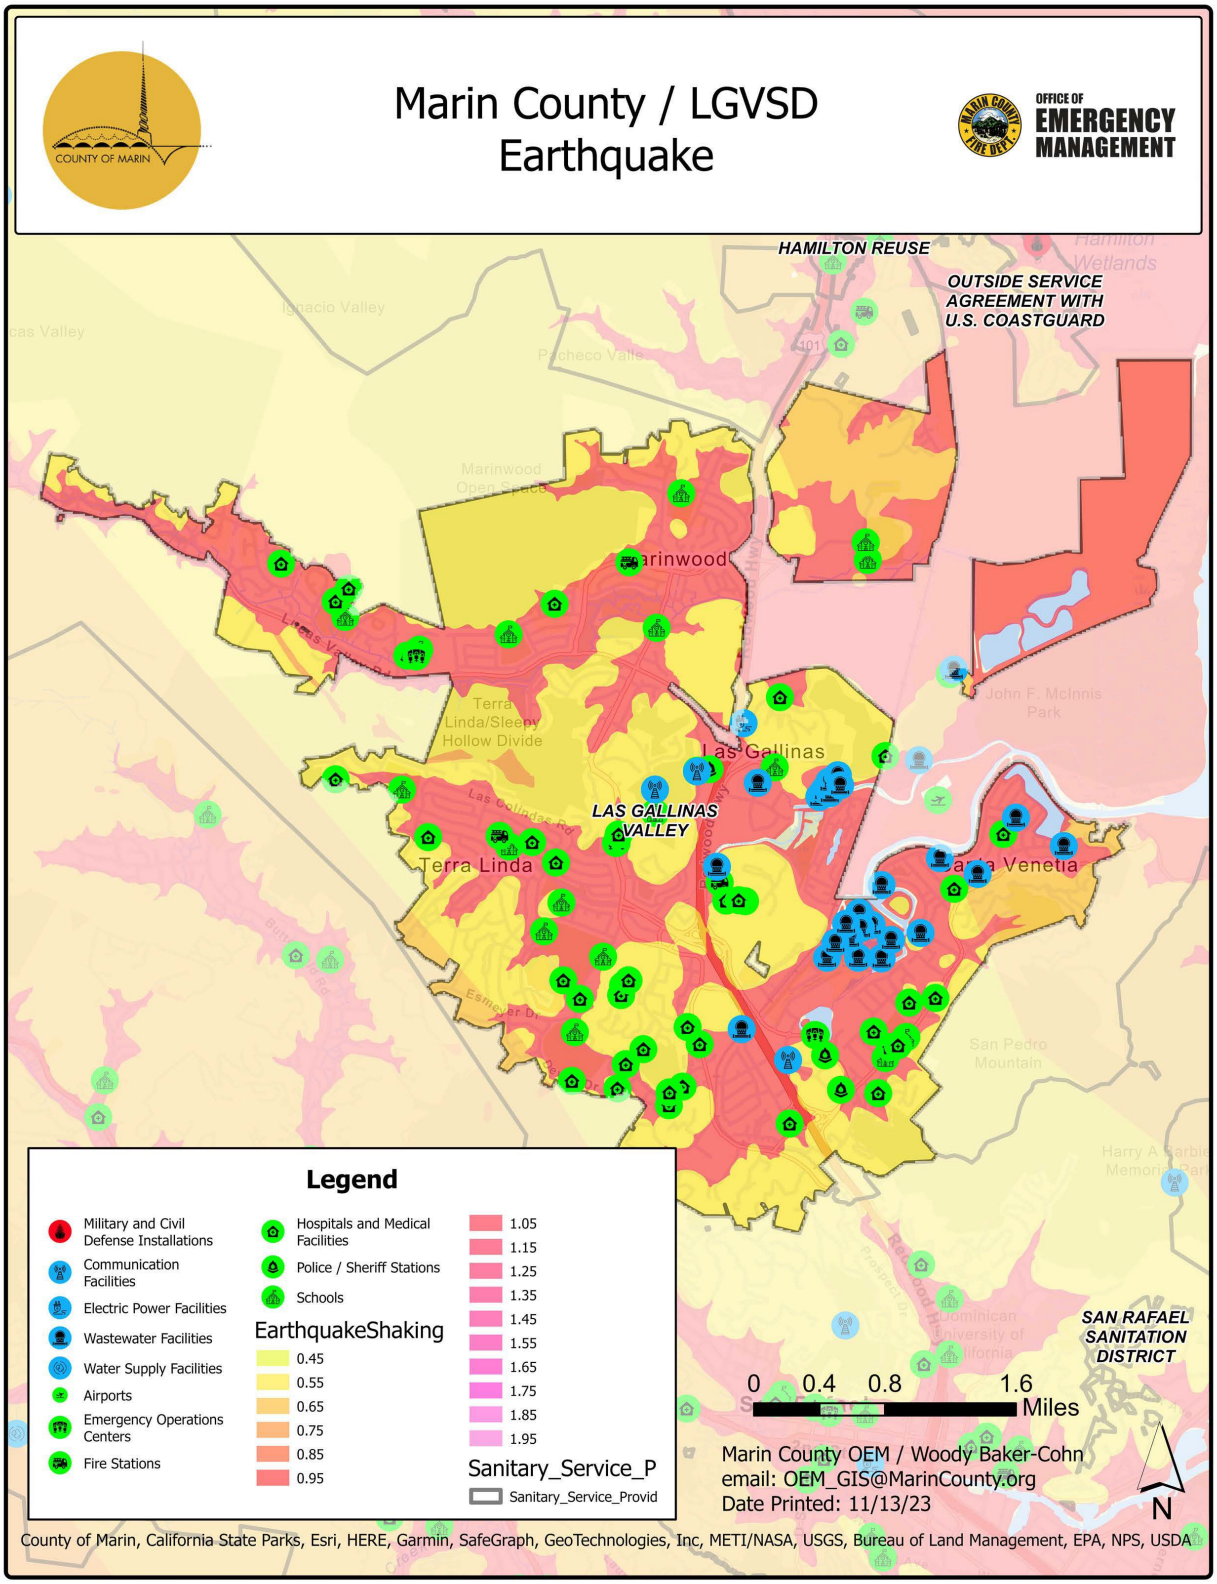

Figure 271: LGVSD Earthquake Critical Facilities and Infrastructure
Source: Marin County OEM

The District is located directly between the San Andreas and Hayward faults. A moderate to extreme earthquake originating from either of these major faults or any of the other faults in the region could have major impacts to the District. There is increased risk of shaking and liquefaction in the District from an earthquake, particularly in the central and eastern lowland areas where superficial deposits and fill are more prevalent. All of the Districts critical facilities lie in these areas and have a moderate susceptibility to earthquake shaking. Vulnerable structures include District infrastructure and facilities that have not undergone major seismic retrofitting. Utility infrastructure throughout the District could be impacted by an earthquake, disrupting service to District customers.

The LGVSD has not experienced a major earthquake. Marin County was sparsely populated at the time of the 1906 San Francisco Earthquake, and the effects across the County were relatively minimal. Likewise, the 1989 Loma Prieta Earthquake caused minimal impacts across Marin County as the epicenter of the quake was further south in Santa Cruz County. Smaller earthquakes with minimal to no impacts are routinely felt in the District.

Climate Change and Future Development Considerations

There is no direct link between climate change and seismic activity that could impact the Marin County OA including LGVSD, so climate change is not expected to cause any changes to the frequency or intensity of seismic shaking. According to a 2018 study by the Institute of Physics (IOP)[19], climate change could result in "isostatic rebounds," or a sudden upward movement of the crust because of reduced downward weight caused by glaciers. As glaciers are known to melt when overall global temperatures increase, climate change could indirectly lead to an increase in seismicity in the Marin County OA including the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent. Climate change could also impact earthquakes felt in the Marin County OA as droughts can further deteriorate existing fault lines and pumping groundwater can put further pressure on the earth's crust. Future development in the populated areas of Marin County OA where seismic shaking and subsidence are more prevalent could exacerbate the impacts of an earthquake. This includes the lowland and creek side areas of the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent where the risk of subsidence and subsequent earthquake shaking are higher. Future development in these areas could expose more people and infrastructure to earthquake shaking as a result of climate change.

2.2.4 FLOODING

Flooding is the rising and overflowing of a body of water onto normally dry land. Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. The area adjacent to a channel is the floodplain. Floodplains are illustrated on inundation maps, which show areas of potential flooding and water depths. In its common usage, the floodplain most often refers to that area that is inundated by the 100-year flood, the flood that has a one percent chance in any given year of being equaled or exceeded. The 100-year flood is the national minimum standard to which communities regulate their floodplains through the National Flood Insurance Program. The 200-year flood is one that has 0.5% chance of being equaled or exceeded each year. The 500-year flood is the flood that has a 0.2 percent chance of being equaled or exceeded in any given year. The potential for flooding can change and increase through various land use changes and changes to land surface, which result in a change to the floodplain. A change in environment can create localized flooding problems inside and outside of natural floodplains by altering or confining natural drainage channels. These changes are most often created by human activity such as construction of bridges or channels. In areas where flow contains high sediment load, such as Easkoot Creek in Stinson Beach (due to an active landslide upstream), the flow carrying capacity of the channel may be reduced dramatically during a single flood event. Coastal floodplains may also change over time as waves and currents alter the coastline (especially wetlands) and sea levels rise.

Flooding can occur in several ways:

Riverine flooding – Riverine flooding, defined as when a watercourse exceeds its "bank-full" capacity, generally occurs as a result of prolonged rainfall, or rainfall that is combined with snowmelt and/or already saturated soils from previous rain events. This type of flood occurs in river systems whose tributaries may drain large geographic areas and include one or more independent river basins. The onset and duration of riverine floods may vary from a few hours to many days and is often characterized by high peak flows combined with a large volume of runoff. Factors that directly affect the amount of flood runoff include precipitation amount, intensity and distribution, the amount of soil moisture, seasonal variation in vegetation, snow depth, and water-resistance of the surface due to urbanization. In the Marin County OA, riverine flooding can occur anytime from November through April and is largely caused by heavy and continued rains, sometimes combined with snowmelt, increased outflows from upstream dams, and heavy flow from tributary streams. These intense storms can overwhelm the local waterways as well as the integrity of flood control structures. Flooding is more severe when antecedent rainfall has resulted in saturated ground conditions. The warning time associated with slow rise riverine floods assists in life and property protection.

Flash flooding – Flash flooding describes localized floods of great volume and short duration. This type of flood usually results from a heavy rainfall on a relatively small drainage area. Precipitation of this sort usually occurs in the winter and spring. Flash floods often require immediate evacuation within the hour and thus early threat identification and warning is critical for saving lives.

Localized/Stormwater flooding – Localized flooding problems are often caused by flash flooding, severe weather, or an unusual amount of rainfall. Flooding from these intense weather events usually occurs in areas experiencing an increase in runoff from impervious surfaces associated with development and urbanization as well as inadequate storm drainage systems.

Tidal flooding – Tidal flooding develops when high tides exceed either the top of bank elevation of tidal sloughs and channels, or the crest of bay levees. An especially high tide event that occurs during alignment of the gravitational pull between the sun and the moon, causing tidal water levels to rise to higher-than normal levels. King tides are normal, predictable events that occur semi-annually during winter months. Typically storms in which high tides coincide with peak stormwater flow may be damaging to municipal infrastructure and private property.

The area is also at risk to flooding resulting from levee failures and dam failures. Dam failure flooding is discussed separately in the Dam Failure Section of this document; levee failure flooding is discussed separately in the Levee Failure Section of this document. Regardless of the type of flood, the cause is often the result of severe weather and excessive rainfall, either in the flood area or upstream reach.

A weather pattern called the "Atmospheric River" contributes to the flooding potential of the area. An Atmospheric River brings warm air and rain to the West. A relatively common weather pattern brings southwest winds to the Pacific Northwest or California, along with warm, moist air. The moisture sometimes produces many days of heavy rain, which can cause extensive flooding. The warm air also can melt the snowpack in the mountains, which further aggravates the flooding potential. In the colder parts of the year, the warm air can be cooled enough to produce heavy, upslope snow as it rises into the higher elevations of the Sierra Nevada or Cascades. Forecasters and others on the West Coast often used to refer to this warm, moist air as the "Pineapple Express" because it comes from around Hawaii where pineapples are grown. A diagram of an atmospheric river event is shown in Figure 32.

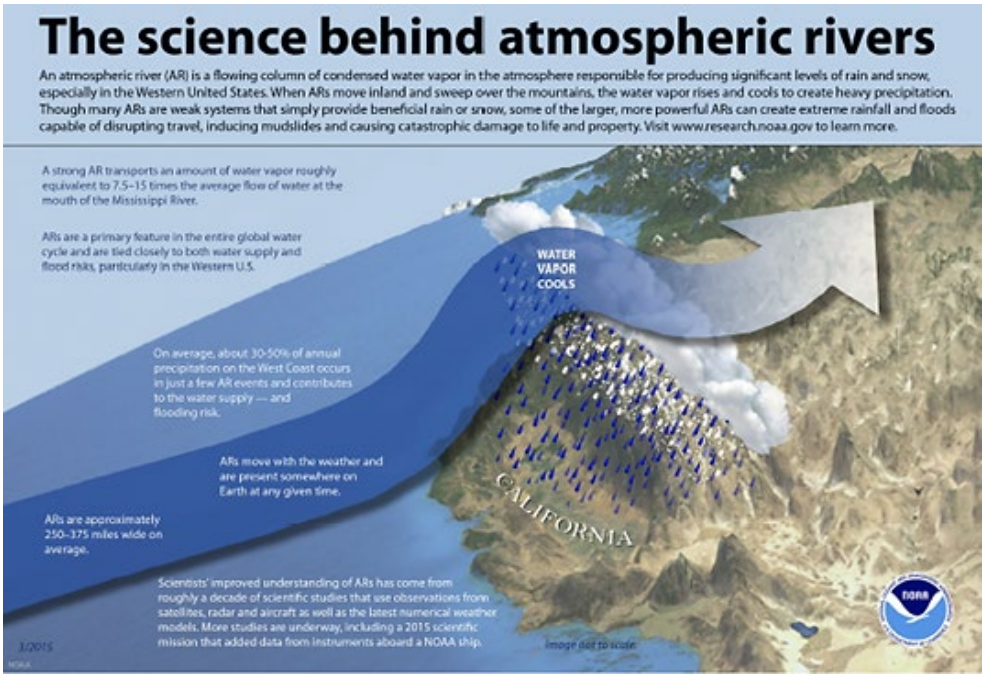

Figure 272: Diagram of an Atmospheric River Event
Source: NOAA

The Marin County OA is susceptible to various types of flood events. In coastal areas, flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Other types of flooding in Marin include isolated ponding and stormwater overflow. Isolated ponding is when pools form on the ground and can occur in any area that doesn't drain effectively – for example, in a natural depression in the landscape. Stormwater overflow is when storm drains back up. Stormwater drainage systems quickly convey rainwater through underground culverts (pipes) to creeks and the Bay. When the storm drains are obstructed or broken or when the water bodies to which they lead are already full, water backs up onto the streets and into the riparian area surrounding the drainage way. Although stormwater overflow and isolated ponding also occur throughout the County, the effects are typically not widespread or significantly damaging.

Flooding in the LGVSD generally results from creek flooding in low-lying areas. Approximately half of the lowland areas in the District are in the 100-year floodplain, with the other half in the 500-year floodplain.

Table 137: Las Gallinas Valley Sanitary District Critical Facilities in the Flood Zones
Source: Marin County/FEMA DFIRM

Significant waterways that contribute to flooding within the District include Miller Creek, Gallinas Creek and the South Fork of Gallinas Creek. Most of the critical facilities in the District, including the LGVSD Treatment Plant and numerus pump stations, lie withing the 100-year floodplain of these creeks. Numerous pump stations, including all six of the Captain Cove Pump Station's, the Northgate Industrial Park Pump Station and the John Duckett Pump Station lie in the 500-year floodplain.

Floodwaters can be deep enough to drown people and move fast enough to sweep people and vehicles away, lift buildings off foundations, and carry debris that smashes into buildings and other property. Flood waters can cause significant erosion which can lead to slope instability, severely damaging transportation and utility infrastructure by undermining foundations or washing away pavement. If water levels rise high enough to get inside buildings, flooding can cause extensive damage to personal property and the structure itself. Flood events that develop very quickly are especially dangerous because there may be little advance warning. Flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. A breach and/or overtopping of the levees throughout the District could contribute to flooding in the lowland areas of the District where most of the District critical facilities lie.

Climate Change and Future Development Considerations

Climate change is expected to affect California's precipitation patterns, which are likely to influence future flood events. A 2017 study[20] found that the number of very intense precipitation days in California is projected to more than double by the end of the century, increasing 117 percent, making it likely that flood events will become more frequent in the Marin County OA including the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent. Climate change is expected to alter rainfall patterns in Northern California, including the Marin County OA. As the climate warms, rain events are predicted to become more intense. The Marin County OA including the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent will likely experience more rain inundation events that lead to flooding and increase the potential threat of dam and levee failure, tree mortality, and other potential hazards. Sea level rise as a result of climate change will exacerbate the impacts of tidal flooding in the lowland areas of the Marin County OA including the shoreline areas of the City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent. Future development in these areas will expose more people and infrastructure to the effects of flooding. Development in the marshland area of the City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent would expose additional people and infrastructure to flooding as marshlands act as a natural buffer to storm surge. Development along Miller Creek, Gallinas Creek and the North Fork of Gallinas Creek would expose more people, structures and infrastructure including major roads to creek flooding and storm surge as a result of climate change.

2.2.5 LAND SUBSIDENCE

Land subsidence is a gradual settling or sudden sinking of the Earth's surface owing to subsurface movement of earth materials. The principal causes are aquifer-system compaction, drainage of organic soils through groundwater pumping, underground mining, hydro-compaction, natural compaction, sinkholes, and thawing permafrost. More than 80 percent of the identified subsidence in the United States is a consequence of underground water exploitation. The increasing development of land and water resources threatens to exacerbate existing land-subsidence problems and initiate new ones.

Sinkholes can form in three primary ways. Dissolution sinkholes form when dissolution of the limestone or dolomite is most intensive where the water first contacts the rock surface. Aggressive dissolution also occurs where flow is focused in preexisting openings in the rock, such as along joints, fractures, and bedding planes, and in the zone of water-table fluctuation where groundwater is in contact with the atmosphere. See Figure 34 for a picture and description of how dissolution sinkholes form.

[20] Precipitation in a Warming World: Assessing Projected Hydro-Climate Changes in California and other Mediterranean Regaions. https://www.nature.com/articles/s41598-017-11285-y

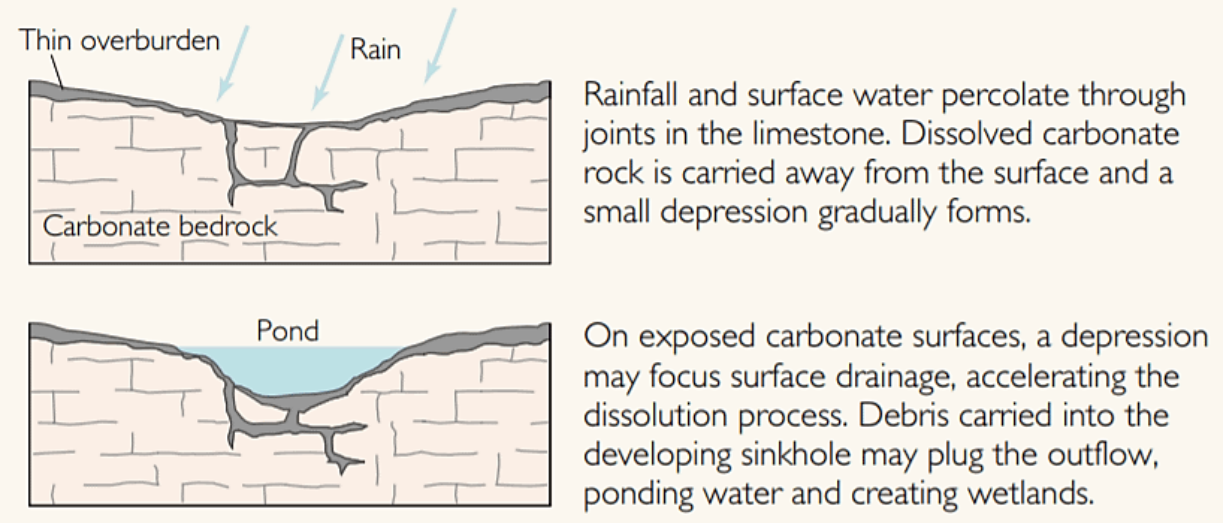

Figure 274: Dissolution Sinkhole Formation
Source: USGS

Cover-subsidence sinkholes tend to develop gradually where the covering sediments are permeable and contain sand. In areas where cover material is thicker, or sediments contain more clay, cover-subsidence sinkholes are relatively uncommon, are smaller, and may go undetected for long periods. See Figure 35 for a picture and description of how cover-subsidence sinkholes form.

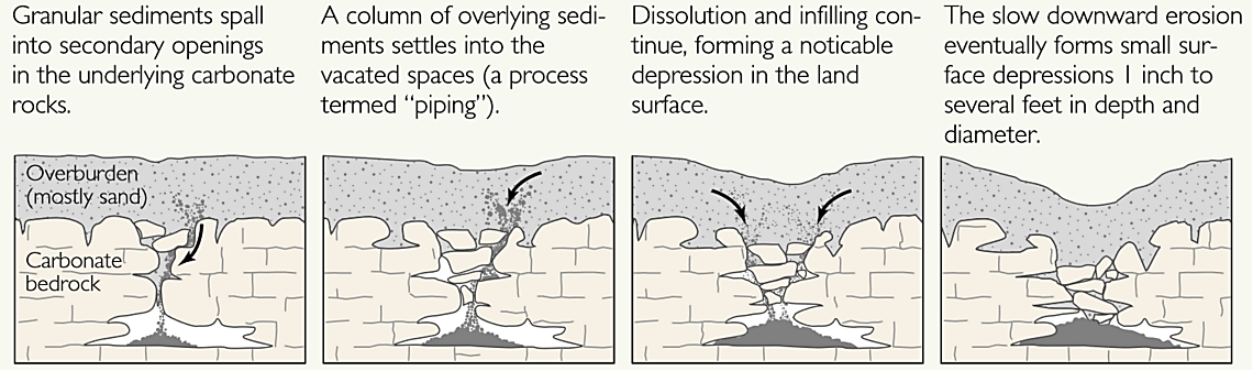

Figure 275: Cover-Subsidence Sinkhole Formation
Source: USGS

Cover-collapse sinkholes may develop abruptly over a period of hours and cause catastrophic damages. They occur where the covering sediments contain a significant amount of clay. Over time, surface drainage, erosion, and deposition of sediment transform the steep-walled sinkhole into a shallower bowl-shaped depression. See Figure 36 for a picture and description of how cover-collapse sinkholes form.

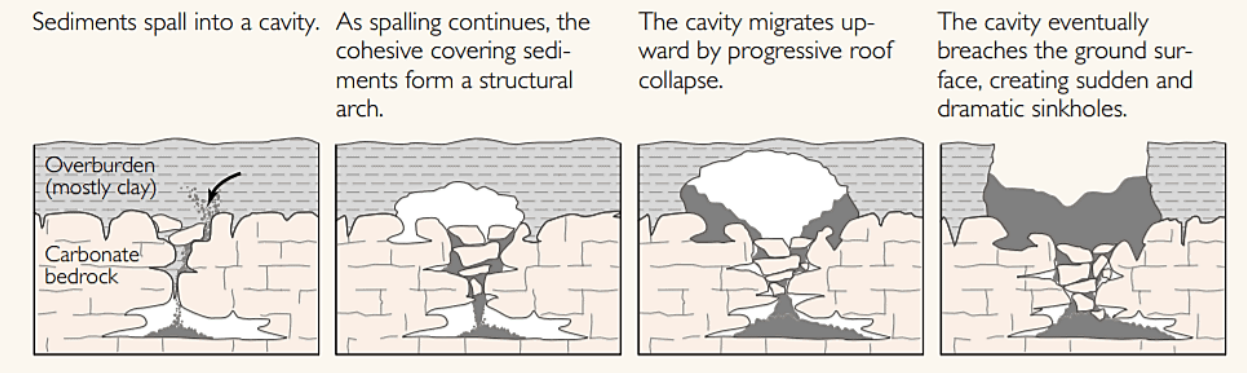

Figure 276: Cover-Collapse Sinkhole Formation
Source: USGS

New sinkholes have been correlated to land-use practices, especially from groundwater pumping and from construction and development practices that cause land subsidence. Sinkholes can also form when natural water-drainage patterns are changed and new water-diversion systems are developed. Some sinkholes form when the land surface is changed, such as when industrial and runoff-storage ponds are created. The substantial weight of the new material can trigger an underground collapse of supporting material, thus causing a sinkhole.

The overburden sediments that cover buried cavities in the aquifer systems are delicately balanced by groundwater fluid pressure. The water below ground helps to keep the surface soil in place. Groundwater pumping for urban water supply and for irrigation can produce new sinkholes in sinkhole-prone areas. If pumping results in a lowering of groundwater levels, then underground structural failure, and thus, sinkholes, can occur.

Land subsidence and sinkholes would most likely occur in the central and eastern lowland areas of the LGVSD where superficial deposits and fill are more prevalent. This includes the areas around Las Gallinas and Santa Venetia where all of the District critical facilities lie. These areas could anticipate increased rates of subsidence as bay waters saturate the soil from below. Land subsidence could have numerous impacts for the District, including the settling of District facilities as well as the shifting of District infrastructure.

Climate Change and Future Development Considerations

Climate change could indirectly influence land subsidence as more severe and prolonged periods of drought may encourage more groundwater withdrawals. In coastal areas like the Marin County OA including the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent, land subsidence leads to higher sea levels and increased flood risk. The rate of land subsidence could increase across the Marin County OA including the lowland areas of the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent as a result of climate change. The impacts of land subsidence on infrastructure, including roads and underground utilities in the District could increase with future development in the lowland populated areas of the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent where land subsidence is more likely to occur.

2.2.6 LEVEE FAILURE

Levee failure is the overtopping, breach or collapse of the levee. Levees can fail in the event of an earthquake, internal erosion, poor engineering/construction or landslides, but levees most commonly fail as a result of significant rainfall or very high tides. During a period of heavy rainfall, the water on the water-body side of the levee can build up and either flow over the top ("overtopping") or put pressure on the structure causing quickening seepage and subsequent erosion of the earth. The overflow of water washes away the top portion of the levee, creating deep grooves. Eventually the levee weakens, resulting in a breach or collapse of the levee wall and the release of uncontrollable amounts of water. Figure 37 shows a levee and the multiple ways it can fail.

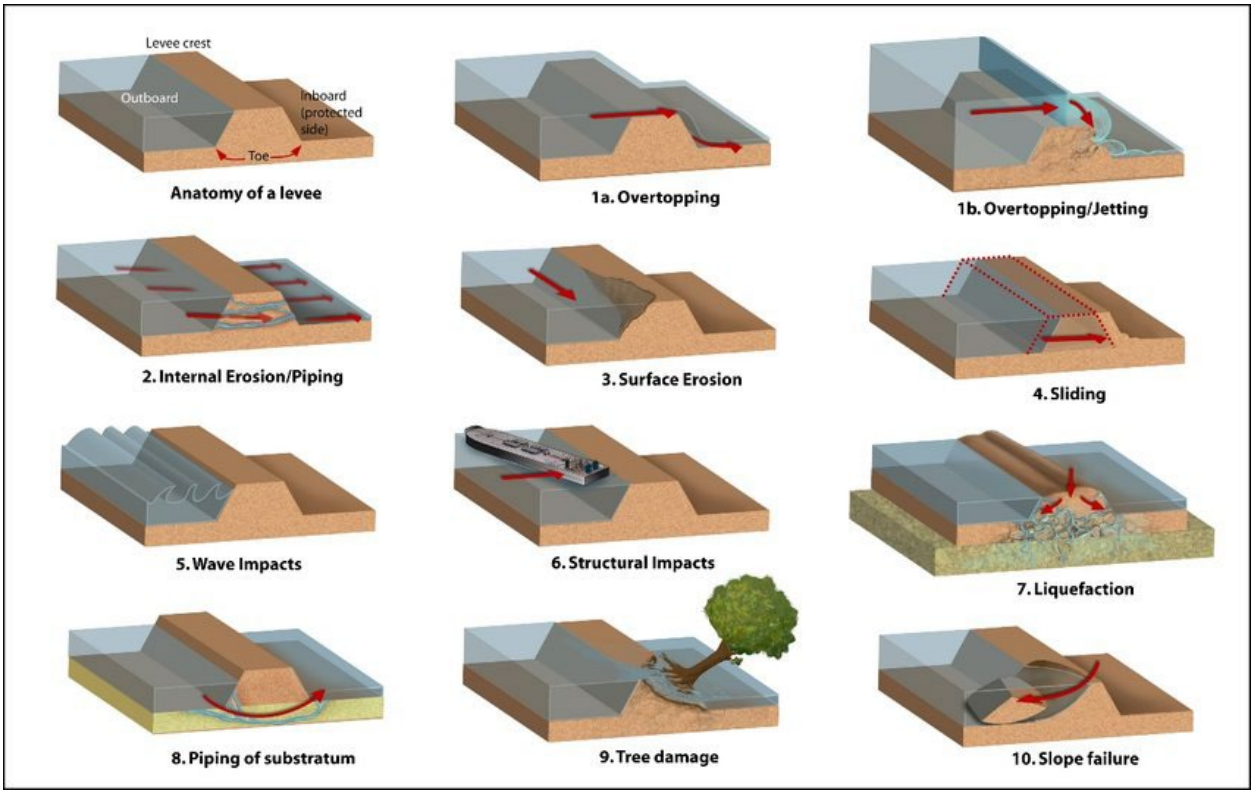

Figure 277: Levee Failure Mechanisms
Source: University of California

The LGVSD is protected by levees along Miller Creek, Gallinas Creek and the South Fork of Gallinas Creek. A failure of any of these levees during a high rain event could cause flooding into the District, with property and critical infrastructure within the 100-year floodplain being most susceptible.

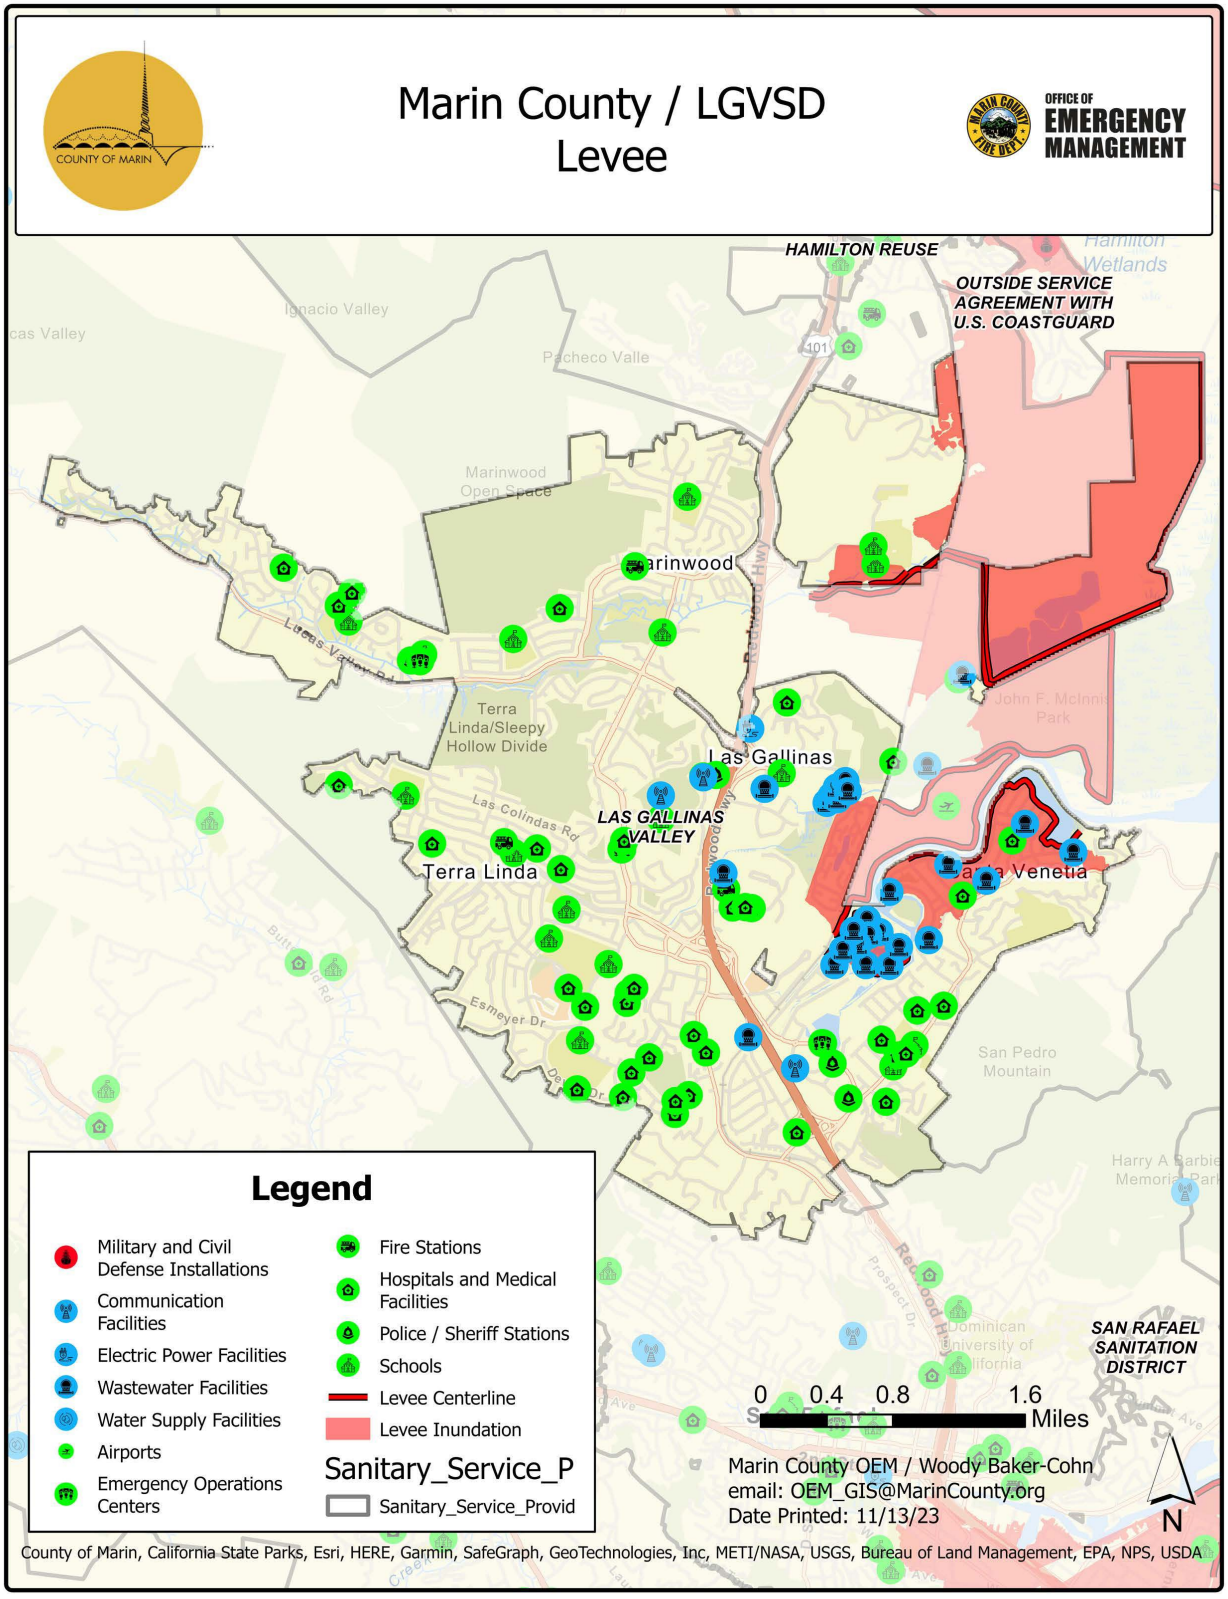

Figure 278: LGVSD Levee Inundation Map
Source: Marin County OEM

Three levee systems exist in St. Vincent. Two of them, Marin County Levee 33 and Marin County Levee 24, are located along the north bank of Miller Creek. Marin County Levee 33 is 0.25 miles long with an undocumented height and Marin County Levee 24 is 0.2 miles long with an undocumented height. The third levee is the LGVSD Levee which extends along the north and east bank of Miller Creek before diverging north to the Hamilton Wetlands and west to Long Point. It is 3.63 miles long with an undocumented height and protects the LGVSD Treatment Plant from flooding. Figure 39 shows the three levees in St. Vincent.

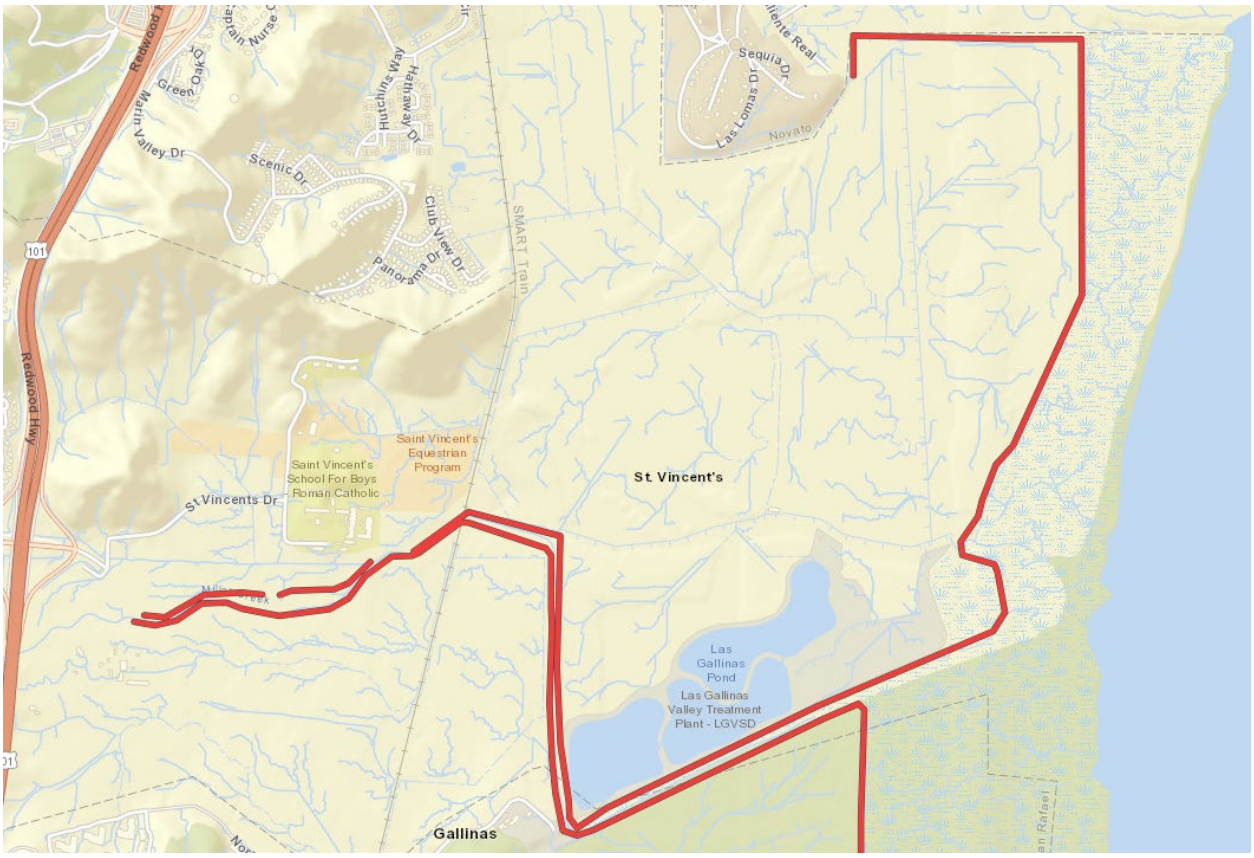

Figure 279: Marin County Levees 33 and 24 and the LGVSD Levee in St. Vincent
Source: U.S. Army Corps of Engineers

One levee system exists in Santa Venetia and is located along the South Fork of Galinas Creek. The Santa Venetia Levee is 1.45 miles long with an undocumented height. It protects six District pump stations in Santa Venetia from flooding. Figure 40 shows the Santa Venetia Levee in Santa Venetia.

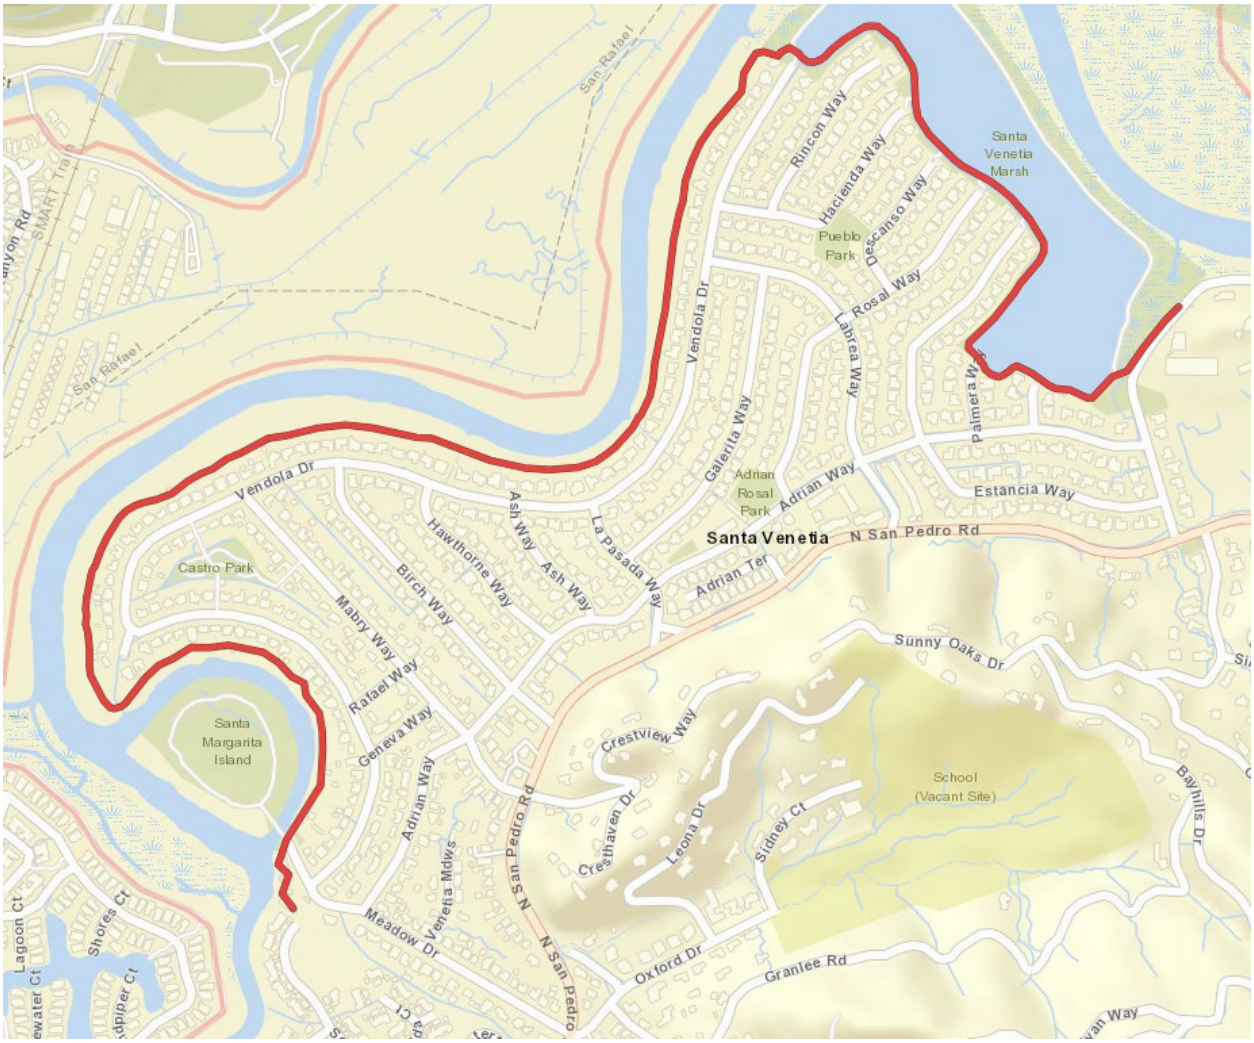

Figure 280: Santa Venetia Levee in Santa Venetia
Source: U.S. Army Corps of Engineers

Marin County Levee #3 is located on the south bank of the South Fork of Gallinas Creek. Marin County Levee #3 is 0.9 miles long with an undocumented height and protects the Marin Lagoon area of the District, including nine of its pump stations. Figure 41 shows the Marin County Levee #3.

Figure 281: Marin County Levee #3
Source: U.S. Army Corps of Engineers

The Smith Ranch Airport Levee is located along the north bank of the South Fork of Gallinas Creek and the South Bank of Gallinas Creek. It is 2.26 miles long with an undocumented height. No District critical facilities are protected by the Smith Ranch Airport Levee. Figure 42 shows the Smith Ranch Airport Levee.

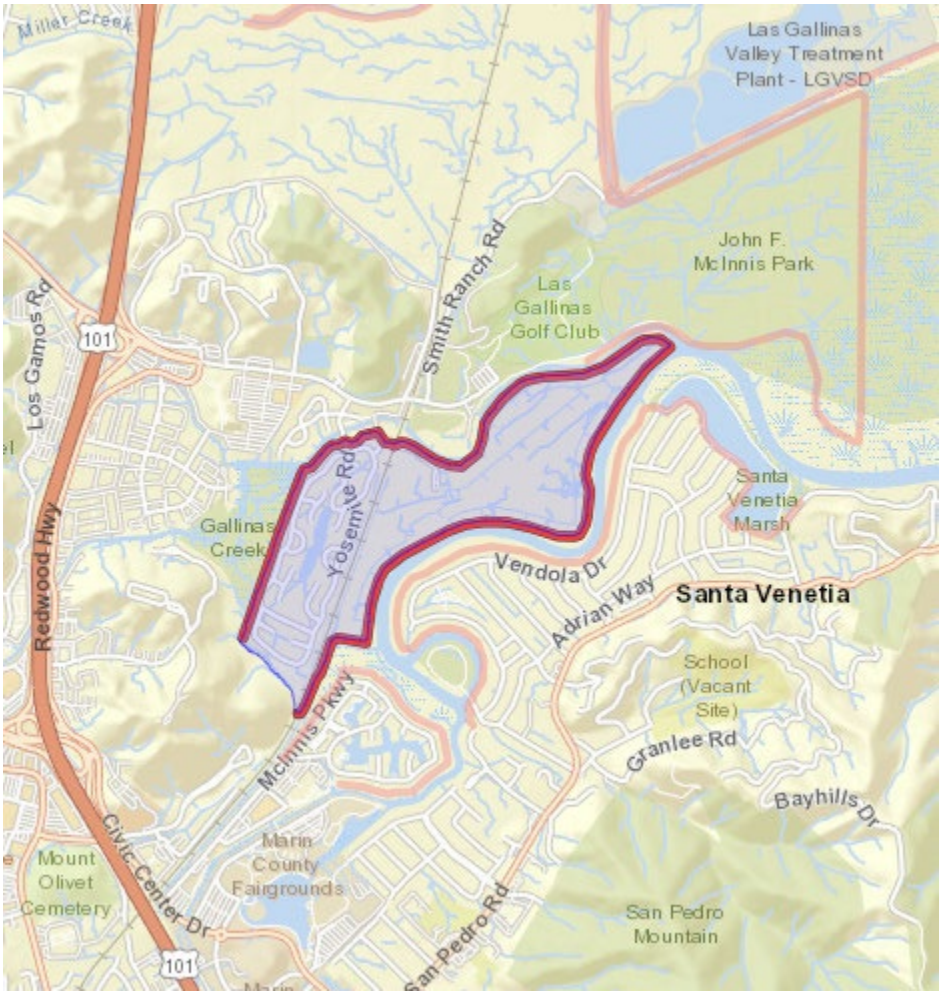

Figure 282: Smith Ranch Airport Levee
Source: U.S. Army Corps of Engineers

There has never been a documented levee failure in the District.

Climate Change and Future Development Considerations

Climate change is expected to lead to an increase in the frequency and severity of major storm events, which can place added strain on levee systems. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in leveed areas across the Marin County OA including in the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent, increasing the potential for a levee failure. Rising seas will lead to increased stress on the levees around the Marin County OA shoreline including in the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent, particularly during a major tidal event and potential tsunami. As development increases in the populated areas of the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent protected by its levees, particularly along Gallinas Creek and the South Fork of Gallinas Creek and around their marshlands, the potential for significant impacts to residents and infrastructure will only increase.

2.2.7 Sea Level Rise

Climate change is the distinct change in measures of weather patterns over a long period of time, ranging from decades to millions of years. More specifically, it may be a change in average weather conditions such as temperature, rainfall, snow, ocean and atmospheric circulation, or in the distribution of weather around the average. While the Earth's climate has cycled over its 4.5-billion-year age, these natural cycles have taken place gradually over millennia, and the Holocene, the most recent epoch in which human civilization developed, has been characterized by a highly stable climate until recently.

The Marin County OA MJHMP is concerned with human-induced climate change that has been rapidly warming the Earth at rates unprecedented in the last 1,000 years. Since industrialization began, the burning of fossil fuels (coal, oil, and natural gas) at escalating quantities has released vast amounts of carbon dioxide and other greenhouse gases responsible for trapping heat in the atmosphere, increasing the average temperature of the Earth. Secondary impacts include changes in precipitation patterns, the global water cycle, melting glaciers and ice caps, and rising sea levels. According to the Intergovernmental Panel on Climate Change (IPCC), climate change will "increase the likelihood of severe, pervasive and irreversible impacts for people and ecosystems" if unchecked.

Through changes to oceanic and atmospheric circulation cycles and increasing heat, climate change affects weather systems around the world. Climate change increases the likelihood and exacerbates the severity of extreme weather – more frequent or intense storms, floods, droughts, and heat waves. Consequences for human society include loss of life and injury, damaged infrastructure, long-term health effects, loss of agricultural crops, disrupted transport and freight, and more. Climate change is not a discrete event but a long-term hazard, the effects of which communities are already experiencing.

Climate change adaptation is a key priority of the State of California. The 2013 State of California Multi- Hazard Mitigation Plan stated that climate change is already affecting California. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Rising sea levels are considered a secondary effect of climate change due to warming ocean temperatures and melting glacial ice sheets into the ocean. The California coast has already seen a rise in sea level of four to eight inches over the 20th century due to climate change. Sea level rise impacts can be exacerbated during coastal storms, which often bring increased tidal elevations called "storm surge." The large waves associated with such storm surges can cause flooding in low-lying areas, erosion of coastal wetlands, saltwater contamination of drinking water, disruption of septic system operations, impacts on roads and bridges, and increased stress on levees. In addition, rising sea levels results in coastal erosion as shoreline sediment is re-deposited back into the ocean. Evidence shows that winter storms have increased in frequency and intensity since 1948 in the North Pacific, increasing regional wave heights and water levels during storm events.

According to the 2017 “Rising Seas in California, An Update on Sea-Level Rise Science” report Marin County may experience impacts from Sea Level Rise over defined periods of time, to include long-term changes (second half of this century and beyond), and short- to mid-term projections (within the next two or three decades).

Much of the District lies at a lower elevation and most of its critical facilities, including the LGVSD and all of its pump stations in Santa Venetia and the Marin Lagoon are susceptible to sea level rise between one and five feet of inundation.

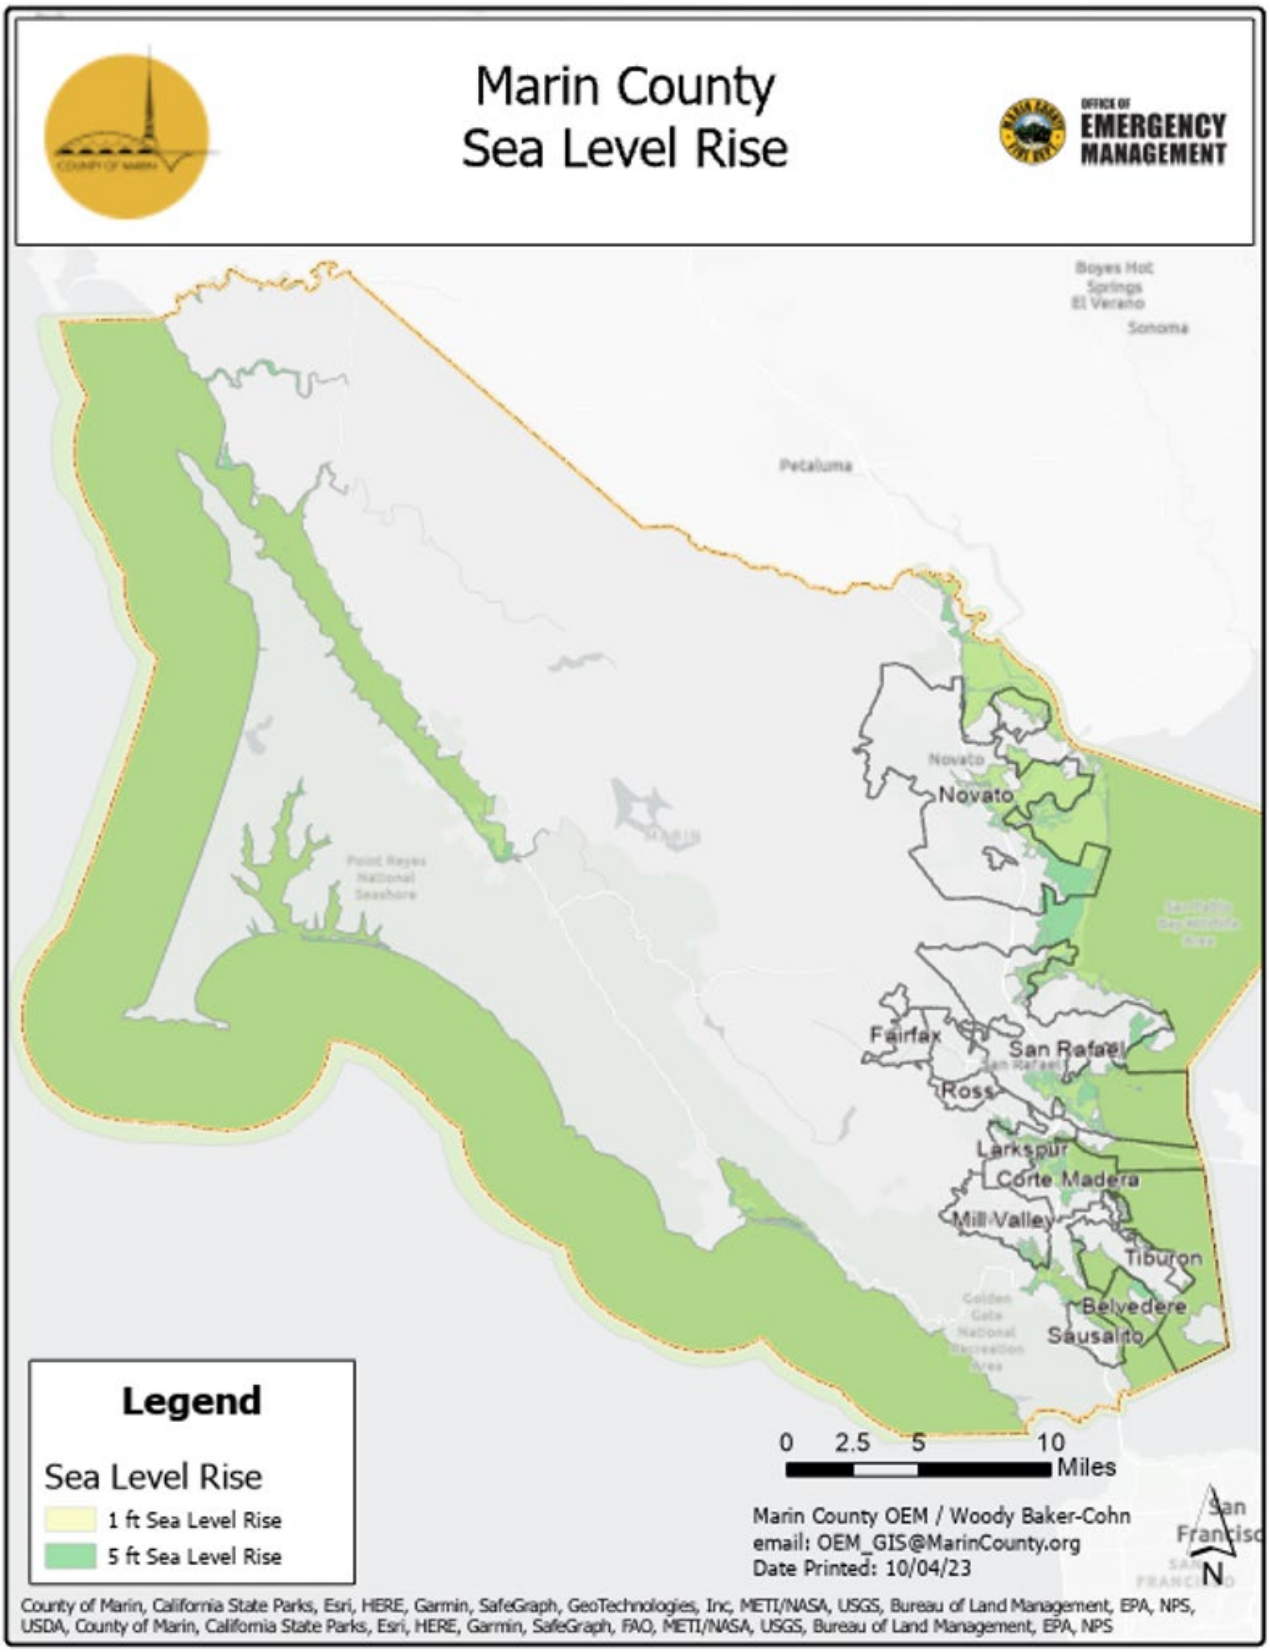

Figure 283: Marin County Sea Level Rise Impact
Source: Marin County OEM

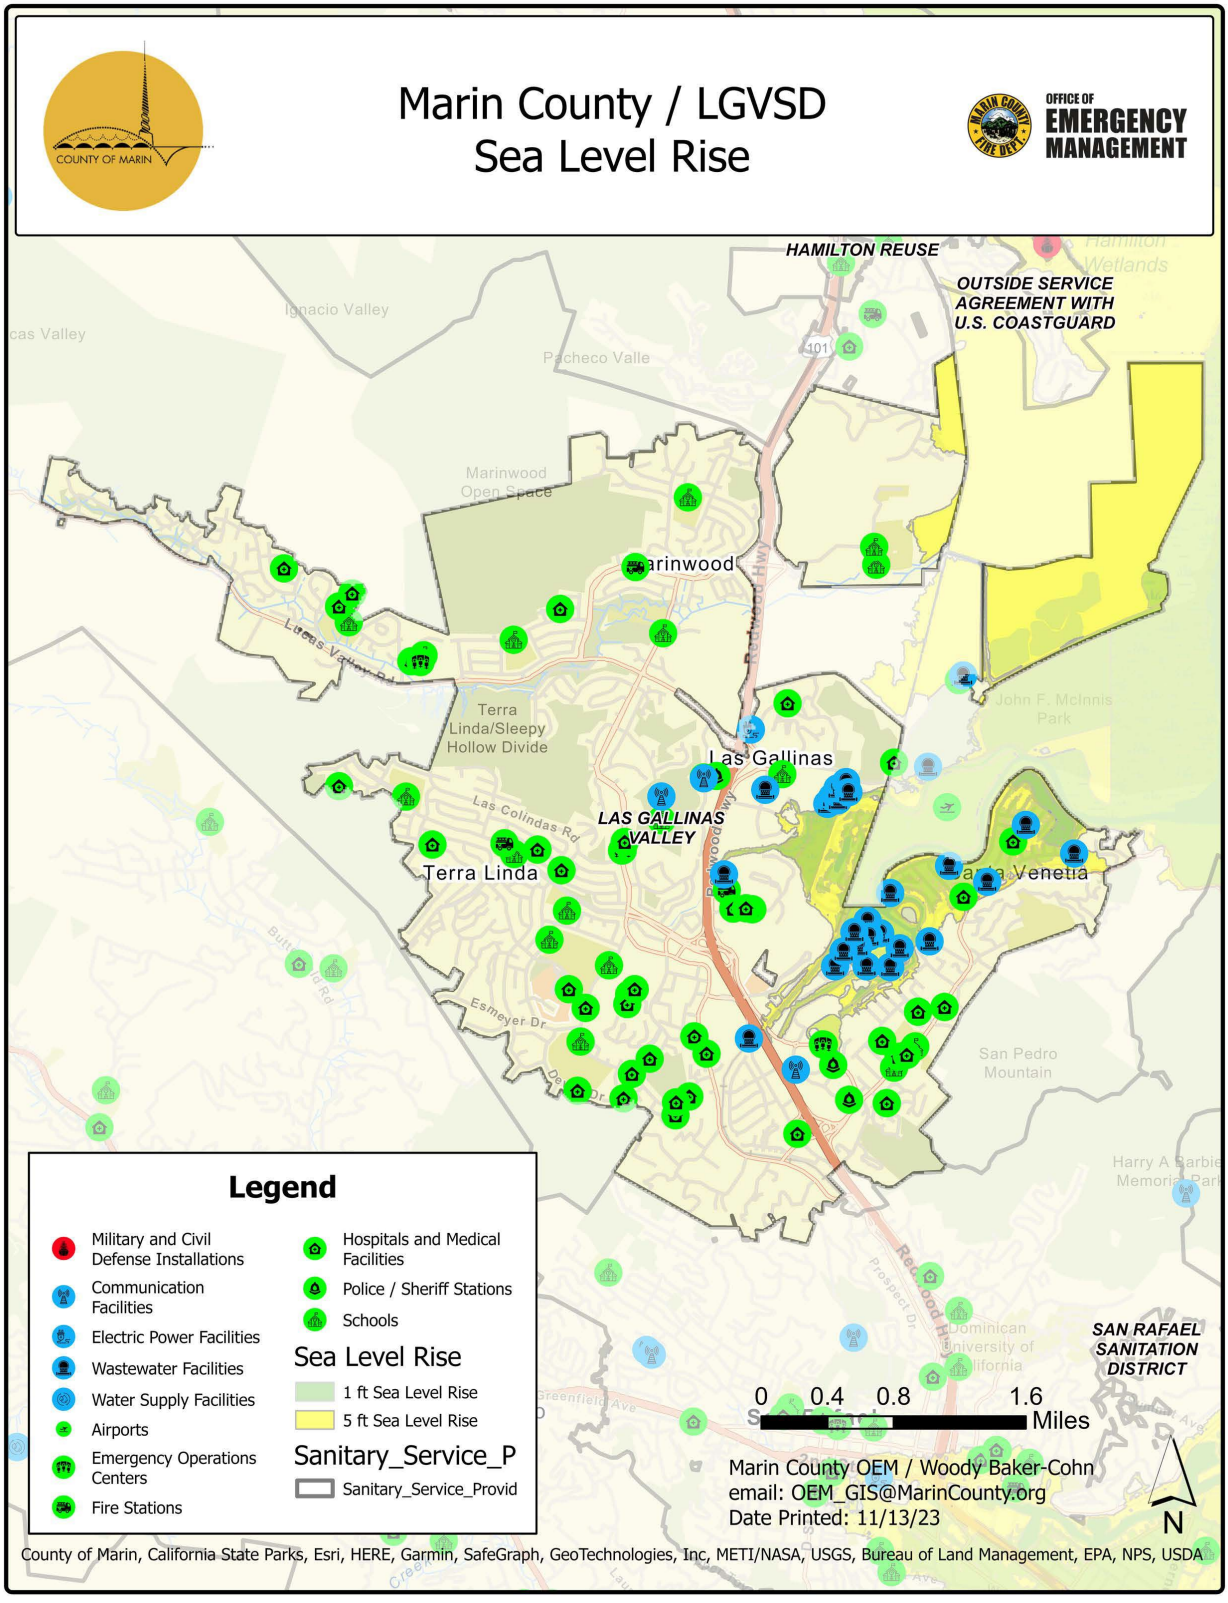

Figure 284: LGVSD Sea Level Rise Impact on Critical Facilities
Source: Marin County OEM

Critical facilities throughout the District can become damaged extensively with their foundations compromised over time. Of particular concern are those facilities that have not been elevated to projected sea level rise heights over the next century. Sea level rise in the District has the potential to exacerbate inland flooding when a significant rain or tidal event occurs, pushing water from local creeks over their banks and into areas were critical facilities lie. Sea level rise can also cause increased subsidence in the District, which may damage underground water and wastewater pipelines and disrupt services.

Climate Change and Future Development Considerations

The two major causes of global sea level rise are thermal expansion of warming oceans and the melting of land-based glaciers and polar ice caps. Climate change is affecting natural and built systems around the world, including the California coast. In the past century, average global temperature has increased about 1.4°F, and average global sea level has increased 7 to 8 inches. Sea level rise in the San Francisco Bay Area is projected to increase by eight inches MHW in 2050 and could reach 4.5 to eight feet by 2021 if greenhouse gas emissions aren't reduced.

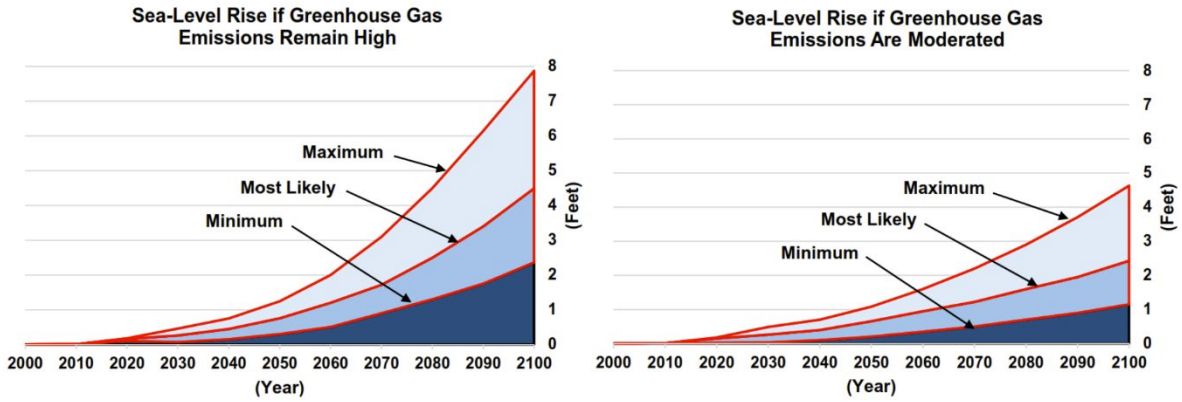

Figure 285: Projections of Sea Level Rise in the San Francisco Bay Area, 2000-2100
Source: 2019–2020 Marin County Civil Grand Jury, Climate Change: How Will Marin Adapt?

While the Marin County OA shoreline including around the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent already experiences regular erosion, flooding, and significant storm events, sea level rise will exacerbate these natural processes, leading to significant social, environmental, and economic impacts. The third National Climate Assessment cites strong evidence that the cost of doing nothing exceeds the costs associated with adapting to sea level rise by 4 to 10 times. Sea level rise will continue to affect the Marin County OA including the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent with increased tidal flooding and storm surge during severe weather events, and future development along the Marin County OA shoreline including around the northern City of San Rafael and the unincorporated County areas of Lucas Santa Venetia and St. Vincent will only amplify these impacts. Sea level can also lead to increased land subsidence and the potential of levee failure. The impacts of a tsunami would also be magnified with rising seas. Future development in the coastal and lowland areas of the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent will put more people and property at risk from flooding as a result of sea level rise. Roads and utility infrastructure across the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent will continue to become inundated.

2.2.8 Severe Weather – Extreme Heat

Extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. A heat wave is an extended period of extreme heat, often with high humidity. When relative humidity is factored in, the temperature can feel much hotter as reflected in the Heat Index (see Figure 46):

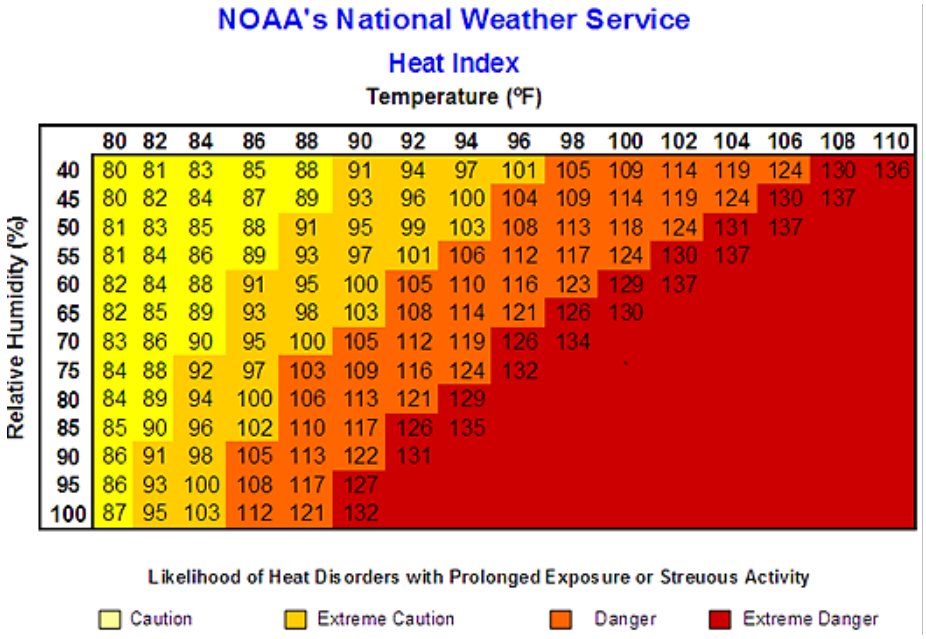

Figure 286: Heat Index
Source: NOAA

Heat kills by taxing the human body beyond its abilities. In a normal year, about 1,300 Americans succumb to the demands of summer heat. Heat is the leading weather-related cause of mortalities in the US. In 2006, California reported a high of 204 heat related deaths, with 98 reported in 2017 and 93 deaths reported in 2018.

Extreme heat has the potential to impact all areas of Mill Valley and would be felt more in areas where there is a widespread presence of concrete and asphalt, which stores heat longer. This includes most of the downtown and commercial area of the city between Miller Avenue and E. Blithedale Avenue. There are dozens of residences in this area. Heat waves can cause power outages and can sicken people who are exposed to high temperatures too long, particularly infants and the elderly.

In September 2022 the Marin County OA experienced an Extreme Heat Event with temperatures exceeding 103 degrees.

Climate Change and Future Development Considerations

The primary effect of climate change is warmer average temperatures. The annual average daily high temperatures in California are expected to rise by 2.7°F by 2040, 5.8°F by 2070, and 8.8°F by 2100 compared to observed and modeled historical conditions. At the current rate, annual average temperatures in the Marin County OA region and Bay Area will likely increase by approximately 4.4 degrees by 2050 and 7.2 degree by the end of the century unless significant efforts are made to reduce greenhouse emotions according to California's latest climate change assessment.

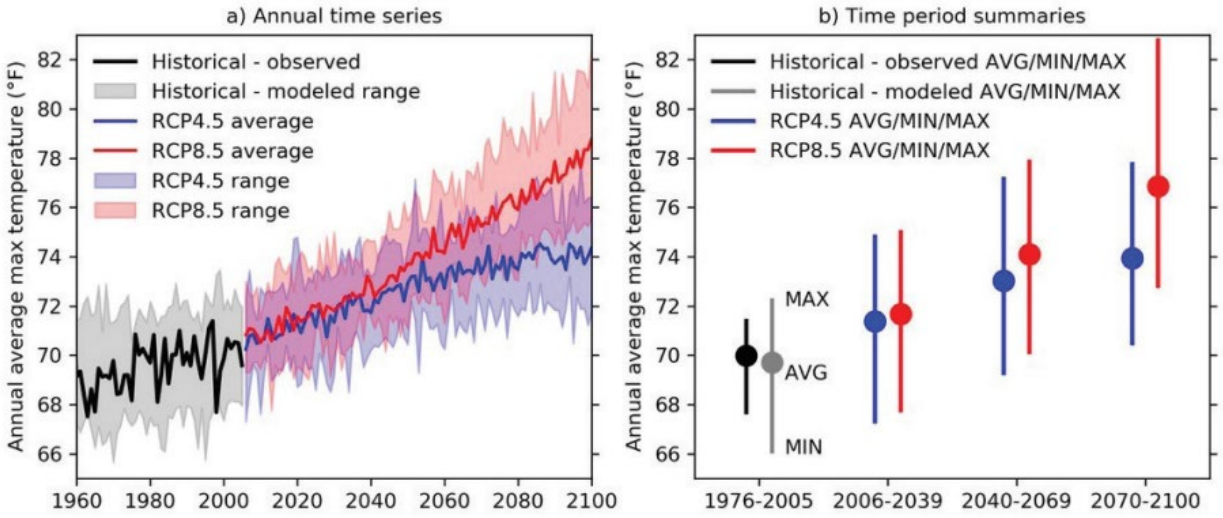

Figure 287: Annual Average Temperatures in the San Francisco Bay Area, 2000-2100
Source: California Climate Change Assessment (Fourth Edition)

As climate change accelerates in the 21st century, it is anticipated that extreme heat events will become more frequent and intense across the Marin County OA including in the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent. There will be increased residential and business needs for cooling and addressing heat-related issues. These effects would primarily be felt in the lowland areas of the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent where heat builds in developed areas. Heat waves also tax the energy grid. Future development in the Marin County OA including the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent could exacerbate the impacts from heat related events, particularly in electricity provision and water delivery. Increased temperatures will also lead to an increase in the occurrence and severity of wildfires across the Marin County OA including the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent as conditions become hotter and drier. These effects will primarily be felt in the mountainous areas of the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent; and the marshland areas of the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent where hotter and drier conditions are more apt to lead to wildfires. Future development near the many open spaces around the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent could expose more people and infrastructure to the threat of a major wildfire as a result of increasing temperatures.

2.2.9 Severe Weather – High Wind & Tornado

High Wind

High wind is defined as a one-minute average of surface winds 40 miles per hour or greater lasting for one hour or longer, or winds gusting to 58 miles per hour or greater regardless of duration that are either expected or observed over land. These winds may occur as part of a seasonal climate pattern or in relation to other severe weather events such as thunderstorms. The Beaufort scale is an empirical measure that relates wind speed to observed conditions on land and is a common measure of wind intensity (see Figure 48).

Beaufort number	Description	Wind speed		Land conditions
		kts	km/h	
0	Calm	< 1	< 1	Calm. Smoke rises vertically.
1	Light air	1 – 2	1 – 5	Wind motion visible in smoke.
2	Light breeze	3 – 6	6 – 11	Wind felt on exposed skin. Leaves rustle.
3	Gentle breeze	7 – 10	12 – 19	Leaves and smaller twigs in constant motion.
4	Moderate breeze	11 – 15	20 – 28	Dust and loose paper raised. Small branches begin to move.
5	Fresh breeze	16 – 20	29 – 38	Branches of a moderate size move. Small trees begin to sway.
6	Strong breeze	21 – 26	39 – 49	Large branches in motion. Whistling heard in overhead wires. Umbrella use becomes difficult. Empty plastic garbage cans tip over.
7	High wind, Moderate gale, Near gale	27 – 33	50 – 61	Whole trees in motion. Effort needed to walk against the wind. Swaying of skyscrapers may be felt, especially by people on upper floors.
8	Gale, Fresh gale	34 – 40	62 – 74	Some twigs broken from trees. Cars veer on road. Progress on foot is seriously impeded.
9	Strong gale	41 – 47	75 – 88	Some branches break off trees, and some small trees blow over. Construction/temporary signs and barricades blow over. Damage to circus tents and canopies.
10	Storm, Whole gale	48 – 55	89 – 102	Trees are broken off or uprooted, saplings bent and deformed. Poorly attached asphalt shingles and shingles in poor condition peel off roofs.
11	Violent storm	56 – 63	103 – 117	Widespread vegetation damage. Many roofing surfaces are damaged; asphalt tiles that have curled up and/or fractured due to age may break away completely.
12	Hurricane	≥ 64	≥ 118	Very widespread damage to vegetation. Some windows may break; mobile homes and poorly constructed sheds and barns are damaged. Debris may be hurled about.

Figure 288: Beaufort Wind Scale
Source: NOAA

Windstorms in the Marin County OA are typically straight-line winds. Straight-line winds are generally any thunderstorm wind that is not associated with rotation (i.e., is not a tornado). It is these winds, which can exceed 100 mph, which represent the most common type of severe weather and are responsible for most wind damage related to thunderstorms.

Tornado

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes are the most powerful storms that exist, and damage paths can be in excess of one mile wide and 50 miles long. The Enhanced Fujita Scale (see Figure 49) is commonly used to rate the intensity of tornadoes in the United States based on the damages that they cause.

Enhanced Fujita Scale	
EF-0	65-85 mph winds
EF-1	86-110 mph winds
EF-2	111-135 mph winds
EF-3	136-165 mph winds
EF-4	166-200 mph winds
EF-5	>200 mph winds

Figure 289: Enhanced Fujita Scale
Source: NOAA

Tornadic waterspouts are tornadoes that form over water or move from land to water. They have the same characteristics as a land tornado. They are associated with severe thunderstorms, and are often accompanied by high winds and seas, large hail, and frequent dangerous lightning.

Figure 290: Waterspout Formation
Source: MarineInsights

All of the LGVSD is susceptible to storms and damage from wind and tornadoes, though the hilly and mountainous areas throughout the District have increased susceptibility due to a higher presence of trees. Drought can increase the susceptibility of trees toppling over in a high wind event. Fallen trees could damage critical facilities and infrastructure. Power lines could be impacted by fallen trees and wind, causing power outages. Roadways could also become blocked by fallen trees, affecting the delivery of services and access to critical facilities.

Climate Change and Future Development Considerations

It is anticipated that the atmospheric rivers that deliver storms to Northern California may intensify because of climate change. This increase in storm intensity may bring more intense winds and potential tornados to Northern California, including the Marin County OA and the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent. Significant wind events and tornados can topple trees, particularly those that may be saturated, or drought stressed as a result of climate change. An increase in fallen trees in the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent as a result of increased storms due to climate change can lead to an increase in power outages. Future development in any of the forested areas of the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent including in the southern and western mountainous residential areas will increase the effects of severe wind events.

2.2.10 TSUNAMI

Tsunamis consist of waves generated by large disturbances of the sea floor, which are caused by volcanic eruptions, landslides or earthquakes. Shallow earthquakes along dip slip faults are more likely to be sources of tsunami than those along strike slip faults. The West Coast/Alaska Tsunami Warning Center (WC/ATWC) is responsible for tsunami warnings. Tsunamis are often incorrectly referred to as tidal waves. They are actually a series of waves that can travel at speeds averaging 450 (and up to 600) miles per hour with unusual wave heights. Tsunamis can reach the beach before warnings are issued.

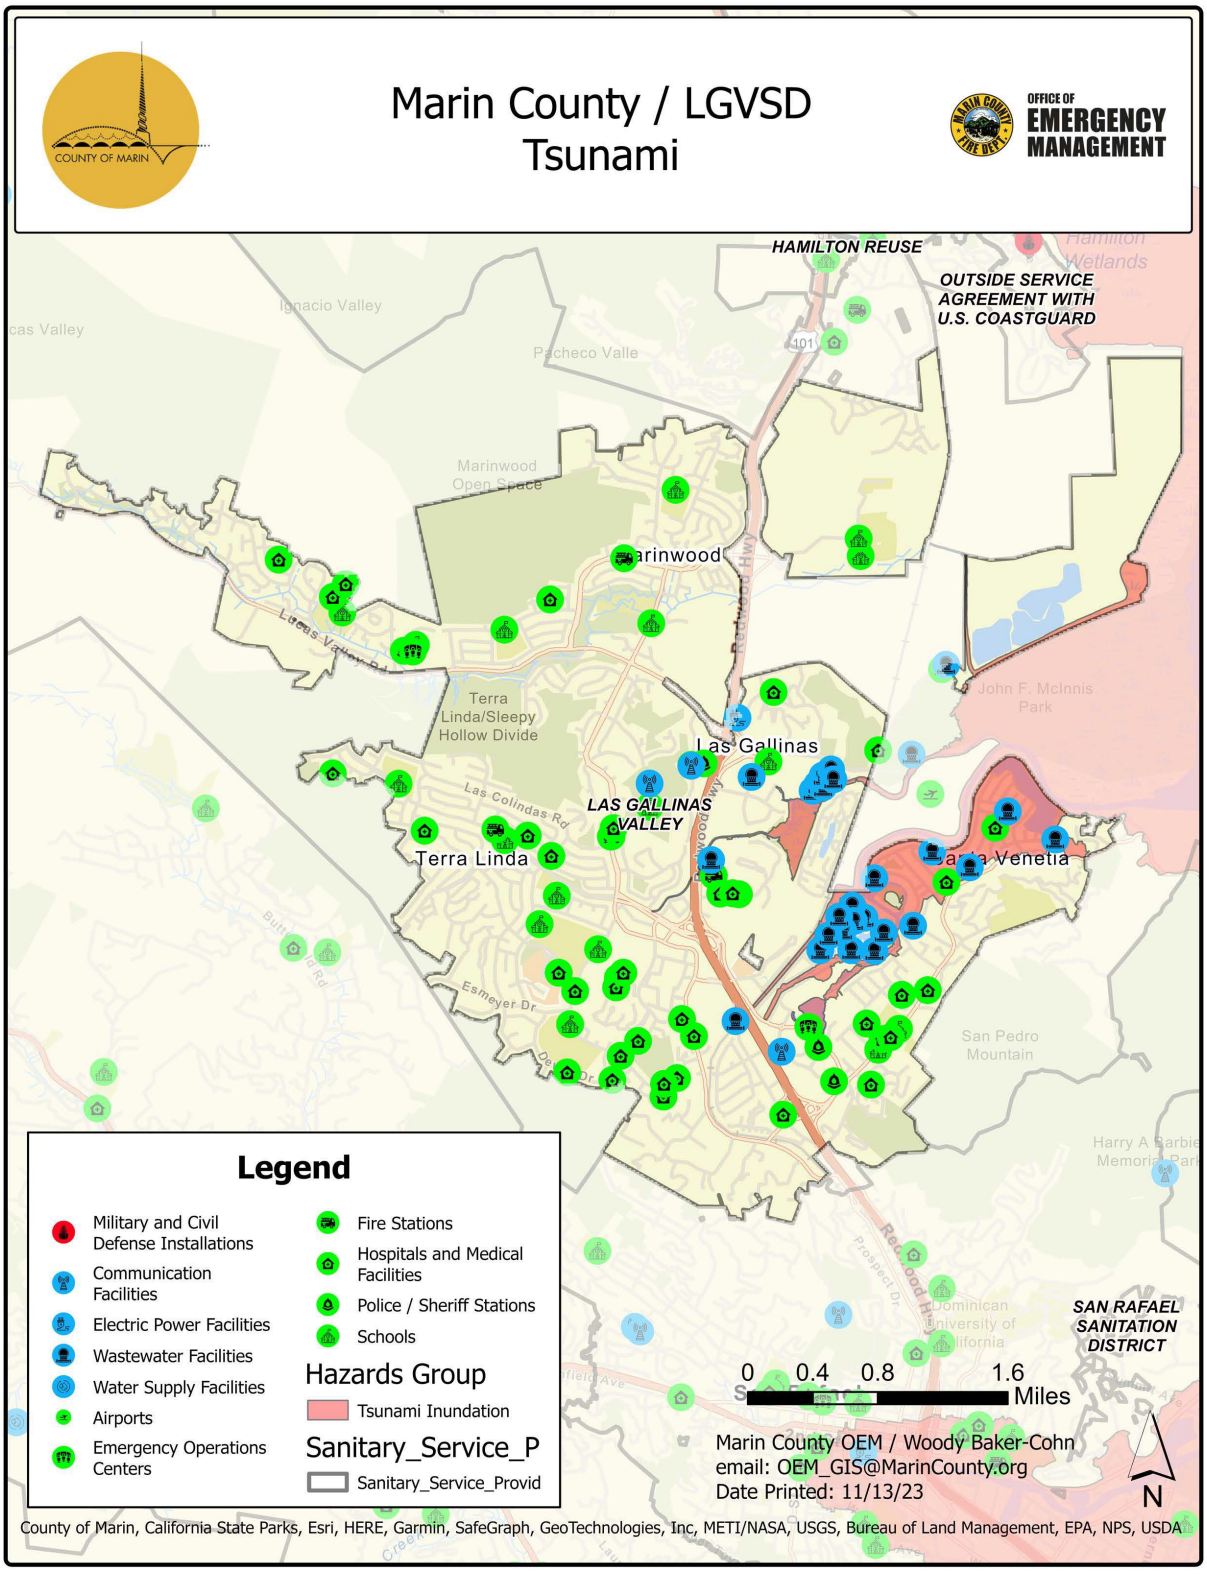

Figure 291: LGVSD Tsunami Critical Facilities and Infrastructure
Source: Marin County OEM

A tsunami experienced by the LGVSD would most likely occur from an earthquake, the location of which would determine the amount of time that the tsunami waves would reach the District. Most of the eastern half of the District is at a lower elevation. Most of this area, including around the LGVSD Treatment Plant, is protected by levees and does not lie in a tsunami hazard area. The Santa Venetia area, while protected by a levee, does lie in a tsunami hazard area. There are five pump stations in this area that could be susceptible to a tsunami and could be inundated with floodwater in the event of a tsunami.

The LGVSD has never experienced a tsunami.

Climate Change and Future Development Considerations

The biggest threat to tsunamis is sea level rise which is a direct result of climate change. Sea level rise can make tsunamis worse than they already are because higher sea levels allow for tsunamis to travel further inland and cause even more damage. Sea level rise results in more vulnerable coastlines which make coastal communities even more vulnerable to an incoming tsunami as the natural buffer to absorb the energy of an incoming tsunami will cease to exist. This is particularly true in the Marin County OA including LGVSD, where a large segment of the developed population lies in an area vulnerable to sea level rise. Furthermore, it has been theorized that ocean warming, caused by climate change, can impact the tectonic plates that rest below large bodies of water. Ultimately, this can result in more geological activities and worse tsunamis. Climate change has also affected ocean patterns, which could eventually lead to tsunamis distributing themselves across the ocean and impacting areas that are currently not susceptible to a tsunami. Tsunamis as a result of climate change and associated sea level rise will exacerbate the impacts of flooding in the lowland areas of the Marin County OA including the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent. This is particularly true along Gallinas Creek and the South Fork of Gallinas Creek and around the marshland areas of the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent where additional storm surge as a result of a larger tsunami could cause greater impacts. Future development in these areas will expose more people and infrastructure to the effects of flooding in the Marin County OA as tsunami inundation areas expand with climate change. Development in marshland in the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent would expose additional people and infrastructure to flooding as marshlands act as a natural buffer to a tsunami. Flooding could be exacerbated in areas where levees could fail along Gallinas Creek and the South Fork of Gallinas Creek and along the shoreline of the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent as a result of high wave heights associated with a more significant tsunami.

2.2.11 WILDFIRE

A wildfire is a fire that occurs in an area of combustible vegetation. The three conditions necessary for a wildfire to burn are fuel, heat, and oxygen. Fuel is any flammable material that can burn, including vegetation, structures, and cars. The more fuel that exists and the drier that fuel is, the more intense the fire can be. Wildfires can be started naturally through lightning or combustion or can be set by humans. There are many sources of human-caused wildfires including arson, power lines, a burning campfire, an idling vehicle, trains, and escaped controlled burns. On average, four out of five wildfires are started by humans. Uncontrolled wildfires fueled by wind and weather can burn acres of land and everything in their path in mere minutes and can reach speeds up to 15 miles per hour or faster depending upon wind speed and ember distribution. On average, more than 100,000 wildfires burn 4 to 5 million acres of land in the United States every year. Although wildfires can occur in any state, they are most common in the Western states including California where heat, drought, and thunderstorms create perfect wildfire conditions.

Wildfires are of primary concern when they occur in the Wildland Urban Interface (WUI), which is defined as areas where homes are built near or among lands prone to wildfire. Even relatively small acreage fires may result in disastrous damages. Most structures in the WUI are not destroyed from direct flame impingement, but from embers carried by wind. The damages can be widely varying, but are primarily reported as damage to infrastructure, built environment, and injuries to people.

The pattern of increased damages is directly related to increased urban spread into historical forested areas that have wildfire as part of the natural ecosystem and climate change. Many WUI fire areas have long histories of wildland fires that burned only vegetation in the past. However, with new development, a wildland fire following a historical pattern may now burn these newly developed areas. WUI fires can occur where there is a distinct boundary between the built and natural areas or where development or infrastructure has encroached or is intermixed in the natural area. WUI fires may include fires that occur in remote areas that have critical infrastructure easements through them, including electrical transmission towers, railroads, water reservoirs, communications relay sites or other infrastructure assets.

Consequently, wildland fires that burn in natural settings with little or no development are part of a natural ecological cycle and may actually be beneficial to the landscape. Century old policies of fire exclusion and aggressive suppression have given way to better understanding of the importance fire plays in the natural cycle of certain forest types.

Warning times are usually adequate to ensure public safety, provided that evacuation recommendations and orders are heeded in a timely manner. While in most cases wildfires are contained within a week or two of outbreak, in certain cases, they have been known to burn for months, or until they are completely extinguished by fall rains.

Wildfire poses the greatest risk to human life and property in the Marin County OA's densely populated WUI, which holds an estimated 69,000 living units. Marin County is home to 23 communities listed on CAL FIRE's Communities at Risk list, with approximately 80% of the total land area in the county designated as having moderate to very high fire hazard severity ratings. The county has a long fire history with many large fires over the past decades, several of which have occurred in the WUI. To compound the issue, national fire suppression policies and practices have contributed to the continuous growth (and overgrowth) of vegetation resulting in

dangerous fuel loads. The Community Wildfire Protection Plan (CWPP) provides a scientifically based assessment of wildfire threat in the WUI of the Marin County OA.

Fire protection in California is the responsibility of either the federal, state, or local government depending upon the location of the incident. On federally owned land, or federal responsibility areas (FRA), fire protection is provided by the federal government, and or in partnership with local agreements. In state responsibility areas (SRA), CAL FIRE typically provides fire protection. However, in some counties CAL FIRE contracts with county fire departments to provide protection of the SRA – this is the case in the Marin County OA, where CAL FIRE contracts with MCFD. Local responsibility areas (LRA) include incorporated cities and cultivated agriculture lands, and fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

CAL FIRE contracts with MCFD to provide wildland fire protection and associated fire prevention activities for lands designated by the State Board of Forestry as SRA.. The MCFD is responsible for the protection of approximately 200,000 acres of SRA within the county and is the primary agency that handles wildland fires. MCFD also provides similar protection services to approximately 100,000 acres of FRA in the Golden Gate National Recreation Area (GGNRA), the Muir Woods National Monument, and the Point Reyes National Seashore.

Figure 52 indicates the federal responsibility areas, state responsibility areas and local responsibility areas in the Marin County OA.

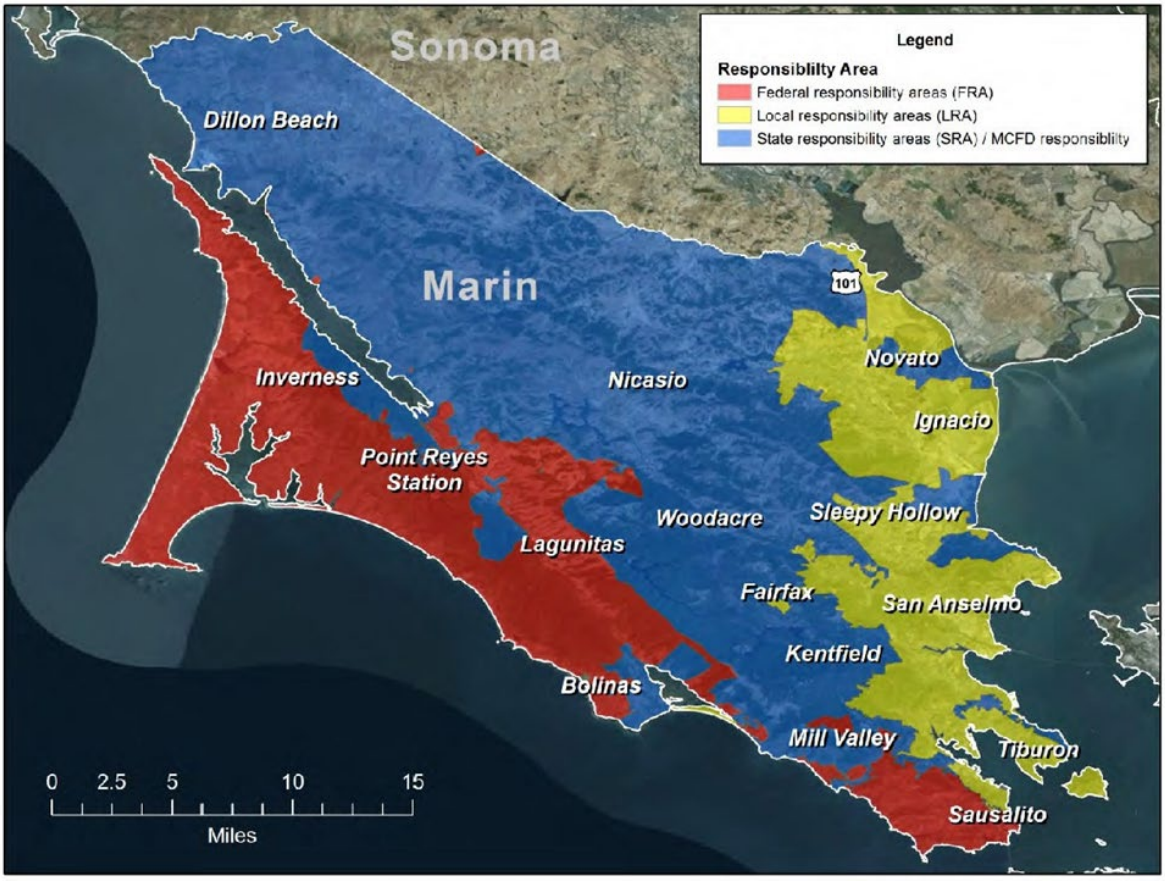

Figure 292: Federal, State and Local Responsibility Areas in the Marin County OA
Source: Marin Community Wildfire Protection Plan

The mix of weather, diverse vegetation and fuel characteristics, complex topography, and land use and development patterns in the Marin County OA are important contributors to the fire environment. The MCFD Woodacre ECC currently manages the data from four Remote Automated Weather Stations (RAWS) for predicting fire danger utilizing the National Fire Danger Rating System (NFDRS) during the fire season. The RAWS are located in Woodacre, Middle Peak, Barnabe, Big Rock and a new station will be coming online in Novato.

Marin County is bounded by the cool waters of the Pacific Ocean to the west, the San Francisco and Richardson Bays to the southeast, the San Pablo Bay to the east, and Sonoma County agricultural lands to the north. The combination of these large bodies of water, location in the mid-latitudes, and the persistent high pressure over the eastern Pacific Ocean results in several micro-climates. Weather in the OA consists of warm, dry summers and cool, wet winters. The climate in early fall and late spring is generally similar to the summer, and late fall is similar to winter. Spring is generally cool, but not as wet as the winter. While these general weather conditions are fairly representative of the typical Marin County weather, complex topography, annual variability of weather patterns, and less frequent and transient weather patterns are important to fire conditions.

In the late spring through early fall, the combination of frequent and strong high-pressure systems (known as the Pacific High) over California combined with the cool waters of the ocean/bays results in persistent fog and low clouds along the coast (including over southern Marin County near the San Francisco Bay). The fog often penetrates into the inland valleys of northern and central Marin County, especially during overnight hours. At the coastline, mist from fog can keep the land surfaces modestly moist while inland land surfaces above the fog or inversion are often very dry.

The Pacific High that persists from late spring through early fall over the eastern Pacific, combined with a thermal low pressure over the Central Valley of California, results in an almost continuous sea breeze. These winds usher in cool and moist air and can be strong (15 to 25 mph), especially over the ridge tops and through northwest to southeast lying valleys, including San Geronimo/Ross, Hicks, and Lucas Valleys. These westerly winds are usually highest in the afternoon, decrease in the evening, and are light overnight before increasing again in the late morning/early afternoon.

Occasionally in the summer and more often in the fall, the Pacific High moves inland and centers over Oregon and Idaho, while low pressure moves from the Central Valley of California to southern California and Arizona. The resulting north-to-south pressure gradient can be strong enough to retard the typical sea breeze and can even result in winds blowing from the land to the ocean (offshore winds). As the offshore winds move air from the Great Basin to the coastal areas of California, the air descends and compresses, which greatly warms and dries the air. Under these “Diablo” wind conditions, temperatures in the Marin County OA can reach 100°F in the inland areas and even 80°F at the coast, and relative humidity can be very low. In addition, wind speeds can be high (20 to 40 mph) and gusty and are often much faster over the mountains and ridge tops such as Mt. Tamalpais, Loma Alta, and Mt. Burdell compared to low-lying areas. Wind speeds can be high over the ridges and mountains at all times of day under this “offshore” wind pattern and are often much slower or even calm at night in low-lying areas because nighttime cooling decouples the aloft winds from the surface winds. It is during these Diablo wind events that there is a high potential for large, wind-driven fires should there be an

ignition. Historically, the largest and most destructive fires have occurred during these offshore (also known as Foehn) wind events including the Angel Island and the Vision fires.

A few times per year in the summer and early fall, monsoonal flow from Mexico brings in moist and unstable air over central and northern California, which can result in thunderstorms with or without precipitation. With the otherwise dry summer conditions, the lightning can ignite fires. These monsoonal flow patterns are usually only one to two-day events.

Beginning in late November and lasting through the end of March, the Pacific High moves south and weakens, allowing storms that originate in the Gulf of Alaska to move over California.

These storms bring precipitation and, at times, strong winds out of the south. Each storm usually results in one fourth inch to several inches of rain over a day or so. Near Mt. Tamalpais, rainfall amounts are enhanced by orographic lifting, resulting in higher rain amounts in the Kentfield and Fairfax areas compared to the rest of the county. Typically, after the first rain in November, the cool weather and occasional storm keeps the ground wet through late Spring. However, in some years, significant rain does not occur until later in the year (e.g., early-to-late December) and there can be several weeks without any storms and rain. During storms, temperatures are usually mild.

When there are no storms over California, a land-breeze typically forms (i.e., winds blowing from the Central Valley to the Pacific Ocean). These winds can reach 30 mph, and travel through the southeast to northwest lying valleys, over low-lying ridges such as the Marin Headlands, and through the Golden Gate. These winds are usually highest in the mid-morning hours and decrease in the afternoon as the Central Valley warms during the day. The winds are associated with cold and modestly moist air.

In late February/early March through late April, the Pacific High strengthens and moves north, and storms impacting the county become less frequent. During this time of year there is often a low-pressure area over the desert in southwest California. The combination of the Pacific High to the north and low-pressure to the southwest results in strong winds blowing from the northwest to the southeast. Like the sea breeze, these winds bring in cool, moist air and are usually highest in the afternoon hours. Because of winter and spring rains, the land is wet and there is little danger of wildland fire despite the strong winds and only occasional precipitation. There is often little coastal fog this time of year.

Vegetation, which is also known as fuel, plays a major role in fire behavior and potential fire hazards. A fuel's composition, including moisture level, chemical make-up, and density, determines its degree of flammability. Of these, fuel moisture level is the most important consideration. Generally, live trees contain a great deal of moisture while dead logs contain very little. The moisture content and distribution of fuels define how quickly a fire can spread and how intense or hot it may become. High moisture content will slow the burning process since heat from the fire must first eliminate moisture.

In addition to moisture, a fuel's chemical makeup determines how readily it will burn. Some plants, shrubs, and trees such as chamise and eucalyptus (both present in the Marin County OA) contain oils or resins that promote combustion, causing them to burn more easily, quickly, and intensely.

Finally, the density of a fuel influences its flammability; when fuels are close together but not too dense, they will ignite each other, causing the fuel to spread readily. However, if fuels are so close that air cannot circulate easily, the fuel will not burn freely.

The Marin County OA has extensive topographic diversity that supports a variety of vegetation types.

Environmental factors, such as temperature, precipitation, soil type, aspect, slope, and land use history, all help determine the existing vegetation at any given location. In the central and eastern parts of the county, north facing slopes are usually densely wooded from lower elevations to ridge peaks with a mixture of mostly hardwood tree species such as coast live oak, California bay, Pacific madrone, and other oak species. Marshlands are also present throughout the county; once ignited marsh fires can be difficult to contain and extinguish.

Grasslands with a mixture of native and nonnative annual and perennial plant species occur most often in the northern and western parts of the county due to a combination of soil type, lower rainfall, and a long history of ranching. The southern and western facing slopes tend to have a higher percentage of grasslands, which in turn have the potential to experience higher rates of fire spread. Grassland fires are dangerous even without extreme fire weather scenarios due to the rapid rate of fire spread; in some cases, fires spread so quickly that large areas can burn before response resources are able to arrive.

In the west portion of the county closer to the coast, where precipitation is higher and marine influence is greater, most areas are densely forested with conifer species (i.e., Bishop pine, Douglas-fir, and coast redwood) and associated hardwood species. Chaparral vegetation also occurs in parts of the county, especially on steeper south and west facing slopes. This mix of densely forested areas mixed with chaparral results in higher fuel loads and potentially higher fire intensity. Expansion of the residential community into areas of heavier vegetation has resulted in homes existing in close proximity to dense natural foliage; these homes are often completely surrounded by highly combustible or tall vegetation, increasing the potential that wildland fires could impact them.

As part of the development of the CWPP, an updated vegetation map layer was created using the most recent vegetation information available from a variety of state and local data sources.

Vegetation distribution in the Marin County OA is characterized by approximately 20 different types of vegetation which have been classified into 15 fire behavior fuel models.

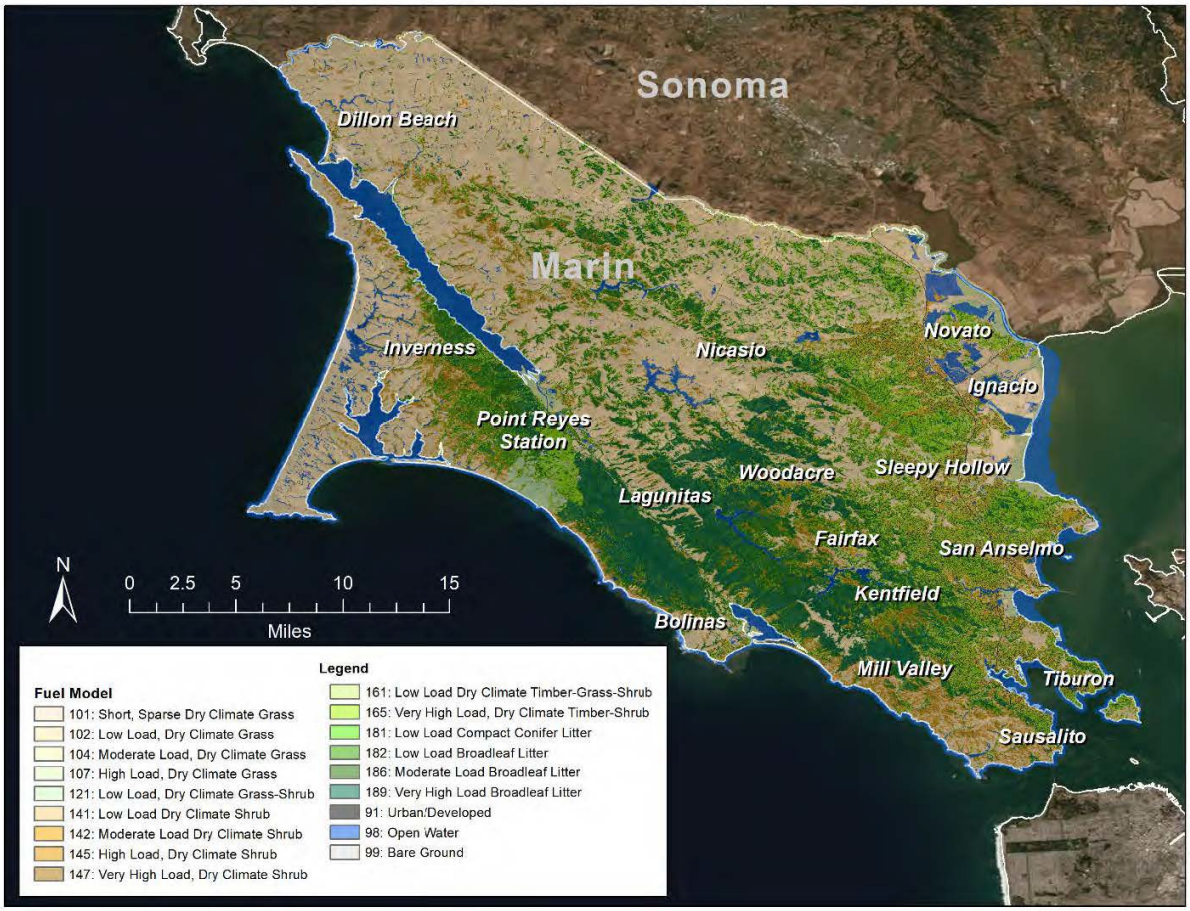

Figure 293: Fuel Model Map for the Marin County OA
Source: Unknown

Insect infestations and plant diseases, such as California oak mortality syndrome (sudden oak death), are increasing and threaten to change the structure and overall health of native plant communities in the Marin County OA. Sudden oak death has no known cure and is a concern since this specific desease can impact vegetation through Marin including the WUI .; this syndrome is caused by the fungus-like Phytophthora ramorum, which has led to widespread mortality of several tree species in California since the mid-1990s; the tanoak (Lithocarpus densiflorus) in particular, appears to have little or no resistance to the disease. Sudden oak death has resulted in stands of essentially dead trees with very low fuel moistures

Studies examining the impacts of sudden oak death on fire behavior indicate that while predicted surface fire behavior in sudden oak death stands seems to conform to a common fuel model already in use for hardwood stands, the very low moisture content of dead tanoak leaves may lead to crown ignitions more often during fires of “normal” intensity.

Two other plant diseases prevalent in the Marin County OA are pitch canker (which affects conifers such as Bishop pine and other pine species), and madrone twig dieback (which affects Pacific madrones). Pitch canker is caused by the fungus Fusarium circinatum (F. subglutinans, F. sp. pini), which enters the tree through wounds caused by insects. While some trees do recover, most infected trees are eventually killed by the fungus. Management of this disease

largely focuses on containment to reduce the fungus spreading to other trees. Pitch canker is a particular issue in the NPS lands of Pt. Reyes National Seashore, where many acres of young Bishop Pines that were seeded on the Inverness Ridge by the Mount Vision Fire of 1995 have been infected.

These dead and dying trees have created large swaths of land with dense and dry fuel loads. Madrone twig dieback is caused by the native fungus Botryosphaeria dothidea and appears to be getting worse throughout the county due to drought effects on Pacific madrones. Three additional threats to trees common to the Marin County OA include:

- Bark and ambrosia beetles (Monarthrum dentiger and monarthrum scutellare), which target oak and tanoak trees. Sudden oak death may be exacerbating the effects of beetle infestations which prey on trees already weakened by this disease.
- Root rot, caused by oak root fungus (Armillaria mellea), is primarily associated with oaks and other hardwoods but also attacks conifers. These fungal infestations cause canopy thinning and branch dieback and can kill mature trees. As with the beetle infestations, sudden oak death may be exacerbating the effects of root rot fungus in the county forests.
- Velvet-top fungus (Phaeolus schweinitzii) is a root rot fungus affecting Douglas-fir and other conifers, with the infection typically occurring through a wound.

Topography characterizes the land surface features of an area in terms of elevation, aspect, and slope. Aspect is the compass direction that a slope faces, which can have a strong influence on surface temperature, and more importantly on fuel moistures. Both elevation and aspect play an important role in the type of vegetation present, the length of the growing season, and the amount of sunlight absorbed by vegetation. Generally, southern aspects receive more solar radiation than northern aspects; the result is that soil and vegetation on southern aspects is warmer and dryer than soil and vegetation on northern aspects. Slope is a measure of land steepness and can significantly influence fire behavior as fire tends to spread more rapidly on steeper slopes. For example, as slope increases from 20 – 40%, flame heights can double and rates of fire spread can increase fourfold; from 40 – 60%, flame heights can become three times higher and rates of spread can increase eightfold.

The Marin County OA is topographically diverse, with rolling hills, valleys and ridges that trend from northwest to southeast. Elevation throughout the county varies considerably, with Mt. Tamalpais' peak resting at 2,574 feet above sea level and many communities at or near sea level. Correspondingly, there is considerable diversity in slope percentages. The San Geronimo Valley slopes run from level (in the valley itself) to near 70%. Mt. Barnabe has slopes that run from 20 to70%, and Throckmorton ridge has slopes that range in steepness from 40 – 100%. These slope changes can make fighting fires extremely difficult.

In the WUI where natural fuels and structure fuels are intermixed, fire behavior is complex and difficult to predict. Research based on modeling, observations, and case studies in the WUI indicates that structure ignitability during wildland fires depends largely on the characteristics and building materials of the home and its immediate surroundings.

The dispersion of burning embers from wildfires is the most likely cause of home ignitions. When embers land near or on a structure, they can ignite near-by vegetation or accumulated

debris on the roof or in the gutter. Embers can also enter the structure through openings such as an open window or vent and could ignite the interior of the structure or debris in the attic.

Wildfire can further ignite structures through direct flame contact and/or radiant heat. For this reason, it is important that structures and property in the WUI are less prone to ignition by ember dispersion, direct flame contact, and radiant heat.

Public Safety Power Shutoff (PSPS) Events

As a result of the 2017 Northern California Wildfires, the 2018 Camp Fire in Butte County and other wildfires caused by power line infrastructure, Pacific Gas & Electric (PG&E) began initiating Public Safety Power Shutoff (PSPS) events in their service areas (including Marin County) to help prevent the start of future wildfires. PG&E will initiate a PSPS if conditions indicate potentially dangerous weather conditions in fire-prone areas due to strong winds, low humidity, and dry vegetation. During these events, PG&E will proactively turn off power in high fire risk areas to reduce the threat of wildfires. The most likely electric lines to be considered for a public safety power outage will be those that pass through areas that have been designated by the California Public Utilities Commission (CPUC) High Fire-Threat District at elevated (Tier 2) or extreme risk (Tier 3) for wildfire. Customers outside of these areas could have their power shut off, though, if their community relies upon a line that passes through a high fire-threat area or an area experiencing severe weather. PG&E will consider numerous factors and analyze historical data to help predict the likelihood of a wildfire occurring, and closely monitoring weather watch alerts from the National Weather Service (NWS). These factors generally include, but are not limited to:

- A Red Flag Warning declared by the National Weather Service
- Low humidity levels, generally 20 percent and below
- Forecasted sustained winds generally above 25 mph and wind gusts in excess of approximately 45 mph, depending on location and site-specific conditions such as temperature, terrain and local climate
- Condition of dry material on the ground and live vegetation (moisture content)
- On-the-ground, real-time observations from PG&E's Wildfire Safety Operations Center and field crews

Pacific Gas & Electric Company (PG&E) operates a total of 1,179 miles of overhead electricity transmission and distribution lines in the Marin County OA. Overhead electricity lines and poles can be damaged or downed under severe weather conditions, particularly severe wind conditions, which increases the potential for wildfire ignition. 52 percent of PG&E’s overhead distribution lines and 41 percent of its overhead transmission lines are located in CPUC-identified High-Fire Threat Districts subject to elevated or extreme fire risk. PG&E is currently planning and implementing safety measures to prevent wildfires and reduce the impacts of Public Safety Power Shutoff (PSPS) events on communities in the Marin County OA and throughout California.

These measures include installing weather stations; installing high-definition cameras; installing sectionalizing devices on its overhead lines to separate the grid into smaller sections; hardening the system by installing stronger power poles, covering lines, and undergrounding lines in targeted areas; creating temporary microgrids to provide electricity during PSPS events; and enhancing existing vegetation management activities. From 2018 to July 2021, PG&E hardened

three miles of overhead lines, installed 68 transmission and distribution sectionalizing devices, completed enhanced vegetation management on approximately 51 of overhead line miles, installed 28 weather stations, and installed 12 high-definition cameras in the Marin County OA.

A wildfire in the LGVSD would most likely occur in the areas of the District where there is more forested terrain. There are no District critical facilities in these areas. District critical facilities, including the LGVSD Treatment Plant and the McInnis Park Pump Station are in a high FHSZ and could be impacted by a brush fire in the vegetated marshland areas of the District adjacent to San Pablo Bay. As wildland areas around the District become drier due to climate change and drought, the risk of a wildfire or brush fire occurring and impacting the City will continue to increase as open spaces experience drier conditions.

The District has never experienced a major wildfire or brush fire.

Climate Change and Future Development Considerations

Climate change can lead to an increase in wildfire events. Climate change has been a key factor in increasing the risk and extent of wildfires in the western United States. Changes in climate create warmer, drier conditions. Increased drought, and a longer fire season are boosting these increases in wildfire risk.

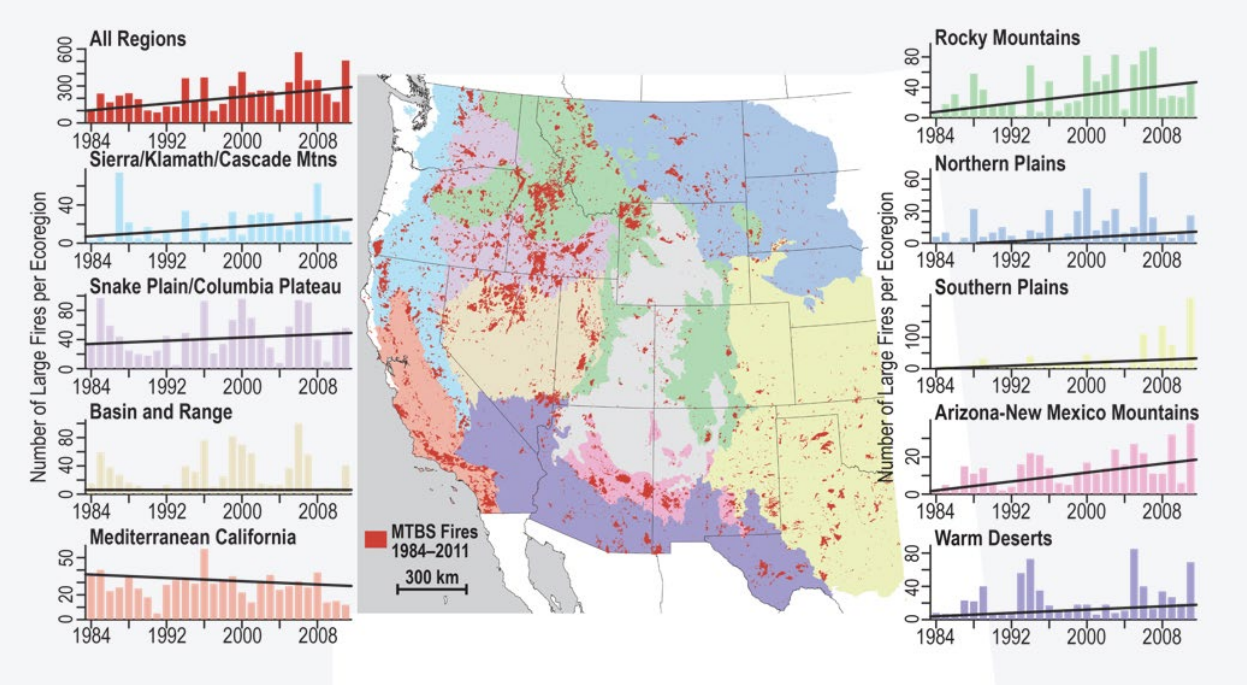

Figure 294: Trends in the Annual Number of Large Wildfires in the United States
Source: Fourth Climate Change Assessment, 01/04/23

As summer conditions in Northern California become hotter and drier due to climate change, the occurrence and severity of wildfires will only increase. The Marin County OA including the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent is particularly susceptible to these future impacts of climate change on wildfire, as the OA's climate has generally been wet enough historically to avoid major wildfires. Extreme heat events and high wind events could cause electrical systems to become overloaded and fail, sparking wildfires. An increase in wildfires as a result of climate

change could lead to more significantly burned areas that could contribute to debris flows after a significant storm event, particularly in the open space areas around the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent. Future development in the WUI throughout the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent will expose more people and property to the impacts of a potentially significant wildfire. The growing number of people in the northern City of San Rafael and the unincorporated County areas of Lucas Valley, Marinwood, Santa Venetia and St. Vincent WUI can increase risk to life, property and public health as a result of a wildfire. Future development around the northern City of San Rafael and the unincorporated County areas of Santa Venetia and St. Vincent marshlands would expose more people to the effects of brush fires as the marshlands dry out in the summer due to climate change.

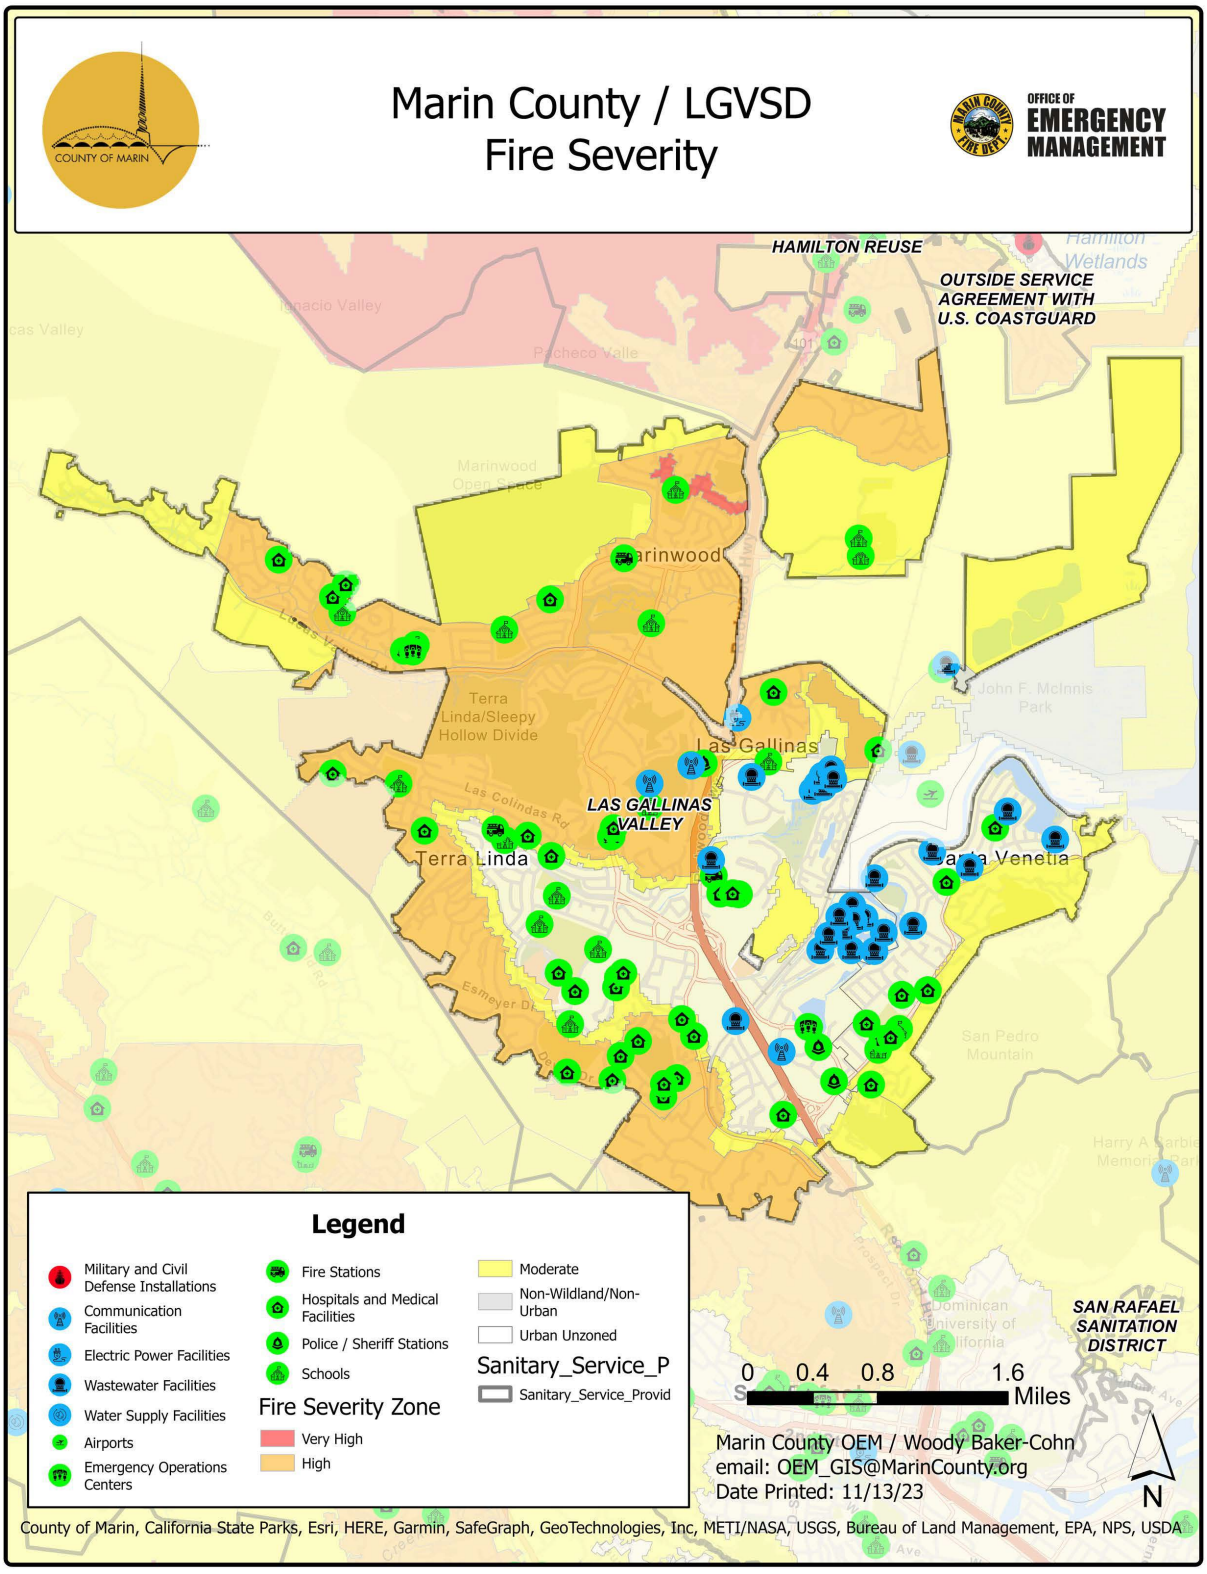

Figure 295: LGVSD Wildfire Critical Facilities and Infrastructure
Source: Marin County OEM

SECTION 3.0: MITIGATION STRATEGY

3.1 CHANGES IN DEVELOPMENT

The various Marin County Jurisdiction's General Plans guide growth and development across the County based on maintaining the County's small communities with their own unique character. Future large development in the County is not expected within the next 5 years, however, some managed development has been identified, approved, or submitted.

There has been a significant amount of development within the Las Gallinas Valley Sanitary District since the last plan update in 2018. However, the development has been within the City of San Rafael or Marin County jurisdictions, and to existing facilities or within the facility footprint of the LGVSD. There has not been any increased risk to the District as a result of new development since the last plan update in 2018.

Future land use and growth management strategies in the Las Gallinas Valley Sanitary District are consistent with priorities detailed in the 2023 Marin County MJHMP and aim to concentrate future development into and toward existing areas away from locations where natural characteristics may limit development (e.g., steep slopes or sensitive habitats), and to areas that have, or can readily be supplied with, adequate public facilities and services. This is done through various policies relating to zoning and minimum development standards and requirements. No further development is planned for the next five years.

3.2 CAPABILITY ASSESSMENT

The Las Gallinas Valley Sanitary District did not participate in the 2018 Marin County MJHMP. However, the strategies which support the overall District priorities are reflected in the sections below. Several current and future mitigation actions are identified to coincide with priorities, progress in local mitigation efforts and changes in development.

Capabilities are the programs and polices currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. The capability assessment identifies the local planning mechanisms and hazard mitigation information from this 2023 MJHMP will be incorporated once approved. The capability assessment is divided into four sections: regulatory, administrative and technical, fiscal, and outreach and partnerships.

3.2.1 REGULATORY CAPABILITIES

The legal and regulatory capabilities include existing ordinances and codes that affect the District's physical or built environment. Examples of legal and/or regulatory capabilities can include: a jurisdiction's building codes, zoning ordinances, subdivision ordnances, special purpose ordinances, growth management ordinances, site plan review, general plans, capital improvement plans, economic development plans, emergency response plans, and real estate disclosure plans. The table below lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place.

Opportunities for Enhancement

The 2023 Marin County OA MJHMP update provided the LGVSD an opportunity to review and update the capabilities currently in place to mitigate hazards. This also provided an opportunity to identify where capabilities could be improved or enhanced. Specific opportunities could include:

- **Community Wildfire Protection Plan:** The district may consider taking an active role in mitigation actions to enhance wildfire protection.
- **StormReady certification and Firewise Communities certification:** The district may consider participation in these programs.

Table 16: Legal and Regulatory Capabilities

Plans	Yes/No Latest Update	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive /Master Plan	Yes	Integrated Wastewater Master Plan (IWMP) addresses hazards, identifies projects, and it can be used to implement mitigation actions.
Strategic Plan	Yes	Guiding document determining vision including vision to action table. Does not address hazards. Can be used to identify goals but not to implement mitigation actions.
Capital Improvements Plan	Yes	Hazards identified in IWMP are funded based on priority. Mitigation projects could be included in the CIP. If Board approves CIP funding, the plan supports implementation of mitigation actions.
Economic Development Plan	No	N/A
Local Emergency Operations Plan	Yes	Emergency Preparedness Response Plan, District specific. Responds to hazards. Does not identify projects to mitigate.
Continuity of Operations Plan	Yes	Resilience plan for treatment plant required as part of NPDES permit. Sewer System Management Plan (SSMP) for continued operations of the collection system.
Flood Mitigation Plan (FMP)	Yes	District participates in the Marin County Plan.
Engineering Studies for Streams	No	N/A
Open Space Management Plan	No	N/A
Regional Transportation Plan (RTP)	No	N/A
Stormwater Management Plan/Program	Yes	District participates in the San Rafael & Marin County Plan.
Community Wildfire Protection Plan	Yes	District participates in the Marin County WPP
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal	No	N/A

zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Yes	Yes, District adheres to city, county, state, & federal codes.
Building Code Effectiveness Grading Schedule (BCEGS) Score	Yes	Yes, District adheres to city, county, state, & federal codes.
Fire department ISO rating:	No	
Site plan review requirements	Yes	Yes, District participates San Rafael or Marin County plan reviews.
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
District Code	Yes	District Code allows for collection of sewer service fees and capacity fees to fund mitigation projects. Program is adequately administered. No enforcement.
Zoning ordinance	Yes	Yes, District participates San Rafael or Marin County plan reviews.
Subdivision ordinance	Yes	Yes, District participates San Rafael or Marin County plan reviews.
Floodplain ordinance	Yes	Yes, District participates San Rafael or Marin County plan reviews.
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Yes	Yes, District participates San Rafael or Marin County plan reviews.
Flood insurance rate maps	Yes	Yes, District participates San Rafael or Marin County plan reviews.
Elevation Certificates	Yes	Yes, District participates San Rafael/Marin County plan review.
Acquisition of land for open space and public recreation uses	No	
Erosion or sediment control program	Yes	Yes, District participates San Rafael or Marin County plan reviews.

Table 138: Las Gallinas Valley Sanitary District Legal and Regulatory Capabilities
Source: Las Gallinas Valley Sanitary District

Las Gallinas Valley Sanitary District Comprehensive Plan or Master Plan

Las Gallinas Valley Sanitary District boundaries overlap unincorporated areas of Marin County and the City of San Rafael, both of which are required to have a General Plan or Master Plan per California Government Code 65300. Please see their respective General Plan or Master Plan for details.

3.2.2 Administrative and Technical Capabilities

The administrative and technical capability identifies the District personnel responsible for activities related to mitigation and loss prevention. Many positions are full time and/or filled by the same person.

Table 17: Administrative and Technical Capabilities

Administrative	Yes/No	Is coordination effective?
Planning Commission	Yes	Yes, Coordinate & participate with San Rafael & Marin County.
Administrative Services	Yes	Yes, Coordinate with San Rafael & Marin County.
Hazard Mitigation Planning Committee	Yes	Yes, Coordinate & participate with San Rafael & Marin County.
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Yes	Yes, Easements kept clear (trees and unpermitted obstructions) for emergency access
Mutual aid agreements	Yes	Between other local wastewater agencies and Marin OEM
Technical	Yes/No	Has capability been used to assess/mitigate risk in the past?
Warning systems/services (Reverse 911, outdoor warning signals)	Yes	Yes, Coordinate & participate with San Rafael & Marin County.
Hazard data and information	No	
Grant writing	No	
Hazus analysis	No	
Staff/Personnel Resources	Yes/No FT/ PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	No	
Floodplain Administrator	No	
Emergency Manager	Yes	General Manger serves in this role by definition. Leads the management team and coordinates with other wastewater agencies as needed during emergencies.
Community Planner	No	
Civil Engineer	Yes	District Engineer and Engineering Department enforce District regulations, have training on hazard mitigation, and coordinates with County and City officials.
Engineer(s), project manager(s), technical staff, equipment operators, and	Yes	Yes, Coordinate with San Rafael & Marin County on projects.

maintenance and construction staff.		
GIS Coordinator	No	
Community Development Staff	No	
City Planning, Building, and Public Works Staff	No	
Police Department Staff	No	
Fire Protection District Staff	No	
Community Development Staff	No	

Table 139: Las Gallinas Valley Sanitary District Administrative and Technical Capabilities
Source: **Las Gallinas Valley Sanitary District**

3.2.3 Fiscal Capabilities

The fiscal capability assessment shows specific future financial and budgetary tools available to the district such as Hazard Mitigation grants; capital improvements project funding; authority to work with San Rafael and Marin County to levy utility taxes for specific purposes; fees for sewer or impact fees for home buyers or developers for new development; ability to incur debt through general obligations bonds; and withholding spending in hazard-prone areas.

Table 18: Fiscal Capabilities

Financial	Yes/No	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Yes	Feasibility studies, planning, and construction. Resource can be used to fund future mitigation actions.
Authority to levy taxes for specific purposes	No	
Fees for water, sewer, gas, or electric services	Yes	The District has the ability to assess sewer service charge fees and capital facilities charges. If mitigation projects are identified and included in an adopted Sewer Rate Study or Capacity Fee Study, the fees can be use for mitigation project when adopted with the annual budget.
Impact fees for new development	Yes	Development impact fees may be required when permit for connection to the wastewater system is required.
Storm water utility fee	No	
Incur debt through general obligation bonds and/or special tax bonds	Yes	Recent upgrade of the Secondary Treatment Plant facility and expansion of the Recycled Water facility was funding in part by bond.
Incur debt through private activities	Yes	Funding of capital improvements to the sewer collection system to meet the capital financing needs of the District. Funds could be used to fund mitigation actions.

Community Development Block Grant	No	
Other federal funding programs	Yes	Federal grant and infrastructure awards could be used to fund mitigation projects, such as sea-level rise and drought contingency. Regional coordination through North Bay Water Reuse Authority was used to obtain federal grant in for partial funding used towards Secondary Treatment Plant facility and expansion of the Recycled Water facility.
State funding programs	Yes	California Clean Water State Revolving Fund obtained in 2010 to complete primary clarifier system improvements at the treatment plant. Funding can be used to fund future mitigation actions.

Table 140: Las Gallinas Valley Sanitary District Fiscal Capabilities
Source: **Las Gallinas Valley Sanitary District**

3.2.4 COMMUNITY OUTREACH

The outreach and partnerships capability assessment shows outreach and public education programs available to the Las Gallinas Valley Sanitary District and the Las Gallinas Valley Sanitary District partnerships utilized to promote those programs.

Table 19: Las Gallinas Valley Sanitary District Community Outreach

Outreach and Partnerships	Yes/No	Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	Local groups and non-profits may be able to help spread the word on environmental protection but may be limited by funding challenges. The District supports environmental protection. Educational center is part of the District's plan for new facilities near the District's treatment plant and/or reclamation ponds.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	Environmental education related to wastewater and pollution prevention programs are held at various regional events throughout the year. Newsletters round out the education initiative in the District. Both can support future implementation of future mitigation activities.
Natural disaster or safety related school programs	No	
StormReady certification	No	
Firewise Communities certification	No	
Community Rating System	Yes	Local groups and non-profits may be able to help spread the word on environmental protection but may be limited by funding challenges. The District supports

		environmental protection. Educational center is part of the District's plan for new facilities near the District's treatment plant and/or reclamation ponds.
Public-private partnership initiatives addressing disaster-related issues	Yes	Environmental education related to wastewater and pollution prevention programs are held at various regional events throughout the year. Newsletters round out the education initiative in the District. Both can support future implementation of future mitigation activities.

Table 141: Las Gallinas Valley Sanitary District Community Outreach
Source: **Las Gallinas Valley Sanitary District**

3.2.5 Participation in the National Flood Insurance Program

As a Special District the Las Gallinas Valley Sanitary District does not participate in the national flood insurance program (NFIP). However, the City of San Rafael and the County of Marin do participate in the NFIP and have profiled their flood risk in the Flood Profile in this Annex, the Marin County OA MJHMP, and the City of San Rafael Annex. Repetitive loss and severe repetitive loss structures are also addressed in the NFIP portion of the Marin County OA MJHMP, and the City of San Rafael Annex.

3.3 MITIGATION GOALS

44 CFR Requirement § 201.6(c)(3)(i) [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long‐term vulnerabilities to the identified hazards.

The information developed from the risk assessment was used as the primary basis for developing mitigation goals and objectives. Mitigation goals are defined as general guidelines explaining what each jurisdiction wants to achieve in terms of hazard and loss prevention.

Hazard Risk Prioritization
↓
Mitigation Goals & Objectives
↓
Mitigation Project Identification
↓
Mitigation Project Implementation

Goal statements are typically long-range, policy-oriented statements representing jurisdiction-wide visions. Objectives are statements that detail how each jurisdiction's goals will be achieved, and typically define strategies or implementation steps to attain identified goals. Other important inputs to the development of jurisdiction-level goals and objectives include performing reviews of existing local plans, policy documents, and regulations for consistency and complementary goals, as well as soliciting input from the public.

The following represents overarching strategic goals associated with the identification and eventual implementation of appropriate and meaningful hazard mitigation efforts in relation to prioritized hazards and threats confronting Marin County. These goals form the basis for specific supporting process objectives and are shown from the highest priority, at the top of the list, to those of lesser importance.

The establishment of hazard mitigation goals represents both individual and collective strategies that have been mutually agreed upon by the Steering Committee and have changed with the 2023 MJHMP update. Objectives were added to Goals 2 and 5. Eventually, these goals have been adopted by Marin County and its participating jurisdictions as the guiding policy behind local hazard mitigation efforts, in conjunction with other associated principles.

Goals were defined for the purpose of this mitigation plan as broad-based public policy statements that:

- Represent basic desires of the community;
- Encompass all aspects of community, public and private;
- Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;
- Are future-oriented, in that they are achievable in the future; and
- Are time-independent, in that they are not scheduled events.

Goals are stated without regard to implementation. Implementation cost, schedule, and means are not considered. Goals are defined before considering how to accomplish them so that they are not dependent on the means of achievement. Goal statements form the basis for objectives

and actions that will be used as means to achieve the goals. Objectives define strategies to attain the goals and are more specific and measurable.

Goal 1: Minimize risk and vulnerability of the community to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, and environment in Marin County.

- Minimize economic and resource impacts and promote long-term viability and sustainability of resources throughout Marin County.
- Minimize impact to both existing and future development.
- Provide protection for public health.
- Prevent and reduce wildfire risk and related losses.

Goal 2: Provide protection for critical facilities, infrastructure, utilities, and services from hazard impacts.

- Incorporate defensible space and reduce hazard vulnerability.
- Develop redundancies in utilities and services.
- Enhance resilience through enhanced construction.

Goal 3: Improve public awareness, education, and preparedness for hazards that threaten our communities.

- Enhance public outreach and participation in the Alert Marin Emergency Notification System.
- Enhance public outreach, education, and preparedness program to include all hazards of concern.
- Increase public knowledge about the risk and vulnerability to identified hazards and their recommended responses to disaster events, including evacuation and sheltering options.
- Provide planning and coordination for "At-Risk" populations.
- Provide planning and coordination for companion animals, livestock, and other animal populations.
- Increase community awareness and participation in hazard mitigation projects and activities.

Goal 4: Increase communities' capabilities to be prepared for, respond to, and recover from a disaster event.

- Improve interagency (local, state, federal) emergency coordination, planning, training, and communication to ensure effective community preparedness, response and recovery.
- Enhance collaboration and coordination of disaster-related plans, exercises, and training with local, state, and federal agencies, neighboring communities, private partners, and volunteers.
- Enhance the use of shared resources/Develop a strong mutual aid support system.
- Create and maintain a fully functional, interoperable radio and communication system with all regional public safety partners.

Goal 5: Maintain FEMA Eligibility/Position the communities for grant funding.

- Review hazard events and ongoing hazard mitigation projects annually.
- Assess the need to pursue or adjust hazard mitigation projects after significant hazard events.

Goal 6: Reduce exposure to High Hazard Dams that pose an unacceptable risk to the public.

- Improve alert and warning systems to provide residents downstream of a High Hazard Dam to receive timely warning to evacuation when threatened by potential or imminent dam failure.
- Enhance overall community preparedness to respond and evacuate a potential or imminent dam failure.
- Increase public awareness of the risk posed by High Hazard Dams and the potential for relocation of housing outside a possible inundation zone.
- Prioritize High Hazard Dam Mitigation projects and programs.

3.4 Status of Previous Mitigation Actions

The Las Gallinas Valley Sanitary District did not participate in the 2018 Marin County MJHMP and therefore, did not have any previous mitigation actions.

3.5 Hazard Mitigation Actions

The 2023 Marin County MJHMP was revised to reflect progress in local mitigation efforts. Mitigation projects were selected for each hazard and for the Las Gallinas Valley Sanitary District based off the hazard risk assessment. The projects are supported by the mitigation goals and objectives, and are ranked using the following criteria; approximate cost, timeframe of completion, whether the project requires District Board of Directors regulatory action, and an assumption as to whether or not the project would be subject to CEQA or NEPA requirements. Funding sources are identified for all projects. All projects consider new, future, and existing development. Project worksheets are used by the Planning Team and Steering Committee to describe criteria for each project.

Based on the hazard profiles, threat assessment, capabilities assessment, community survey results, discussions among the Planning Team members, and existing best practices, a set of potential mitigation actions was developed and then evaluated based on the following criteria:

- FEMA requires local governments to evaluate the monetary and non-monetary costs and benefits of potential mitigation actions. Although local governments are not required to assign specific dollar values to each action, they should identify the general size of costs and benefits.
- The Planning Team may elect to include measures with a high cost or low benefits, but such measures should be clearly beneficial to the community and an appropriate use of local resources.

In addition, FEMA directs local governments to consider the following questions as part of the financial analysis:

- What is the frequency and severity of the hazard type to be addressed by the action, and how vulnerable is the community to this hazard?
- What impacts of the hazard will the action reduce or avoid?
- What benefits will the action provide to the community?

The Planning Team also chose to review and revise the potential hazard mitigation actions with consideration for climate impact and social vulnerability. Projects and programs were assessed with consideration of these variables.

Prioritization

As part of the mitigation actions development and review, the Planning Team also prioritized the actions. The prioritization efforts looked at the risks and threats from each hazard; lifesaving, life safety, property protection and lastly environmental protection; financial costs and benefits; technical feasibility; consideration for climate impact, and social vulnerability, and community values. Planning Team members were asked to identify their priority actions using the following criteria.

Implementation priority ratings were assigned as follows:

- **High Priority** - An action that meets multiple objectives, is linked to a high risk hazard, has benefits that exceed costs, and has a potential source of funding. Action can begin within the short term (1 to 5 years).
- **Medium Priority** - An action that meets multiple objectives, is linked to a high or medium risk hazard, has benefits that exceed costs, and is eligible for funding though no funding has yet been secured for it. Action can begin within the short term (1 to 5 years) once funding is secured.
- **Low Priority** - An action that will mitigate the risk of a hazard, has benefits that do not exceed the costs or are difficult to quantify, has no secured source of funding, and is not eligible for any known grant funding. Action can be completed in the long term (1 to 10 years). Low-priority actions may be eligible for grant funding from programs that have not yet been identified.

Table 20 lists the Current Hazard Mitigation Actions for the Las Gallinas Valley Sanitary District.

Table 20: Las Gallinas Valley Sanitary District Current Hazard Mitigation Actions

No.	Mitigation Actions	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
LGV-1	Encourage participation in Alert Marin and other community alert & warning systems to ensure the public is aware of any potential emergencies or risk.	All Hazards 1, 2, 3, 4, 5	Las Gallinas Valley Sanitary Dist./ Marin County	New (2023)	Cost: General Funds	1 -2 Years/ High	
LGV-2	Flood Protection Plan/Sea Level Rise Mitigation Program Planning. Develop Flood Management Plan to improve flood protection and resilience of biosolids disposal area, reclamation, pump stations, and all critical treatment facilities.	Flooding, Sea Level Rise, Tsunami /1, 2	Las Gallinas Valley Sanitary District	New (2023)	Cost TBD; HMGP, BRIC, FMA, CDAA and Local Grants	1-2 Years/ High	
LGV-3	Standby Generators for Minor Pump Stations. Installation of permanent generators to provide emergency power backup to select wastewater pump stations during PG&E Public Safety Power Shutoff outages.	Wildfire/ 1, 2	Las Gallinas Valley Sanitary District	Existing	Cost $700k; LGVSD Capital Improvement Program (CIP)	On-going/ High	
LGV-4	John Duckett Pump Station Improvements. Improve sea level rise resiliency; pipeline structural integrity during earthquakes; and increase pumping capacity during major storm events.	Flooding, Sea Level Rise; Earthquake; Severe Weather/1, 2	Las Gallinas Valley Sanitary District	New (2023)	Cost TBD; Loan, LGVSD CIP	1-2 Years/ High	
LGV-5	Administration, lab, and Operations Control Building Construction. Design and construction of a state-of-the-art operations control center incorporating advanced communication and alarm system for pump stations and other facilities during service disruptions, such as major storm events, earthquakes, and other disasters. The administration, lab,	Earthquake; Flooding, Sea Level Rise; Severe Weather Heat and Wind; Tsunami, Wildfire/ 1, 2	Las Gallinas Valley Sanitary District	New (2023)	Cost TBD; SRF Loan, HMGP, BRIC, FMA, CDAA Grants, LGVSD CIP	1-2 Years/ High	

Table 20: Las Gallinas Valley Sanitary District Current Hazard Mitigation Actions							
No.	**Mitigation Actions**	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
	and control center building(s) shall comply with current Building Code requirements for seismic, flood, and fire.						
LGV-6	Miller Creek Vegetation Maintenance. Maintain vegetated sloped areas because of previous dredging of Lower Miller Creek on LGVSD property to control gravel and debris flow downstream and control landslide and erosion of existing levees.	Debris Flow/ 1, 2	Las Gallinas Valley Sanitary District	Existing	Cost $50k per year; LGVSD CIP	On-going/ High	
LGV-7	Miller Creek Dredging Project. Dredging Lower Miller Creek on LGVSD property to remove accumulated sediment and increase creek capacity to convey runoff during major storm events.	Flooding, Sea Level Rise; Tsunami, Severe Weather/ 1, 2	Las Gallinas Valley Sanitary District	New	Cost TBD; HMGP, BRIC, FMA, CDAA Grants, LGVSD CIP	2-5 Years High	
LGV-8	Recycled Water Expansion. Expanded capacity of Title 22 recycled water production for distribution by NMWD and MMWD.	Drought/ 1, 2	Las Gallinas Valley Sanitary District	Existing	Cost: $6M; USBR WaterSmart Grant and LGVSD CIP	On-going/ High	
LGV-9	Sewer Main Rehabilitation. Maintain and improve the wastewater collection system to minimize inflow and infiltration during peak wet weather events.	Flooding; Tsunami, Severe Weather/ 1, 2	Las Gallinas Valley Sanitary District	New (2023)	Cost TBD; LGVSD CIP	1-2 Years/ High	
LGV-10	Integrated Wastewater Master Plan. Address current issues and develop long-term strategies for the wastewater treatment plant, pump stations, force mains, and gravity sewers and reclamation facilities.	All hazards/ 1, 2	Las Gallinas Valley Sanitary District	Existing	Cost: $1.5M; LGVSD CIP	On-going/ High	

Table 142: Las Gallinas Valley Sanitary District Current Hazard Mitigation Actions

3.6 Progress in Local Mitigation Efforts

This plan has been created as a "living" document with input from the population and professionals within the Las Gallinas Valley Sanitary District. Based on the planning meetings and the progress monitored by the steering committee members several mitigation actions were accomplished since the last planning cycle. Table 19 provides a brief description of the progress made in the local mitigation efforts and the plan for those mitigation actions that were not completed or are ongoing.

The planning team for the Las Gallinas Valley Sanitary District identified and prioritized the mitigation actions as detailed in Table 20, based on the risk assessment and in accordance with the process outline in Section 3, Mitigation Strategy, of the base plan. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. General processes and information on plan implementation and maintenance of this LHMP by all participating jurisdictions is included in Section 4.0: Plan Review, Evaluation, and Implementation.

3.7 Plan Integration

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as master planning, strategic planning, capital facilities planning, emergency management, hazard specific planning, and that relevant information from those sources is also used in hazard mitigation. This section identifies where the 2023 MJHMP will be used for further integration.

The planning team for the Las Gallinas Valley Sanitary District will maintain this plan and will serve as a lead staff for grant project applications on District projects selected for application under the Hazard Mitigation Assistance grant programs.

An important implementation mechanism that is highly effective and low-cost is incorporation of the hazard mitigation plan recommendations and their underlying principles into town plans and mechanisms. Where possible the Las Gallinas Valley Sanitary District will use existing plans and/or programs to implement hazard mitigation actions both directly within the District and through the coordinated efforts with the Cities and Towns they serve.

Mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and development. As described in this plan's capability assessment, the Las Gallinas Valley Sanitary District and the Cities and Towns they serve already implement policies and programs to reduce losses to life and property from hazards. This plan builds upon the momentum developed through previous and related planning efforts and mitigation programs and recommends implementing actions, where possible, through these other program mechanisms. These existing mechanisms include Integration opportunities for the 2023 Marin County MJHMP:

District Master & Strategic Plans - Integrates hazard mitigation through the consideration of hazards most likely to impact the district.

District Emergency Operations Plans – Integrates hazard mitigation through the consideration of the Cities and Town's planned response to hazards most likely to impact the district.

Flood/Storm Water Management/Master Plans - Integrates hazard mitigation through the consideration of strategies to reduce flood risk and storm water management for the protection of life and property.

Community Wildfire Protection Plan - Integrates hazard mitigation through the consideration of strategies to reduce fire hazard and the risk of catastrophic wildfires in the WUI, while promoting the protection and enhancement of the county's economic assets and ecological resources.

The successful implementation of this mitigation strategy will require review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. A few examples of incorporation of the MJHMP into existing planning mechanisms include:

13. As recommended by Assembly Bill 2140, each community should adopt (by reference or incorporation) this MJHMP into the Safety Element of their General Plans. Evidence of adoption (by formal, certified resolution) shall be provided to CalOES and FEMA
14. Integration of flood actions identified in this mitigation strategy with the actions and implementation priorities established in existing Flood Management Programs
15. Using the risk assessment information to update the hazards section in the County, City and Town Emergency Operations Plans

Efforts should continuously be made to monitor the progress of mitigation actions implemented through these other planning mechanisms and, where appropriate, their priority actions should be incorporated into updates of this hazard mitigation plan.

3.8 Future Development Trends

Marin County and the City of San Rafael have planning and development departments, LGVSD only is involved in issuing will-serve letters allowing connection to the sewer system for plan preliminary approved by the County and City of San Rafael. The LGVSD recently completed major upgrades to existing facilities and is considering the construction of Administration, Laboratory, and Operations Control Buildings on the existing LGVSD footprint. Upsizing of the District's sewer collection system as needed to support development as outlined in the District's Integrated Wastewater Master Plan. No other development projects are being considered.

SECTION 4.0: PLAN REVIEW, EVALUATION, AND IMPLEMENTATION

The strategies presented are deemed appropriate and effective by recommendation of the Las Gallinas Valley Sanitary District.

4.1 PLAN ADOPTION

Upon submission to the California Office of Emergency Services (CalOES) for review, and subsequent approval by the Federal Emergency Management Agency (FEMA), the Marin County MJHMP will be presented to local government for formal adoption. As appropriate, the adopted plan and accompanying Las Gallinas Valley Sanitary District Community Profile will then be incorporated into local general plans for integration into organizational policy.

4.2 PLAN MONITORING

The process of hazard mitigation does not end with the completion, approval, and adoption of the Marin County OA MJHMP. During the five-year lifespan the Marin County and LGVSD plan, the County, cities, towns and special districts, along with community-based organizations will ensure that the mitigation goals and strategies identified are exercised and monitored under a collaborative and cooperative umbrella, and that the document itself is properly maintained.

The Marin County Office of Emergency Management, as lead coordinating agency for hazard mitigation planning within the Marin County OA, leads the Marin Operational Area Hazard Mitigation Working Group that meets quarterly to review and manage the plan, projects, and programs. The LGVSD is a participating member of the Marin Operational Area Hazard Mitigation Working Group. The LGVSD Administrative Services Manager will monitor and update the LGVSD Annex to the Marin County OA MJHMP.

The review will identify changing community priorities, updated or new planning documents and the progress or status of the mitigation actions as detailed in the mitigation strategy. Additional questions to complete the review will be considered as follows:

- Do the goals address current and expected conditions?
- Are the goals and objectives consistent with changes in the local, state, and federal policy?
- Status updates on all mitigation actions?
- Have the hazards or risks changed?
- Are current resources appropriate for implementing the MJHMP?
- Have the outcomes occurred as expected?
- Is the County and jurisdictions or districts participating in the plan implementation process as expected?

The Working Group is a subgroup of the Marin Disaster and Citizens Corps Council. During the five-year update cycle, the Marin Operational Area Hazard Mitigation Working Group will have quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. Further, Marin OEM will host an annual one-day mitigation summit to increase engagement and enhance collaboration on the plan and projects. The summit will also have the goal to educate stakeholders on innovative approaches to mitigation, trends, and new plan

requirements. Marin OEM, as the host, will seek subject matter experts, state and federal officials, and representatives from within the Marin OA to speak to mitigation and planning. The knowledge gathered and the coordination facilitated during the summit will be used to update the base plan and annexes.

Marin OEM has the capacity to lead the Working Group and Multi-Jurisdictional Planning with one coordinator assigned with direct maintenance of the plan, a department analyst assigned to support the coordinator with project and grant tracking, and a community preparedness coordinator assigned with conducting regular public outreach on the plan and education on mitigation. Community feedback and integration will continue through outreach events and OEM website, where residents and visitors are invited to provide feedback through a survey, available in English or Spanish.

Specific plan maintenance activities by the Marin County Office of Emergency Management and its participating jurisdictions/special districts may include:

- Hold quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions.
- Annual Hazard Mitigation Summit
- Holding public meetings after the first quarter and third quarter update meetings.
- Maintaining the Marin County OEM Hazard Mitigation Website, which provides the public with the ability to access identified hazard impact maps, location address search capability, and a listing of hazard mitigation actions.
- Monitoring of the Marin County and all participating jurisdiction mitigation project activities and dissemination of status reports.
- Generation of reports relative to plan status, project management, and revision updates to executive leadership.
  Preparations for the plan's future revision and updating.

4.3 Plan Evaluation

Upon approval and adoption by the LGVSD, the prioritized mitigation strategies will be further developed for funding and implementation by the lead agencies. The plan describes the potential sources of hazard mitigation funding, and general procedures to obtain that funding.

The mitigation strategies represented and adopted within this plan are recommendations only and must be approved and funded in order to be implemented as official mitigation solutions. Ultimately, it is the responsibility of jurisdictional and agency officials within the Marin County to undertake project implementation based upon identified mitigation strategies, funding availability, and local need when it arises. The Marin County Office of Emergency Management will meet with the Marin Operational Area Hazard Mitigation Working Group, including the LGVSD, to evaluate the plan after each update meeting.

4.4 Plan Update

The LGVSD Administrative Services Mgr. will monitor and update the LGVSD Annex to the Marin County OA MJHMP. During the five-year update cycle, the LGVSD and the Marin County Office of Emergency Management will hold quarterly update meetings with the Marin Operational Area Hazard Mitigation Working Group and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. The Marin County Office of

Emergency Management and all participating jurisdictions and special districts will continue to hold public meetings after the first quarter and third quarter update meetings annually and will continue to invite public participation in the update process via updated public surveys.

7. City of Mill Valley Community Profile

Marin County Multi-Jurisdictional Hazard Mitigation Plan 2023

This page is intentionally blank.

ACKNOWLEDGEMENTS

The City of Mill Valley and Preparative Consulting would like to thank those collaborators and partners who participated in the planning and development of this document.

The official Marin County Operational Area (OA) Multi-Jurisdictional Hazard Mitigation Plan (MJHMP) Steering Committee provided the oversight and dedication to this project that was required, and without their commitment, this project would not be possible.

As with any working plan, this document represents planning strategies and guidance as understood as of the date of this plan's release. This plan identifies natural hazards and risks and identifies the hazard mitigation strategy to reduce vulnerability and make the communities of the City of Mill Valley more disaster resistant and sustainable.

SECTION 1.0: INTRODUCTION

1.1 INTRODUCTION

The City of Mill Valley, Community Profile has been prepared in conjunction with the Marin County Operational Area (OA) Multi-Jurisdictional Hazard Mitigation Plan (MJHMP), establishing an inter-jurisdictional process for the development and implementation of effective hazard mitigation strategies in association with identified hazards that pose real or potential threats to the City of Mill Valley.

1.2 PLANNING PROCESS

The majority of the Marin County OA is unincorporated sparsely populated rural and protected lands. Most of the 262,000 county population, both incorporated and unincorporated, is concentrated in the Eastern portion of the county. There are a total of 11 incorporated jurisdictions within Marin County. The Marin County OA MJHMP Steering Committee and broader Planning Team approached the development of the Marin County OA MJHMP and the associated jurisdictional and district profiles from a coordinated and collaborative planning and public engagement unity of effort.

The Steering Committee felt a unified effort, led by the County Office of Emergency Management (OEM), would be the most effective approach for this planning process. This approach allowed the small jurisdictions and districts with limited staffing and resources to take advantage of the combined efforts of the County and other jurisdictions to reach a broader segment of each of their own populations and do so in a way to ensure greater equity and inclusion of the public in this planning process. Extensive and coordinated public outreach was done involving all participating jurisdictions and districts with an eye towards equity, inclusion, openness, accessibility, and ensuring they meet the population where they live, work, or recreate to provide the public convenience of access and ease of participation in this planning process.

The Marin County OA is very different from most California Counties in that the populated portion of the County where the jurisdictions and district's planning areas are located has the same climate, similar topography, and are exposed to many of the same hazards. Only three jurisdictions, Larkspur, Ross, and San Anselmo, are not coastal jurisdictions and are not impacted by Tsunami or Sea Level Rise.

This unity of effort approach allowed the Steering Committee to establish a more robust Planning Team representing local, countywide, regional, state, and federal stakeholders servicing the Marin County OA planning area. These stakeholders were in a unique position to provide informed and specific information and recommendations on hazard mitigation goals and actions, as well as population needs and social vulnerability for each of the jurisdictional and district planning areas. This united effort allowed the planning team to attend fewer meetings than they would have been required to attend if they were required to attend separate meetings for each participating jurisdiction and district. The reduced number of meetings allowed the planning team the opportunity and time to provide more detailed and thoughtful contributions to the planning effort.

In addition to providing representation on the coordinated Marin County OA MJHMP Steering Committee, the City of Mill Valley involved additional internal planning team members to support the broader planning process. The City of Mill Valley jurisdictional representatives for the

coordinated Marin County OA MJHMP Steering Committee and the Planning Team Members are represented below.

1.2.1 Steering Committee Members (Jurisdictional Representatives)

Primary Point of Contact
Patrick Kelly, Planning & Building Director
Telephone: 415-388-4039
E-mail: pkelly@cityofmillvalley.org

Alternate Point of Contact
Daisy Allen, Senior Planner
Telephone: 415-384-4811
E-mail: daisy.allen@cityofmillvalley.org

This annex was developed by the primary point of contact with assistance from the members of the local mitigation planning team listed in Table 1 and Table 2.

Table 1: City of Mill Valley Local Hazard Mitigation Planning Team Members

Jurisdiction	Name	Title/ Department	Phone	Email
Mill Valley	Patrick Kelly	Department of Planning & Building	415-388-4039	pkelly@cityofmillvalley.org

SASM	Mark Grushayev	General Manager, SASM	415-388-2402	mgrushayev@cityofmillvalley.org

Table 143: City of Mill Valley Local Hazard Mitigation Planning Team Members

This 2023 Marin County Operational Area (OA) MJHMP is a comprehensive update of the 2018 Marin County OA MJHMP. The planning area and participating jurisdictions and organizations were defined to consist of the unincorporated County of Marin, five special districts, and the eleven incorporated jurisdictions to include the City of Mill Valley. All participating jurisdictions are within the geographical boundary of the Marin County OA and have jurisdictional authority within this planning area.

The Steering Committee led the planning process based on the contribution and input from the whole community of stakeholders who identified the community's concerns, values, and priorities. The Steering Committee met and reviewed the mitigation recommendations and strategies identified within this plan. Each participating local jurisdiction established a mechanism for the development and implementation of jurisdictional mitigation projects, as identified within this plan and associated locally specific supporting documents. As deemed necessary and appropriate, participating jurisdictions will organize local mitigation groups to facilitate and administer internal activities.

The Steering Committee assisted with the planning process in the following ways:

- Attending and participating in the Steering Committee meetings.
- Identification of potential mitigation actions.
- Updating the status of mitigation actions from the 2018 Marin County OA MJHMP.
- Collecting and providing other requested data (as available).
- Making decisions on plan process and content.
- Reviewing and providing comments on plan drafts; including annexes.
- Informing the public, local officials, and other interested stakeholders about the planning process and providing opportunity for them to be involved and provide comment.
- Coordinating, and participating in the public input process.
- Coordinating the formal adoption of the plan by the governing boards.

1.2.2 Steering Committee Planning Process

The Steering Committee met monthly to develop the plan. Email notifications were sent out to each Steering Committee member to solicit their participation in the Steering Committee meetings. The meetings were conducted using a Zoom platform videoconferencing. Meeting attendees signed in using the chat feature to record their attendance.

The Steering Committee agreed to make and pass plan-based general policy recommendations by a vote of a simple majority of those members present. The Steering Committee will also seek input on future hazard mitigation programs and strategies from the mitigation planning team by focusing on the following:

- Identify new hazard mitigation strategies to be pursued on a state and regional basis and review the progress and implementation of those programs already identified.
- Review the progress of the Hazard Mitigation program and bring forth community input on new strategies.
- Coordinate with and support the efforts of the Marin County OEM to promote and identify resources and grant money for implementation of recommended hazard mitigation Strategies within local jurisdictions and participating public agencies.

During the planning process, the Steering Committee communicated through videoconferencing, face-to-face meetings, email, telephone conversations, and through the County website. The County website included information for all stakeholders on the MJHMP update process. Hannah Tarling of the Marin County OEM and Preparative Consulting established a Microsoft 365 SharePoint folder which allowed the Steering Committee members and Marin OEM and Preparative Consulting to share planning documents and provide a format for the planning partners to submit completed documents and access other planning related documents and forms. Draft documents were also posted on this platform and the Marin County OEM website so that the Steering Committee members and the public could easily access and review them.

1.2.3 Coordination with Stakeholders and Agencies

Opportunities for involvement in the planning process must be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other private and nonprofit interests (44 CFR, Section 201.6(b)(2)).

Early in the planning process, the Marin County and City of Mill Valley Steering Committee reached out to the following Local and Regional Agencies involved in hazard mitigation activities to invite them to participate in this planning process as a member of the Planning Team. These individuals work with Marin County and the City of Mill Valley communities and could provide subject matter expertise and relevant information to the planning process regarding the community history, hazard risk, vulnerability, and impact, mitigations efforts, community needs, demographics, and social vulnerability, economic concerns, ecology, and other community services and needs.

The Marin County and City of Mill Valley Steering also determined that data collection, risk assessment analyses, mitigation strategy development, and plan approval would be greatly enhanced by inviting other local, state and federal agencies and organizations to participate in the process. Based on their involvement in hazard mitigation planning, their landowner status in the County, the City of Mill Valley and/or their interest as a neighboring jurisdiction, representatives from the following groups were invited to participate on the Planning Team:

Eighty-five planning partners participated in this update, as listed in Table 2.

Table 144: 2023 MJHMP Local Planning Team Members

Several opportunities were provided for the groups listed above to participate in the City of Mill Valley's planning process. At the beginning of the planning process, invitations were extended to these groups to actively participate on the Planning Team. Participants from these groups

assisted in the process by attending several videoconferencing meetings where hazard vulnerability and risk were discussed along with hazard mitigation strategies and actions. Planning Team members provided data and other applicable information directly as requested in meetings, emails, telephone calls, videoconferencing, worksheets, or through data contained on their websites or as maintained by their offices. This information was used to develop hazard vulnerability and risk profiles along with mitigation actions.

These key agencies, organizations, and advisory groups received meeting announcements, agendas, and minutes by e-mail throughout the plan update process. They supported the effort by attending meetings or providing feedback on issues. All the agencies were provided with an opportunity to comment on this plan update and were provided with a copy of the plan to review and offer edits and revisions. They were also provided access to the Marin County OEM hazard mitigation plan website to review all planning documents and hazard mapping tools.

Each was sent an e-mail message informing them that draft portions of the plan were available for review. In addition, the complete draft plan was sent to the California Governor's Office of Emergency Services (Cal OES) and FEMA Region IX for a pre-adoption review to ensure program compliance.

In addition, through the public meetings conducted at the beginning of the planning process, members of the planning team, the public, and other key stakeholders were invited to participate in the planning process through public outreach activities.

Further as part of the public outreach process, all planning areas engaged in public outreach and education by providing information on their website or though press releases directing the public to the main Marin County OEM website that provided coordinated and detailed public information of the planning process and how the public could participate. All planning areas were invited to attend the public meetings and to review and comment on the plan prior to submittal to Cal OES and FEMA. Additional public outreach action is detailed in the 1.2.4 PUBLIC ENGAGEMENT section of this annex.

The following planning meetings were held with the planning team:

1.2.4 PUBLIC ENGAGEMENT

Early discussions with the Marin County OEM established the initial plan for public engagement to ensure a meaningful and inclusive public process with a focus on equity and accessible to the whole community. The Public Outreach efforts mirrored the Planning Team approach with a unified effort, led by the County OEM, involving all participating jurisdictions and districts. Public outreach for this plan update began at the beginning of the plan development process with a detailed press release informing the community of the purpose of the hazard mitigation planning process for the Marin County OA planning area and to invite the public to participate in the process.

Public involvement activities for this plan update were conducted by the County and all participating jurisdictions and districts and included press releases; website postings; a community survey; stakeholder and public meetings; and the collection of public and stakeholder comments on the draft plan which was posted on the County website. Information provided to the public included an overview of the mitigation status and successes resulting from implementation of the 2018 plan as well as information on the processes, new risk assessment data, and proposed mitigation strategies for the plan update.

Equity and Whole Community Approach

The Marin County OEM and the Steering Committee prioritized equity and engagement of the whole community in the development of the Marin County OA MJHMP by establishing a framework with key actions for each step of the planning process. Elements of the equity approach included:

Engaging hard-to-reach populations

This effort was to ensure the greatest equity and access to the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." The Town Hall meetings were conducted at different familiar locations within the county where people could easily access them and were conducted on both a weekday and weekend, and in the evening and during the daytime. The meetings were offered in-person with a virtual broadcast using Zoom videoconferencing and streamed live on the Marin County OEM Facebook account. After the meeting, Marin County OEM uploaded the recorded meeting to their website to allow the public on demand access to the meetings.

Additionally, to reach those who may not be engaged digitally, the planning team worked with Marin County Community Response Teams, (CRTs are a collaboration of non-profit organizations supporting underrepresented communities in four zones) to conduct outreach with half-sheet flyers in English and Spanish to share in the 4 CRT zones (southern Marin, north Marin, west Marin, San Rafael). These half sheets were also shared county-wide at libraries, including in areas not covered by CRTs, like at the Fairfax library. CRTs are designed to reach Marin's traditionally underserved and underrepresented communities, so by conducting outreach through this method, we were able to inform residents who may not have been engaged otherwise, including residents in Marin City, West Marin, and the Canal District of San Rafael.

Translation and Interpretation Services

The survey and outreach materials were provided in both English and Spanish to improve accessibility among populations with limited English proficiency. The website uses Google Translate for accessibility in multiple languages. Interpretation services were offered for both town hall meetings. Each town hall meeting included live Spanish translation and subtitles, live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slides.

Three stakeholder and public meetings were held, two at the beginning of the plan development process and one prior to finalizing the updated plan. Where appropriate, stakeholder and public comments and recommendations were incorporated into the final plan, including the sections that address mitigation goals and strategies. Specifically, public comments were obtained during the plan development process and prior to plan finalization.

All press releases and website postings are on file with the Marin County OEM. Public meetings were advertised in a variety of ways to maximize outreach efforts to both targeted groups and to the public at large. Advertisement mechanisms for these meetings and for involvement in the overall MJHMP development process included:

- Development and publishing of an MJHMP public outreach article
- Providing press releases to local newspapers and radio stations
- Posting meeting announcements on the local County MJHMP website
- Email to established email lists
- Personal phone calls

The public outreach activities were conducted with participation from and on behalf of all jurisdictions participating in this plan.

The Steering Committee has made the commitment to periodically bring this plan before the public through public meetings and community posting so that citizens may make input as strategies and implementation actions change. During the five-year update cycle, the Marin County OEM will hold tri-annual update meetings with the hazard mitigation Steering Committee, including the City of Mill Valley, and local stakeholders to discuss revisions to the plan. Public meetings will continue to be held twice a year after the first and third MJHMP meetings. Public meetings will continue to be stand-alone meetings but may also follow a council meeting or other official government meeting. The public will continue to be invited to public meetings via social media messaging, newspaper invitations, and through the website for each jurisdiction participating in the plan. Each jurisdiction is responsible for assuring that their citizenry is informed when deemed appropriate by the Steering Committee.

WEBSITE

At the beginning of the plan update process, Marin County OEM established a hazard mitigation website https://emergency.marincounty.org/pages/lhmp on behalf of all the planning areas to ensure consistent messaging and information, to keep the public posted on plan development milestones, and to solicit relevant input. The website also provided information on signing up for Alert Marin, provided detailed information about the hazard mitigation process and plan development, provided a URL and QR code link to the survey in both English and Spanish, and provided information about upcoming town hall meetings. (See Figure 1)

The site's address was publicized in all press releases, surveys and public town hall meetings. Each planning partner also established a link on their own agency website. Mill Valley created news items regarding the plan that were posted on the City's main website (https://www.cityofmillvalley.org/), as well as the emergency preparedness section of the website (https://www.cityofmillvalley.org/210/Emergency-Preparedness). Information on the plan development process, the Steering Committee, a link to the Hazard Mitigation survey, and drafts of the plan were made available to the public on the site. The County of Marin intends to keep a website active after the plan's completion to keep the public informed about successful mitigation projects and future plan updates.

Figure 296: Marin County OEM MJHMP and Mill Valley Website

PUBLIC MEETINGS

Two separate Marin County OAMJHMP Public Town Hall Meeting were conducted at different locations within the County, on different days of the week and during different times of the day. This effort was to ensure the greatest equity and access by the public to enable participation in the process. The Marin County OEM outreach strategy is to "meet people where they are." Each Town Hall Meeting included live Spanish translation and subtitles, Live American Sign Language (ASL/CDI) interpretation, the ability for the Zoom videoconferencing attendee to activate subtitles in 29 different languages, and vision accessible PowerPoint slides.

The first Town Hall Meeting was conducted on Thursday, April 13, 2023, from 6:00 pm to 7:30 pm, at the Marin County Board of Supervisors Chambers, Marin County Civic Center, 3501 Civic Center Drive, Room #330 San Rafael, CA 94903. The in-person meeting was also broadcast virtually using Zoom videoconferencing and streamed live on Marin County OEM Facebook account. Each of the jurisdictions participating in the MJHMP released a Press Release on their respective websites announcing the Public Town Hall Meeting and providing the date, time, and URL link to the Zoom Meeting for the public to log in and attend the Zoom Meeting. Marin County OEM also posted a notice for the Public Town Hall Meeting on their Facebook account. At the conclusion of the presentation, a question and answer session was held to answer questions from the attendees.

The second Town Hall Meeting was conducted on Saturday, April 29, 2023, from 10:00 am to 11:30 am, at the Marin County Health and Wellness Center, 3240 Kerner Ave. Rooms

#109 and #110 San Rafael, CA. 94903. The meeting followed the same format as the first and hosted the same access level of equity and accessibility.

The Marin County OA MJHMP Public Town Hall Meeting was recorded and downloaded from Zoom and made available to all of the jurisdictions and districts to place on their websites and local Access TV for the public to view.

Meeting participants were also invited to complete the Hazard Mitigation Survey and were provide the URL link to the Survey Monkey website to complete the survey.

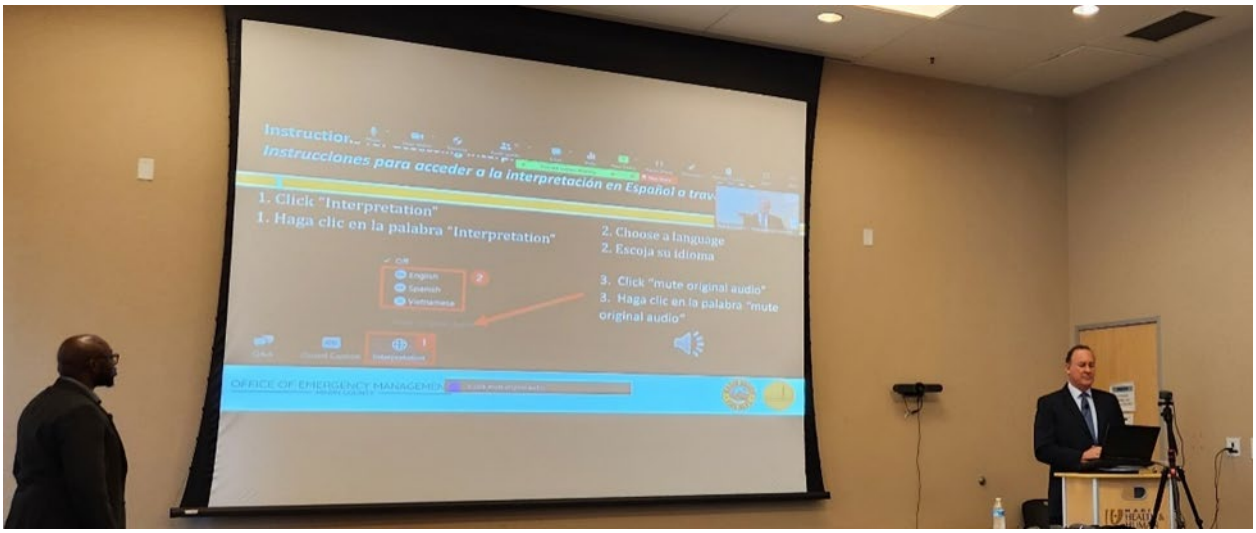

Figure 297: Marin County OA MJHMP Public Town Hall Meeting

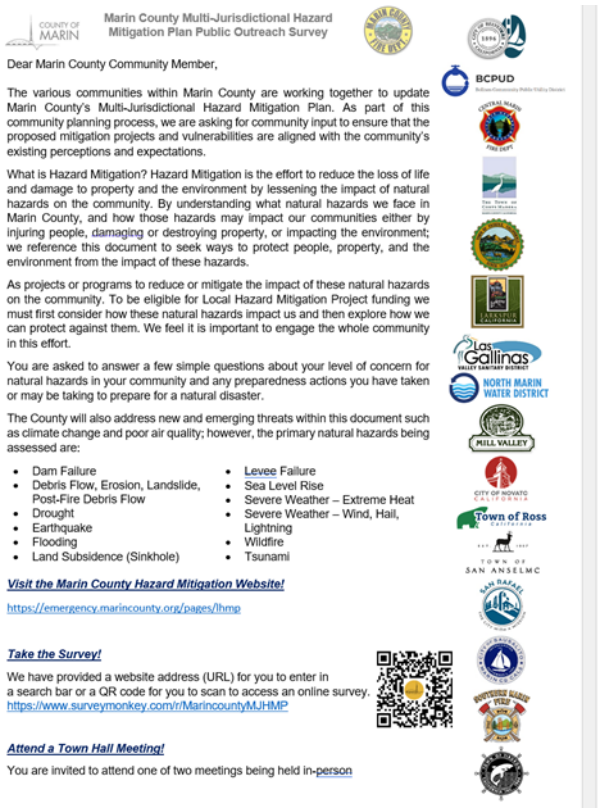
SOCIAL MEDIA

The Marin County OA utilized several forms of social media to reach residents and customers. Information about the Hazard Mitigation Planning process was communicated to the public via Facebook, Twitter, and local access TV. Residents and customers were invited to complete the Hazard Mitigation Plan survey which was accessible via an attached URL or QR Code and provide feedback on potential hazard mitigation projects or programs.

Social media accounts were updated four times with an initial ask, two reminders, and a closing announcement. The Marin OEM Public Information Officer coordinated with the Marin County Public Information Officers (MAPIO) working group to distribute information to partner jurisdictions (city, town, and special districts) to share this information on their social media sites and with the communities in the area.

PRESS RELEASES

Press releases were distributed over the course of the plan's development as key milestones were achieved and prior to each Marin County OA MJHMP Public Town Hall Meeting. All County press releases were made available to the Mill Valley community in both English and Spanish. The Marin Independent Journal (Marin IJ) used the press release to write an article



Marin County Multi-Jurisdictional Hazard Mitigation Plan Public Outreach Survey

Dear Marin County Community Member,

The various communities within Marin County are working together to update Marin County's Multi-Jurisdictional Hazard Mitigation Plan. As part of this community planning process, we are asking for community input to ensure that the proposed mitigation projects and vulnerabilities are aligned with the community's existing perceptions and expectations.

What is Hazard Mitigation? Hazard Mitigation is the effort to reduce the loss of life and damage to property and the environment by lessening the impact of natural hazards on the community. By understanding what natural hazards we face in Marin County, and how those hazards may impact our communities either by injuring people, damaging or destroying property, or impacting the environment; we reference this document to seek ways to protect people, property, and the environment from the impact of these hazards.

As projects or programs to reduce or mitigate the impact of these natural hazards on the community. To be eligible for Local Hazard Mitigation Project funding we must first consider how these natural hazards impact us and then explore how we can protect against them. We feel it is important to engage the whole community in this effort.

You are asked to answer a few simple questions about your level of concern for natural hazards in your community and any preparedness actions you have taken or may be taking to prepare for a natural disaster.

The County will also address new and emerging threats within this document such as climate change and poor air quality; however, the primary natural hazards being assessed are:

- Dam Failure
- Debris Flow, Erosion, Landslide, Post-Fire Debris Flow
- Drought
- Earthquake
- Flooding
- Land Subsidence (Sinkhole)
- Levee Failure
- Sea Level Rise
- Severe Weather – Extreme Heat
- Severe Weather – Wind, Hail, Lightning
- Wildfire
- Tsunami

Meeting ID: 818 2436 0040 Passcode: 432999

Thank you for taking the time to complete this important survey. Each community member's feedback is critical to the County's effort to develop a community-based plan to effectively protect the communities of Marin.

Sincerely,

Steven Torrence
Director of Emergency Management
Office of Emergency Management

Figure 298: Hazard Mitigation Plan Public Outreach Press Release

SURVEY

A hazard mitigation plan survey (see Figure 4) was developed by the Steering Committee and made available to the public in both English and Spanish. The survey was used to gauge household preparedness for natural hazards and the level of knowledge of tools and techniques that assist in reducing risk and loss from natural hazards. This survey was designed to help identify areas vulnerable to one or more natural hazards. The answers to its ten questions helped guide the Steering Committee in defining our hazards, and selecting goals, objectives, and mitigation strategies. The survey was available on the hazard mitigation plan website, advertised in press releases, and at town hall meetings. Finally, the survey and the process of public input was advertised throughout the course of the planning process. The survey was available to the public on March 13, 2023, and closed on June 12, 2023. At the conclusion of the planning process 293 surveys were completed by the public.

The results of the survey were provided to each of the planning partners and used to support the jurisdictional annex process. Each planning partner was able to use the survey results to help identify actions as follows:

- Gauge the public's perception of risk and identify what citizens are concerned about.
- Identify the best ways to communicate with the public.
- Determine the level of public support for different mitigation strategies.
- Understand the public's willingness to invest in hazard mitigation.

Public Comments Considered by the Planning Team

The Planning Team used the following information gathered from the Public Outreach Survey to inform decisions regarding hazard mitigation strategies, actions, and priorities.

- Climate Change, Wildfire, and Drought were the top hazards of concern for the public.
- Text messages, mail, and the County website were the preferred methods for receiving hazard mitigation information.
- 48% of respondents expressed that they were “Very Much” concerned and 31% were “Moderately” concerned that a natural disaster could impact their home or place of residence.
- 85% of respondents own their own home.
- 99% of respondents have access to the internet.

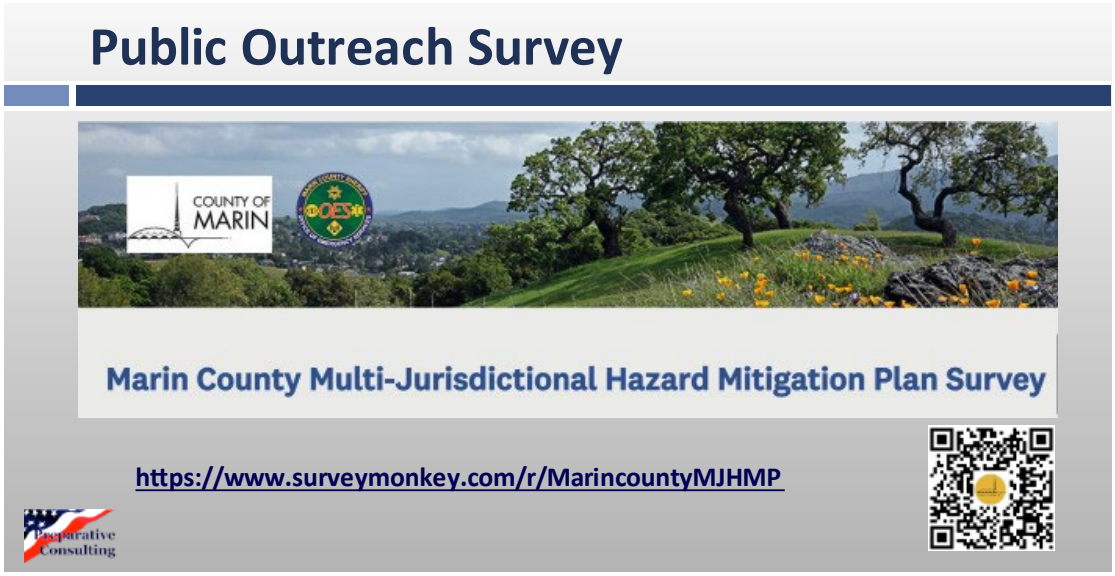

Figure 299: Hazard Mitigation Plan Survey

PUBLIC COMMENT ON THE PLAN

To solicit public feedback on the draft plan, Marin OEM engaged in a multi-faceted approach intended to reach as many Marin residents as possible, including members of the community who are under-served and under-represented. All members of the community had the opportunity to provide initial comments on the plan during a two-week period from Wednesday, December 4, 2023, to Wednesday, December 18, 2023. Although the initial comment period was listed as two weeks, the public could submit comments indefinitely via the County's website to support the County's continuous improvement efforts. The base plan, as well as city, town and special district annexes, were available for download on emergency.marincounty.org

After December 18, 2023, the various participating jurisdiction and district profiles remained on the Marin County OEM website for public comments. The City of Mill Valley had an additional 14-day comment period for the City of Mill Valley Community Profile where their profile was posted on the City website for final public comment from January 29 – February 5, 2024.

The 14-day public comment period gave the public an opportunity to comment on the draft plan update prior to the plan's submittal to Cal OES. Comments received on the draft plan are available upon request. All comments were reviewed by the planning team and incorporated into the draft plan as appropriate.

Public Comments Considered by the Planning Team

The Marin County OEM posted the draft Hazard Mitigation Plan and hazard mitigation actions on their website and solicited public comments on the content. The Town of Corte Madera distributed press releases directing the community to the Marin County OEM website to review the draft plans. The Planning Team gathered public comments and information on the Marin County OEM website regarding proposed and current Hazard Mitigation Actions. The Planning Team used the comments and suggestions to inform decisions regarding hazard mitigation strategies, actions, and priorities. Most comments included ideas for hazard mitigation projects and comments on the effectiveness of current mitigation projects. These comments were used to revise the proposed hazard mitigation actions which resulted in the final list of hazard mitigation actions listed in 3.5 Hazard Mitigation Actions.

1.3 OVERVIEW AND HISTORY

Mill Valley is a City in Marin County, California, United States, located about 14 miles north of San Francisco via the Golden Gate Bridge.

The population was 14,231 at the 2020 census. According to the United States Census Bureau the city has a total area of 4.8 square miles, of which 4.7 square miles is land and 0.1 square miles or (1.74%) is water.

Mill Valley is located on the western and northern shores of Richardson Bay, and the eastern slopes of Mount Tamalpais. Beyond the flat coastal area and marshlands, it occupies narrow wooded canyons, mostly of second-growth redwoods, on the southeastern slopes of Mount Tamalpais.

The Mill Valley 94941 area code lies between Mt. Tamalpais on the west, the city of Tiburon on the east, the City of Corte Madera on the north, and the Golden Gate National Recreational Area (GGNRA) on the south. Two streams flow from the slopes of Mt. Tamalpais through Mill Valley to the bay: the Arroyo Corte Madera del Presidio; and Cascade Creek. Mill Valley is surrounded by hundreds of acres of state, federal, and county park lands. In addition, there are many municipally maintained open-space reserves, parks, and coastal habitats which, when taken together, ensconce Mill Valley in a natural wilderness.

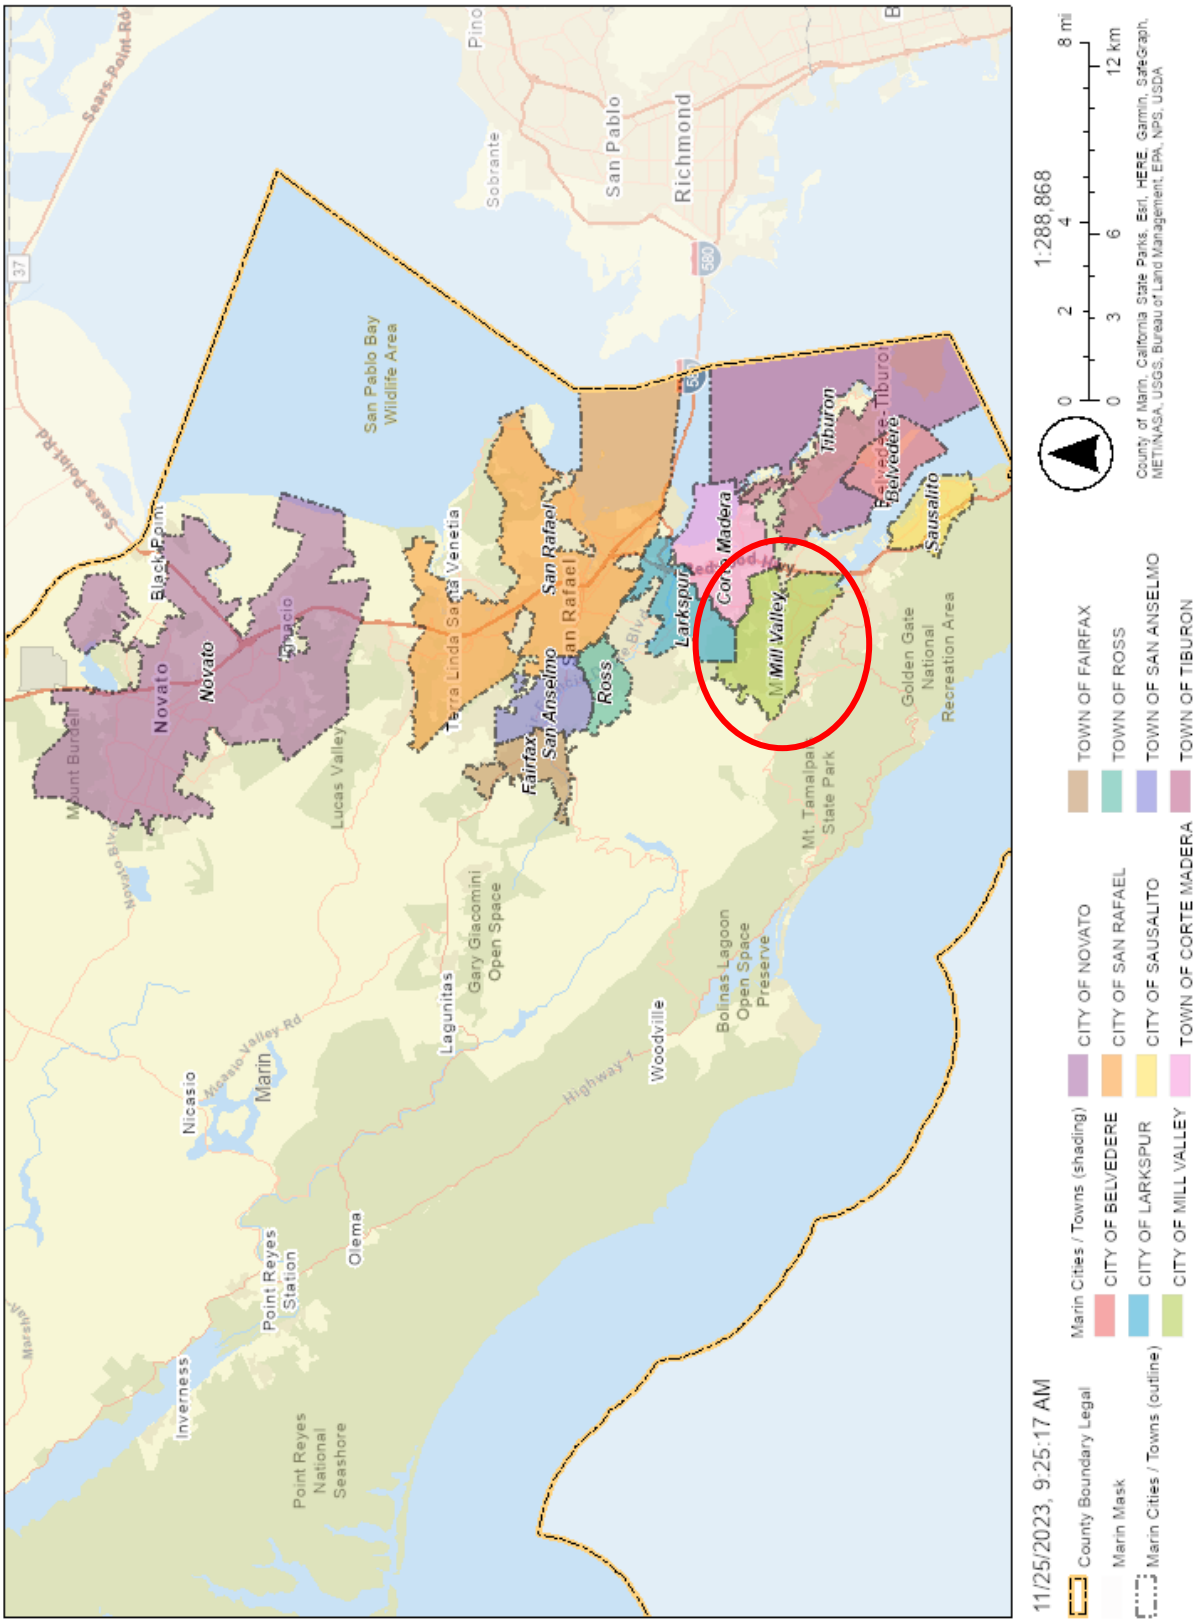

Figure 300: Map of City of Mill Valley in Marin County
Source: Marin County OEM

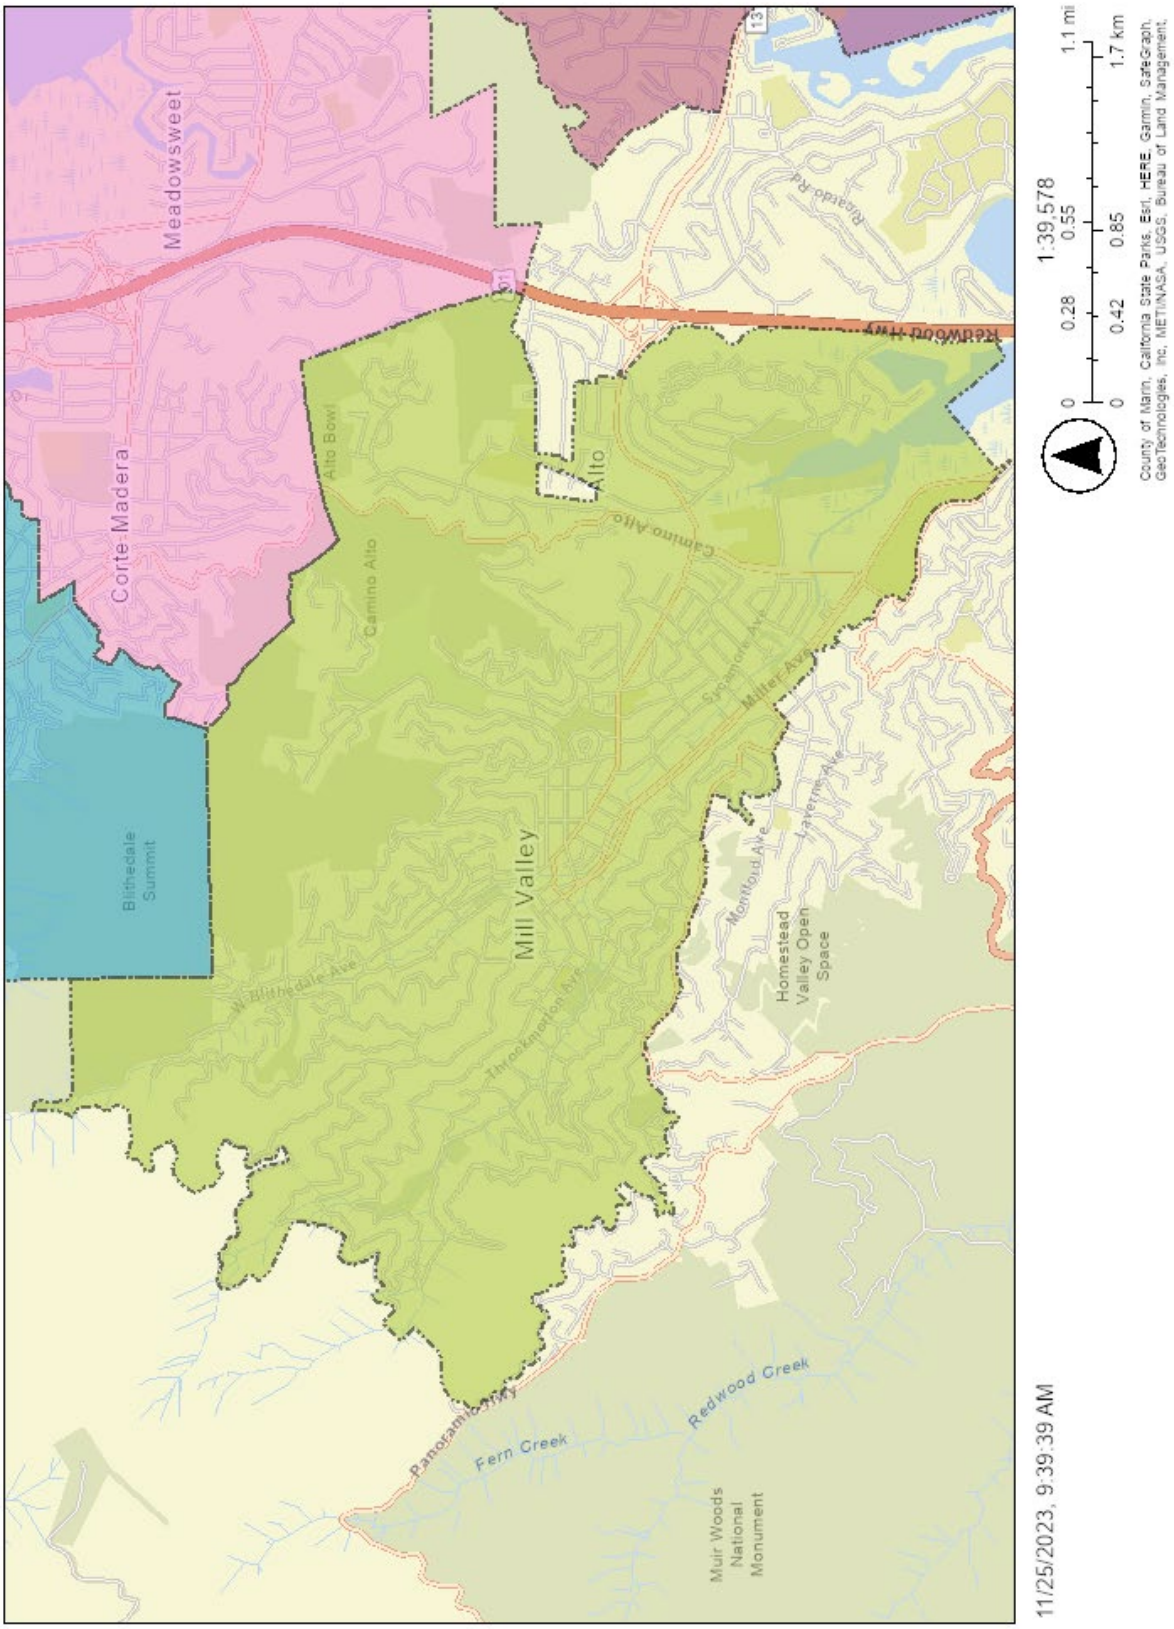

Figure 301: Map of the City of Mill Valley
Source: Marin County OEM

1.4 GOVERNMENT

The City of Mill Valley is governed by an elected five-person City Council responsible for passing local ordinances, approving the City budget, and setting strategic priorities for the City. The City Council elects a mayor and vice mayor each year from its membership, the executive head of the City; and appoints a City Manager, the administrative head of the City. The City consists of 10 departments: the City Manager (including the City Clerk), City Attorney, Finance & Human Resources, Fire, Library, Planning & Building, Police, Recreation, Public Works, and the Sewerage Agency of Southern Marin (SASM) Waste Water Treatment Plant (WWTP).

The City Council assumes responsibility for the adoption of this plan; and the City Manager will oversee its implementation.

On July 1, 2023, Mill Valley Fire Department was officially annexed and consolidated fire agencies with the Southern Marin Fire Protection District. The Southern Marin Fire Protection District is an independent special district established by the Marin County Board of Supervisors in July of 1999. The Southern Marin Fire District serves the cities of Sausalito, and Mill Valley, approximately ¼ of the town of Tiburon, and communities of Tamalpais Valley, Almonte, Homestead Valley, Alto, Strawberry, Fort Baker and the Marin Headlands. The District covers over 25.3 square miles, a population of approximately 41,576 and over 20,500 homes and commercial properties. The District has 93 full time employees.

The Mill Valley Police Department is a full time police department of 17 sworn officers. Mill Valley Police provides a professional and proactive response through Law enforcement, criminal investigation, patrol, traffic, crime prevention, and other public safety duties.

1.5 WEATHER AND CLIMATE

The City of Mill Valley is approximately 79 feet above sea level. In the City of Mill Valley, the summers are long, comfortable, arid, and mostly clear and the winters are short, cold, wet, and partly cloudy. Over the course of the year, the temperature typically varies from 43°F to 73°F and is rarely below 36°F or above 84°F. The difference in precipitation between the driest month and the wettest month is 8 inches. The annual rainfall is 45 inches. The month of highest relative humidity is February (80%). The month with the lowest relative humidity is June (69%). The month which sees the most rainfall is January. The driest month of the year is July.

	January	February	March	April	May	June	July	August	September	October	November	December
Avg. Temperature °C (°F)	9.4 °C (48.9) °F	10.2 °C (50.3) °F	11.3 °C (52.4) °F	12.3 °C (54.1) °F	14 °C (57.2) °F	15.9 °C (60.7) °F	16.3 °C (61.3) °F	16.7 °C (62) °F	16.8 °C (62.3) °F	15.3 °C (59.6) °F	12.2 °C (53.9) °F	9.6 °C (49.4) °F

1.6 DEMOGRAPHICS

The City of Mill Valley had an estimated population of 14,199 in 2022 according to the US Census Bureau. There has been a decrease in population in Mill Valley as well as the Marin County OA since 2018 based on population estimates.

Table 4: City of Mill Valley Estimated Jurisdictional Population

Jurisdiction	Population 2022 (Estimate)	Population 2020	Population 2018 (Estimate)	Percent Change 2018-2022
Marin County OA	255,470	262,321	262,179	-2.6%
City of Mill Valley	14,199	14,674	14,343	-1.0%

Table 146: City of Mill Valley Estimated Jurisdictional Population
Source: California Department of Finance

Prior to 2022, Census data indicates that prior to 2020 Mill Valley's population has had a slow but steady increase. Table 5 shows the population growth comparison of the State of California, County of Marin and the City of Mill Valley between 2010 – 2020.

Table 5: Population Change of The City of Mill Valley				
Jurisdiction	Total Population		Change, 2010-2020	
	April 1, 2010	April 1, 2020	Number	Percent
California	37,253,956	39,538,223	2,284,267	6.1%
Marin County OA	252,409	260,831	8,422	3.3%
Mill Valley, City	13,903	14,674	771	5.5%

1.7 Social Vulnerability and Risk

The California Governor's Office of Emergency Services (Cal OES) has initiated the "Prepare California" grant program focused on building community resilience amongst vulnerable individuals living in the areas of the state most susceptible to natural disasters. The Prepare California Initiative is aimed at reducing long-term risks from natural disasters by investing in local capacity building and mitigation projects designed to protect communities.

Prepare California leverages funds approved in Governor Gavin Newsom's 2021-22 State Budget and is designed to unlock federal matching funds for community mitigation projects that vulnerable communities would otherwise be unable to access. This program is intended for communities that are the most socially vulnerable and at the highest risk for future natural hazard events. The state identified communities by prioritizing California census tracts according to their estimated hazard exposures and social vulnerability.

The National Risk Index is a dataset and online tool to help illustrate the United States communities most at risk for 18 natural hazards: Avalanche, Coastal Flooding, Cold Wave, Drought, Earthquake, Hail, Heat Wave, Hurricane, Ice Storm, Landslide, Lightning, Riverine Flooding, Strong Wind, Tornado, Tsunami, Volcanic Activity, Wildfire, and Winter Weather.

For purposes of this plan the following National Risk Index (NRI) hazards are profiled in support of eight of the twelve Marin County OA MJHMP Hazards. NRI data was not available for Dam Failure, Land Subsidence, Levee Failure, or Sea Level Rise.

Table 8: NRI Hazards and Marin County OA MJHMP Hazards

NRI Hazards	Marin County OA MJHMP Hazards
Earthquake	Earthquake
Riverine Flooding	Flooding
Coastal Flooding	Flooding
Wildfire	Wildfire
Landslide	Debris Flow
Drought	Drought
Heat Wave	Severe Weather -Extreme Heat
Tsunami	Tsunami
Strong Wind	Severe Weather – Wind, Tornado

Table 150: NRI Hazards and Marin County OA MJHMP Hazards
Source: FEMA National Risk Index 2023

The National Risk Index leverages available source data for Expected Annual Loss due to these 18 hazard types, Social Vulnerability, and Community Resilience to develop a baseline relative risk measurement for each United States county and Census tract. These measurements are calculated using average past conditions, but they cannot be used to predict future outcomes for a community. The National Risk Index is intended to fill gaps in available data and analyses to better inform federal, state, local, tribal, and territorial decision makers as they develop risk reduction strategies.

Calculating the Risk Index

Risk Index scores are calculated using an equation that combines scores for Expected Annual Loss due to natural hazards, Social Vulnerability and Community Resilience:
Risk Index = Expected Annual Loss × Social Vulnerability ÷ Community Resilience

Hazard Type Risk Index

Hazard type Risk Index scores are calculated using data for only a single hazard type, and reflect a community's Expected Annual Loss value, community risk factors, and the adjustment factor used to calculate the risk value.

Table 9 illustrates the NRI Hazard Type Risk Index for Mill Valley Census Tract 1261.00.

Table 9: NRI Hazard Type Risk Index for Mill Valley Census Tract 1261.00

Hazard Type	EAL Value	Social Vulnerability	Community Resilience	CRF	Risk Value	Score
Earthquake	$1,347,641	Very Low	Very High	0.66	$894,146	90.4

Social Vulnerability in Mill Valley and the Marin County OA

Most socially vulnerable residents in the Marin County OA reside in parts of Novato, parts of San Rafael, including in and around the Canal District, the Greenbrae neighborhood of Larkspur, and the unincorporated areas of Marin City and Santa Venetia.

The median income for a household in the City was $179,529 and the per capita income for the City was $110,356. Approximately 2.4 percent of families and 4.5 percent of the population were below the poverty line (2020 data, U.S. Census Bureau). All three census tracts reflect a Very Low or Relatively Low Social Vulnerability Index in the City, which reflects the City's SVI position within the County.

1.8 Economy and Tax Base

Table 12 shows income by household in The City of Mill Valley as of 2019.

Table 12: Household Income for The City of Mill Valley as of 2021		
Household Income	Number	Percent
Total Households	5,622	-
Less than $10,000	174	3.1
$10,000 to $14,999	118	2.1
$15,000 to $24,999	90	1.6
$25,000 to $34,999	107	1.9
$35,000 to $49,999	242	4.3
$50,000 to $74,999	433	7.7
$75,000 to $99,999	394	7.0
$100,000 to $149,999	871	15.5
$150,000 to $199,999	703	12.5
$200,000 or more	2,491	44.3
Median household income (dollars)	$179,529	
Mean household income (dollars)	$277,907

1.10 HISTORICAL PROPERTIES

The City of Mill Valley has three registered national and state historically significant homes, public buildings, or landmarks, as indicated in Table 15. To inventory these resources, the HMPC collected information from a number of sources:

- California Department of Parks and Recreation Office of Historic Preservation (OHP) OHP is responsible for the administration of federally and state mandated historic preservation programs to further the identification, evaluation, registration, and protection of California's irreplaceable archaeological and historical resources. OHP administers the National Register of Historic Places, the California Register of Historical Resources, California Historical Landmarks, and the California Points of Historical Interest programs.
- City of Mill Valley Chamber of Commerce.
- City of Mill Valley website.

The City also has a number of locally-designated historic resources identified in a historic overlay zone district as well as a historic resources inventory (https://www.cityofmillvalley.org/763/Historic-Preservation). Also, as defined by the National Environmental Policy Act (NEPA), any property over 50 years of age is considered a potential historic resource and is potentially eligible for the National or California Register. Thus, in the event that the property is to be altered, or has been altered, as the result of a major federal action, the property must be evaluated under the guidelines set forth by NEPA. Structural mitigation projects are considered alterations for the purpose of this regulation. Similar regulations exist for buildings under the California Environmental Quality Act (CEQA).

Table 15: National and State Registered Historic Sites In The City of Mill Valley

Name/Landmark State Plaque Number	National Register (NR)	State Landmark	California Register	Date Listed (NR)	Jurisdiction

SECTION 2.0: HAZARD IDENTIFICATION AND RISK ASSESSMENT

The City of Mill Valley identified hazards that affect the city and developed natural hazard profiles based upon the countywide risk assessment, past events and their impacts. Figure 14 shows the top hazards that the Jurisdiction is at risk from according to the hazard mitigation Steering Committee.

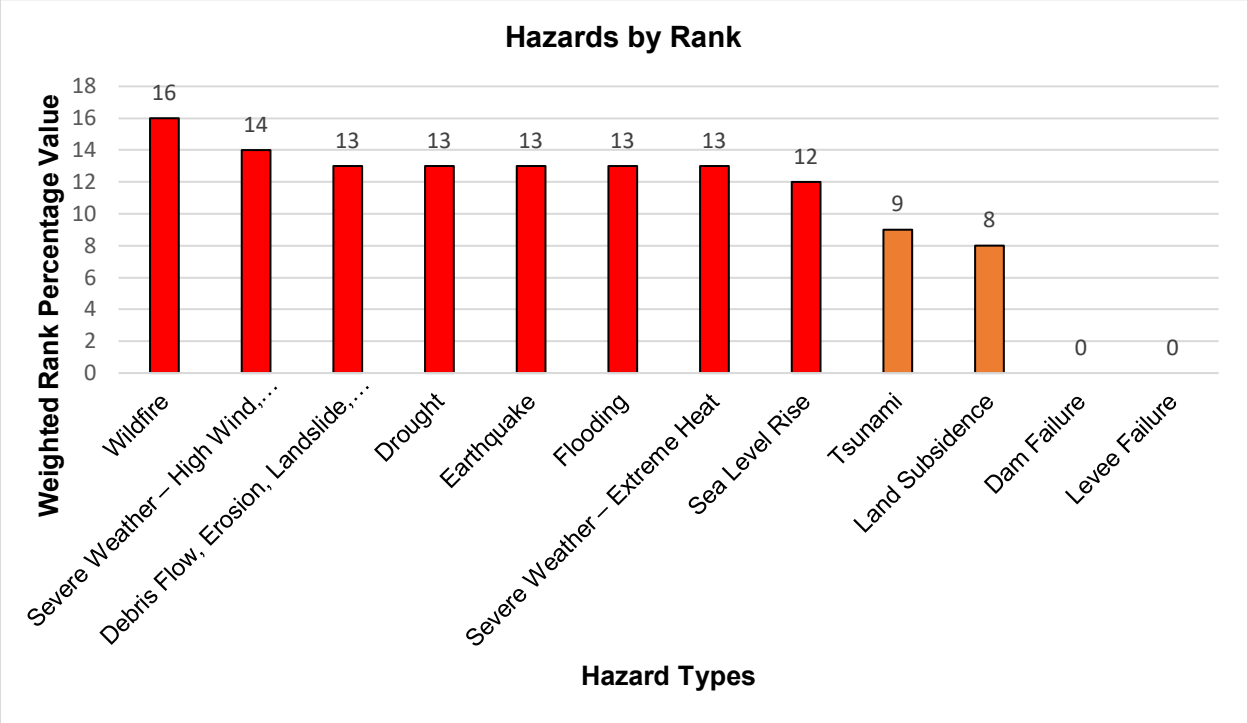

Figure 309: City of Mill Valley Risk Assessment – Planning Team Top Hazards

Figure 15: Risk Rank Categorization	
Risk Level	**Risk Numerical Score**
High Risk	**12 - 18**
Serious Risk	**8 - 11**
Moderate Risk	**4 - 7**
Low Risk	**1 - 3**

Figure 310: Hazard Risk Categorization

Each Marin County OA MJHMP participating jurisdiction and organization reviewed and approved the Top Hazards identified by the Planning Team. Each participating jurisdiction and district then completed a more complex assessment tool to further develop their hazard assessment and prioritization.

The planning process used the available FEMA tools to evaluate all the possible threats faced. The primary tool selected was the Hazard Assessment and Prioritization Tool. This matrix allowed the participating jurisdiction or organization to assess their own level of vulnerability and mitigation capability. Each participating Jurisdiction and organization assessed the top hazards for:

- Probability/ Likelihood of Future Events
- Geographic Extent
- Magnitude/ Severity
- Climate Change Influence
- Significance

Probability/ Likelihood of Future Events

- **Unlikely:** Occurs in intervals greater than 100 years - Less than 1% probability of occurrence in the next year or a recurrence interval greater than 100 years.
- **Occasional:** Occurring every 11 to 100 years - 1-10% probability of occurrence in the next year or a recurrence interval of 11 to 100 years.
- **Likely:** Occurring every 1 to 10 years - 10-90% probability of occurrence in the next year or recurrence interval of 1 to 10 years.
- **Highly Likely:** Occurring almost every year - 90-100% probability of occurrence in the next year or a recurrence interval of less than 1 year.

Geographic Extent

- **Negligible:** Less than 10% of the planning area
- **Limited:** 10-25% of the planning area
- **Significant:** 25-75% of planning area
- **Extensive:** 75-100% of planning area

Magnitude/ Severity

- **Weak:** Limited classification on scientific scale, slow speed of onset or short duration of event, resulting in little to no damage.
- **Moderate:** Moderate classification on scientific scale, moderate speed of onset or moderate duration of event, resulting in some damage and loss of services for days.
- **Severe:** Severe classification on scientific scale, fast speed of onset or long duration of event, resulting in devastating damage and loss of services for weeks or months.
- **Extreme:** Extreme classification on scientific scale, immediate onset or extended duration of event, resulting in catastrophic damage and uninhabitable conditions.

Table 16: Select Hazards Magnitude and Severity Scale					
Hazard	**Scale/Index**	**Weak**	**Moderate**	**Severe**	**Extreme**
Drought	Palmer Drought Severity Index	+1.99 to -1.99	-2.00 to -2.99	-3.00 to -3.99	-4.00 and below
Earthquake	Modified Mercalli	I to IV	V to VII	VIII	IX to XII
	Richter Magnitude	2,3	4,5	6	7,8
Tornado	Fujita Tornado Damage Scale	FO	F1, F2	F3	F4, F5

Table 158: Select Hazards Magnitude/ Severity Scale or Index

Climate Change Influence

- **Low:** Minimal potential impact
- **Medium:** Moderate potential impact
- **High:** Widespread potential impact

Significance

- **Low:** Minimal potential impact - Two or more criteria fall in lower classifications, or the event has a minimal impact on the planning area. This rating is sometimes used for hazards with a minimal or unknown record of occurrences or for hazards with minimal mitigation potential.
- **Medium:** Moderate potential impact - The criteria fall mostly in the middle ranges of classifications and the event's impacts on the planning area are noticeable but not devastating. This rating is sometimes used for hazards with a high extent rating but very low probability rating.
- **High:** Widespread potential impact - The criteria consistently fall in the high classifications and the event is likely/highly likely to occur with.

2.1 CLIMATE CHANGE

The County of Marin and associated jurisdictions profiled jointly recognize that the earth's climate is forcibly being augmented due to humans' reliance on fossil fuels and non-natural resources which pose negative impacts on the earth's climate. Reliance on fossil fuels and non-natural products results in the climate shifting to include unseasonable temperatures, more frequent and intense storms, prolonged heat and cold events, and a greater reliance on technological advancements to maintain the wellbeing of community members and balance of the environment. The forced adaptation to climatic shifts is necessary for the County and jurisdictions to understand and include with these assessments.

Locally to Marin, drought and rain events have already had devastating impacts to critical infrastructure, agriculture, and water resources; and globally, unseasonable temperatures have been identified as the cause for enhanced wildfires, severe droughts, ice sheets and glaciers disappearing, and persons emigrating from their countries due to a lack of sustainable, local resources. Melting land ice contributes additional water to the oceans and as ocean temperatures rise the water expands, both of which contribute to increase rates of sea level rise. Marin is bordered on the west by the Pacific Ocean and on the east by San Francisco Bay, making it particularly vulnerable to flooding and erosion caused by sea level rise.

The cause of current climate change is largely human activity, burning fossil fuels, natural gas, oil, and coal. Burning these materials releases greenhouse gases into Earth's atmosphere. Greenhouse gases trap heat from the sun's rays inside the atmosphere causing Earth's average temperature to rise. This rise in the planet's temperature was formerly called, "global warming", but climate change has shown to include both intense heat and cold shifts. The warming of the planet impacts local and regional climates. Throughout Earth's history, climate has continually changed; however, when occurring naturally, this is a slower process that has taken place over hundreds and thousands of years. The human influenced climate change that is happening now is occurring at an abnormally faster rate with devastating results.

GLOBAL OBSERVED AND PROJECTED IMPACTS AND RISKS

Source: Intergovernmental Panel on Climate Change, Headline Statements from the Summary for Policymakers, 2022

- Human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability.
- Global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans.
- Beyond 2040 and depending on the level of global warming, climate change will lead to numerous risks to natural and human systems.
- The magnitude and rate of climate change and associated risks depend strongly on near-term mitigation and adaptation actions, and projected adverse impacts and related losses and damages escalate with every increment of global warming.
- Multiple climate hazards will occur simultaneously, and multiple climatic and non-climatic risks will interact, resulting in compounding overall risk and risks cascading across sectors and regions.

FUTURE TRENDS/ IMPACTS

Source: Study Confirms Climate Models are Getting Future Warming Projections Right – Climate Change: Vital Signs of the Planet (nasa.gov)

Global Warming

- If global warming transiently exceeds 1.5°C in the coming decades or later, then many human and natural systems will face additional severe risks.
- An estimated 60% of today's methane emissions are the result of human activities. The largest sources of methane are agriculture, fossil fuels, and decomposition of landfill waste.
- The concentration of methane in the atmosphere has more than doubled over the past 200 years. Scientists estimate that this increase is responsible for 20 to 30% of climate warming since the Industrial Revolution (which began in 1750).
- According to the most recent National Climate Assessment, droughts in the Southwest and heat waves (periods of abnormally hot weather lasting days to weeks) are projected to become more intense, and cold waves less intense and less frequent.
- The last eight years have been the hottest years on record for the globe.

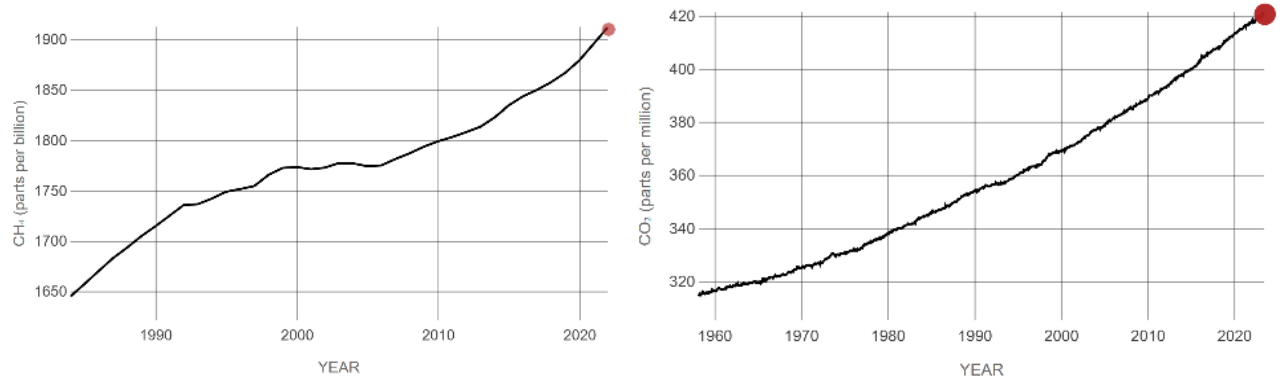

Figure 311: NASA Global Temperature Change CO2 Gas
Source: NASA Global Climate Change, 2022

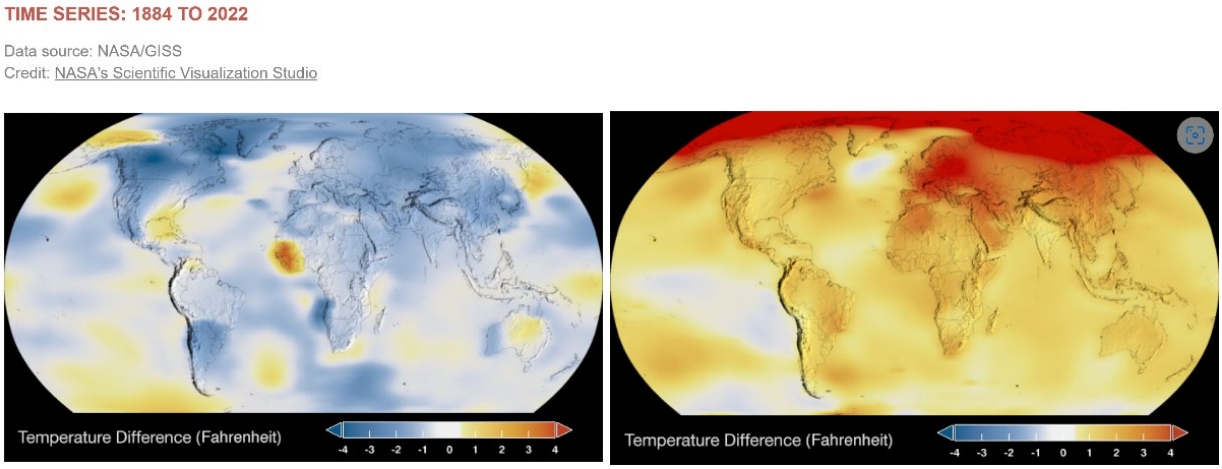

Figure 312: NASA Global Temperature Change 1884 to 2022
Source: NASA Global Climate Change, 2022

Drought

- A NASA-led study in 2022 concluded that the 22-year-long megadrought in southwestern US was the driest the territory had experienced in at least 1,200 years and was expected to persist through at least 2022.

Sea Level Rise

- Global sea levels are rising as a result of human-caused global warming, with recent rates being unprecedented over the past 2,500-plus years.
- U.S. Sea Level Likely to Rise 1 to 6.6 Feet by 2100.
- Global sea level has risen about 8 inches (0.2 meters) since reliable record-keeping began in 1880. By 2100, scientists project that it will rise at least another foot (0.3 meters), but possibly as high as 6.6 feet (2 meters) in a high-emissions scenario.

- Sea ice cover in the Arctic Ocean is expected to continue decreasing, and the Arctic Ocean will very likely become essentially ice-free in late summer if current projections hold. This change is expected to occur before mid-century.
- An indicator of changes in the Arctic sea ice minimum over time. Arctic sea ice extent both affects and is affected by global climate change.

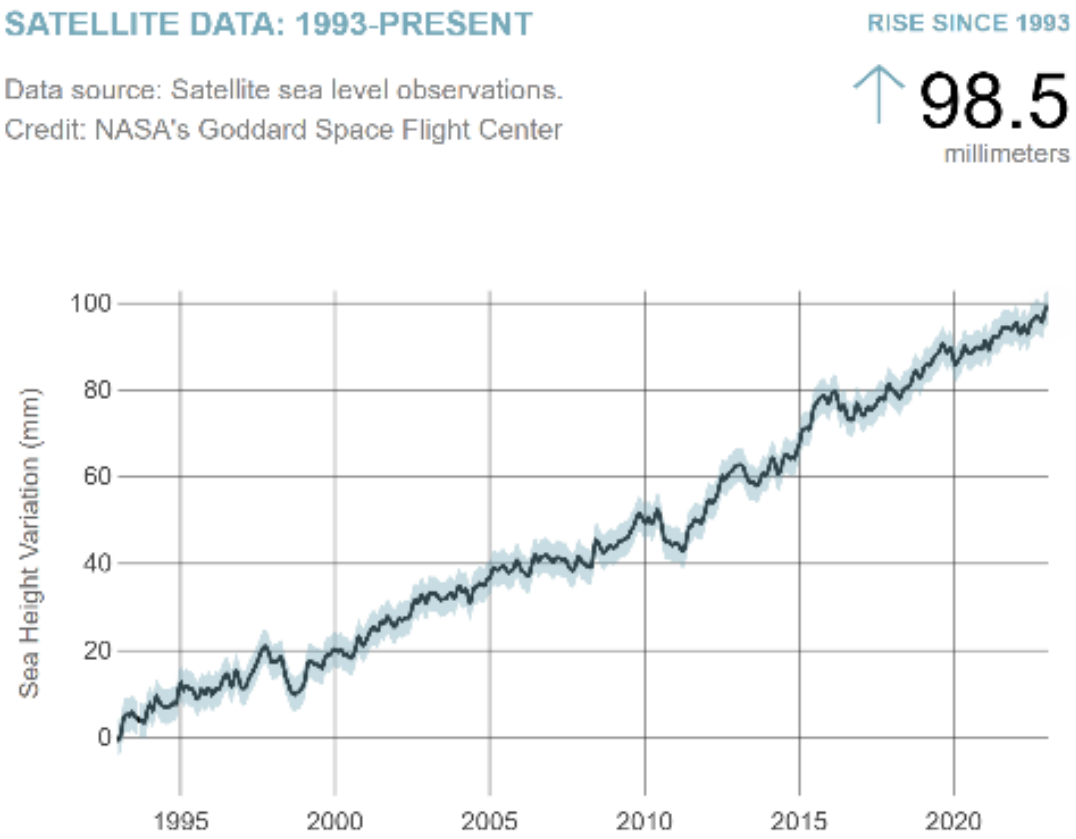

Figure 313: NASA Global Temperature Change Sea Level
Source: NASA Global Climate Change, 2022

Wildfire

- Warming temperatures have extended and intensified wildfire season in the West, where long-term drought in the region has heightened the risk of fires.
- Scientists estimate that human-caused climate change has already doubled the area of forest burned in recent decades. By around 2050, the amount of land consumed by wildfires in Western states is projected to further increase by two to six times.
- Even in traditionally rainy regions like the Southeast, wildfires are projected to increase by about 30%.

Flooding (Precipitation)

- Climate change is having an uneven effect on precipitation (rain and snow) in the United States, with some locations experiencing increased precipitation and flooding, while others suffer from drought.

- On average, more winter and spring precipitation is projected for the northern United States, and less for the Southwest, over this century.
- Projections of future climate over the U.S. suggest that the recent trend toward increased heavy precipitation events will continue. This means that while it may rain less frequently in some regions (such as the Southwest), when it does rain, increased intensity of rain fall may occur and may become more common.

Extreme Cold

- The length of the frost-free season, and the corresponding growing season, has been increasing since the 1980s, with the largest increases occurring in the western United States.

According to the California Natural Resource Agency (CNRA), climate change is already affecting California and is projected to continue to do so well into the foreseeable future. Current and projected changes include increased temperatures, sea level rise, a reduced winter snowpack, altered precipitation patterns, and more frequent storm events. Over the long term, reducing greenhouse gases can help make these changes less severe, but the changes cannot be avoided entirely. Unavoidable climate impacts result in a variety of secondary consequences including detrimental impacts on human health and safety, economic continuity, ecosystem integrity and provision of basic services. Climate change is being profiled in the 2023 Marin County OA MJHMP as a standalone hazard while addressing each of the other natural hazards. The Marin County OA is considering climate change issues when identifying future mitigation actions.

California is experiencing a climate crisis that is increasingly taking a toll on the health and well-being of its people and on its unique and diverse ecosystems. Every Californian has suffered from the effects of record high temperatures, dry winters, prolonged drought, and proliferating wildfires in recent years. California's biodiversity is threatened as alterations to habitat conditions brought about by a changing climate are occurring at a pace that could overwhelm the ability of plant and animal species to adapt.

Indicators of Climate Change in California
Source: 2022 Report: Indicators of Climate Change in California | OEHHA

- Since 1895, annual average air temperatures in California have increased by about 2.5 degrees Fahrenheit (°F). Warming occurred at a faster rate beginning in the 1980s.
- Recent years have been especially warm: Eight of the ten warmest years on record occurred between 2012 and 2022; 2014 was the warmest year on record.
- Of all the Western states, California endured the hottest temperatures for the longest time, driving the average statewide temperature to the second warmest over the past 128 years.
- Extreme heat ranks among the deadliest of all climate-driven hazards in California, with physical, social, political, and economic factors effecting the capacity of individuals, workers, and communities to adapt, and with the most severe impacts often on communities who experience the greatest social and health inequities.
- Glaciers have essentially disappeared from the Trinity Alps in Northern California
- In 2020, wildfire smoke plumes were present in each county for at least 46 days.

- The 2022 fire season saw more fires than the previous fire season along with continued extreme drought and heat conditions.
- The drought, begun in 2019, was the third statewide drought declared in California since 2000.
- This drought has been marked by extreme swings; the state received record-breaking amounts of precipitation in October and December 2021 that were offset by the driest January, February, and March 2022 dating back more than 100 years. The year 2023 opened with California simultaneously managing both drought and flood emergencies.
- A series of storms in late December 2022 and early January 2023 broke rural levees, disrupted power, flooded roads, downed trees, and eroded coastal land.
- Sea level rise accelerates coastal erosion, worsens coastal flooding during large storms and peak tidal events, and impacts important infrastructure positioned along our state's 1,100-mile coast.
- The western drought which impacted all of California and the western United States was nearly lifted due to unseasonably heavy rains in late 2022 and early 2023.

The graph below shows the relative change, in millimeters, in sea levels at Crescent City (1933-2020), San Francisco (1900-2020), and La Jolla (1925-2020).

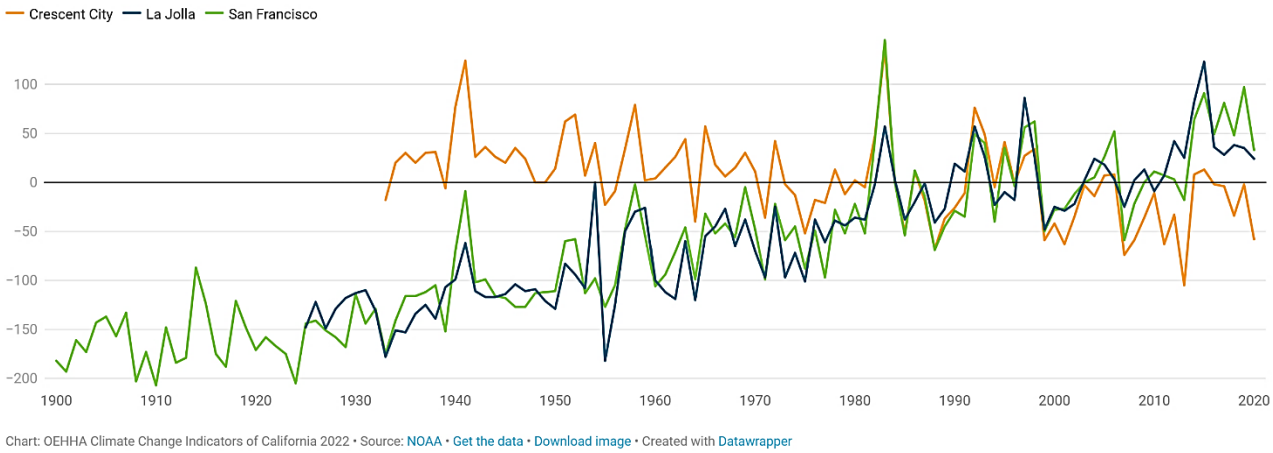

Figure 314: Annual Mean Sea Level Trends

Climate Change in the Marin County Operational Area

Climate change is already having significant impacts across California. Temperatures are warming, heat waves are more frequent, and precipitation has become increasingly variable.

Climate change will continue to alter Marin County OA ecosystems as a result of rising temperatures, changes in precipitation, and sea level rise, which will increase the severity and occurrence of natural hazards across the Marin County OA well into the future. Coastal cooling processes that keep temperatures down, such as fog, will continue to decrease. Rising temperatures will exacerbate drought conditions and raise the potential for significant wildfires and associated smoke as vegetation becomes drier and tree mortality increases. Forested woodlands that play a major role in carbon reduction will gradually transition into chaparral and shrublands. There will be more extreme storms and weather events, including expanded heat waves and increased rain events with changes in precipitation. Significant rain events will lead to an increase in flooding and the potential for severe landslides. Shoreline communities will become inundated with sea level rise, storm surge, and high tide events. Marshlands and wetlands that act as natural storm barriers will disappear as they transition into open water.

Notable impacts from climate change that are already evident in the Marin County OA and surrounding region as identified in a 2020 Marin County Civil Grand Jury Report include:

- From 1895-2018, the average temperature in Marin County increased by 2.3 degrees Fahrenheit.
- Over the past century, sea level rise in the San Francisco Bay Area rose by eight inches and has accelerated rapidly since 2011.
- The threat of wildfires in 2019 was so severe that Pacific Gas and Electric shut off electric power to the County for multiple days.

Climate change will continue to affect homes, businesses, infrastructure, utilities, transportation systems and agriculture across the Marin County OA. The risk to socially vulnerable populations will increase as they feel the immediate impacts of climate change more significantly and are less able to adapt to climate change and recover from its impacts.

The Marin County OA has adopted numerous planning initiatives and mitigation measures to help combat the effects of climate change across the OA. The Marin Climate Energy Partnership (MCEP), which is a partnership program of Marin County jurisdictions, the County, and Marin County regional agencies, adapted a model Climate Action Plan (CAP) that is intended to support countywide implementation efforts and is currently being used to update additional climate action plans for other jurisdictions in Marin County. The CAP supports the Climate Action Plan for the unincorporated County, which was completed in 2020. The MCEP also collects data and report on progress in meeting each County jurisdictions' individual greenhouse gas emission targets. In June 2023, the County published the Greenhouse Gas Inventory for Unincorporated Community Emissions for the Year 2021. Marin County OA jurisdictions have already met their greenhouse reduction goals for 2020 and are about halfway to meeting the statewide goal to reduce emissions 40% below 1990 levels by the year 2030. Marin County also formed a Sea Level Marin Adaptation Response Team in 2018 and had a Sea Level Rise Vulnerability Assessment and associated Adaptation Report completed for the County and each of its jurisdictions in 2017 as part of their Bay Waterfront Adaptation and Vulnerability Evaluation. Additional Marin County OA climate change mitigation initiatives

include Marin Clean Energy, Electrify Marin, the Marin Solar Project, the Marin Energy Watch Partnership, Resilient Neighborhoods, and Drawdown: Marin.

2.2 HAZARDS

Of the hazards profiled in the Marin County OA MJHMP, those noted in the table are specific for the City of Mill Valley as per the planning team.

Table 17: City of Mill Valley Hazard Risk Assessment

Hazard	Probability/ Likelihood of Future Events	Geographic Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Debris Flow	Likely	Significant	Moderate	Medium	High	**13.00**
Drought	Likely	Extensive	Weak	High	Medium	**13.00**
Earthquake	Occasional	Extensive	Extreme	Low	Medium	**13.00**
Flooding	Occasional	Extensive	Severe	Medium	Medium	**13.00**
Land Subsidence (Sinkhole)	Likely	Negligible	Moderate	Low	Low	**8.00**
Levee Failure	None	None	None	None	None	**0.00**
Sea Level Rise	Highly Likely	Limited	Weak	High	Medium	**12.00**
Severe Weather – Extreme Heat	Likely	Extensive	Moderate	Medium	Medium	**13.00**
Severe Weather – Wind, Tornado	Highly Likely	Significant	Moderate	High	Medium	**14.00**
Tsunami	Unlikely	Negligible	Severe	Medium	Medium	**9.00**
Wildfire	Likely	Extensive	Severe	High	High	**16.00**

Table 159: City of Mill Valley Hazard Risk Assessment
Source: City of Mill Valley

Omitted Hazards

Dam Failure: The City of Mill Valley has one dam, the Cascade Canyon Dam. This dam, owned by the City of Mill Valley, is 20 feet tall, with a capacity of 2.08 acre-feet. The Cascade Canyon Dam is not in active use, is not a high hazard dam and does not pose a risk to life. For these reasons, dam failure was not included in the hazard analysis presented in the following section.

Table 18: County of Marin Hazard Risk Assessment						
Hazard	Probability/ Likelihood of Future Events	Geographic Extent	Magnitude/ Severity	Climate Change Influence	Significance	Risk Score
Dam Failure	Unlikely	Negligible	Extreme	Low	Medium	**9.00**
Debris Flow	Occasional	Extensive	Severe	Medium	Medium	**13.00**
Drought	Highly Likely	Extensive	Moderate	High	High	**16.00**
Earthquake	Highly Likely	Extensive	Extreme	None	High	**15.00**
Flooding	Highly Likely	Limited	Severe	High	Medium	**14.00**
Land Subsidence	Occasional	Limited	Moderate	Medium	Medium	**10.00**
Levee Failure	Unlikely	Negligible	Moderate	Medium	High	**9.00**
Sea Level Rise	Highly Likely	Limited	Extreme	High	High	**16.00**
Severe Weather – Extreme Heat	Highly Likely	Extensive	Moderate	High	Medium	**15.00**
Severe Weather – Wind, Tornado	Highly Likely	Extensive	Moderate	High	Medium	**15.00**
Tsunami	Highly Likely	Limited	Extreme	Medium	High	**15.00**
Wildfire	Highly Likely	Significant	Severe	High	High	**16.00**

Table 160: County of Marin Hazard Risk Assessment

2.2.1 Debris Flows

For the purposes of the Marin County OA MJHMP, debris flows are classified as landslides (including rockslides) and mud flows.

A landside is the breaking away and gravity-driven downward movement of hill slope materials, which can travel at speeds ranging from fractions of an inch per year to tens of miles per hour depending on the slope steepness and water content of the rock/soil mass. Landslides range from the size of an automobile to a mile or more in length and width and, due to their sheer weight and speed, can cause serious damage and loss of life. The rate of a landslide is affected by the type and extent of vegetation, slope angle, degree of water saturation, strength of the rocks, and the mass and thickness of the deposit. Some of the natural causes of this instability are earthquakes, weak materials, stream and coastal erosion, and heavy rainfall. In addition, certain human activities tend to make the earth materials less stable and increase the chance of ground failure. These activities include extensive irrigation, poor drainage or groundwater withdrawal, removal of stabilizing vegetation and over-steepening of slopes by undercutting them or overloading them with artificial fill. These activities can cause slope failure, which normally produces landslides.

Landslide material types are often broadly categorized as either rock or soil, or a combination of the two for complex movements. Rock refers to hard or firm bedrock that was intact and in place

prior to slope movement. Soil, either residual or transported material, means unconsolidated particles. The distinction between rock and soil is most often based on interpretation of geomorphic characteristics within landslide deposits, but can also be inferred from geologic characteristics of the parent material described on maps or in the field. Landslide movements are also based on the geomorphic expression of the landslide deposit and source area, and are categorized as falls, topples, spreads, slides, or flows. Falls are masses of soil or rock that dislodge from steep slopes and free fall. Topples move by the forward pivoting of a mass around an axis below the displaced mass. Lateral spreads move by horizontal extension and shear or tensile fractures. Slides displace masses of material along one or more discrete planes and can either be rotational or transitional. Flows mobilize as a deforming, viscous mass without a discrete failure plane.

Natural conditions that contribute to landslide include the following:

- Degree of slope
- Water (heavy rain, river flows, or wave action)
- Unconsolidated soil or soft rock and sediments
- Lack of vegetation (no stabilizing root structure)
- Previous wildfires and other forest disturbances
- Earthquake

In addition, many human activities tend to make the earth materials less stable and, thus, increase the chance of ground movement. Human activities contribute to soil instability through grading of steep slopes or overloading them with artificial fill, by extensive irrigation, construction of impermeable surfaces, excessive groundwater withdrawal, and removal of stabilizing vegetation.

Another hazard related to landslide and erosion is the fall of a detached mass of rock from a cliff or down a very steep slope (rockfall). Weathering and decomposition of geological materials produce conditions favorable to rockfalls. Other causes include ice wedging, root growth, or ground shaking (earthquake). Destructive landslides and rockfalls usually occur very suddenly with little or no warning time and are short in duration.

Landslides can cause high mortality and injuries from rapidly flowing water and debris. The most common cause of death in a landslide is trauma or suffocation by entrapment. Broken power, water, gas or sewage pipes can also result in injury or illness in the population affected, such as water-borne diseases, electrocution or lacerations from falling debris. People affected by landslides can also have short- and long-term mental health effects due to loss of family, property, livestock or crops. Landslides can also greatly impact the health system and essential services, such as water, electricity or communication lines.

Landslide susceptibly can be characterized by looking at both slope class and rock strength. Landslide susceptibility classes express the generalization that on very low slopes, landslide susceptibility is low even in weak rock, and that landslide susceptibility increases with slope and in weaker rocks. Very high landslide susceptibility includes very steep slopes in hard rocks and moderate to very steep slopes in weak rocks. Figure 20 shows landslide susceptibility classes.

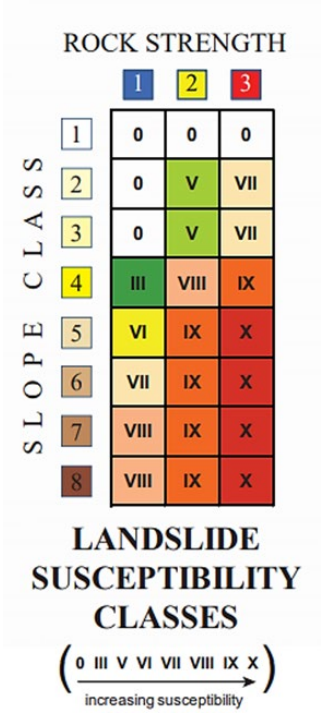

Figure 315: Landslide Susceptibility Classes
Source: USGS

A mud flow is a general term for a mass-movement landform and process characterized by a flowing mass of fine-grained earth material with a high degree of fluidity. Heavy rainfall, snowmelt, or high levels of groundwater flowing through cracked bedrock may trigger a movement of soil or sediments. Floods and debris flows may also occur when strong rains on hill or mountain slopes cause extensive erosion and/or what is known as "channel scour". Some broad mud flows are rather viscous and therefore slow; others begin very quickly and continue like an avalanche. Mud flows are composed of at least 50% silt and clay-sized materials and up to 30% water.

The point where a muddy material begins to flow depends on its grain size and the water content. Fine grainy material or soil has a smaller friction angle than a coarse sediment or a debris flow, but falling rock pieces can trigger a material flow, too. When a mud flow occurs it is given four named areas, the 'main scarp', in bigger mud flows the 'upper and lower shelves', and the 'toe'. See Figure 21 for the typical areas of a mud flow, with shelves (right) and without (left). The main scarp will be the original area of incidence, the toe is the last affected area(s). The upper and lower shelves are located wherever there is a large dip (due to mountain or natural drop) in the mud flow's path. A mud flow can have many shelves.

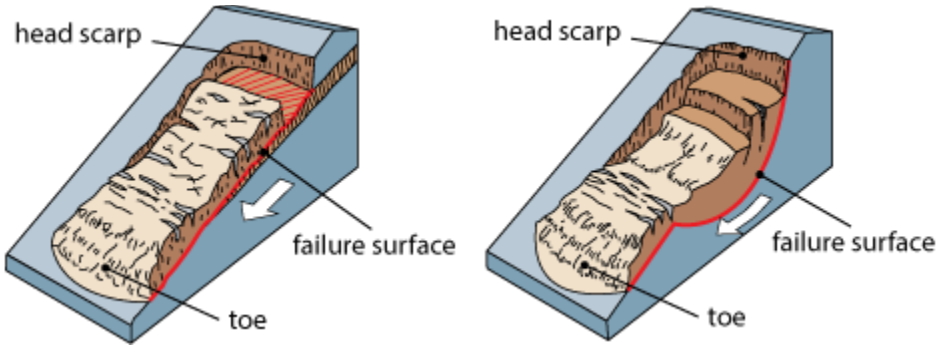

Figure 316: Mud Flow Areas
Source: Washington Department of Natural Resources

If large enough, mud flows can devastate villages and country-sides. Mud flows are common in mountain areas prone to wildfire, where they have destroyed many homes built on hillsides without sufficient support after fires destroy vegetation holding the land. The area most generally recognized as being at risk of a dangerous mud flow are:

- Areas where wildfires or human modification of the land have destroyed vegetation
- Areas where landslides have occurred before
- Steep slopes and areas at the bottom of slopes or canyons
- Slopes that have been altered for construction of buildings and roads
- Channels along streams and rivers
- Areas where surface runoff is directed

Most of Mill Valley is extremely susceptible to landslides due to the steepness of the terrain around the City. A landslide in Mill Valley could occur anywhere in the city where the terrain may be susceptible to soil movement. These areas primarily consist of numerous winding and dead end streets and hillside homes that may sustain damage from soil movement. Development in these areas was mostly done in the 1920s and 1930s before landslides were factored into design and construction regulations. Most of the downtown and commercial area of Mill Valley between Miller Avenue and E. Blithedale Avenue from Thockmorton Avenue to Camino Alto lies on relatively flat land with low to no landslide susceptibility. Approximately half of Mill Valley's critical facilities lie in areas of no landslide susceptibility but are adjacent to areas of moderate to high landslide susceptibility. The Old Mill Elementary School, The Mill Valley Fire Station #6, the Greenwood School, Park Elementary School, the Helix School, and Edna Maguire Elementary School all lie in areas of the City that have some landslide susceptibility. The Mill Valley Police Department and SMFD Fire Station #7 lie directly adjacent to an area of very high landslide susceptibility.

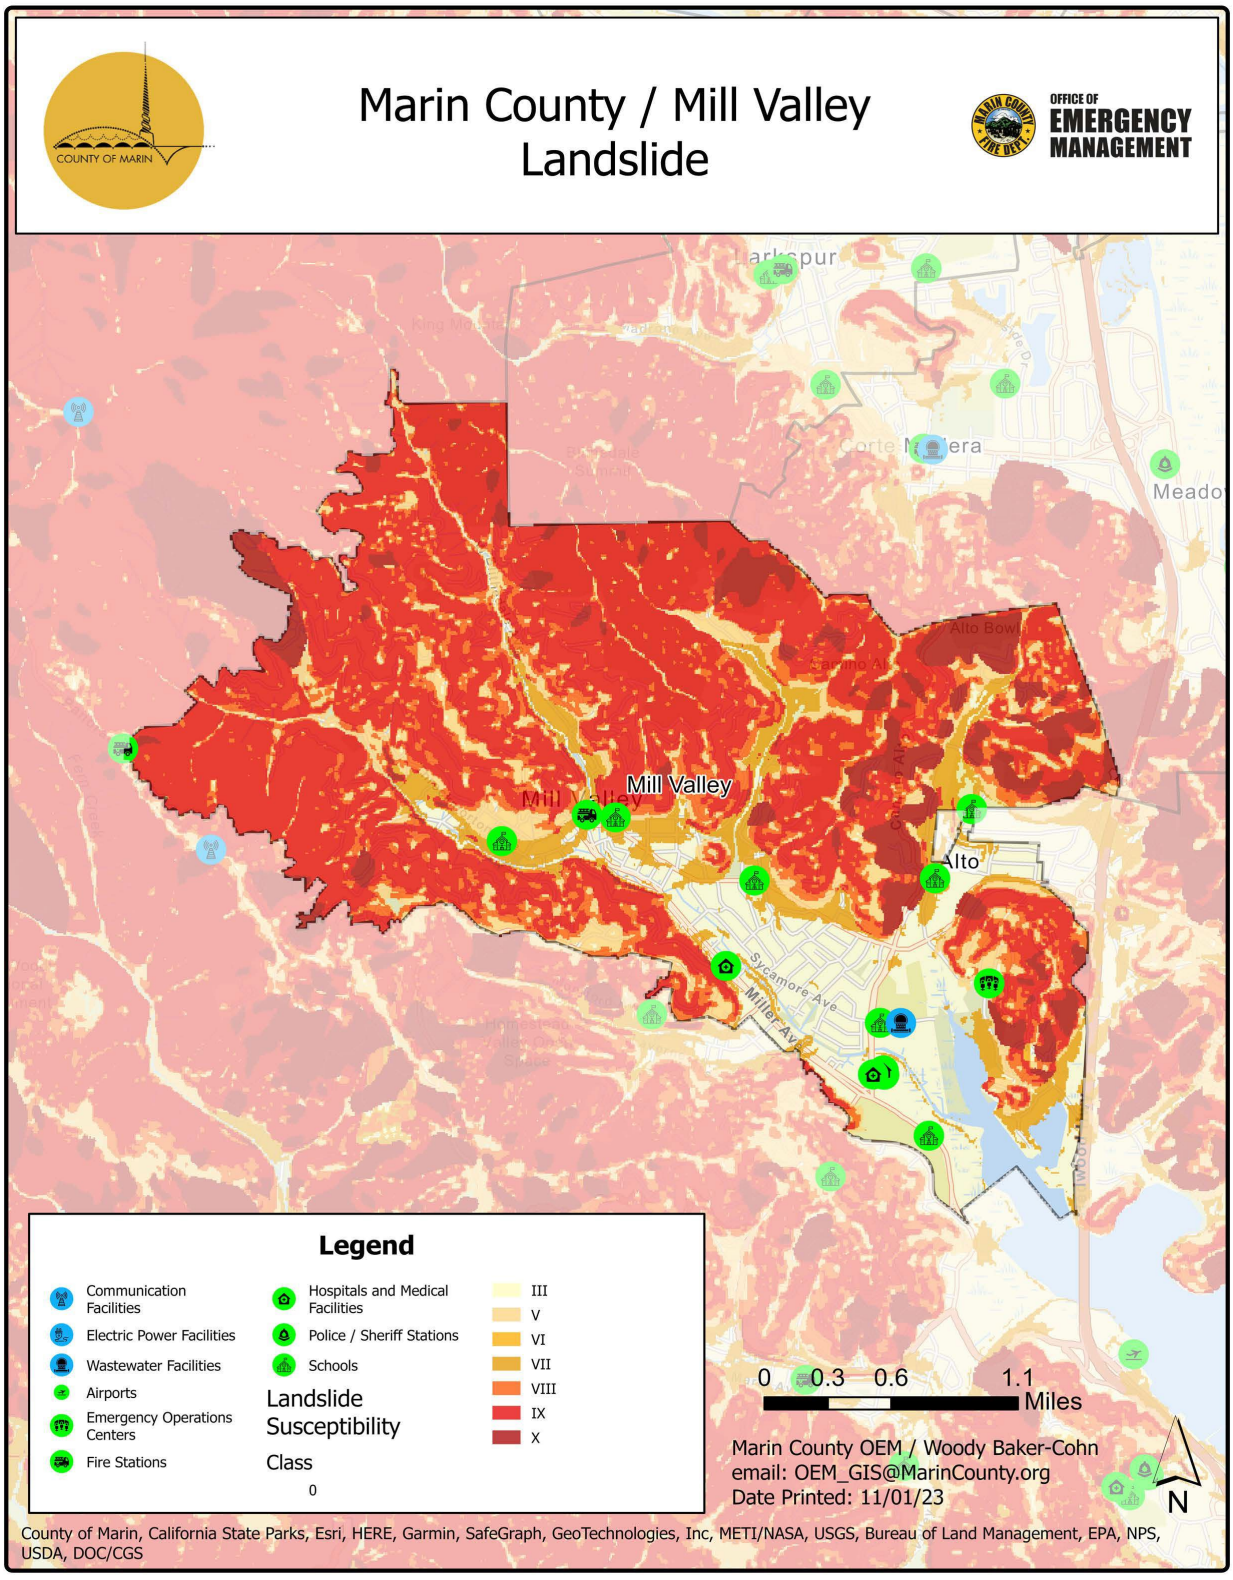

Figure 317: City of Mill Valley Debris Flow Critical Facilities and Infrastructure
Source: Marin County OEM

Transportation challenges may be of particular concern with a landslide in the City, particularly in the hilly and mountainous residential areas around the city. Ingress and egress into these areas may be impacted by a landslide.

Earthquakes also have the potential to cause soil instabilities throughout this area. Wildfires and subsequent rain events in the Marin Headlands and any of the open space above Mill Valley may contribute to soil instabilities and pose a risk to properties and infrastructure in Mill Valley. Several small watersheds originate above Mill Valley in the Muir Woods National Monument and Mount Tamalpais State Park and flow towards Richardson Bay through Mill Valley. Erosion from these small watersheds can add to soil instability and could contribute to debris flows. Homes along Old Mill Creek, Arroyo Corte Madera del Presido and Warner Creek are particularly susceptible to a debris flow, which could destroy bridges and other road infrastructure.

On 10/24/2021, a severe storm caused a mudslide that damaged the Guidepost Montessori School.

On 4/12/2006, a mud flow coursed down the steep slope behind a home at 70 Bolsa Avenue, uprooting oak trees before crashing into the master bedroom. The debris flow was about 50 feet wide and 12- to 14-feet deep and it killed a resident who was found under 12 feet of mud.

Climate Change and Future Development Considerations

Extreme storm events and more frequent wildfires as a result of climate change have the potential to increase the amount and severity of landslides, including disastrous debris flows. Climate change is leading to more volatile precipitation patterns around the world with very dry stretches punctuated by storms that drop large amounts of rain in a short amount of time. Landslides in wetter regions of California, including the Marin County OA, move on average faster and farther downhill during rainy periods compared to drought years, according to a 2022 study by the American Geophysical Union (AGU)[21], showing the increased potential for landslides in the Marin County OA in rainy years. As development increases in the numerous canyons and around the many open spaces of the Marin County OA, the potential for significant impacts from a landslide and/or mudflow increases. Further development of the residential areas of Mill Valley that have a higher landslide susceptibility, including the numerous open spaces around the city will expose more people and property to landslide risk. With increased wildfire potential as a result of climate change, more residents in Mill Valley could be susceptible to post-fire debris flows. This includes areas of Old Mill Creek and Arroyo Corte Madera del Presidio which flow and converge into downtown. Future development should take into account the movement of mud and debris in waterways after a major rain event. Adequate space adjacent to susceptible waterways should be maintained free of development to allow for the passage of mud and debris, and catchment basins should be built in these areas to help capture any excess mud and debris.

[21] Landslide Sensitivity and Response to Precipitation Changes in Wet and Dry Climates. https://agupubs.onlinelibrary.wiley.com/doi/10.1029/2022GL099499

2.2.2 DROUGHT

A drought is a deficiency in precipitation over an extended period, usually a season or more, resulting in a water shortage causing adverse impacts on vegetation, animals, and/or people. It is a normal recurrent feature of climate that occurs in virtually all climate zones, from very wet to very dry. Drought is a temporary aberration from normal climatic conditions and can thus vary significantly from one region to another. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Drought is a complex issue involving many factors—it occurs when a normal amount of moisture is not available to satisfy an area's usual water-consuming activities.

There are several types of drought which can often be defined regionally based on their effects:

- Meteorological drought is usually defined by a period of below average water supply, based on the degree of dryness (in comparison to normal or average) and the duration of the dry period. Drought onset generally occurs with a meteorological drought.
- Agricultural drought occurs when there is an inadequate water supply to meet the needs of the state's crops and other agricultural operations such as livestock. Agricultural drought links various characteristics of meteorological (or hydrological) drought to agricultural impacts, focusing on precipitation shortages, soil water deficits, reduced ground water or reservoir levels needed for irrigation.
- Hydrological drought is defined as deficiencies in surface and subsurface water supplies. It is generally measured as stream flow, snowpack, and as lake, reservoir, and groundwater levels. Hydrological drought usually occurs following periods of extended precipitation shortfalls.
- Socioeconomic drought occurs when a drought impacts health, well-being, and quality of life, or when a drought starts to have an adverse economic impact on a region.

Drought can occur in all areas of Mill Valley and Marin, though its effects would be most felt in the hillside and mountainous areas where the risk of wildfire may increase. Dry trees throughout the city may become a safety hazard to the public due to falling trees or limbs.

Climate Change and Future Development Considerations

Climate change increases the odds of worsening drought. Warmer temperatures enhance evaporation, which reduces surface water and dries out soils and vegetation. This makes periods with low precipitation in the summer drier than they would be in cooler conditions. Climate also alters the timing of water availability as warmer winter temperatures cause less precipitation to fall. During droughts, communities in the Marin County OA including Mill Valley may have limited access to water for household use, including drinking, cooking, cleaning, and watering plants, as well as for agriculture, transportation, and power generation. Drought may lead to higher water costs, rationing, or even the decimation of important water sources like wells in the Marin County OA. As more people move into the Marin County OA and the City of Mill Valley, additional strain will be placed on the OA's water supply. Drought can affect livestock and crops in the Marin County OA, impacting its economy. Drought can increase the occurrence and severity of wildfires and tree mortality in the Marin County OA including in the open spaces in and around Mill Valley. Impacts to residents and infrastructure from wildfire as a

result of drought will increase as more development occurs in the mountainous areas of the Marin County OA including Mill Valley where wildfires are more likely to occur. Drought also has the potential to dry out the marshlands along the shoreline of Mill Valley, increasing the chances of brush fires there. Future development in this area and in the mountainous areas of Mill Valley could expose people to drier summer conditions that could increase their vulnerability to wildfire. Drought also increases the amount of carbon dioxide in the atmosphere, including by decreasing land productivity, which reduces the amount of vegetation storing carbon dioxide. In addition, increases in drought-related wildfire and soil erosion can release carbon dioxide sequestered in trees and plants back into the atmosphere. This will only worsen climate change for the Marin County OA into the future. When considering future development, the Marin County OA including Mill Valley can help prepare for both future droughts and climate change by practicing and promoting water conservation and enhancing water efficiency throughout landscapes, city plans, and water infrastructure. The Marin County OA can also identify alternative water supplies, create drought emergency plans, and encourage farmers to plant drought-resistant crops.

2.2.3 EARTHQUAKE

Earthquakes are sudden rolling or shaking events caused by movement under the earth's surface. Earthquakes happen along cracks in the earth's surface, called fault lines, and can be felt over large areas, although they usually last less than one minute.

The amount of energy released during an earthquake is usually expressed as a magnitude and is currently measured by seismologists on the Moment Magnitude (Mw Scale). The Mw Scale was developed to succeed the previously used Richter Scale and is measured on a scale of zero to ten with increasing values reflecting increasing intensity.

The other commonly used measure of earthquake severity is intensity, which is an expression of the amount of shaking at any given location on the ground service. Intensity is most commonly measured on the Modified Mercalli Intensity (MMI) Scale (see Figure 23).

Intensity	Shaking	Description/Damage
I	Not felt	Not felt except by a very few under especially favorable conditions.
II	Weak	Felt only by a few persons at rest,especially on upper floors of buildings.
III	Weak	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Light	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Moderate	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Strong	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Very strong	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Severe	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Violent	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	Extreme	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.

Figure 318: Modified Mercalli Intensity Scale
Source: USGS

Figure 24 gives intensities (measured on the MMI scale) that are typically observed at locations near the epicenter or earthquakes of different magnitudes.

Richter Magnitude Scale	Typical Maximum Modified Mercalli Intensity Scale
1.0 – 2.9	I
3.0 – 3.9	II – III
4.0 – 4.9	IV – V
5.0 – 5.9	VI – VII
6.0 – 6.9	VII – IX
7.0 or higher	VIII or higher

Figure 319: Mercalli Scale vs. Magnitude
Source: USGS

The extent of ground shaking also depends in large part on how soft the underlying soil is. Soft soils amplify ground shaking (see Figure 25). This was observed during the 1989 Loma Prieta Earthquake when the most significant damages experienced in San Francisco were in the Marina District, which was built on fill.

Soil type A	Vs > 1500 m/sec	Includes unweathered intrusive igneous rock. Occurs infrequently in the bay area. We consider it with type B (both A and B are represented by the color blue on the map). Soil types A and B do not contribute greatly to shaking amplification.
Soil type B	1500 m/sec > Vs > 750 m/sec	Includes volcanics, most Mesozoic bedrock, and some Franciscan bedrock. (Mesozoic rocks are between 245 and 64 million years old. The Franciscan Complex is a Mesozoic unit that is common in the Bay Area.)
Soil Type C	750 m/sec > Vs > 350 m/sec	Includes some Quaternary (less than 1.8 million years old) sands, sandstones and mudstones, some Upper Tertiary (1.8 to 24 million years old) sandstones, mudstones and limestone, some Lower Tertiary (24 to 64 million years old) mudstones and sandstones, and Franciscan melange and serpentinite.
Soil Type D	350 m/sec > Vs > 200 m/sec	Includes some Quaternary muds, sands, gravels, silts and mud. Significant amplification of shaking by these soils is generally expected.
Soil Type E	200 m/sec > Vs	Includes water-saturated mud and artificial fill. The strongest amplification of shaking due is expected for this soil type.

Figure 320: Soil Types
Source: USGS

An earthquake fault is defined as “a fracture or fracture zone in the earth’s crust along which there has been displacement of the sides relative to one another.” For the purpose of planning, there are two types of faults, active and inactive. Active faults have experienced displacement in historic time, suggesting that future displacement may be expected. Inactive faults show no evidence of movement in recent geologic time, suggesting that these faults are dormant.

Two types of fault movement represent possible hazards to structures in the immediate vicinity of the fault: fault creep and sudden fault displacement. Fault creep, a slow movement of one side of a fault relative to the other, can cause cracking and buckling of sidewalks and foundations even without perceptible ground shaking. Sudden fault displacement occurs during an earthquake event and may result in the collapse of buildings or other structures that are found along the fault zone when fault displacement exceeds an inch or two. The only protection against damage caused directly by fault displacement is to prohibit construction in the fault zone.

An earthquake could occur anywhere in and around Mill Valley due to the number of active faults within and near the Marin County OA.

Earthquake Shake Intensity
The colors on Figures 26 and 27 represent the level of ground shaking intensity of a potential future earthquake. The result is expressed as the level of ground shaking (**expressed as a percentage of gravity**) that on average occurs every 500 years.

This map shows the expected relative intensity of ground shaking and damage in California from anticipated future earthquakes. The shaking potential is calculated as the level of ground motion that has a 2% chance of being exceeded in 50 years, which is the same as the level of ground-shaking with about a 2500 year average repeat time. The relatively long-period (1.0 second) earthquake shaking is shown here. Long period-shaking affects tall, relatively flexible buildings, but also correlates well with overall earthquake damage.

Earthquake Shaking Potential Maps for California depict expected intermediate period (1s or 1hz) ground motions with 2% exceedance probability in 50 years.

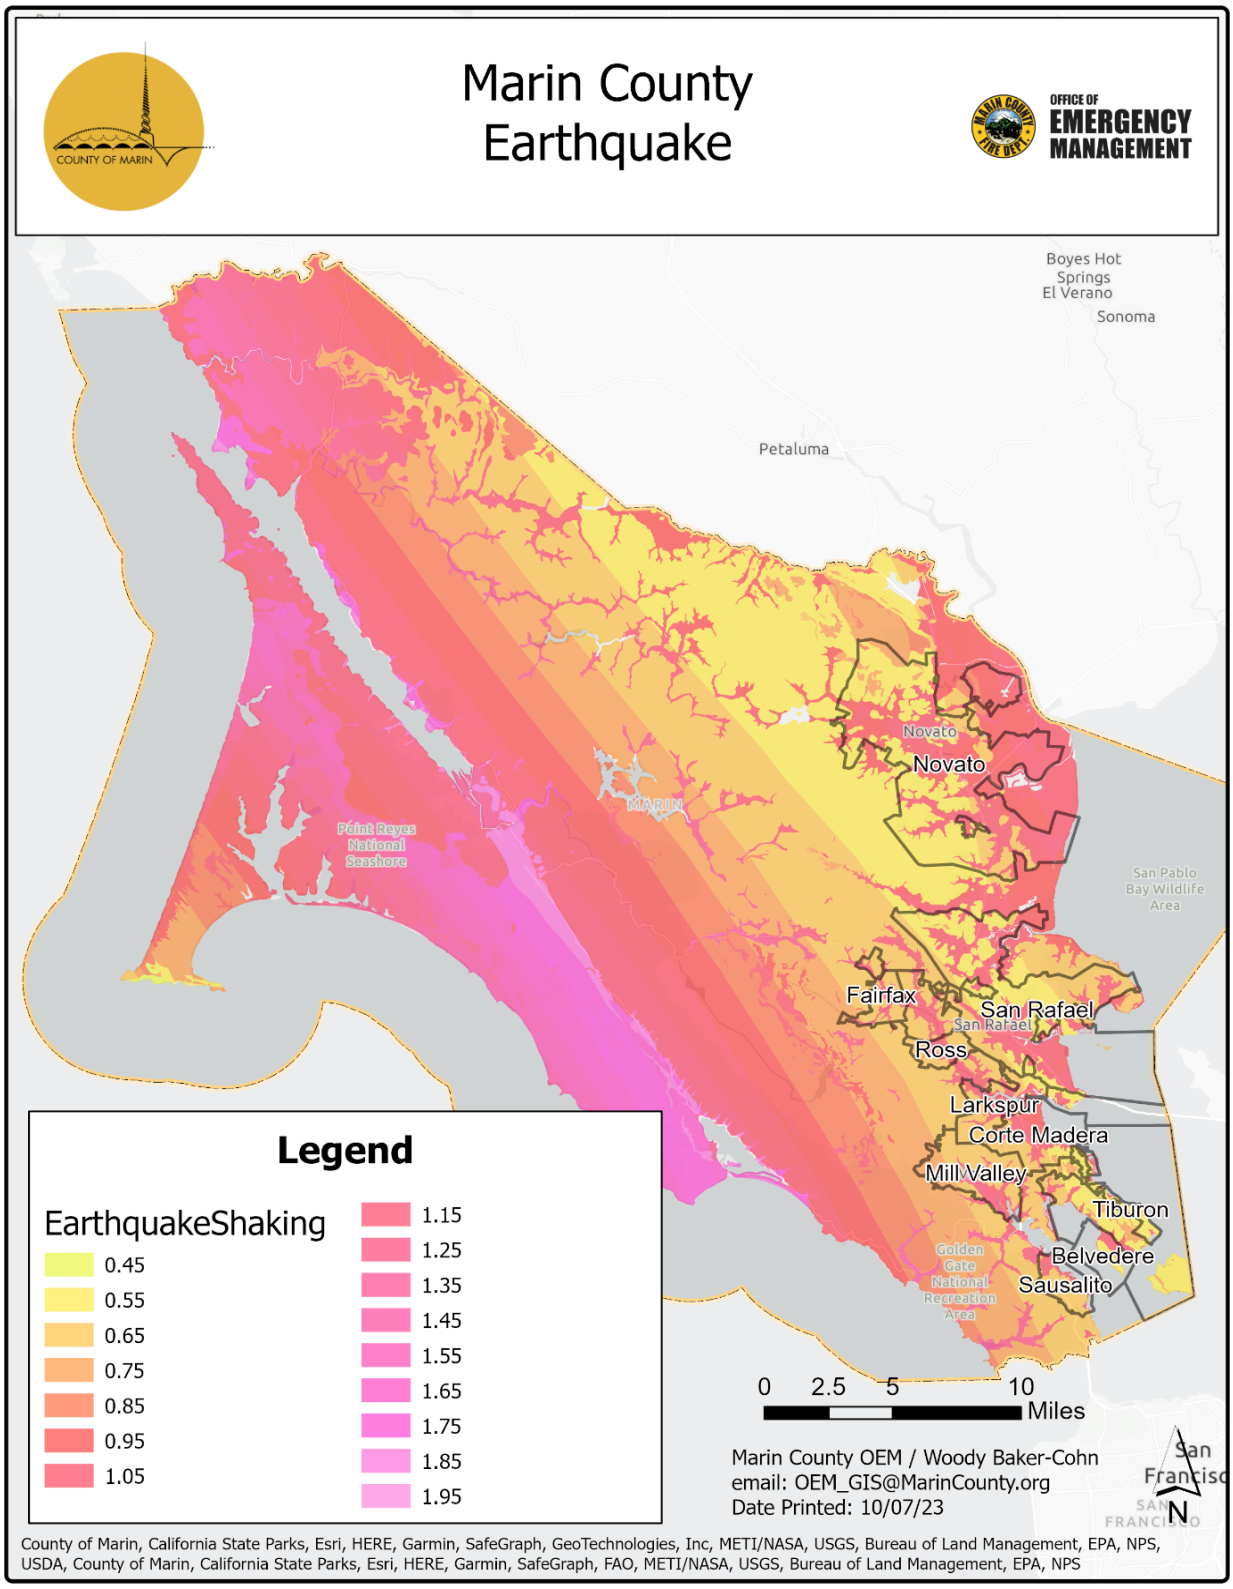

Figure 321: Marin County OA Earthquake Impact and Fault Lines

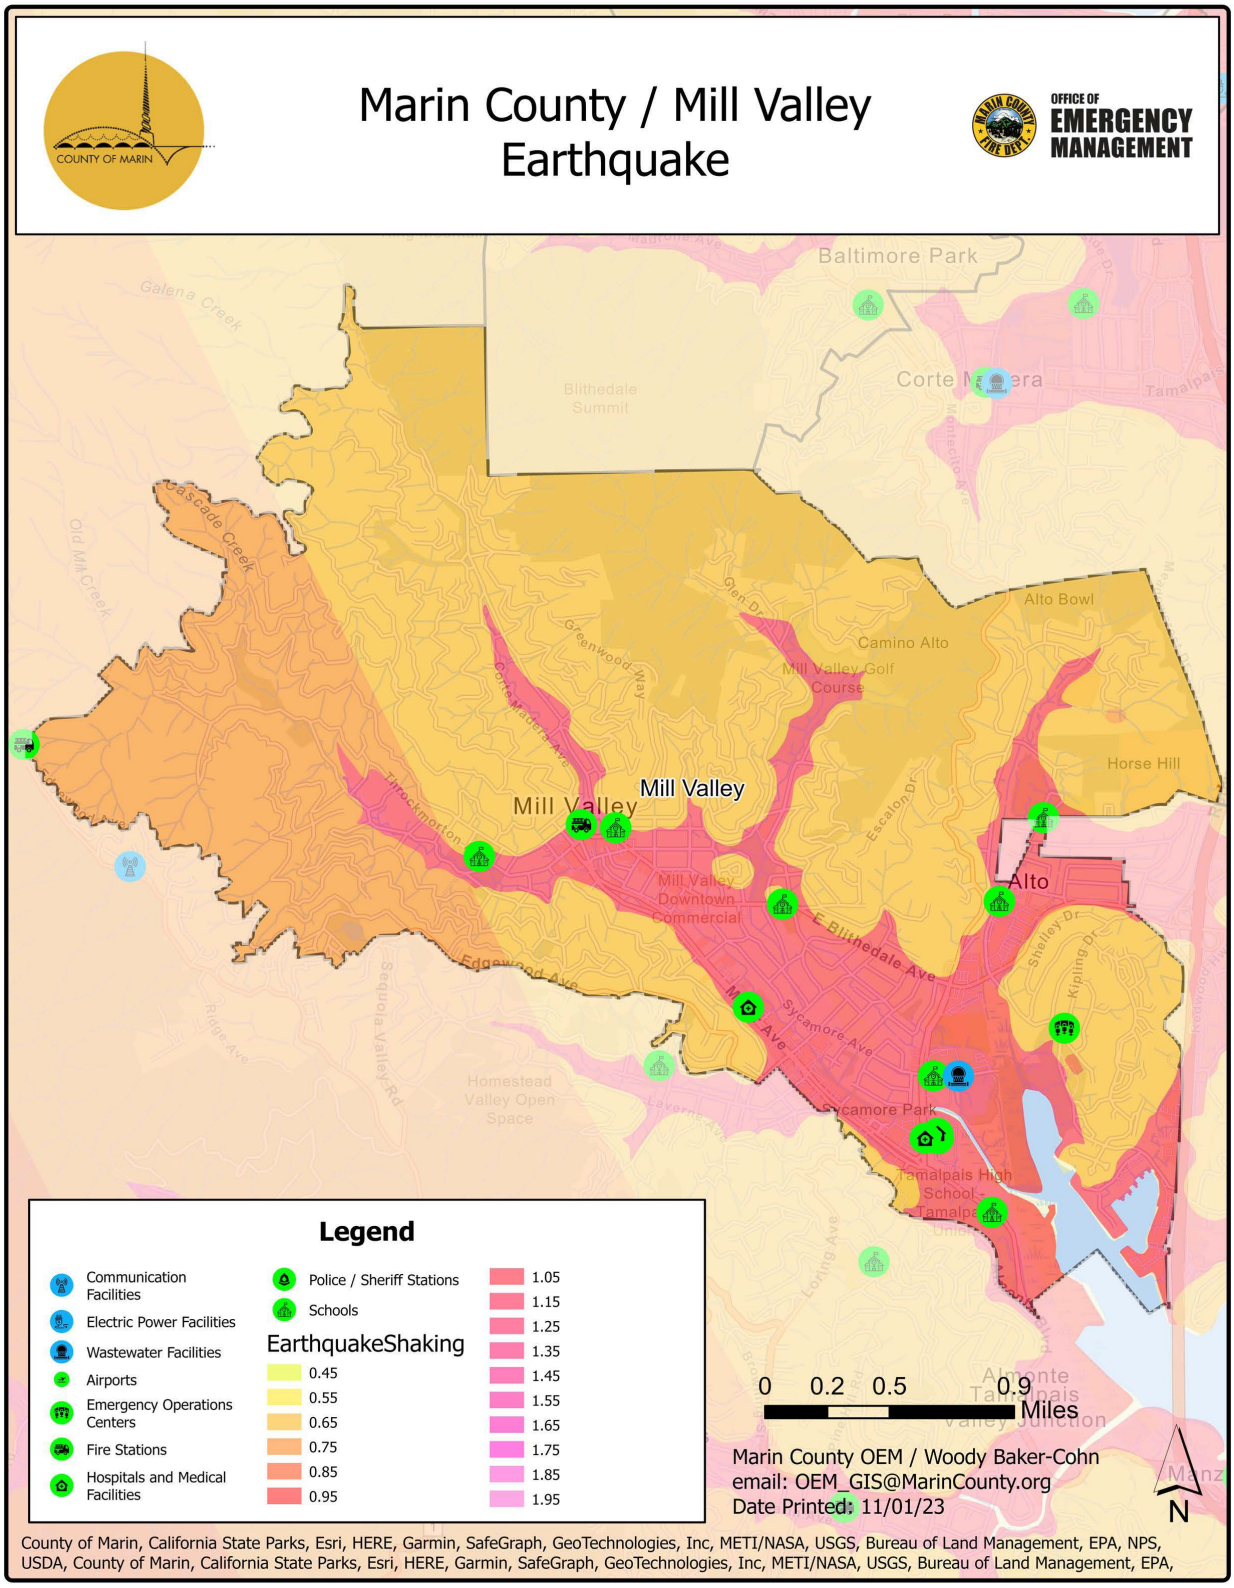

Figure 322: City of Mill Valley Earthquake Critical Facilities and Infrastructure
Source: Marin County OEM

Mill Valley is located directly between the San Andreas and Hayward faults. A moderate to extreme earthquake originating from either of these major faults or any of the other faults in the region may have major impacts to the City. In the upland areas of the City, most modern single-family buildings with foundations to bedrock should perform well to shaking. Modern multi-story buildings with foundations to bedrock should not be subject to collapse, although some serious damage may occur. There is increased risk of earthquake shaking and liquefaction in certain parts of Mill Valley, particularly in the area of the city south of E. Blithedale Avenue and north of Miller Avenue, as well as lowland areas around Bothin Marsh, Bayfront Park, Camino Alto, Shelter Bay Avenue and around the Redwood Highway commercial area adjacent to Highway 101 where superficial deposits and fill are more prevalent. This area has greater development density and includes residences and the primary downtown and commercial areas of the City. Residential areas of the city along the lower reaches of Old Mill Creek, Arroyo Corte Madera del Presidio and Warner Creek also have an increased risk of earthquake shaking. All of the City's critical facilities lie areas of moderate earthquake shaking susceptibility. Unreinforced masonry buildings in the downtown area could suffer moderate to severe damage from an earthquake. Falling debris could endanger those in the vicinity of these older buildings. "Pancaking" of these older structures during business hours may entrap many people. The City's densely settled alluvial lowlands have a potential for heavy damage. Southeast from La Goma Street to the bay is unconsolidated fill, and the Sutton Manor area is of the same base.

Landslides in Mill Valley as a result of an earthquake may cause damage to homes and roads as a result of shifting soils, effecting ingress and egress in the hilly and mountainous residential areas of the city where there are numerous windy and dead-end roads. Many hillsides in Mill Valley are unstable in their natural state, and even minor changes in the shape of the land surface could create major landslide problems.

Mill Valley hasn't yet experienced a significant earthquake. The Marin County OA was sparsely populated at the time of the 1906 San Francisco Earthquake, and the effects across the County were relatively minimal. Likewise, the 1989 Loma Prieta Earthquake caused minimal impacts across the Marin County OA as the epicenter of the quake was further south in Santa Cruz County. Smaller earthquakes with minimal to no impacts are routinely felt in Mill Valley On 12/31/2020, a 3.6 magnitude earthquake originating from the San Andreas Fault struck near Mill Valley. There were no reports of damages or injuries.

In 2023, the Mill Valley City Council approved an ordinance that requires retrofitting for some apartment buildings built before 1978. The ordinance applies to "soft-story" apartment buildings or those with a wood-frame target story design and three or more residences. Approximately 50 to 90 buildings could meet the criteria according to the city.

Climate Change and Future Development Considerations

There is no direct link between climate change and seismic activity that could impact the Marin County OA including Mill Valley, so climate change is not expected to cause any changes to the frequency or intensity of seismic shaking. According to a 2018 study by the Institute of Physics (IOP)[22], climate change could result in "isostatic rebounds," or a sudden upward movement of the crust because of reduced downward weight caused by glaciers. As glaciers are known to melt when overall global temperatures increase, climate change could indirectly lead to an increase in seismicity in the Marin County OA including Mill Valley. Climate change could also

[22] An Enhanced Seismic Activity Observed Due to Climate Change: Preliminary Results from Alaska. https://iopscience.iop.org/article/10.1088/1755-1315/167/1/012018

impact earthquakes felt in the Marin County OA as droughts can further deteriorate existing fault lines and pumping groundwater can put further pressure on the earth's crust. Future development in the populated areas of Marin County OA where seismic shaking and subsidence are more prevalent could exacerbate the impacts of an earthquake. This includes the lowlands of Mill Valley downtown and along its creek beds and marshlands, where the risk of subsidence and subsequent earthquake shaking are higher. Future development in these areas could expose more people and infrastructure to earthquake shaking as a result of climate change.

2.2.4 FLOODING

Flooding is the rising and overflowing of a body of water onto normally dry land. Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. The area adjacent to a channel is the floodplain. Floodplains are illustrated on inundation maps, which show areas of potential flooding and water depths. In its common usage, the floodplain most often refers to that area that is inundated by the 100-year flood, the flood that has a one percent chance in any given year of being equaled or exceeded. The 100-year flood is the national minimum standard to which communities regulate their floodplains through the National Flood Insurance Program. The 200-year flood is one that has 0.5% chance of being equaled or exceeded each year. The 500-year flood is the flood that has a 0.2 percent chance of being equaled or exceeded in any given year. The potential for flooding can change and increase through various land use changes and changes to land surface, which result in a change to the floodplain. A change in environment can create localized flooding problems inside and outside of natural floodplains by altering or confining natural drainage channels. These changes are most often created by human activity such as construction of bridges or channels. In areas where flow contains high sediment load, such as Easkoot Creek in Stinson Beach (due to an active landslide upstream), the flow carrying capacity of the channel may be reduced dramatically during a single flood event. Coastal floodplains may also change over time as waves and currents alter the coastline (especially wetlands) and sea levels rise.

Flooding can occur in several ways:

Riverine flooding – Riverine flooding, defined as when a watercourse exceeds its "bank-full" capacity, generally resulting from prolonged rainfall, or rainfall that is combined with snowmelt and/or already saturated soils from previous rain events. This type of flood occurs in river systems whose tributaries may drain large geographic areas and include one or more independent river basins. The onset and duration of riverine floods may vary from a few hours to many days and is often characterized by high peak flows combined with a large volume of runoff. Factors that directly affect the amount of flood runoff include precipitation amount, intensity of rainfall and distribution of overland flow, the amount of soil moisture, seasonal variation in vegetation, snow depth, and water-resistance of the surface due to urbanization and geomorphology. In the Marin County OA, riverine flooding can occur anytime from November through April and is largely caused by intense and continued rains, sometimes combined with snowmelt, increased discharges from upstream dams, and intense flow from tributary streams. These intense storms can overwhelm the local waterways as well as the integrity of flood control structures such as culverts and bridges. Flooding is more severe when antecedent rainfall has resulted in saturated soil conditions. The warning time associated with slow rise riverine floods assists in life and property protection.

Flash flooding – Flash flooding describes localized floods of great volume and short duration. This type of flood usually results from a heavy rainfall on a relatively small drainage area. Precipitation of this sort usually occurs in the winter and spring. Flash floods often require immediate evacuation within the hour and thus early threat identification and warning is critical for saving lives.

Localized/Stormwater flooding – Localized flooding problems are often caused by flash flooding, severe weather, or an unusual amount of intense rainfall. Flooding from these intense weather events usually occurs in areas experiencing an increase in runoff from impervious surfaces associated with development and urbanization as well as inadequate storm drainage systems.

Tidal flooding – Tidal flooding develops when high tides exceed either the top of bank elevation of tidal sloughs and channels, or the crest of bay levees. An especially high tide event that occurs during alignment of the gravitational pull between the sun and the moon, causing tidal water levels to rise to higher-than normal levels. King tides are normal, predictable events that occur semi-annually during winter months. Typically storms in which high tides coincide with peak stormwater flow may be damaging to municipal infrastructure and private property.

The area is also at risk of flooding resulting from levee failures and dam failures. Dam failure flooding is discussed separately in the Dam Failure Section of this document; levee failure flooding is discussed separately in the Levee Failure Section of this document. Regardless of the type of flood, the cause is often the result of severe weather and excessive rainfall, either in the flood area or upstream reach.

A weather pattern called the “Atmospheric River” contributes to the flooding potential of the area. An Atmospheric River brings warm air and rain to the West. A relatively common weather pattern brings southwest winds to the Pacific Northwest or California, along with warm, moist air. The moisture sometimes produces many days of heavy rain, which can cause soil saturation, extensive flooding and other impacts such as landslides. The warm air also can melt the snowpack in the mountains, which further aggravates the flooding potential. In the colder parts of the year, the warm air can be cooled enough to produce heavy, upslope snow as it rises into the higher elevations of the Sierra Nevada or Cascades. Forecasters and others on the West Coast often used to refer to this warm, moist air as the “Pineapple Express” because it comes from around Hawaii where pineapples are grown. A diagram of an atmospheric river event is shown in Figure 28.

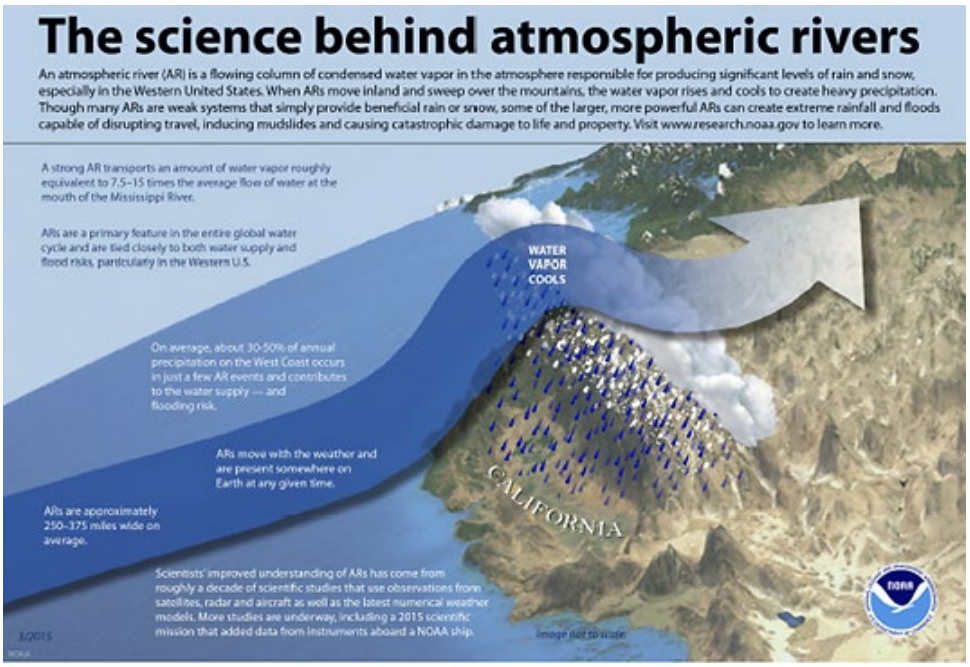

Figure 323: Diagram of an Atmospheric River Event
Source: NOAA

The Marin County OA is susceptible to various types of flood events. In coastal areas, flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Other types of flooding in Marin include isolated ponding and stormwater overflow. Isolated ponding is when pools form on the ground and can occur in any area that doesn't drain effectively – for example, in a natural depression in the landscape. Stormwater overflow is when storm drains back up. Stormwater drainage systems quickly convey rainwater through underground culverts (pipes) to creeks and the Bay. When the storm drains are obstructed or broken or when the water bodies to which they lead are already full, water backs up onto the streets and into the riparian area surrounding the drainage way. Although stormwater overflow and isolated ponding also occur throughout the County, the effects are typically not widespread or significantly damaging.

Many developed and undeveloped Mill Valley lands are subject to flooding due to a combination of factors, including periodic heavy winter rainfalls, tidal fluctuations, and potential for tsunami due to seismic activity. Mill Valley has numerous drainage basins which lead to small riparian streams and creeks which drain to Richardson Bay. Flooding in Mill Valley generally results from a combination of creek flooding along Old Mill Creek, Arroyo Corte Madera del Presidio and Warner Creeks as well as from high tides and storm runoff in low-lying areas along Richardson Bay. Mill Valley drains into Richardson Bay mainly by way of the Arroyo Corte Madera del Presidio. The creek drains an area of about six square miles from the upper reaches of Mount Tamalpais. Creek bank gradients are, therefore, exceptionally steep in the upper elevations, and flatten markedly as the creek continues over alluvial plains and enters the tidal marshlands along the periphery of Richardson Bay. Consequently, the creek often overflows its banks in the lower reaches during periods of heavy rainfall. Sunny-day king tide flooding has become a common occurrence along the bay in Mill Valley. Several lowland areas in Mill Valley, particularly the alluvial fan where its creeks converge, are in the 100-year floodplain, with several pockets in in the 500-year floodplain. Significant encroachment by urban development and vegetative growth has occurred along Arroyo Corte Madera del Presidio. Both factors have

imposed extreme limitations on channel flow capacities along substantial portions of the creek, resulting in flood problems. During heavy rainfall conditions, floodwaters cascade down the steep upper reaches of the main tributary streams and flow through central Mill Valley, where they overflow the flatter, generally constricted and inadequate channels. Damaging floods have periodically occurred over this area as a result. Part of the downtown area, the commercial areas along Miller Avenue, E. Blithedale Avenue east of Lomita Drive and along Redwood Highway adjacent to Highway 101, and numerous residences lie in the 100-year floodplain and could be susceptible to flooding. Part of the Mill Valley City Hall and Fire Station #6, the Marin Terrace and Redwoods medical facilities, Tamalpais High School and part of the Mill Valley Treatment Plant lie in the 100-year floodplain. Part of the Mill Valley Middle School, the Redwoods medical facility, the Mill Valley Treatment Plant and dozens of homes and businesses lie in the 500-year floodplain and could be susceptible to flooding.

1 The parcel at 1 Hamilton Drive contains a small area in the AE zone but the critical police and fire facilities are not located in that portion of the parcel.

Table 161: City of Mill Valley Critical Facilities in the Flood Zones
Source: County of Marin/FEMA DFIRM

Floodwaters can be deep enough to drown people and move fast enough to sweep people and vehicles away, lift buildings off foundations, and carry debris that smashes into buildings and other property. Flood waters can cause significant erosion which can lead to slope instability, severely damaging transportation and utility infrastructure by undermining foundations or washing away pavement. If water levels rise high enough to get inside buildings, flooding can cause extensive damage to personal property and the structure itself. Flood events that develop very quickly are especially dangerous because there may be little advance warning. Flooding may occur when strong winds or tides result in a surge of seawater into areas that are above the normal high tide line. Tide elevations within Richardson Bay have the potential to

significantly impact the Mill Valley storm drain system. Mill Valley already sees flooding from king tides in Richardson Bay and this is only expected to increase with sea level rise and climate change. Mill Valley areas subject to frequent flooding in the past are predominantly former marshlands (Bay Mud areas) that have previously been filled for urban expansion purposes. Consequently, the flood problem in Mill Valley has increased with time.

Mill Valley has experienced the impacts of flooding from winter storms, most notably in 1982, 1997, 1998, 2005 and 2006.

On 01/10/2023, roads and schools closed in Mill Valley as storms doused the region. Saturated soil caused fallen trees and landslides to impact roads. Power outages impacted thousands. Flooding in Mill Valley prompted closures at Sycamore Avenue and Locust Avenue and Miller Avenue at Evergreen Avenue, according to Southern Marin Fire District.

Figure 325: 2023 Flooding in Mill Valley – San Francisco Bay Trail
Source: SF Gate

On 12/23/2022, king tides in Mill Valley peaked preceding a storm. Water pooled on roads in some places, including the ramps on and off Highway 101 outside city limits, and along the San Francisco Bay Trail and on Miller Avenue and E Blithedale Avenue and at the SASM WWTP within city limits. The City worked to ensure that drains and debris were clear.

Figure 326: Flooding in Mill Valley – E Blithedale
Source: City of Mill Valley

On 10/21/2021, a storm caused flooding in Mill Valley, particularly in the Sycamore Triangle neighborhood. Residents were told to move their vehicles to higher ground at the Mill Valley Community Center. Miller Avenue was closed at three spots due to localized flooding including Montford Avenue, at Camino Alto, and between Camino Alto and Almonte Boulevard. Residents living along the Arroyo Corte Madera del Presidio were advised to monitor their properties closely for flooding.

On 1/3/2018, a king tide caused flooding in Mill Valley, inundating the shoreline in several places.

On 2/7/2017, a storm caused flooding across Mill Valley. Miller Avenue was closed at Almonte Street and along parts of Camino Alto, police said. Golden Gate Transit suspended bus service at the Manzanita Park and Ride lot because of flooding.

On 12/3/2014, storms caused such significant flooding across roads in Mill Valley that the city advised all residents to stay home due to heavy traffic congestion and so emergency crews could work.

Figure 327: Mill Valley Flooding – SASM WWTP
Source: City of Mill Valley

Figure 328: A cyclist rides through a flooded section of roadway Dec. 3, 2014
Source: CBS News

On 11/7/2010, significant rains and a king tide of over six feet backed up storm drains and caused flooding across numerous parking lots. Residents in the City were affected by flooding.

Climate Change and Future Development Considerations

Climate change is expected to affect California's precipitation patterns, which are likely to influence future flood events. A 2017 study[23] found that the number of very intense precipitation days in California is projected to more than double by the end of the century, increasing 117 percent, making it likely that flood events will become more frequent in the Marin County OA including Mill Valley. Climate change is expected to alter rainfall patterns in Northern California, including the Marin County OA. As the climate warms, rain events are predicted to become more intense. The Marin County OA including Mill Valley will likely

[23] Precipitation in a Warming World: Assessing Projected Hydro-Climate Changes in California and other Mediterranean Regions. https://www.nature.com/articles/s41598-017-11285-y

experience more rain inundation events that lead to flooding and increase the potential threat of dam and levee failure, tree mortality, and other potential hazards. Sea level rise as a result of climate change will exacerbate the impacts of tidal flooding in the lowland areas of the Marin County OA including the shoreline areas of Mill Valley. Future development in these areas will expose more people and infrastructure to the effects of flooding. Development in the marshland area of Mill Valley would expose additional people and infrastructure to flooding as marshlands act as a natural buffer to storm surge. Development along Old Mill Creek and Arroyo Corte Madera del Presidio would expose more people, structures and infrastructure including major roads to creek flooding as a result of climate change.

2.2.5 Land Subsidence

Land subsidence is a gradual settling or sudden sinking of the Earth's surface owing to subsurface movement of earth materials. The principal causes are aquifer-system compaction, drainage of organic soils through groundwater pumping, underground mining, hydro-compaction, natural compaction, sinkholes, and thawing permafrost. More than 80 percent of the identified subsidence in the United States is a consequence of underground water exploitation. The increasing development of land and water resources threatens to exacerbate existing land-subsidence problems and initiate new ones.

Sinkholes can form in three primary ways. Dissolution sinkholes form when dissolution of the limestone or dolomite is most intensive where the water first contacts the rock surface. Aggressive dissolution also occurs where flow is focused in preexisting openings in the rock, such as along joints, fractures, and bedding planes, and in the zone of water-table fluctuation where groundwater is in contact with the atmosphere. See Figure 34 for a picture and description of how dissolution sinkholes form.

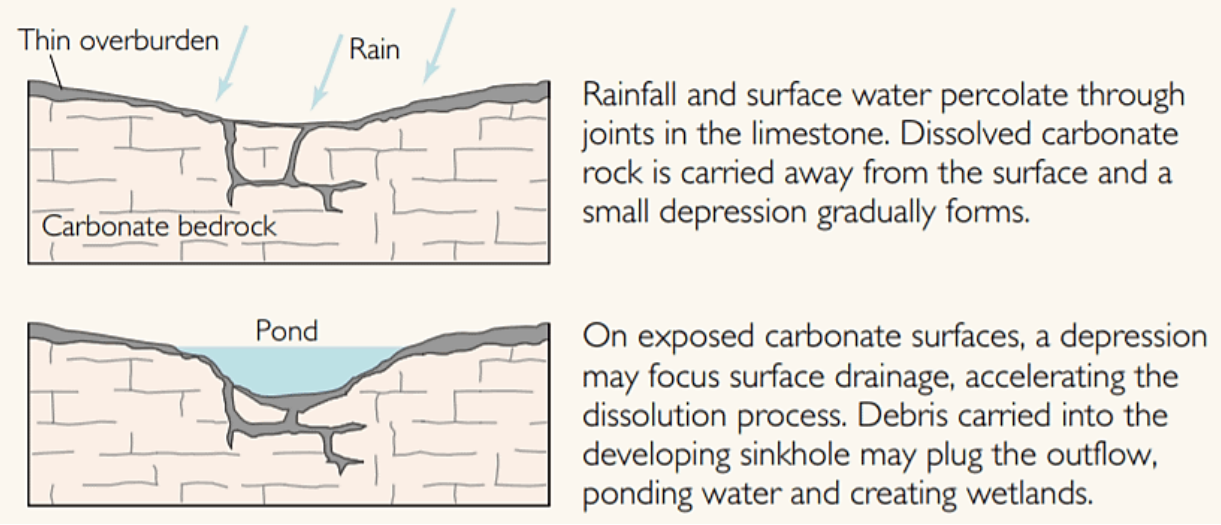

Figure 329: Dissolution Sinkhole Formation
Source: USGS

Cover-subsidence sinkholes tend to develop gradually where the covering sediments are permeable and contain sand. In areas where cover material is thicker, or sediments contain more clay, cover-subsidence sinkholes are relatively uncommon, are smaller, and may go

undetected for long periods. See Figure 35 for a picture and description of how cover-subsidence sinkholes form.

Subsidence can also occur in bay mud areas which are prevalent around San Francisco Bay. Bay Mud, which has very little strength, can move and shift over long periods of time and is also affected by other natural events such as earthquakes, storm activities, water pressure and composition. Older construction of buildings placed on fill material on Bay Mud are susceptible to differential settlement which affects the service life of the structures as well as utilities, roadways and other infrastructure that supports these areas. The Marinship area and other low elevation areas built on bay mud have experienced significant differential settlement over time.

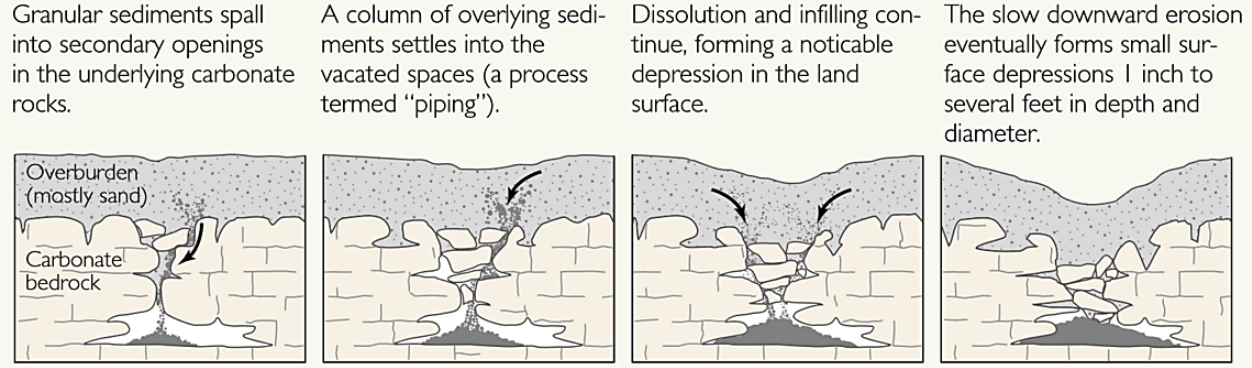

Figure 330: Cover-Subsidence Sinkhole Formation
Source: USGS

Cover-collapse sinkholes may develop abruptly over a period of hours and cause catastrophic damages. They occur where the covering sediments contain a significant amount of clay. Over time, surface drainage, erosion, and deposition of sediment transform the steep-walled sinkhole into a shallower bowl-shaped depression. See Figure 36 for a picture and description of how cover-collapse sinkholes form.

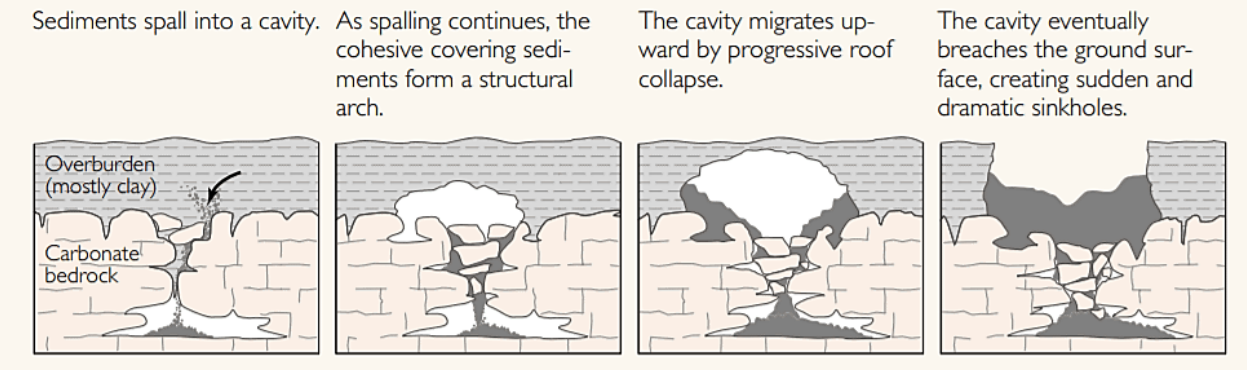

Figure 331: Cover-Collapse Sinkhole Formation
Source: USGS

New sinkholes have been correlated to land-use practices, especially from groundwater pumping and from construction and development practices that cause land subsidence. Sinkholes can also form when natural water-drainage patterns are changed and new water-diversion systems are developed. Some sinkholes form when the land surface is changed, such as when industrial and runoff-storage ponds are created. The substantial weight of the

new material can trigger an underground collapse of supporting material, thus causing a sinkhole.

The overburden sediments that cover buried cavities in the aquifer systems are delicately balanced by groundwater fluid pressure. The water below ground helps to keep the surface soil in place. Groundwater pumping for urban water supply and for irrigation can produce new sinkholes in sinkhole-prone areas. If pumping results in a lowering of groundwater levels, then underground structural failure, and thus, sinkholes, can occur.

Large areas of former bay mud marshlands in Mill Valley have been artificially filled over the years. Land subsidence and sinkholes would most likely occur in these lowland areas of Mill Valley along Richardson Bay where superficial deposits and fill are more prevalent. This includes the area around Bothin Marsh, Bayfront Park and the SASM WWTP. Southeast from La Goma Street to the bay is unconsolidated fill, and the Sutton Manor area is of the same base. There are several schools, medical facilities, and commercial buildings in area of increased land subsidence susceptibility. These areas could anticipate increased rates of subsidence as bay waters saturate the soil from below. The Redwoods medical facility, Mill Valley Middle School, the Mill Valley Community Center, the Mill Valley Fire Station #7 and the Mill Valley Police Station are all located within very high liquefaction risk areas. Land subsidence could have numerous impacts for Mill Valley, including the settling of businesses and homes as well as the shifting of roadways and utility infrastructure that run through the City.

There have been no major sinkholes recorded in Mill Valley, however, there have been several smaller sink holes around the city caused by a variety of factors.

Climate Change and Future Development Considerations

Climate change could indirectly influence land subsidence as more severe and prolonged periods of drought may encourage more groundwater withdrawals. In coastal areas like the Marin County OA including Mill Valley, land subsidence leads to higher sea levels and increased flood risk. The rate of land subsidence could increase across the Marin County OA including the lowland areas of Mill Valley as a result of climate change. The impacts of land subsidence on infrastructure, including roads and underground utilities, in Mill Valley could increase with future development in the lowland populated areas of the city where land subsidence is more likely to occur.

2.2.6 Levee Failure

Levee failure is the overtopping, breach or collapse of the levee. Levees can fail in the event of an earthquake, internal erosion, poor engineering/construction or landslides, but levees most commonly fail as a result of significant rainfall or very high tides. During a period of heavy rainfall, the water on the water-body side of the levee can build up and either flow over the top ("overtopping") or put pressure on the structure causing quickening seepage and subsequent erosion of the earth. The overflow of water washes away the top portion of the levee, creating deep grooves. Eventually the levee weakens, resulting in a breach or collapse of the levee wall and the release of uncontrollable amounts of water. Figure 37 shows a levee and the multiple ways it can fail.

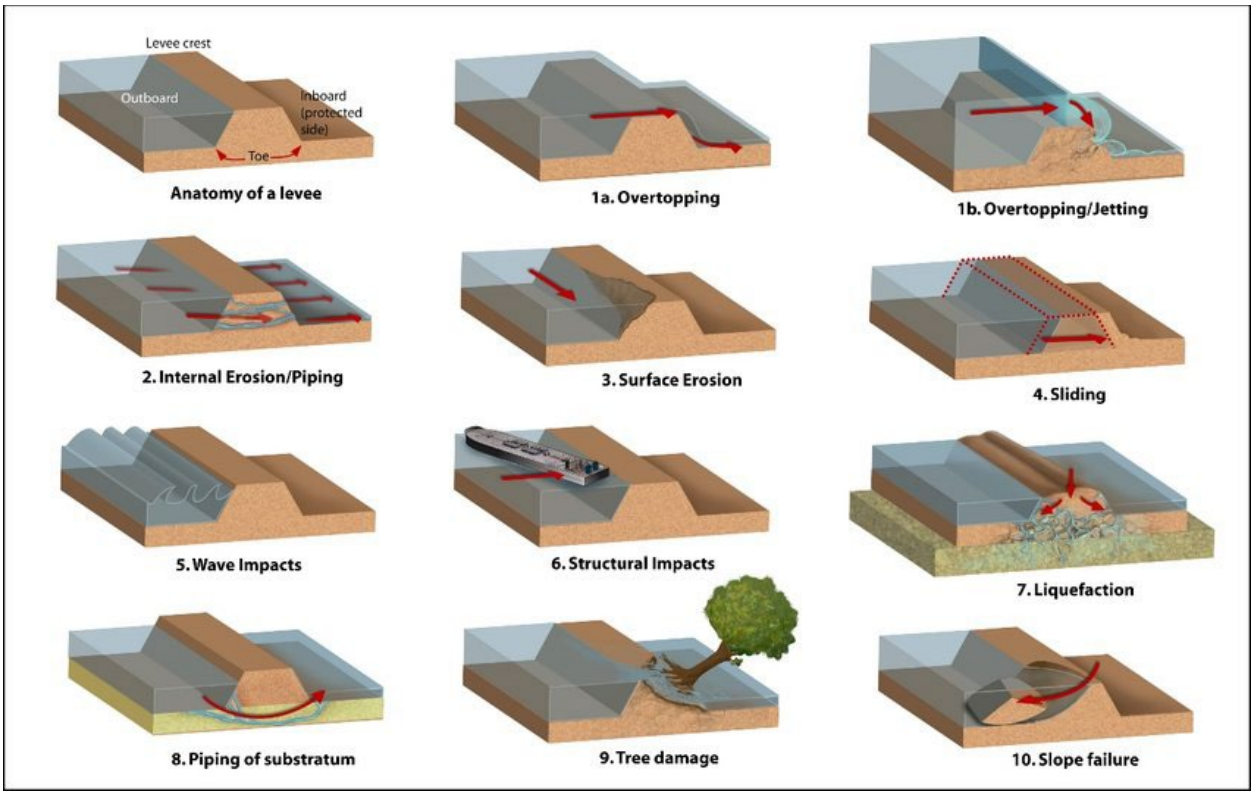

Figure 332: Levee Failure Mechanisms
Source: University of California

The City of Mill Valley has one existing levee. Marin County Levee 57 is 0.32 miles long with an undocumented height and surrounds the SASM WWTP on three sides. It is maintained by the SASM and according to the Mill Valley Department of Public Works, the levee at the SASM is above the high tide water mark and is not technically a levee but rather a berm to hold extra water storage at the side. It is not acting as a flood wall.

Twenty-six people and four buildings with a property value of $4.48 million are at risk from a failure of the Marin County 57 levee.

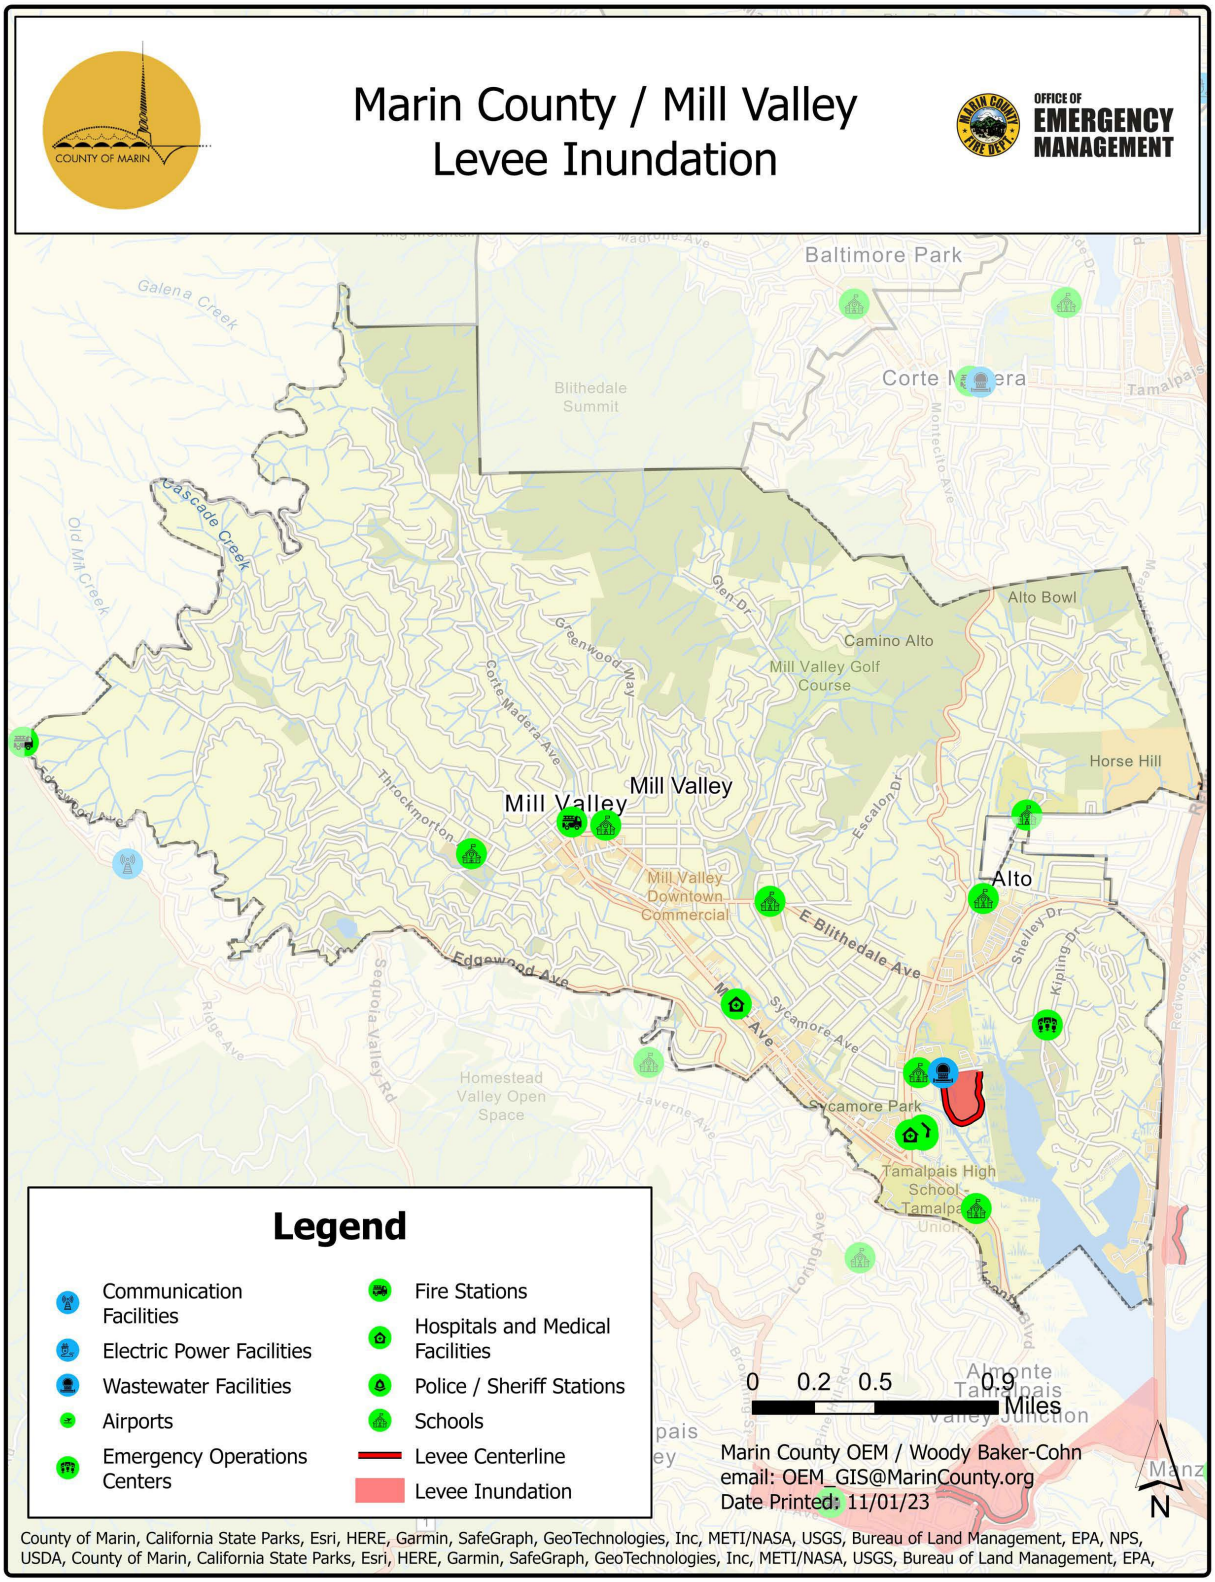

Figure 333: City of Mill Valley Levee failure Critical Facilities and Infrastructure
Source: Marin County OEM

There have been no failures of Marin County Levee 57.

Climate Change and Future Development Considerations

Climate change is expected to lead to an increase in the frequency and severity of major storm events, which can place added strain on levee systems. An increase in rainfall and runoff as a result of climate change will increase the potential for higher water levels in leveed areas across the Marin County OA including in Mill Valley, increasing the potential for a levee failure. Rising seas will lead to increased stress on the levees around the Marin County OA shoreline including in Mill Valley, particularly during a major tidal event and potential tsunami. As development increases in the populated areas of Mill Valley protected by its levee, the potential for significant impacts to residents and infrastructure will only increase.

2.2.7 Sea Level Rise

Climate change is the distinct change in measures of weather patterns over a long period of time, ranging from decades to millions of years. The Marin County OA MJHMP is concerned with human-induced climate change that has been rapidly warming the Earth at rates unprecedented in the last 1,000 years. Rising sea levels are considered a secondary effect of climate change due to warming ocean temperatures and melting glacial ice sheets into the ocean. The California coast has already seen a rise in sea level of four to eight inches over the 20th century due to climate change. Sea level rise impacts can be exacerbated during coastal storms, which often bring increased tidal elevations called “storm surge.” The large waves associated with such storm surges can cause flooding in low-lying areas, erosion of coastal wetlands, saltwater contamination of drinking water, disruption of septic system operations, impacts on roads and bridges, and increased stress on levees. In addition, rising sea levels result in coastal erosion as shoreline sediment is re-deposited back into the ocean. Evidence shows that winter storms have increased in frequency and intensity since 1948 in the North Pacific, increasing regional wave heights and water levels during storm events.

According to the 2017 “Rising Seas in California, An Update on Sea-Level Rise Science” report Marin County may experience impacts from Sea Level Rise over defined periods of time, to include long-term changes (second half of this century and beyond), and short- to mid-term projections (within the next two or three decades).

While only a small area of the Mill Valley could flood tidally from Richardson Bay, several key access routes and public facilities used by entire communities are in the exposed low-lying areas surrounding the Bay. The lowland areas of Mill Valley close to the Bay, including part of the city south of E. Blithedale Avenue and north of Miller Avenue, as well as lowland areas around Bothin Marsh, Bayfront Park, Camino Alto, Shelter Bay Avenue and around the Redwood Highway commercial area adjacent to Highway 101 are vulnerable to sea level rise and may experience between one and six feet of inundation based latest predictions of sea level rise in this area in the next 100 years.

Numerous commercial areas, dozens of residences, the Mill Valley Sewerage Agency of Southern Marin (SASM) Wastewater Treatment Plant (WWTP), Tamalpais High School, and the Redwoods medical facility lie in areas of Mill Valley susceptible to sea level rise. Several main thoroughfares including Miller Avenue and Camino Alto also lie in this area and already experience tidal flooding. The 2017 Marin Shoreline Sea Level Rise Vulnerably Assessment

estimates Mill Valley could anticipate impacts to over 13,000 people and over 1,000 living units with $550 million in assessed property value as a result of a 100-year sea level rise scenario and including storm surge. In the near-term, 44 acres of the City could be exposed to sea level rise. In the long-term, 190 acres of the City could be exposed to sea level rise; and 273 acres could be exposed with an additional 100-year storm surge. Ten percent of Mill Valley's land area could be exposed to five feet of sea level rise and a 100-year storm surge. Miller Avenue could be flooded in the near-term. This area already experiences seasonal flooding that extends to Tamalpais High School fields. Homes and businesses along and near Shelter Cove, Hamilton Drive, and the Frontage Road could expect near-term flooding impacts. The Redwoods, a retirement community, is vulnerable in the medium-term. The SASM WWTP, serving six sanitary districts and 30,000 people, including Mill Valley residents, could expect flooding impacts in the medium and long-term. The Mill Valley-Sausalito Bike Path could flood a majority of the year during average high tides in the medium-term. This Path currently floods regularly during major storms. Mill Valley Middle School could expect sea level rise impacts to the grounds and could expect flood waters reach the buildings with the 100-year storm coincidence. Bothin Marsh habitat could transition to mudflats without adequate sediment supply because the marsh does not have options for inland migration. Loss of marshland vegetation would remove natural buffers to stormwater inundation from Richardson Bay. The Mill Valley Recreation Center fields could be vulnerable to sea level rise in the long-term. A 100-year storm surge could impact nearly the whole site. Camino Alto, between Miller and Blithedale Avenues, and the neighborhood north of it, could expect flooding in the long-term.

Relative to other East Marin communities, Mill Valley has a low number of buildings vulnerable to sea level rise and a 100-year storm surge. However, several areas already vulnerable to stormwater backups could expect these conditions to worsen with added saltwater. Most of Mill Valley's buildings are wood-framed. While it is unclear how many buildings are older than 30 years, many in the low-lying areas are. Newer buildings typically have drilled piles 20-30 feet deep with reinforced steel cages and concrete to connect the homes to the foundation. This feature can help buildings withstand lateral forces from wind and water. However, even if buildings remain structurally intact, utility-related equipment could be vulnerable. Moreover, material and content damage from water and salt could occur.

Climate Change and Future Development Considerations

The two major causes of global sea level rise are thermal expansion of warming oceans and the melting of land-based glaciers and polar ice caps. Climate change is affecting natural and built systems around the world, including the California coast. In the past century, average global temperature has increased about 1.4°F, and average global sea level has increased 7 to 8 inches. Sea level rise in the San Francisco Bay Area is projected to increase by eight inches MHW in 2050 and could reach 4.5 to eight feet by 2021 if greenhouse gas emissions aren't reduced.

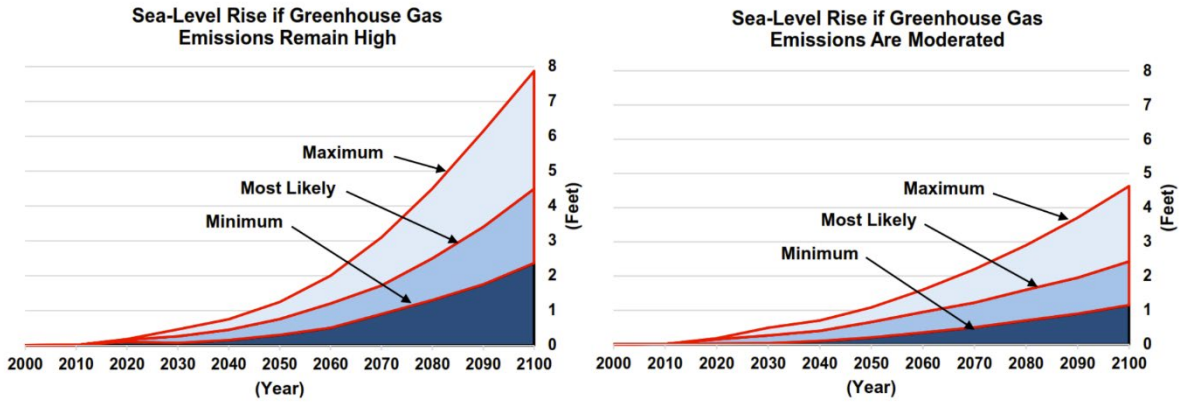

Figure 334: Projections of Sea Level Rise in the San Francisco Bay Area, 2000-2100
Source: 2019–2020 Marin County Civil Grand Jury, Climate Change: How Will Marin Adapt?

While the Marin County OA shoreline including around Mill Valley already experiences regular erosion, flooding, and significant storm events, sea level rise will exacerbate these natural processes, leading to significant social, environmental, and economic impacts. The third National Climate Assessment cites strong evidence that the cost of doing nothing exceeds the costs associated with adapting to sea level rise by 4 to 10 times. Sea level rise will continue to affect the Marin County OA including Mill Valley with increased tidal flooding and storm surge during severe weather events, and future development along the Marin County OA shoreline including around Mill Valley will only amplify these impacts. Sea level can also lead to increased land subsidence and the potential of levee failure. The impacts of a tsunami would also be magnified with rising seas. Future development in the coastal and lowland areas of Mill Valley will put more people and property at risk from flooding as a result of sea level rise. Roads and utility infrastructure across Mill Valley will continue to become inundated.

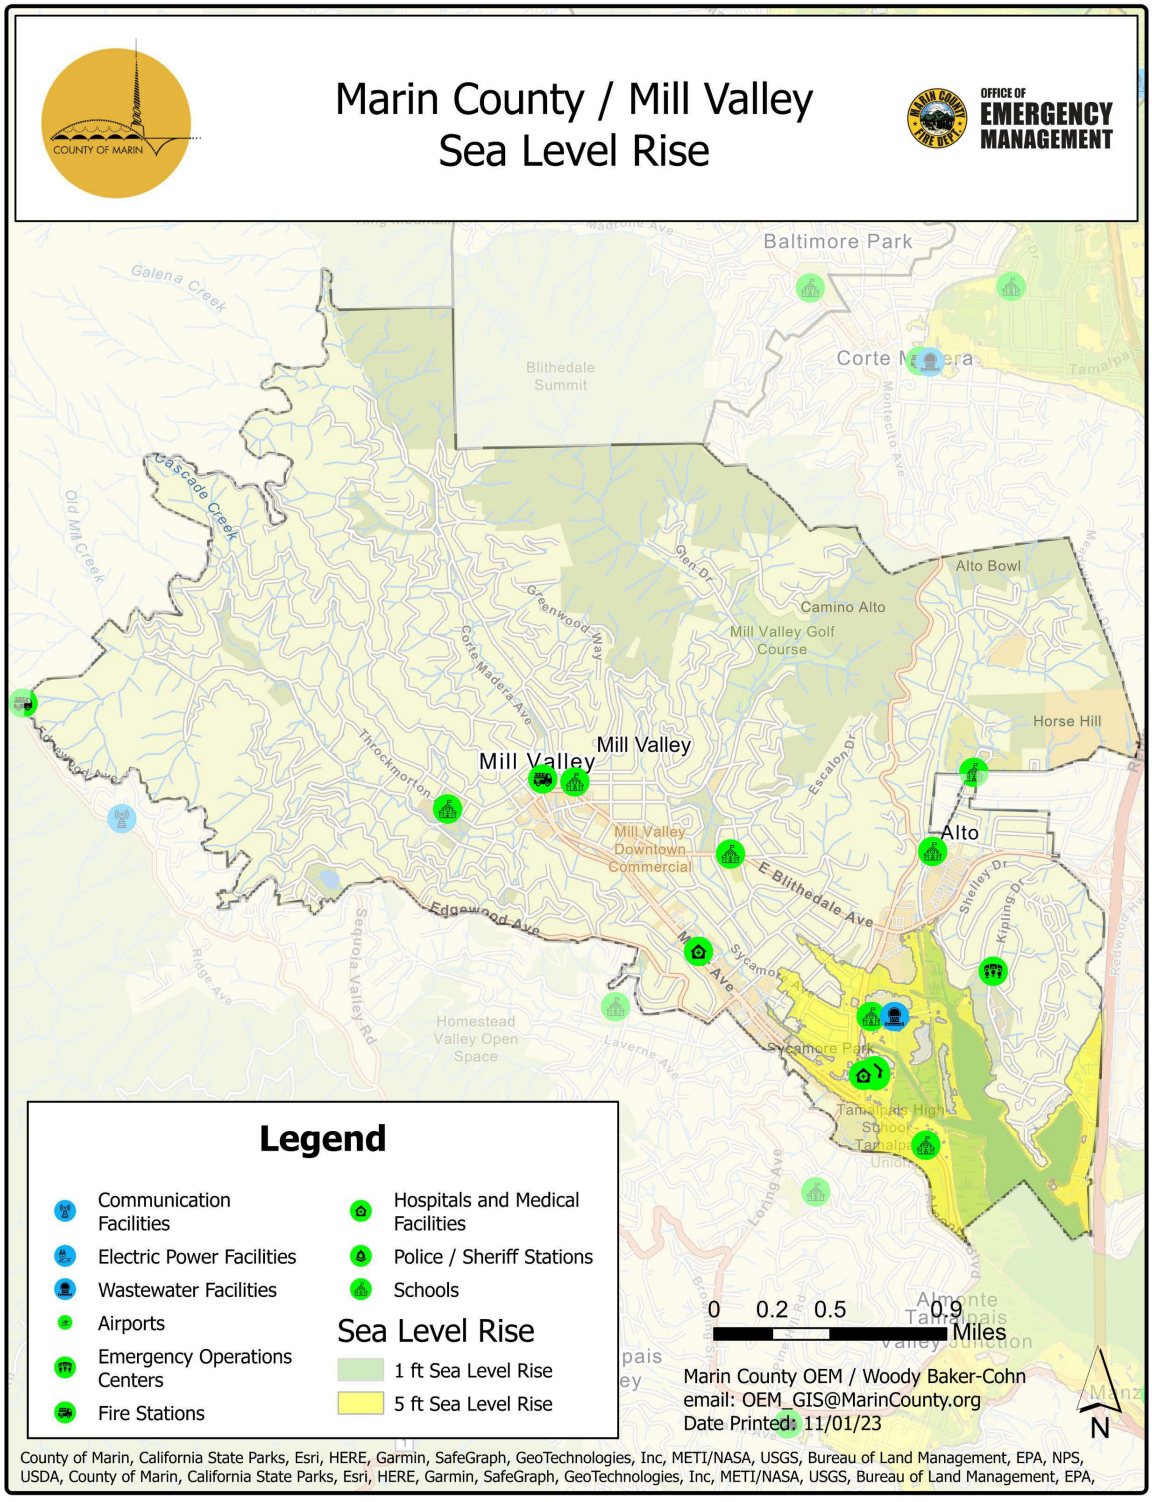

Figure 335: City of Mill Valley Sea Level Rise Impact
Source: Marin County OEM

2.2.8 SEVERE WEATHER – EXTREME HEAT

Extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. A heat wave is an extended period of extreme heat, often with high humidity. When relative humidity is factored in, the temperature can feel much hotter as reflected in the Heat Index (see Figure 41):

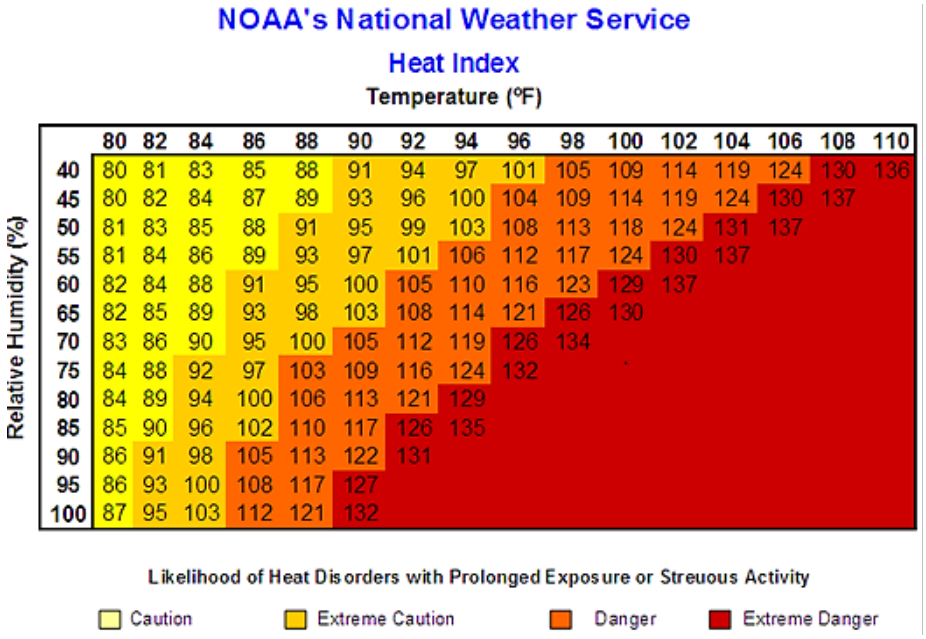

Figure 336: Heat Index
Source: NOAA

Heat kills by taxing the human body beyond its abilities. In a normal year, about 1,300 Americans succumb to the demands of summer heat. Heat is the leading weather-related cause of mortalities in the US. In 2006, California reported a high of 204 heat related deaths, with 98 reported in 2017 and 93 deaths reported in 2018.

Extreme heat has the potential to impact all areas of Mill Valley and would be felt more in areas where there is a widespread presence of concrete and asphalt, which stores heat longer. This includes most of the downtown and commercial area of the city between Miller Avenue and E. Blithedale Avenue. There are dozens of residences in this area. Heat waves can cause power outages and can sicken people who are exposed to high temperatures too long, particularly infants and the elderly.

In September 2022 the Marin County OA including the City of Mill Valley experienced an Extreme Heat Event with temperatures exceeding 103 degrees.

Climate Change and Future Development Considerations

The primary effect of climate change is warmer average temperatures. The annual average daily high temperatures in California are expected to rise by 2.7°F by 2040, 5.8°F by 2070, and 8.8°F by 2100 compared to observed and modeled historical conditions. At the current rate, annual average temperatures in the Marin County OA region and Bay Area will likely increase by approximately 4.4 degrees by 2050 and 7.2 degree by the end of the century unless significant efforts are made to reduce greenhouse emotions according to California's latest climate change assessment.

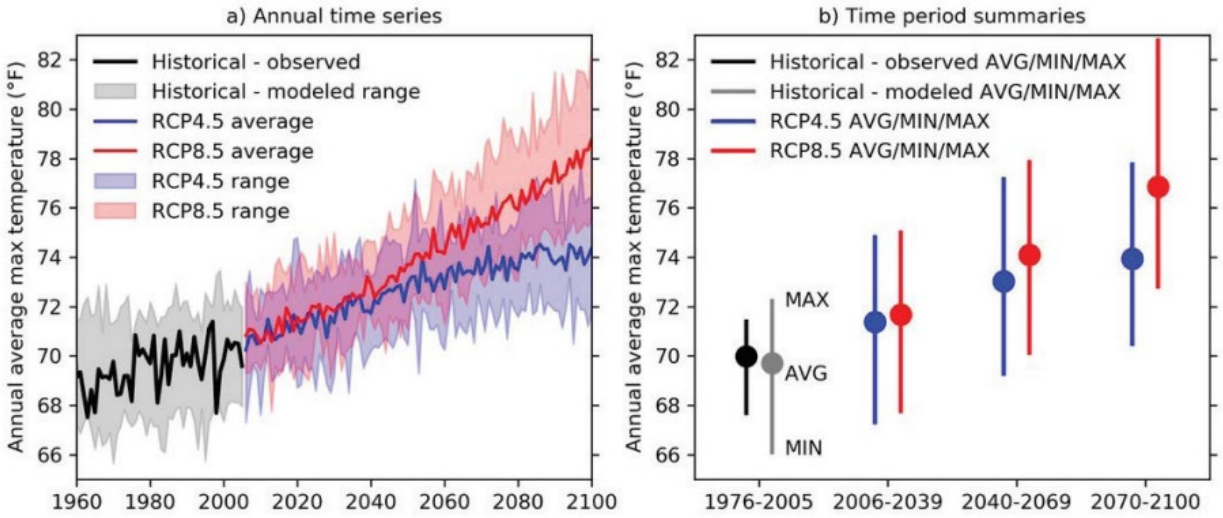

Figure 337: Annual Average Temperatures in the San Francisco Bay Area, 2000-2100
Source: California Climate Change Assessment (Fourth Edition)

As climate change accelerates in the 21st century, it is anticipated that extreme heat events will become more frequent and intense across the Marin County OA including in Mill Valley. There will be increased residential and business needs for cooling and addressing heat-related issues. These effects would primarily be felt in the lowland areas of Mill Valley where heat builds in developed areas. Heat waves also tax the energy grid. Future development in the Marin County OA including Mill Valley could exacerbate the impacts from heat related events, particularly in electricity provision and water delivery. Increased temperatures will also lead to an increase in the occurrence and severity of wildfires across the Marin County OA including Mill Valley as conditions become hotter and drier. These effects will primarily be felt in the mountainous and marshlands areas of Mill Valley where hotter and drier conditions are more apt to lead to wildfires. Future development near the many open spaces around Mill Valley could expose more people and infrastructure to the threat of a major wildfire as a result of increasing temperatures.

2.2.9 Severe Weather – High Wind & Tornado

High Wind

High wind is defined as a one-minute average of surface winds 40 miles per hour or greater lasting for one hour or longer, or winds gusting to 58 miles per hour or greater regardless of duration that are either expected or observed over land. These winds may occur as part of a seasonal climate pattern or in relation to other severe weather events such as thunderstorms. The Beaufort scale is an empirical measure that relates wind speed to observed conditions on land and is a common measure of wind intensity (see Figure 43).

Beaufort number	Description	Wind speed		Land conditions
		kts	km/h	
0	Calm	< 1	< 1	Calm. Smoke rises vertically.
1	Light air	1 – 2	1 – 5	Wind motion visible in smoke.
2	Light breeze	3 – 6	6 – 11	Wind felt on exposed skin. Leaves rustle.
3	Gentle breeze	7 – 10	12 – 19	Leaves and smaller twigs in constant motion.
4	Moderate breeze	11 – 15	20 – 28	Dust and loose paper raised. Small branches begin to move.
5	Fresh breeze	16 – 20	29 – 38	Branches of a moderate size move. Small trees begin to sway.
6	Strong breeze	21 – 26	39 – 49	Large branches in motion. Whistling heard in overhead wires. Umbrella use becomes difficult. Empty plastic garbage cans tip over.
7	High wind, Moderate gale, Near gale	27 – 33	50 – 61	Whole trees in motion. Effort needed to walk against the wind. Swaying of skyscrapers may be felt, especially by people on upper floors.
8	Gale, Fresh gale	34 – 40	62 – 74	Some twigs broken from trees. Cars veer on road. Progress on foot is seriously impeded.
9	Strong gale	41 – 47	75 – 88	Some branches break off trees, and some small trees blow over. Construction/temporary signs and barricades blow over. Damage to circus tents and canopies.
10	Storm, Whole gale	48 – 55	89 – 102	Trees are broken off or uprooted, saplings bent and deformed. Poorly attached asphalt shingles and shingles in poor condition peel off roofs.
11	Violent storm	56 – 63	103 – 117	Widespread vegetation damage. Many roofing surfaces are damaged; asphalt tiles that have curled up and/or fractured due to age may break away completely.
12	Hurricane	≥ 64	≥ 118	Very widespread damage to vegetation. Some windows may break; mobile homes and poorly constructed sheds and barns are damaged. Debris may be hurled about.

Figure 338: Beaufort Wind Scale
Source: NOAA

Windstorms in the Marin County OA are typically straight-line winds. Straight-line winds are generally any thunderstorm wind that is not associated with rotation (i.e., is not a tornado). It is these winds, which can exceed 100 mph, which represent the most common type of severe weather and are responsible for most wind damage related to thunderstorms.

Mill Valley is susceptible to high winds during summer months when high temperatures in the central valley tend to pull in colder temperature air from the Pacific Ocean in the form of fog and winds. Some areas of Mill Valley have been named “Hurricane Gulch” referring to the phenomenon when wind associated with the marine layer rolls over the upper hillsides and proceeds to impact properties, trees and infrastructure in the city.

Tornado

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes are the most powerful storms that exist, and damage paths can be in excess of one mile wide and 50 miles long. The Enhanced Fujita Scale (see Figure 44) is commonly used to rate the intensity of tornadoes in the United States based on the damages that they cause.

Enhanced Fujita Scale	
EF-0	65-85 mph winds
EF-1	86-110 mph winds
EF-2	111-135 mph winds
EF-3	136-165 mph winds
EF-4	166-200 mph winds
EF-5	>200 mph winds

Figure 339: Enhanced Fujita Scale
Source: NOAA

Tornadic waterspouts are tornadoes that form over water or move from land to water. They have the same characteristics as a land tornado. They are associated with severe thunderstorms, and are often accompanied by high winds and seas, large hail, and frequent dangerous lightning.

Figure 340: Waterspout Formation
Source: MarineInsights

All of Mill Valley is susceptible to storms and damage from wind, though the hilly and mountainous areas around the City have increased susceptibility due to a higher presence of trees. There are numerous windy and dead end roads in these areas where a downed tree could hinder access. Mill Valley is unlikely to experience a tornado due to its terrain but it could experience a waterspout originating from Richardson Bay. Drought coupled with high winds which frequently occur may increase the susceptibility of trees toppling and falling branch damages to property. Fallen trees may damage homes and other facilities. Power lines may be impacted by fallen trees and wind, causing power outages. .

On 1/17/2023, a tree fell and destroyed a garage at 56 Monte Vista.

On 1/13/2023, a storm caused a large tree to fall, closing Marion Avenue.

On 1/16/2019 a man was struck and killed by a car as he was trying to avoid a falling tree at the intersection of Laverne Avenue and North Ferndale Avenue during a storm. A huge downed tree fell across the street from the Horizon School during the storm, crushing the rear of a car and narrowly missing the people inside. Nobody was hurt. A 125-foot-tall redwood tree fell off Molino Avenue splitting a power pole in two. It cut power to about 60 homes.

On 2/17/2017, a storm with high winds caused 2,100 people in Mill Valley to lose power.

Climate Change and Future Development Considerations

It is anticipated that the atmospheric rivers that deliver storms to Northern California may intensify because of climate change. This increase in storm intensity may bring more intense winds and potential tornados to Northern California, including the Marin County OA and Mill Valley. Significant wind events and tornados can topple trees, particularly those that may be saturated, or drought stressed as a result of climate change. An increase in fallen trees in Mill Valley as a result of increased storms due to climate change can lead to an increase in power outages. Future development in any of the forested areas of Mill Valley with high tree cover including in the southern and western mountainous residential areas will increase the effects of severe wind events.

2.2.10 TSUNAMI

Tsunamis consist of waves generated by large disturbances of the sea floor, which are caused by volcanic eruptions, landslides or earthquakes. Shallow earthquakes along dip slip faults are more likely to be sources of tsunami than those along strike slip faults. The West Coast/Alaska Tsunami Warning Center (WC/ATWC) is responsible for tsunami warnings. Tsunamis are often incorrectly referred to as tidal waves. They are actually a series of waves that can travel at speeds averaging 450 (and up to 600) miles per hour with unusual wave heights. Tsunamis can reach the beach before warnings are issued.

A tsunami experienced by Mill Valley would most likely occur from an earthquake, the location of which would determine the amount of time that the tsunami waves would reach the City. The entire shoreline of Mill Valley along Richardson Bay is in a lowland area and lies in a tsunami hazard area. The lowland areas of Mill Valley close to Richardson Bay, including part of the city south of E. Blithedale Avenue and north of Miller Avenue, as well as lowland areas around Bothin Marsh, Bayfront Park, the SASM WWTP, along Shelter Bay Avenue and around the Redwood Highway commercial area adjacent to Highway 101 are in a tsunami hazard area and

may be susceptible to a tsunami. Tamalpais High School, Mill Valley Middle School and the Redwood medical facility lie in this area.

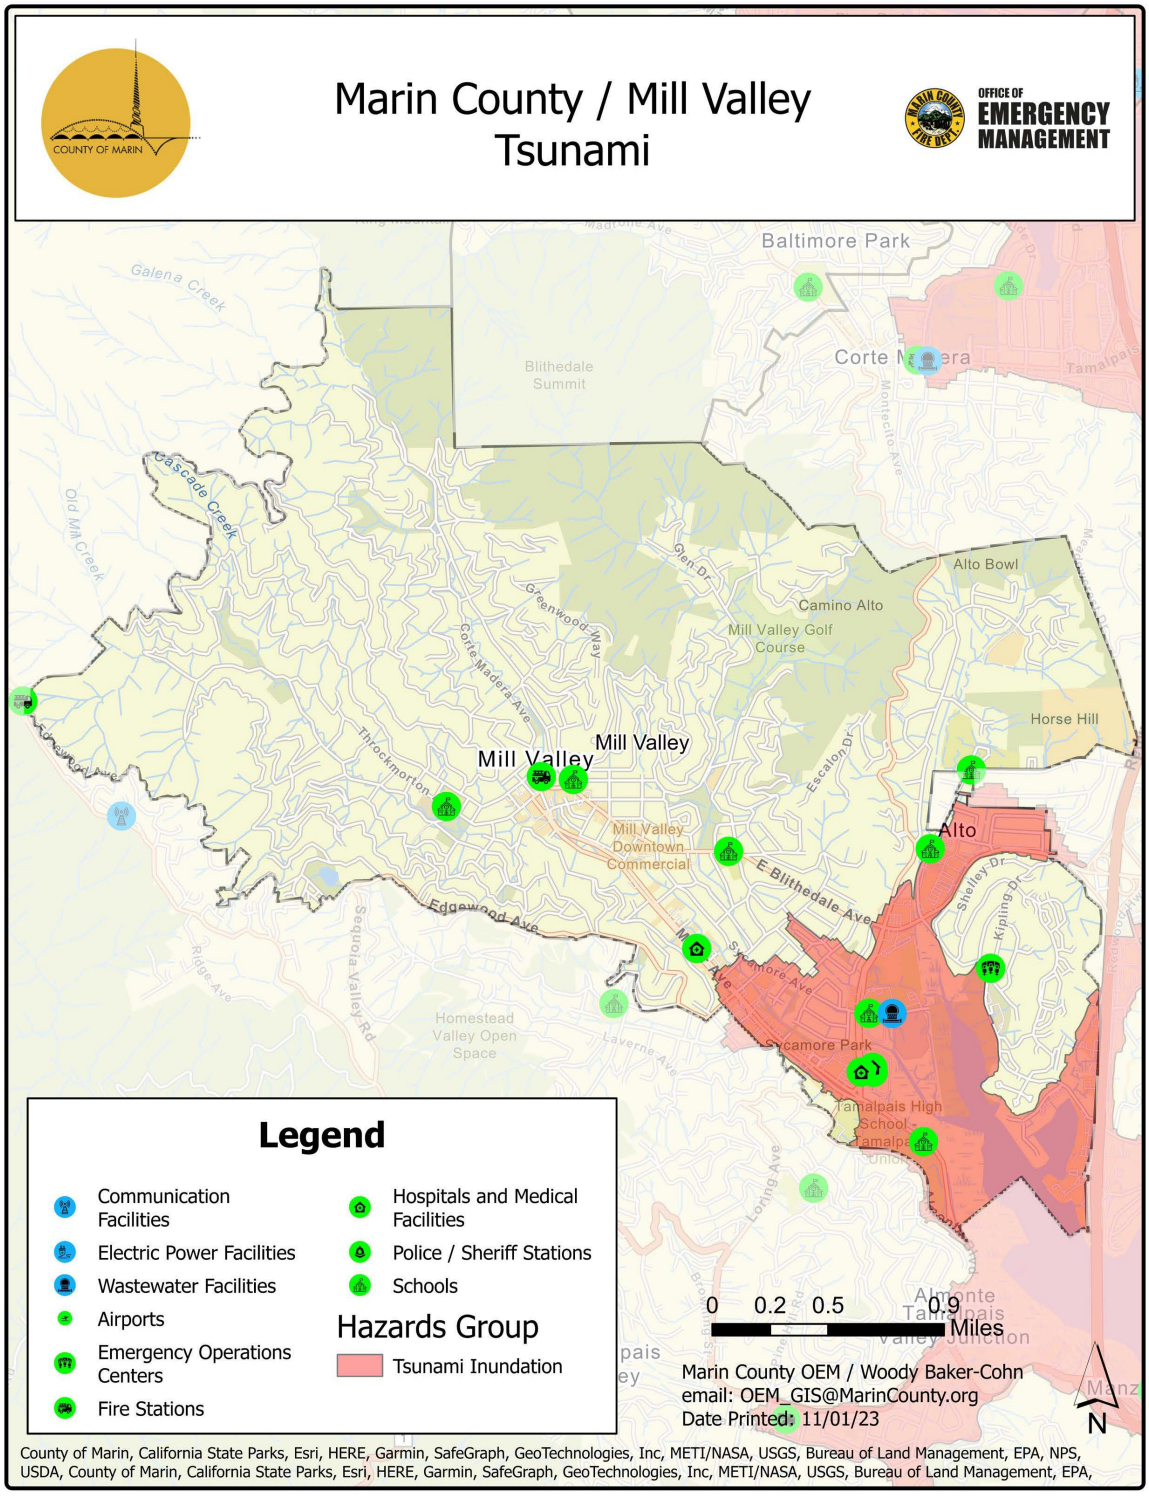

Figure 341: City of Mill Valley Tsunami Critical Facilities and Infrastructure
Source: Marin County OEM

Mill Valley has experienced minor tsunamis in the past. Nevertheless, major tsunamis may occur in Mill Valley. Flooding from a tsunami may be similar to king tide flooding already experienced by the City with the exception that a tsunami occurs in a shorter time frame and may impact the City's vibrant bayside systems. Roadways and City infrastructure may become inundated with salt water, causing transportation issues and utility disruptions.

On 1/15/2022, an undersea volcano erupted in the Pacific Ocean near Tonga causing a minor surge from Richardson Bay. Rough waters were reported with no significant damage.

Climate Change and Future Development Considerations

The biggest threat to tsunamis is sea level rise which is a direct result of climate change. Sea level rise can make tsunamis worse than they already are because higher sea levels allow for tsunamis to travel further inland and cause even more damage. Sea level rise results in more vulnerable coastlines which make coastal communities even more vulnerable to an incoming tsunami as the natural buffer to absorb the energy of an incoming tsunami will cease to exist. This is particularly true in the Marin County OA including Mill Valley, where a large segment of the developed population lies in an area vulnerable to sea level rise. Furthermore, it has been theorized that ocean warming, caused by climate change, can impact the tectonic plates that rest below large bodies of water. Ultimately, this can result in more geological activities and worse tsunamis. Climate change has also affected ocean patterns, which could eventually lead to tsunamis distributing themselves across the ocean and impacting areas that are currently not susceptible to a tsunami. Tsunamis as a result of climate change and associated sea level rise will exacerbate the impacts of flooding in the lowland areas of the Marin County OA including Mill Valley. This is particularly true along lower Arroyo Corte Madera del Presidio and around the marshland areas of Mill Valley where additional storm surge as a result of a larger tsunami could cause greater impacts. Future development in these areas will expose more people and infrastructure to the effects of flooding in the Marin County OA as tsunami inundation areas expand with climate change. Development in marshland in Mill Valley would expose additional people and infrastructure to flooding as marshlands act as a natural buffer to a tsunami. Flooding could be exacerbated in areas of levee failure along the shoreline in Mill Valley as a result of high wave heights associated with a more significant tsunami.

2.2.11 WILDFIRE

A wildfire is a fire that occurs in an area of combustible vegetation. Wildfires can be started naturally through lightning or combustion or can be set by humans. Wildfires are of primary concern when they occur in the Wildland Urban Interface (WUI), which is defined as areas where homes are built near or among lands prone to wildfire. Even relatively small acreage fires may result in disastrous damages. The damages can be widely varying, but are primarily reported as damage to infrastructure, built environment, and injuries to people. WUI fires have unique chemistry due to the combination of natural and human-made fuels that are burned, which may lead to the formation or release of toxic emissions not found in purely wildland fires.

Warning times for wildfires are usually adequate to ensure public safety, provided that evacuation recommendations and orders are heeded in a timely manner. While in most cases wildfires are contained within a week or two of outbreak, in extreme circumstances, they have been known to burn for months, or until they are completely extinguished by fall rains.

The Marin County OA has a long fire history with many large fires over the past decades, several of which have occurred in the WUI. To compound the issue, national fire suppression policies and practices have contributed to the continuous growth (and overgrowth) of vegetation resulting in dangerously high fuel loads. The Community Wildfire Protection Plan (CWPP) provides a scientifically based assessment of wildfire threat in the WUI of the Marin County OA.

Fire protection in California is the responsibility of either the federal, state, or local government depending upon the location of the incident. On federally owned land, or federal responsibility areas (FRA), fire protection is provided by the federal government, and or in partnership with local agreements. In state responsibility areas (SRA), CAL FIRE typically provides fire protection. However, in some counties CAL FIRE contracts with county fire departments to provide protection of the SRA – this is the case in the Marin County OA, where CAL FIRE contracts with Marin County Fire Department (MCFD). Local responsibility areas (LRA) include incorporated cities and cultivated agriculture lands, and fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

CAL FIRE contracts with MCFD to provide wildland fire protection and associated fire prevention activities for lands designated by the State Board of Forestry as SRA. The MCFD is responsible for the protection of approximately 200,000 acres of SRA within the county and is the primary agency that handles wildland fires. MCFD also provides similar protection services to approximately 100,000 acres of FRA in the Golden Gate National Recreation Area (GGNRA), the Muir Woods National Monument, and the Point Reyes National Seashore.

The Southern Marin Fire Protection District (SMFD) provides wildland fire protection and fire prevention activities for the City of Mill Valley as LRA. As a JPA of the Marin County OA, SMFD has response areas within the County for both LRA and SRA.

Figure 47 indicates the federal responsibility areas, state responsibility areas and local responsibility areas in the Marin County OA.

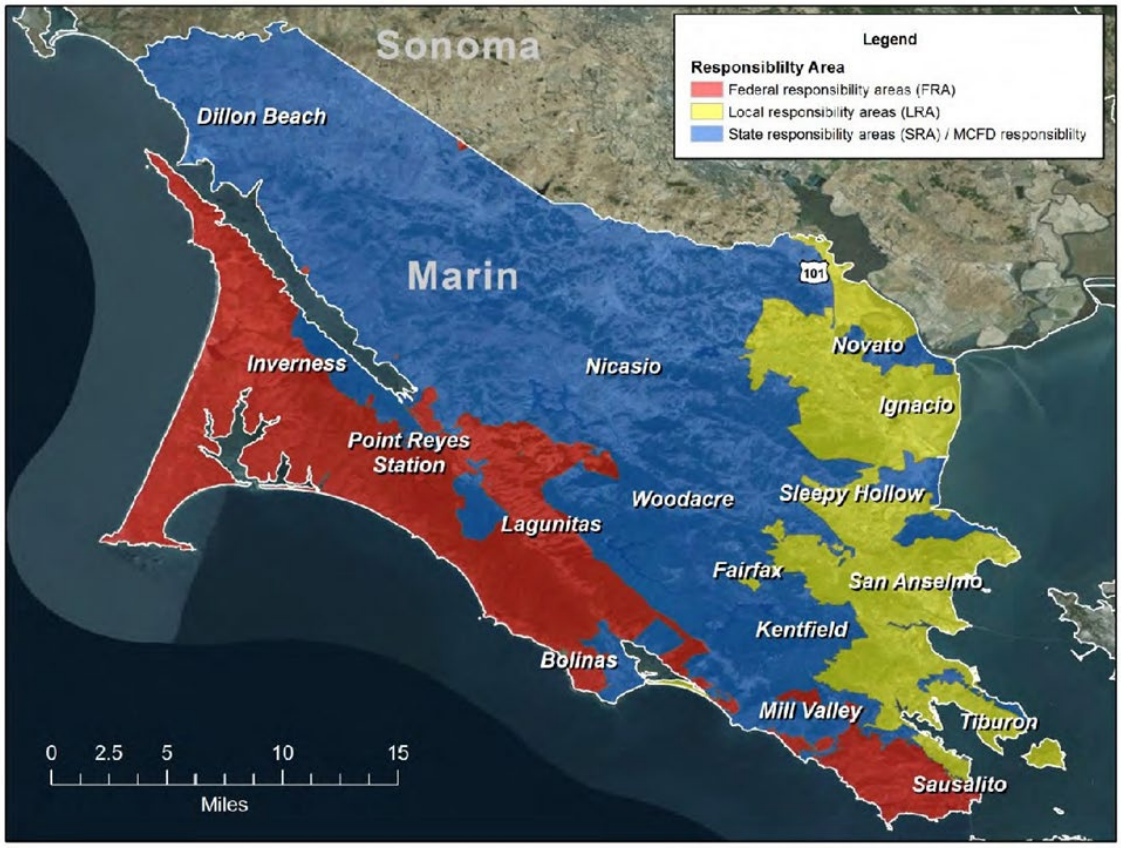

Figure 342: Federal, State and Local Responsibility Areas in the Marin County OA
Source: Marin Community Wildfire Protection Plan

The mix of weather, diverse vegetation and fuel characteristics, complex topography, and land use and development patterns in the Marin County OA are important contributors to the fire environment. Fire risk in the Marin County OA in general and in Mill Vally in particular fluctuates throughout the year based on seasonal weather, and based on topography and vegetation. In addition, throughout the OA insect infestations and plant diseases are increasing and threaten to change the structure and overall health of native plant communities in the Marin County OA. Dead and dying trees have created large swaths of land with dense and dry fuel loads.

Vegetation, which is also known as fuel, plays a major role in fire behavior and potential fire hazards. A fuel's composition, including moisture level, chemical make-up, and density, determines its degree of flammability. Of these, fuel moisture level is the most important consideration. Generally, live trees contain a great deal of moisture while dead logs contain very little. The moisture content and distribution of fuels define how quickly a fire can spread and how intense or hot it may become. High moisture content will slow the burning process since heat from the fire must first eliminate moisture.

In addition to moisture, a fuel's chemical makeup determines how readily it will burn. Some plants, shrubs, and trees such as chamise and eucalyptus (both present in the Marin County OA) contain oils or resins that promote combustion, causing them to burn more easily, quickly, and intensely.

Finally, the density of a fuel influences its flammability; when fuels are close together but not too dense, they will ignite each other, causing the fuel to spread readily. However, if fuels are so close that air cannot circulate easily, the fuel will not burn freely.

Environmental factors, such as temperature, precipitation, soil type, aspect, slope, and land use history, all help determine the existing vegetation at any given location. In the central and eastern parts of the county, north facing slopes are usually densely wooded from lower elevations to ridge peaks with a mixture of mostly hardwood tree species such as coast live oak, California bay, Pacific madrone, and other oak species. Marshlands are also present throughout the county; once ignited marsh fires can be difficult to contain and extinguish.

In the WUI where natural fuels and structure fuels are intermixed, fire behavior is complex and difficult to predict. Research based on modeling, observations, and case studies in the WUI indicates that structure ignitability during wildland fires depends largely on the characteristics and building materials of the home and its immediate surroundings.

The dispersion of burning embers from wildfires is the most likely cause of home ignitions. When embers land near or on a structure, they can ignite near-by vegetation or accumulated debris on the roof or in the gutter. Embers can also enter the structure through openings such as an open window or vent and could ignite the interior of the structure or debris in the attic.

Wildfire can further ignite structures through direct flame contact and/or radiant heat. For this reason, it is important that structures and property in the WUI are less prone to ignition by ember dispersion, direct flame contact, and radiant heat.

In Mill Valley, significant portions of the community are in a designated WUI zone bordering Muir Woods National Monument, Tamalpais State Park and Marin County parkland. These areas are heavily vegetated with various fuel types and include Warner Canyon, Mill Valley Ridge, Blithedale Canyon, Blithedale Ridge, Cascade Canyon, Fern Canyon, Summit Ridge, Scott Valley, and the southeast face of Mount Tamalpais. These areas are characterized by steep slopes and are covered by dense stands of vegetation that can burn explosively and cause fire to spread rapidly. In addition, a significant number of properties and structures are located within these steep hillside communities. A major fire has not occurred in these areas since 1929, and, as a result, the density of dry vegetation has increased. Mill Valley experiences strong winds throughout the summer months and into the fall with the marine layer crossing over the mountains from the Pacific Ocean.

Wildfire protection in Mill Valley is provided by Southern Marin Fire District. Outside the City, CAL FIRE typically provides fire protection or contracts with Marin County Fire Department (MCFD). The MCFD Woodacre Emergency Command Center (ECC) currently manages the data from four Remote Automated Weather Stations (RAWS) for predicting fire danger utilizing the National Fire Danger Rating System (NFDRS) during the fire season. The RAWS are located in Woodacre, Middle Peak, Barnabe, Big Rock and a new station will be coming online in Novato.

Public Safety Power Shutoff (PSPS) Events

As a result of the 2017 Northern California Wildfires, the 2018 Camp Fire in Butte County and other wildfires caused by power line infrastructure, Pacific Gas & Electric (PG&E) began initiating Public Safety Power Shutoff (PSPS) events in their service areas (including the Marin

County OA) to help prevent the start of future wildfires. PG&E will, and has, initiated a PSPS if conditions indicate potentially dangerous weather conditions in fire-prone areas due to strong winds, low humidity, and dry vegetation. During these events, PG&E will proactively turn off power in high fire risk areas to reduce the threat of wildfires. The most likely electric lines to be considered for a public safety power outage will be those that pass-through areas that have been designated by the California Public Utilities Commission (CPUC) High Fire-Threat District at elevated (Tier 2) or extreme risk (Tier 3) for wildfire. Customers outside of these areas could have their power shut off if their community relies upon a line that passes through a high fire-threat area or an area experiencing severe weather. PG&E will consider numerous factors and analyze historical data to help predict the likelihood of a wildfire occurring, and closely monitoring weather watch alerts from the National Weather Service (NWS). These factors generally include, but are not limited to:

- A Red Flag Warning declared by the National Weather Service
- Low humidity levels, generally 20 percent and below
- Forecasted sustained winds generally above 25 mph and wind gusts in excess of approximately 45 mph, depending on location and site-specific conditions such as temperature, terrain and local climate
- Condition of dry material on the ground and live vegetation (moisture content)
- On-the-ground, real-time observations from PG&E's Wildfire Safety Operations Center and field crews

Pacific Gas & Electric Company (PG&E) operates a total of 1,179 miles of overhead electricity transmission and distribution lines in the Marin County OA. Overhead electricity lines and poles can be damaged or downed under severe weather conditions, particularly severe wind conditions, which increases the potential for wildfire ignition. 52 percent of PG&E's overhead distribution lines and 41 percent of its overhead transmission lines are located in CPUC-identified High-Fire Threat Districts subject to elevated or extreme fire risk. PG&E is currently planning and implementing safety measures to prevent wildfires and reduce the impacts of Public Safety Power Shutoff (PSPS) events on communities in the Marin County OA and throughout California.

These measures include installing weather stations; installing high-definition cameras; installing sectionalizing devices on overhead lines to separate the grid into smaller sections; hardening the system by installing stronger power poles, covering lines, and undergrounding lines in targeted areas; creating temporary microgrids to provide electricity during PSPS events; and enhancing existing vegetation management activities. From 2018 to July 2021, PG&E hardened three miles of overhead lines, installed 68 transmission and distribution sectionalizing devices, completed enhanced vegetation management on approximately 51 of overhead line miles, installed 28 weather stations, and installed 12 high-definition cameras in the Marin County OA. PG&E has also begun undergrounding several overhead transmission lines throughout California.

PSPS events have occurred in Mill Valley and other areas of Marin in years past. While PG&E continues to address safety issues with their systems by installing equipment that can segregate their system in order to continue to provide power to their customers wildfires from overhead electrical systems. While wildfires can start anywhere, the high winds and high abundance of fuels within and upslope from the jurisdictional boundary of Mill Valley make this WUI area the

most likely location for a wildfire to occur. Areas which are also heavily vegetated and are primarily residential and consist of numerous winding streets and hillside homes may be damaged or destroyed by a wildfire.

Climate Change and Future Development Considerations

Climate change can lead to an increase in wildfire events. Climate change has been a key factor in increasing the risk and extent of wildfires in the western United States. Changes in climate create warmer, drier conditions. Increased drought, and a longer fire season are boosting these increases in wildfire risk.

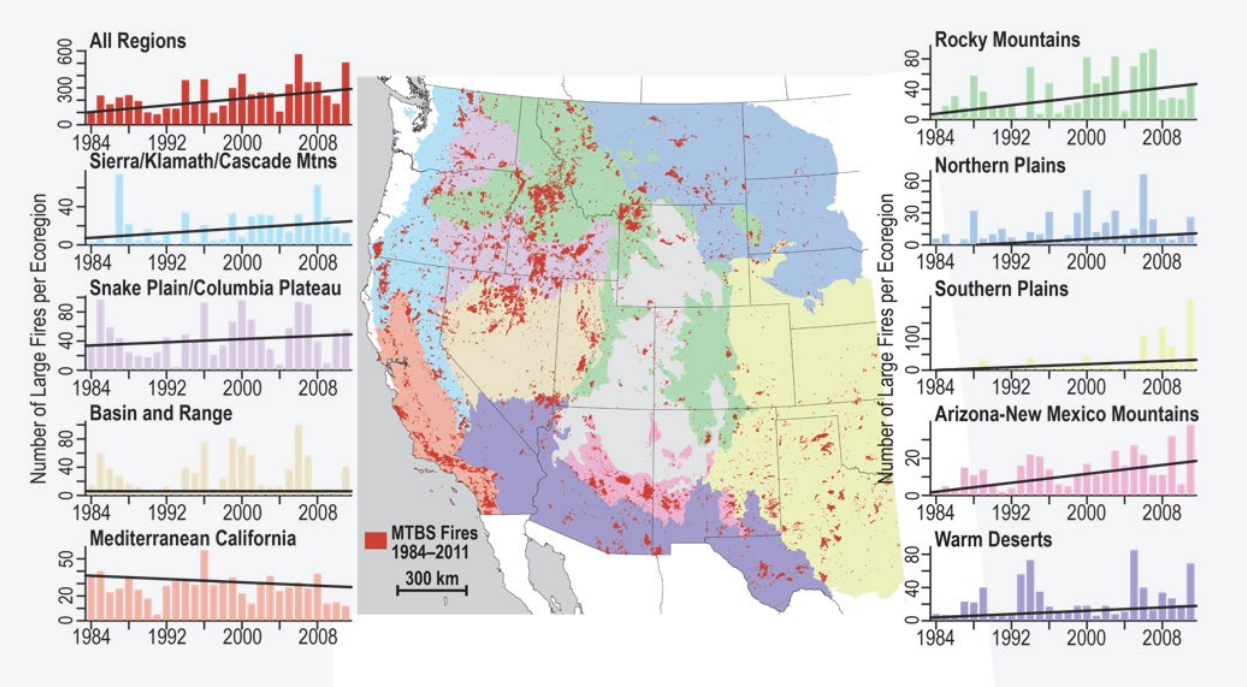

Figure 343: Trends in the Annual Number of Large Wildfires in the United States
Source: Fourth Climate Change Assessment, 01/04/23

As summer conditions in Northern California become hotter and drier due to climate change, the occurrence and severity of wildfires will only increase. The Marin County OA including Mill Valley is particularly susceptible to these future impacts of climate change on wildfire, as the OA's climate has generally been wet enough historically to avoid major wildfires. Extreme heat events and high wind events could cause electrical systems to become overloaded and fail, sparking wildfires. An increase in wildfires as a result of climate change could lead to more significantly burned areas that could contribute to debris flows after a significant storm event, particularly in the open space areas around Mill Valley. Future development in the WUI throughout Mill Valley will expose more people and property to the impacts of a potentially significant wildfire. The growing number of people in the Mill Valley WUI can increase risk to life, property and public health as a result of a wildfire. Future development around the Mill Valley marshlands would expose more people to the effects of brush fires as the marshlands dry out in the summer due to climate change.

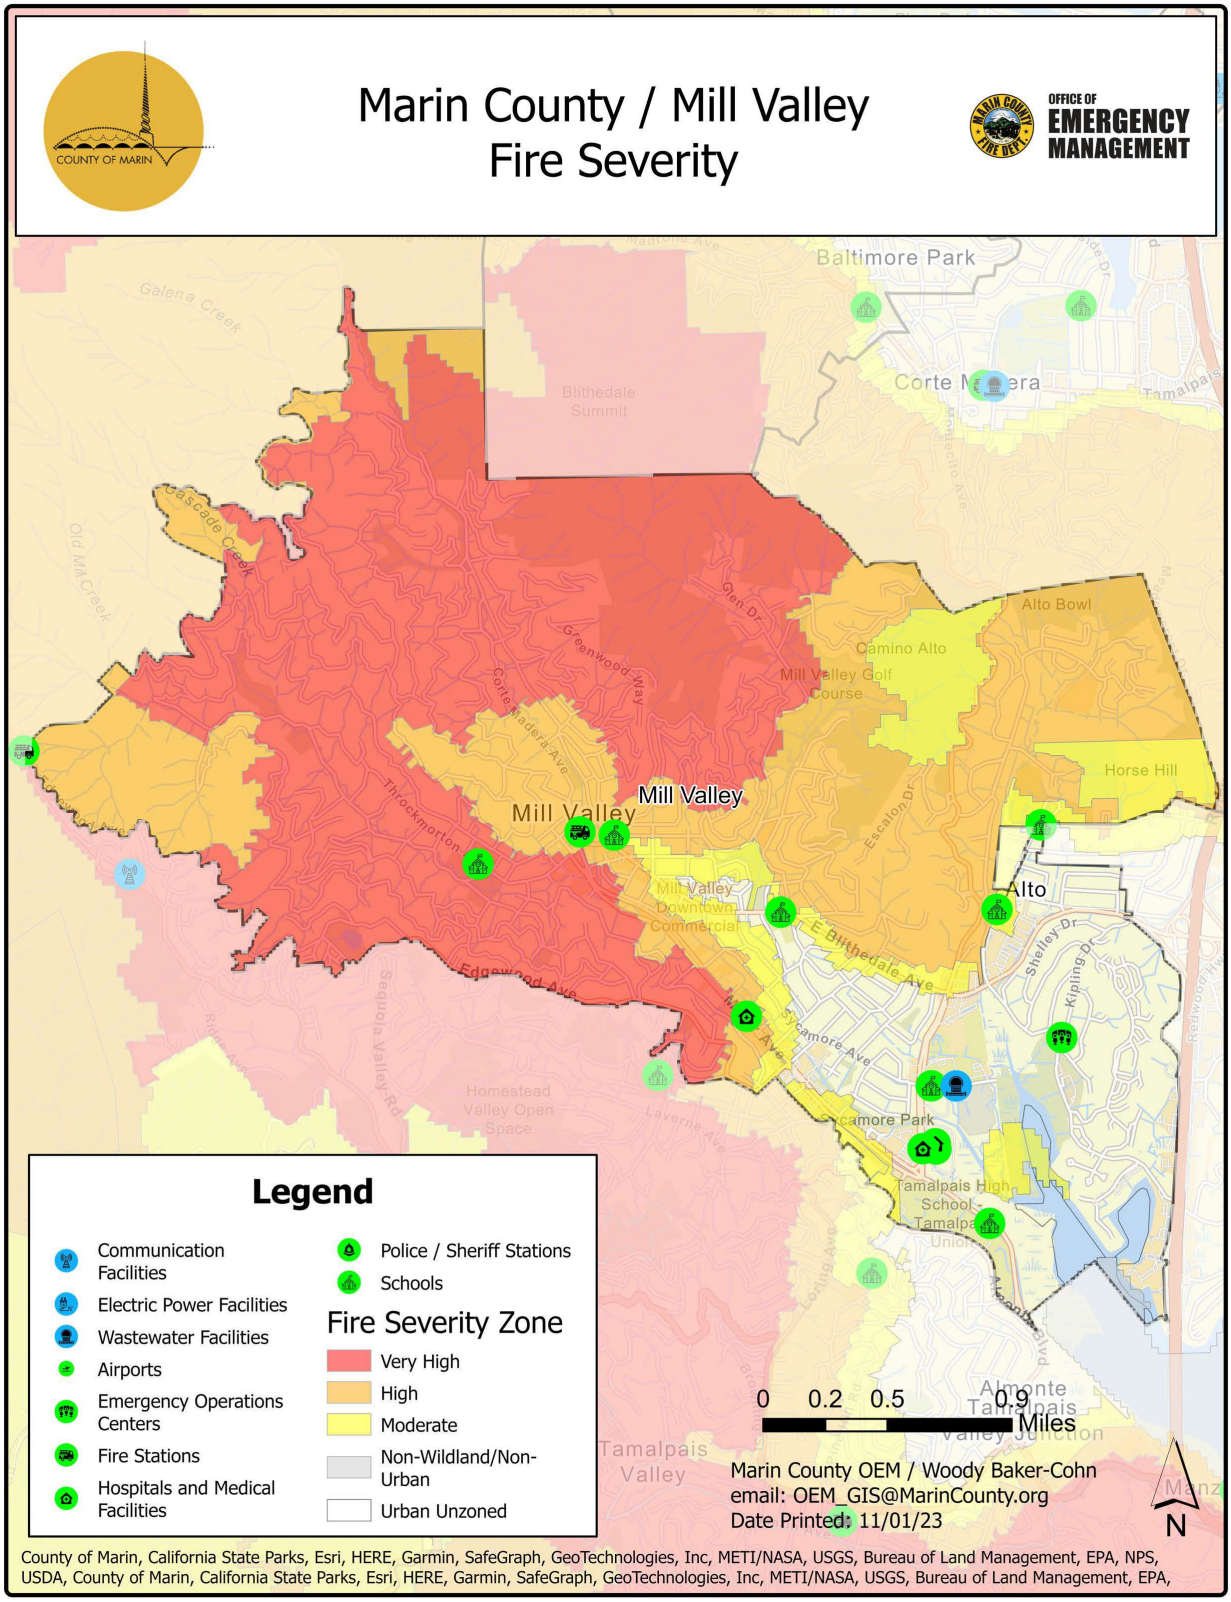

Figure 344: City of Mill Valley Wildfire Critical Facilities and Infrastructure
Source: Marin County OEM

Specific communities in Mill Valley around the northern side of the city are in a Very High FHSZ and are at a higher risk of wildfire. This area includes numerous residential communities with hundreds of homes and consists mostly of windy and dead-end roads that could hinder an evacuation and access. The Old Mill Elementary school lies in this area. Hundreds of homes and parts of the downtown and commercial area along Miller Avenue in Mill Valley lie in a High FHSZ and could be susceptible to wildfire. The Mill Valley Fire Station #6, the Greenwood School and the Marin Terrace medical facility lie in this area. Dozens of residences and parts of the commercial areas along Miller Avenue and E. Blithedale Avenue east of Lomita Drive lie in a Moderate FHSZ and have some susceptibility to wildfire. The Helix School and Edna Maguire Middle School lie in this area. Marshland around Bayfront Park is also in a moderate FHSZ and could be susceptible to a brush fire when vegetation is dry. All of Mill Valley could be impacted by a Public Safety Power Shutoff (PSPS) event and/or suffer poor air quality from smoke as a result of a wildfire in the Marin County OA or the surrounding region. As wildland areas around Mill Valley, including in Muir Woods National Monument, Mount Tamalpais State Park and the Marin Headlands, become drier due to climate change, the risk of a wildfire occurring and impacting the City may continue to increase. Brush fires in the City may increase over time as parks and other open spaces experience drier conditions.

On 9/27/2022, a brush fire broke out on a populated hillside adjacent to the Camino Alto Open Space Preserve near Kite Hill Lane and Camino Alto in Mill Valley. The fire burned a half-acre.

Figure 345: 2022 City of Mill Valley Wildfire
Source: KTVU

In 1929, the base of Mt. Tamalpais in Mill Valley experienced a significant fire known as the Great Mill Valley Fire. That fire's footprint is now developed with more than 1,100 homes (valued at over $1 billion) which have significantly altered the natural vegetation through urban and suburban development.

SECTION 3.0: MITIGATION STRATEGY

3.1 CHANGES IN DEVELOPMENT

Completed development within the City of Mill Valley since the last plan update in 2018 has included 16 single-family homes and 90 accessory dwelling units scattered throughout the city. There has not been new commercial development since 2018 aside from tenant improvements.

Future land use and growth management strategies in City of Mill Valley aim to concentrate future development into and toward existing communities and away from locations where natural characteristics may limit development (e.g., steep slopes or sensitive habitats), and to areas that have, or can readily be supplied with, adequate public facilities and services. This is done through various policies relating to zoning and density standards, with higher densities established along the main arterials and flatland areas of Mill Valley.

The City's commercial and multifamily zone districts are concentrated downtown and along the E Blithedale Ave and Miller Ave corridors and Highway 1 frontage. Hillside areas continue to be zoned for single-family development, with very low density development allowed in the areas far from main roads with high fire hazard. Also, the City's 2023-2031 Housing Element includes creation of three Housing Overlay Zoning Districts on certain commercial and multi-family zoned sites, with increased densities and development standards to encourage multifamily and mixed-use development on the parcels. Minimum densities are also established to ensure efficient use and infrastructure design, conservation of natural resources, and to avoid conflicting uses.

Table 20 identifies 74 parcels included in the new Housing Overlay Zoning Districts that have increased maximum density of 40 units/acre (as opposed to Mill Valley's typical maximum density of 29 units/acre). In addition to these specific identified parcels, over the next five years the City anticipates more multifamily and mixed-use development concentrated in the new overlay zone districts, as well as continued applications for single-family homes and ADUs throughout the City.

Table 20 also identifies mixed-use and multifamily housing projects currently in the construction and entitlement phase. These projects are located along E Blithedale Ave, Miller Ave, and at 1 Hamilton Drive (a City-owned site). Not listed in the table below are the continued applications for single-family home improvement projects that tend to increase square footages of homes and new ADUs built throughout the City. The City averages approximately 12 new ADUs per year.
As detailed in the "Climate Change and Future Development Considerations" section of each hazard profile, development in Mill Valley has occurred and will continue to occur throughout the town in areas prone to all of its identified hazards. Increased growth in these areas may increase the vulnerability of people and structures to these hazards.

Table 20: City of Mill Valley Projected Growth Areas

Development	# of Units	# of Parcels	Project Date[1]	Acres	Fire Severity Zone	Flood Zone
Multifamily and Mixed-Use Projects in Progress						
500 Miller Ave (Mixed-use development)	9	11	In construction. Estimated completion 2023	1.1	Moderate	X

1. "N/A" indicated for those parcels that do not have an active development application or entitled project. The number of units for these properties is a conservative and approximate number of units anticipated on the property based on rezoning the property to include a Housing Overlay that allows up to 40 units/acre. See City of Mill Valley 2023-2031 Housing Element for details.

Table 162: City of Mill Valley Future Growth Areas
Source: City of Mill Valley

3.2 Capability Assessment

The overall hazard mitigation priorities in the City of Mill Valley have not changed since the 2018 MJHMP update. However, in some cases the strategies to support the overall City priorities have changed and are reflected in the sections below. There were many projects that were either ongoing day-to-day business activities or were response related that were completed or deleted from the 2018 MJHMP project list and not carried over to this plan update. Several actions were completed and new projects were added to coincide with the changes in priorities, progress in local mitigation efforts and changes in development.

Capabilities are the programs and polices currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. The capability assessment identifies the local planning mechanisms where information from the 2018 MJHMP is incorporated and where updated hazard mitigation information from this 2023 MJHMP will be incorporated once approved.

3.2.1 Regulatory Capabilities

The legal and regulatory capabilities include existing ordinances and codes that affect the City's physical or built environment. Examples of legal and/or regulatory capabilities can include: a jurisdiction's building codes, zoning ordinances, subdivision ordnances, special purpose ordinances, growth management ordinances, site plan review, general plans, capital improvement plans, economic development plans, emergency response plans, and real estate disclosure plans. The table below lists regulatory mitigation capabilities, including planning and

land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place.

Opportunities for Enhancement

The 2023 Marin County OA MJHMP update provided the City of Mill Valley an opportunity to review and update the capabilities currently in place to mitigate hazards. This also provided an opportunity to identify where capabilities could be improved or enhanced. Specific opportunities could include:

- **Local Emergency Operations Plan and Continuity of Operations Plan**: The City would benefit from the current 2023 update of our own emergency operations Plan and Continuity of Operations Plan. These Plans would allow the City to develop response and contingency plans for the risk and vulnerability of the City to the hazards identified in the Hazard Mitigation Plan.
- **Community Wildfire Protection Plan:** The City plans to take an active role in mitigation actions to enhance wildfire protection.
- **Emergency Manager:** The City will consider identifying staff to provide emergency management or disaster preparedness duties as a collateral role.
- **StormReady certification and Firewise Communities certification:** The City will consider participation in these programs.

Table 21: Legal and Regulatory Capabilities

Plans	Yes/No Latest Update	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
General Plan/Master Plan	Y 2013-2040	Mill Valley's General Plan outlines long-term direction for development and policy. Hazards are addressed in all chapters, but especially in Chapter 6 (Climate Action) and Chapter 7 (Hazards and Public Safety), where policies and programs include hazard mitigation actions. See "General Plan" table for more information.
Strategic Plan	N	
Capital Improvements Plan	Y 2020-2025	Every five years, the City develops a CIP which serves as a planning tool to direct construction activities for City owned facilities and infrastructure. Projects may involve construction of new or upgraded facilities and infrastructure. The plan is updated every two years to reflect the latest community priorities, completed projects, updated project cost estimates and available revenue sources. Capital improvement projects are appropriate to include in the hazard mitigation plan strategy.
Economic Development Plan	N	
Local Emergency Operations Plan	Y 2014 + update in	The Emergency Operations Plan incorporates and coordinates all facilities and personnel of the City into an efficient organization for emergency response. The plan is

	progress 2023	an extension of the Marin Operational Area Emergency Operations Plan. The plan deals with immediate emergency response, not mitigation strategies.
Continuity of Operations Plan	Y	Continuity of Operations is part of the EOP.
Flood Mitigation Plan (FMP)	N	See the Floodplain Management Ordinance under "Land Use Planning and Ordinances" below.
Open Space Management Plan	N	Mill Valley does not have a comprehensive Open Space Management Plan, but open space management and protection is addressed in General Plan Chapter 5: Natural Environment. Natural resources along Mill Valley's edges are made up of both public and private land. Some of the land is under the jurisdiction of the Marin County Open Space District. These natural areas are protected in a series of open space preserves: Blithedale Summit, Camino Alto, and Alto Bowl to the north and Bothin Marsh to the southeast. The City has several tools at its disposal to accumulate and protect open space. These tools include direct acquisition through purchase, purchase of tax defaulted property, acceptance of property donations, and negotiated development plans, which may be in the form of conservation easements or acquisition of development rights. The Marin County Open Space District conducts open space management in collaboration with the Marin County Fire crew, FIRE Foundry workforce development program, contracted tree services, Conservation Corps North Bay, and animal grazing. City of Mill Valley jurisdictional boundaries border many of these open space areas.
Bay Area Regional Transportation Plan (RTP)	Y 2021-2050	Every 4 years, the Metropolitan Transportation Commission prepares a regional transportation plan that identifies regional transportation investments integrated with a sustainable land use strategy over a long-term planning horizon, to accommodate future population growth and meet greenhouse gas emissions reduction targets set by the California Air Resource Board. The Transportation Authority of Marin (Marin's Congestion Management Agency) works with 11 cities and towns and the County — to coordinate, fund and implement transportation projects and programs that support this regional transportation plan. Some of these projects may be appropriate as hazard mitigation strategies.
Stormwater Management	N	The City does not have a Stormwater Management Plan, but Public Works staff follow the standards contained in the Marin County Stormwater Pollution Prevention Program's guidance for small construction projects as best practices. https://www.millvalleylibrary.org/DocumentCenter/View/494/Marin-County-Stormwater-Pollution-Prevention-Program-Best-Management-Practices-PDF

Engineering Studies for Streams	N	
Marin County Community Wildfire Protection Plan	Y 2020	This plan provides a science-based assessment of wildfire hazards and threats to homes in the WUI of Marin County. The purpose of the plan is to provide fire agencies, land managers and other stakeholders in Marin County with guidance and strategies to reduce fire risk in the WUI while promoting protection and enhancement of economic assets and ecological resources. Implementation of this plan serves to mitigate fire risk.
Strategic Communications Plan	Y 2014	This strategic plan was developed to identify goals and strategies to effectively communicate with community members, drive development internal communications policies, and improve the overall effectiveness of the City in meeting community needs. Action 3 of Objective 3 in this plan is dissemination of videos related to emergency information and high-profile issues. This action could be added as a hazard mitigation strategy.
Climate Action Plan	Y 2013 + update in progress	The City's CAP is contained as an element within the General Plan and is used to identify actions that the community and local government can take to reduce emissions based on emission targets set for the community and the city's government operations. The City has successfully achieved 2020 emission reduction targets (20% below year 2000 levels) and is working to identify new targets and update its CAP. Please see General Plan table for specific actions in the current CAP.
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code (Mill Valley Municipal Code Titles 14 and 15)	**Y**	In December 2022, the City adopted the 2022 State of California Building Standards Building Code with certain amendments, especially additional detail regarding construction in the Wildland-Urban Interface (WUI) to safeguard life, health, property, and public welfare. The code allows the City to require the undergrounding of utilities in the case of new construction and major remodels. The City has a "Dangerous Buildings Code" to provide for the abatement of unsafe and/or uninhabitable buildings. The City also just adopted a "Soft Story Ordinance" requiring inspection and remodeling of soft story structures in Mill Valley on a priority schedule based on level of risk assessed.
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	
Fire department ISO rating: 01/1X	Y 2016	In July 2015 SMFD was notified by the Insurance Services Office (ISO) that the District was due for an ISO review and update to its current public protection class (PPC) rating. The 2016 survey resulted in an improved PPC of 1/1X with a total score of 90.4.

Permitting and Inspections requirements	Y	Building permits are required for any work involving utilities and any building or structure exceeding certain minimum thresholds. Final inspections are required to close out building permits. Depending on the type of permit in question, inspections by other departments such as Fire, Public Works, and Planning may also be required.
Residential Building Report	Y	Upon sale of property, a Residential Building Report is prepared summarizing site conditions and existing development, and identifying any unpermitted or dangerous conditions, including hazard risks such as FEMA flood zones and fire severity zone. Data for this report comes from both the City and the County Assessor and is widely used by prospective buyers and agents.
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Municipal Code Chapter 2.12: Emergency Services	Y (1972)	This ordinance lays out roles and responsibilities during an emergency and provides for preparation of the City of Mill Valley emergency plan. It is adequately administered and enforced by the City Manager and designated staff.
Municipal Code Title 12: Trees, Weeds and Vegetation	Y (amend 2017)	This ordinance aims to protect public trees and shrubs for both aesthetic and safety reasons. The ordinance also clarifies that trees must be kept trimmed, and no exposed electrical should be in contact with trees, which is an important measure to reduce fire risk. This ordinance is adequately administered and enforced by the Public Works Dept. Public Works staff maintain certain Eucalyptus Trees governed by the Eucalyptus Management Plan, street trees in the Tamalpais Park Assessment District, and street trees in the Downtown Tree Management Plan. Other public trees must be maintained by adjacent private property owners, and DPW issues citations to property owners for compliance based on complaints received.
Municipal Code Title 14: Building and Construction **Municipal Code Title 15: Fire**	Y (amend 2022)	See Building Code discussion above. Titles 14 and 15 of the Mill Valley Municipal Code are updated and adopted on a three-year cycle when the state code is updated. Title 14 is administered by the Building Official and Title 15 is administered by Southern Marin Fire Protection District. The building and fire codes are adequately enforced by inspection and code enforcement staff as well as the Building Official and Fire Marshal.
Municipal Code Chapter 17.06: Urban Runoff Pollution Prevention	Y (amend 2015)	This ordinance aims to reduce pollutants in stormwater discharges, and maintain pre-development stormwater runoff rates in new development whenever possible, in compliance with the NPDES Phase II Stormwater Permit. Enhanced quality and reduced quantity of stormwater runoff reduces risk of flooding damage from storm events. This ordinance is adequately administered by Public Works staff via responding to discharge of spills, requiring best management practices for construction projects, and requiring new development to minimize

		new stormwater runoff with stormwater management controls.
Municipal Code Title 18: Floodplain Management	Y (amend 2012)	This ordinance aims to protect life and health, restrict certain land uses and construction allowed in flood hazard zones, minimize public and private losses due to flood conditions in specific areas, minimize the need for rescue and relief efforts associated with flooding, and minimize spending for flood control projects. The ordinance clarifies that no development is allowed in floodways, and projects considered to be "substantial improvement" in a floodplain triggers special construction standards such as floodproofing and elevation above base flood elevation. These construction standards reduce risk of damage from future flood events. This ordinance is adequately administered by Planning staff as part of the development review process. However, there is not a specialized floodplain administrator and there is a lack of in-house staff expertise on this subject.
Municipal Code Title 20: Zoning	Y (amend 2021)	The Zoning Ordinance implements the General Plan by establishing specific regulations for development. It includes standards for where development can be located, how buildings must be sized, shaped, and positioned, and what types of activities can occur in an area. Mitigation actions that pertain to new or substantially redeveloped buildings can be adopted into the Zoning Ordinance. The ordinance is adequately administered by Planning staff via Building and Planning Permit application review.
Municipal Code Title 21: Plats and Subdivisions	Y (amend 1985)	The Subdivision ordinance provides regulations regarding when and how property may be subdivided. Minimum lot size depends on slope – steep slopes may not be as easily subdivided. As a result, a lower density of homes is allowed to be built on the steep hillsides with greatest fire and landslide risk. The ordinance is adequately administered by Public Works Engineering staff.
Flood insurance rate maps	Y	Flood insurance rate maps are available online via MarinMap (https://www.marinmap.org/dnn/default.aspx) and FEMA (https://msc.fema.gov/portal/home).
Elevation Certificates	Y	Letters of Map Amendment (LOMAs) and Letters of Map Revision (LOMRs) are linked to property addresses in MarinMap Viewer. The City is not involved with issuing these letters.
Acquisition of land for open space and public recreation uses	N	The City is not currently in the process of acquiring land for open space and public recreation uses. There are multiple open space areas in the unincorporated county just outside city borders. About 20 years ago there was an initiative to identify vacant properties that would be better served with public open space rather than private development, based on factors such as species habitat, fire danger, and geographic location adjacent to existing open space areas. However, further action was not

		taken by the City towards acquiring new property for open space.

Table 163: City of Mill Valley Legal and Regulatory Capabilities
Source: City of Mill Valley

City of Mill Valley General Plan or Master Plan

California Government Code 65300 requires that every City and County in the state have a General Plan. The City of Mill Valley MV2040 General Plan, adopted in 2013, was prepared over a two-year period that included an extensive public review process. The General Plan is the most important policy and planning document in the city and is used by virtually every department. The General Plan is the City's statement of its vision for the future. The General Plan contains policies covering every aspect of the City, with chapters dedicated to the following topics: land use (how land can be developed), mobility (circulation), housing, community vitality, natural environment, climate action, hazards and public safety, and noise.

The City of Mill Valley specific goals and policies related to mitigation of natural hazards are as follows:

Table 22: City of Mill Valley General Plan: MV2040	
Goal/Policy/ Program	**Explanation**
Land Use Element	
Land Use Map	Commercial and higher density residential land use designations are concentrated along Miller Avenue, East Blithedale Avenue, and in downtown Mill Valley. In the hills and canyons, land use is limited to low density single-family residential. This land use layout reduces the population at risk of a wildfire disaster and also reduces climate change impacts through promotion of a walkable downtown core.
Policy LU.1-3: The residential density (dwelling units per acre) of a new or redeveloped residential development project or residential development as part of a mixed-use project may be reduced to below the minimum density established by this General Plan where there is adequate evidence in the record that the physical characteristics of the site (including but not limited to lot size, slope, habitat value, soil conditions, flood hazard, etc. or other conditions identified through the environmental review process clearly indicate that the minimum density cannot be met without appropriate mitigation or is determined to be detrimental to the health, safety, or welfare of the community.	Lower density housing construction is appropriate in areas at risk for natural disasters.
Mobility Element	
Goal MOBILITY-2: Sustainable Transportation. Reduce	This goal and supporting

Table 22: City of Mill Valley General Plan: MV2040	
Goal/Policy/ Program	**Explanation**
transportation-related emissions by reducing traffic congestion and vehicle miles traveled while promoting the use of lower emissions vehicles and non-automotive modes of travel. **Objective M.3 Leadership and Coordination** **Objective M.4 Interconnected transportation Network** **Objective M.5 Education and Technology** **Objective M.6 City Operations** **Objective M.7 Low- and Zero-Emission Vehicles** **Objective M.8 Compact Development**	objectives encourage lower greenhouse gas emissions which directly mitigates climate change impacts.
Objective M.9 Traffic Management: Maintain a well-functioning roadway network that provides for the safe and efficient flow of vehicular traffic.	This objective and supporting policies prioritize maintenance and upgrades to key access points and corridors.
Policy M.10-3: Coordinate with PG&E to underground utilities or, where possible, relocate utility poles to improve sidewalk accessibility. Explore assessment bonds or other financing options to fund undergrounding costs.	Undergrounding electrical infrastructure reduces risk of wildfire caused by this infrastructure and also reduces risk of power outages and other damage from severe weather.
Policy M.10-5: Continue to renovate, repair and maintain the City's steps, lanes and paths that provide pedestrian connections to residential and commercial areas and complete emergency evacuation routes. **Policy M.12-5: The Bicycle and Pedestrian Committee, Parks and Recreation Commission and Emergency Preparedness Commission shall make recommendations for new priorities as the top 25 SLPs projects identified in the Bicycle and Pedestrian Transportation Plan are completed.**	Mill Valley's residential neighborhoods are connected via a network of steps, lanes and paths that allow for easy pedestrian access to downtown from hillside areas. These pathways reduce the need for driving, thus mitigating for climate change, and also provide for pedestrian emergency evacuation.
Policy M.13-2: Promote three-way collaboration among Safe Routes to School, the Bicycle and Pedestrian Advisory Committee, and the Mill Valley Police Department to advance education, safety, and enforcement programs that encourage more walking and cycling.	This policy supports increased pedestrian and bike use, indirectly reducing emissions associated with vehicular travel.
Objective M.14 Improved Transit Network: Work with Marin Transit to support the continued development of and improvements to safe, efficient, and reliable transit service.	This objective supports increased transit use, indirectly reducing emissions associated with private vehicular travel.
Objective M-16 Funding: Seek funding from all possible sources for continued improvements and ongoing maintenance of roadways and bicycle, transit and pedestrian facilities.	This objective and supporting policies ensure adequate funding to address identified maintenance and improvements to roadways and other mobility infrastructure.
Housing Element	
Goal 1, Program 2: Home Maintenance and Public Information: Adopt the Soft Story ordinance in 2023 as a means of protecting the preserving the City's existing affordable multi-family housing stock.	This program protects vulnerable buildings against risk of catastrophic earthquake damage.

Table 22: City of Mill Valley General Plan: MV2040	
Goal/Policy/ Program	**Explanation**
Policy 2.1: Encourage Mixed-Use by Incorporating Residential Housing in Commercial Buildings. Encourage the efficient use of land by allowing commercial and residential uses on the same property in both horizontal and vertical mixed-use configurations. **Policy 5.3: Efficient Use of Multi-Family Zoning. Encourage the sustainable use of land and promote affordability by prohibiting new single-family development within multi-family or commercial land use districts.** **Goal 8: Promote a healthy and sustainable Mill Valley through support of existing and new housing which minimizes reliance on natural resources and automobile use.** **Policy 8.1: Promote Smart Growth. Preserve open space, watersheds and environmental habitats, while accommodating new growth in compact forms in a manner that de-emphasizes the automobile, allowing residents to use their cars less or not at all.**	These goals and policies encourage concentration of new development in areas zoned for multifamily and commercial use. These zone districts are located in the "flats" of Mill Valley away from fire and landslide danger (although some sites are at risk of flooding).
Policy 8.2: Create Healthy, Sustainable Buildings through Green Building Design. Ensure new development, including major remodels and additions, are sustainably designed, and consider establishing incentives to achieve energy efficiencies higher than those required under the CalGreen Building Code. Promote energy efficiency and the use of alternative energy sources such as solar energy, cogeneration, and non-fossil fuels through education materials and providing information on grant funding and other financial resources for home improvement projects. **Program 32. Prioritization of Sustainable Housing Projects. Prioritize redevelopment projects competing for funds and grants that are within a quarter to half mile radius of transit stops, have a large number of amenities and services within a half mile radius, and/or have a higher walk score.** **Program 33A. Green Building and Water/Energy Conservation. Provide outreach and education to developers, architects, and residents to provide information on new proposed CALGREEN regulations as part of the building code update process. Expand website information, including developing handouts on ways to incorporate sustainability into project design and in existing structures as well as funding and grant opportunities available to reduce costs of green home improvement projects.**	These policies and programs encourage energy and water efficiency, which ultimately contributes to reduced risk associated with climate change. On-site energy generation and low water use also enable more resiliency in recovery from disasters such as storms and extreme heat events.
Program 33B. Water Availability. Work with the County of Marin on its collaboration efforts with water service providers to conduct a strategic water supply assessment to evaluate increased supply within Marin (e.g. increased reservoir capacity, new reservoirs, increase use of recycled water, desalination plant) and external to Marin (e.g. EBMUD, Russian River, etc.)	This program encourages collaboration across multiple agencies for water supply resiliency, which is critical for preparation for drought conditions.
Program 33C. Transportation Demand Management	This program encourages reduced

Table 22: City of Mill Valley General Plan: MV2040	
Goal/Policy/ Program	**Explanation**
program to reduce automobile use and vehicle miles traveled. The City Council shall discuss TDM measures that are identified as potentially reducing VMT by the California Air Pollution Control Officers Association Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity and adopt those measures that are considered effective at reducing automobile trips based on the feasibility and cost analysis related to the size and scale of redevelopment.	automobile use for the purpose of reducing greenhouse gas emissions, directly addressing climate change risk.
Program 34. Addressing Natural Hazards. Continue to work with local jurisdictions and through the Multi-Jurisdictional Local Hazard Mitigation Plan and the MV2040 General plan to address and mitigate natural hazards, including fire and flood protection and mitigation. Support redevelopment in the commercial and multi-family zoning districts that are outside of the hazard zones through incentives such as Density Bonus, Senate Bill 9, State Streamlining, reduced fees and local housing overlays.	This program summarizes the City's dedication to cross-agency collaboration to reduce natural hazard risks.
Community Vitality Element	
Objective CV.3 Community Collaboration and Communication: Support the work of community institutions, government agencies, non-profit, and local businesses that contribute to the quality of life of Mill Valley residents.	This objective and supporting policies encourage enhanced community connections via community groups and various forms of communication, which is critical in response to natural disasters.
Natural Environment Element	
Policy NE.3-1: Work with Marin Municipal Water District (MMWD) to optimize storage, transmission, and distribution capacities and efficiencies and to minimize water outages due to drought, emergencies, or other disasters.	This policy encourages collaboration across agencies to prepare for droughts and other water distribution emergencies.
Policy NE.3-2: Explore the retrofit of Cascade Dam for use during drought or emergency, consistent with habitat and species preservation policies and programs.	Cascade Canyon Dam is a small dam originally built by Tamalpais Land and Water Company in the 1800s, creating the Cascade Reservoir. This reservoir is not actively used by any jurisdiction at this time.
Objective NE.4 Conservation of Water Resources: Improve water quality by capturing source pollution, sedimentation, and run-off on public and private properties and allow for conservation of water resources through rainwater storage and greywater systems.	This objective encourages both decreased water use and increased on-site water retention, serving to mitigate risk associated with drought as well as storms and flood events.
Policy NE.5-10: Provide information to residents on local sustainability efforts, surrounding natural environment, potential hazards, and emergency preparedness.	As more residents become educated about sustainability and hazards, they will take measures to mitigate hazard risk.

Table 22: City of Mill Valley General Plan: MV2040	
Goal/Policy/ Program	**Explanation**
Climate Action Plan	
Goal CLIMATE-1: Climate Change and Greenhouse Gas Emissions Reduction. Reduce the community's carbon footprint. **Objective CL.1 Clean Energy and Energy Efficiency** **Objective CL.2 Carbon Offsets** **Objective CL.3 Monitoring** **Objective CL.5 Recycling and Waste Management**	These goals and objectives serve to identify energy efficiency, zero waste, and adaptation planning strategies to lower the community's GHG contribution.
Goal CLIMATE-2: Climate Change Adaptation. Develop strategies for adapting to climate change. **Objective CL.4 Adapting to Climate Change. Ground climate change adaptation strategies in the best-available scientific understanding of hazards, risks, impacts, and vulnerabilities, and make adaptation planning and implementation a City budgeted item and operational priority.** **Policy CL.4-1. Immediately begin to develop plans and policies that will guide the City's ability to recognize, understand, and respond to the effects of climate change on the community (rather than waiting for more complete understanding of climate change and/or data). Adjust plans and actions according to new data and information and establish a permanent adaptation funding mechanism through the City's budget.** **Policy CL.4-2. Plan and fund long-term adaptation strategies to help the people, places, natural systems, and infrastructure that are vulnerable to the effects of climate change, including but not limited to sea level rise and more extreme heat and storm conditions.** **Policy CL.4-3. Encourage adaptation across multiple sectors, geographical scales, and levels of government. Build on the existing efforts and knowledge of a wide range of stakeholders who understand local or regional risks and needs.** **Policy CL.4-4. Update community hazard mitigation plans to recognize that the effects of climate change will also affect the type and intensity of potential community hazards and to anticipate impacts and responses. Include planning for extreme heat and storm events, identifying populations and neighborhoods most vulnerable to these events.**	Adaptation goals, objective and policies serve to provide a policy basis for the City to prioritize long-term adaptation strategies addressing climate-change related risks such as sea level rise, extreme heat, and extreme storm events.
Hazards and Public Safety Element	
Goal Hazard-1: Community Hazard Resilience. Minimize loss of life, property, and important elements of the natural ecosystem and maximize Mill Valley's ability to prevent, mitigate, prepare for, respond to, and recover from disaster.	This goal parallels key goals of the Local Hazard Mitigation Plan.
Policy HZ.1: Hazard Identification and Mitigation. Identify all hazards that threaten the City. Determine the likelihood of occurrence and severity of all hazards, further categorize	Hazard identification is addressed in this way in both the General Plan and the

Table 22: City of Mill Valley General Plan: MV2040	
Goal/Policy/ Program	**Explanation**
them as either "sudden onset" disasters (e.g. earthquakes, wildfire) or "slow onset" disasters/phenomena (e.g., drought, extreme heat, sea level rise), and strengthen hazard mitigation policies and regulations	Local Hazard Mitigation Plan.
Policy HZ.2: Administrative and Equipment Capacity. Maintain adequate concentration and distribution of staff, facilities, materials, and equipment to provide a timely disaster response consistent with the needs of a demographically changing community and a challenging natural environment, while recognizing the difficulties of maintaining these systems on a daily basis.	The City's Emergency Operations Plan addresses appropriate emergency response capabilities. This plan is continuously updated as needs change.
Policy HZ.3: Critical Infrastructure. Develop strategies for critical facilities and services (local and regional) that will minimize problems during post-disaster evacuation rescues, and major clean-up operations following a major disaster.	These strategies are appropriately developed within the Local Hazard Mitigation Plan.
Policy HZ.4: Civic Duty and Responsibility. Promote education and events that reinforce the personal responsibility of all residents, business owners, and City staff to plan for, respond to, and recover from disasters.	As residents, business owners and city staff become more educated, we will be able to better mitigate risk from natural disasters.
Policy HZ.5: Emergency Response and Evacuation Routes. Maintain and expand the network of anticipated emergency response routes and regularly exercise evacuation protocols and procedures.	The City's EOC conducts drills to ensure that staff and residents are aware of and understand emergency protocols.
Policy HZ.6: Prevention and Protection. Reduce injury and damage from hazards.	Implementation of proper emergency preparedness and emergency protocols means lowered risk of injury or damage from hazards.

Table 164: City of Mill Valley General Plan: MV2040
Source: City of Mill Valley General Plan

3.2.2 Administrative and Technical Capabilities

The administrative and technical capability identifies the City personnel responsible for activities related to mitigation and loss prevention. Many positions are full time and/or filled by the same person.

Table 23: Administrative and Technical Capabilities		
Administrative	Yes/No	Is coordination effective?
Administrative Services	Y	The City Manager is the overall administrator for the City, with the City Clerk and two Senior Management Analysts working under the Manager. Within each City department there are administrative services staff. The Finance & Human Resources Department handles budgeting,

		revenue and business license collections, cash flow management, and oversight of all investments and accounts receivable as well as human resource services for employees. Administrative coordination across departments is adequate but could be more efficient.
Planning Commission	Y	The Planning Commission is a decision-making body made up of five Mill Valley Residents (including at least two architects). This body meets every two weeks to review and vote on long range planning documents such as zoning ordinances and General Plan updates, as well as discretionary planning applications such as design reviews, conditional use permits, and variance applications. Staff updates Commissioners periodically on upcoming projects, and meets with Commissioners annually to create the next year's policy work plan. Coordination is amicable and effective.
Hazard Mitigation Planning Committee	Y	The City participates in the Marin County Multi-Jurisdictional Hazard Mitigation Planning Committee.
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	The City's Public Works Department is engaged in the following maintenance programs to reduce risk (per the CIP): • Annual vegetation maintenance program to reduce fuel sources and maintain evacuation routes • Annual sewer rehabilitation and maintenance program, which reduces risk of flooding during storms • Steps, Lanes and Paths (SLP) annual maintenance to improve pedestrian connections and evacuation routes • Annual slide repair program provides emergency response and cleanup of slides plus funding for roadway stabilization projects • Pump station improvement program to allow backup into SCADA system and auto transfer during power outages
Mutual aid agreements	Y	The City is engaged in a Joint Powers Agreement with Southern Marin Fire District for provision of fire services. Coordination is effective, especially in plan review where staff from SMFD and the City work together to discuss key issues on weekly calls.
Technical	Yes/No	Has capability been used to assess/mitigate risk in the past?
Warning systems/services (Reverse 911, outdoor warning signals)	Y	The City utilizes the emergency warning systems through the County EAS (Emergency Alert System) via TV and radio as their primary warning capability. The City also uses MERA (Marin Emergency Ratio Authority) voice radio system, TENS (Telephone Emergency Notification System), and the RACES/ACS countywide organization of amateur radio operators.

Hazard data and information	Y	Hazard data is available via MarinMap (with various source data) and this hazard data has been analyzed as part of the development of the Mill Valley General Plan Safety Element, as well as the Emergency Operations Plan.
Grant writing	N	Grant writing has not been used in the past to support hazard mitigation, but there is potential for this skill to be developed. Currently there is not sufficient full-time staff to support this work.
Hazus analysis	N	The City has not previously used FEMA's Hazus program to estimate natural disaster risk.
Staff/Personnel Resources	Yes/No FT/ PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y/FT	Building personnel include the Building Official, two staff plan checkers, contract plan checkers, and an administrative assistant. Staffing is adequate to enforce regulations and coordination among staff is effective, especially evident in multi-jurisdictional code enforcement cases and stop work orders.
Floodplain Administrator	Y/PT	The Planning and Building Director functions as the Floodplain Administrator. This is one of many roles that the Planning and Building Director fulfills. Staff is not particularly trained in this area, and more support and training would be useful.
Emergency Manager	Y/PT	The City Manager functions as the Director of Emergency Services for the City of Mill Valley, with responsibilities laid out in the City's Emergency Operations Plan. This is one of many roles that the City Manager fulfills. There are periodic coordinated trainings and drills to ensure that the City Manager and staff understand their roles in the event of a disaster.
Community Planner	Y/FT	Planning personnel include the Planning Director, four staff planners, two contract planners, and an administrative assistant. Staff maintain and update the General Plan, including the Safety Element, maintain and update zoning ordinances, and review development projects for consistency and conformity with the General Plan and zoning code. Planning staff coordinate with other agencies for both policy work and development review. Staffing is adequate to enforce regulations.
Civil Engineer	Y/FT	The Public Works Director is the City Engineer, and there is a Deputy Director who is also trained as a civil engineer, with associate level engineers working below the Deputy Director. There are also contract engineering staff to assist with plan reviews and other tasks when full time engineering staff is not available or full time positions are unfilled.
GIS Coordinator	N	GIS staff is located at Marin County. City of Mill Valley staff utilize MarinMap and feed data to the County to

		update the map layers for Mill Valley as needed.
Community Development Staff	Y/FT	See "Community Planner" above.
City Planning, Building, and Public Works Staff	Y/FT	See "Building Official," "Civil Engineer" and "Community Planner" above.
Police Department Staff	Y/FT	The Police Department conducts emergency preparedness activities for the community. Mitigation activities related to emergency preparedness can be implemented by the Police Department. Staffing is adequate to enforce regulations.
Fire Department Staff	Y/FT	Southern Marin Fire District protects the city from the effects of fire and other hazardous conditions and supports implementation of mitigation actions that reduce the risk of wildfire. Staffing is adequate to enforce regulations.
Planner(s), engineer(s) and technical staff with knowledge of land development, land management practices, and natural hazards.	Y/FT	Land development, land management practices, and natural hazards knowledge are critical to successful job performance for Community Development, Public Works, and Fire District staff. These departments are involved trainings and drills as part of the Emergency Operations Plan, and work together to prepare the Capital Improvement Plan, General Plan Safety Element, and Local Hazard Mitigation Plan.
Engineer(s), Building Inspectors/Code Enforcement Officers or other professional(s) and technical staff trained in construction requirements and practices related to existing and new buildings.	Y/FT	The Building Official, building plan check technicians, building inspector, code enforcement officers and contract staff together provide adequate staffing to enforce building regulations. Code enforcement is complaint-based. Building staff is not particularly trained in hazard mitigation aside from code requirements.
Engineers, construction project managers, and supporting technical staff.	Y/FT	The Deputy Public Works Director and staff engineers project manage the city's capital improvement projects. Contract staff is brought in as needed to assist when in-house staffing is not adequate to cover all projects. Many CIP projects provide hazard risk mitigation.
Engineer(s), project manager(s), technical staff, equipment operators, and maintenance and construction staff.	Y/FT	The Department of Public Works Operations Superintendent, along with the Building, Parks, and Streets Maintenance Supervisors, is responsible maintaining and operating of a wide range of local equipment and facilities as well as providing assistance to members of the public. Staff is trained on hazard mitigation as related to maintenance programs. Staffing is generally adequate to provide services. Contract staff may be brought in as needed to assist when in-house crews are not adequate to cover all projects.

Table 165: City of Mill Valley Administrative and Technical Capabilities
Source: **City of Mill Valley**

3.2.3 Fiscal Capabilities

The fiscal capability assessment shows specific financial and budgetary tools available to the jurisdictions such as community development block grants; capital improvements project funding; authority to levy taxes for specific purposes; fees for water, sewer, gas, or electric services; impact fees for homebuyers or developers for new development; ability to incur debt through general obligations bonds; and withholding spending in hazard-prone areas.

Table 24: Fiscal Capabilities

Financial	Yes/No	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	The FY 2022-2027 CIP includes funding allocated to mitigation-focused programs as follows: Annual Vegetation Maintenance: $1,500,000 Fire Engine Access Improvement Program: $300,000 Annual Slide Repair Program: $645,245 Bridges and Culverts Repair Program: $375,000 The Mill Valley Public Financing Authority is a JPA for public financing of the CIP through issuance of revenue bonds.
Authority to levy taxes for specific purposes	Y	The Municipal Service Tax is set at $266 per single family residence with an annual adjustment of 2% to keep up with inflation. The funds generated by the MST go to the maintenance, repair and improvement of streets and roads, as well as fire suppression activities including vegetation removal. The MST could continue to fund future mitigation activities. The General Fund “all purpose” tax sources could also be used for mitigation activities.
Fees for water, sewer, gas, or electric services	Y	Mill Valley collects funds on the tax roll for sewer fees and these fees are used to reduce inflow and infiltration. Funding could possibly fund future mitigation activities. The City does not tax utilities other than a PGE franchise fee. Water is provided by MMWD which is a special district.
Impact fees for new development	Y	New developments are subject to road impact fees and drainage charges which are used toward roadway repair and maintenance. Funding could possibly fund future mitigation activities.
Storm water utility fee	Y	Stormwater fees are assessed for certain types of private development projects. These fees are a parcel tax placed on the property tax roll. Funds from these fees go towards public stormwater improvements as well as the City’s Marin Countywide Stormwater Pollution Prevention Program (MCSTOPPP) member agency fees.

Table 24: Fiscal Capabilities		
Financial	**Yes/No**	**Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?**
Incur debt through general obligation bonds and/or special tax bonds	Y	The City provides payments on the CFD 1996-1 Library Renovation Bond, 2009 Clean Renewable Energy Bond for a solar array, 2011 Community Center COPS, 2021 Sewer Fund Capital Improvement Bond, which could fund mitigation activities.
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	N	

Table 166: City of Mill Valley Fiscal Capabilities
Source: **City of Mill Valley**

3.2.4 COMMUNITY OUTREACH

The outreach and partnerships capability assessment shows outreach and public education programs available to the City of Mill Valley and the City of Mill Valley partnerships utilized to promote those programs.

Table 25: City of Mill Valley Community Outreach		
Outreach and Partnerships	**Yes/No**	**Could the program/organization help implement future mitigation activities?**
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	Mill Valley's Community Engagement Coordinator collaborates with schools, businesses, and faith-based organizations and provides emergency preparedness materials and trainings. This position provides online and print guides for emergency preparedness tailored to a variety of populations in the community (including employees, faith-based organizations, and business/organization leaders). This position creates ongoing content for a social media presence for the Mill Valley Emergency Preparedness Commission, serves as an on-call resource for emergency preparedness information, and provides support for local schools for annual emergency drills. The Mill Valley Emergency Preparedness Commission (EPC), comprised of 7 volunteer residents and supported by first responder staff, educates residents, businesses, non-profit organizations, and schools on risk awareness and disaster preparedness. The EPC engages in frequent community outreach events, providing preparedness education, and assists fire and police staff in hosting evacuation drills. Recent successes include educational

Table 25: City of Mill Valley Community Outreach		
Outreach and Partnerships	**Yes/No**	**Could the program/organization help implement future mitigation activities?**
		videos, guidance for families in how to create emergency plans, and formation of a Neighborhood Response Group. The Southern Marin (formerly Mill Valley) Community Emergency Response Team (CERT) is comprised of citizens from Mill Valley and surrounding unincorporated communities who have taken a hands-on 20-hour training provided jointly by Southern Marin Fire District, Mill Valley Fire Department, Larkspur Fire Department, Tiberon Fire District, and Marin County Fire Department. Training covers disaster first aid/triage, emergency preparedness, fire prevention/suppression, light search and rescue, and utilities. Mill Valley Neighborhood Response Groups are grassroots-led neighborhoods that prepare as a community for emergencies such as earthquakes and floods. Each group of 15-20 homes has a team of block captains to look after residents within their block. As of 2022 there are 9 designated NRGs in Mill Valley and additional NRGs in Tam Valley and other surrounding unincorporated areas. Sustainable Mill Valley is a local non-profit committed to building a community that is zero carbon, zero waste, water smart, and environmentally safe. Reusable MV, a subgroup of Sustainable Mill Valley, works to eliminate single-use disposables and champion a reusable culture. Resilient Neighborhoods is a nonprofit that brings people together and empowers them to do something about climate change by creating low-impact households, adopting sustainable lifestyle practices, strengthening communities and preparing for emergencies. One Tam is a nonprofit partnership between the National Park Service, California State Parks, Marin Municipal Water District, Marin County Parks and Golden Gate National Parks Conservancy to support ecological restoration, wildlife monitoring, and use and enjoyment of Mount Tamalpais. Clean Mill Valley is a nonprofit focused on litter prevention. Mill Valley Streamkeepers focuses on protecting and improving Mill Valley's watersheds, in collaboration with Watershed Alliance Marin. The combined organizations of Clean Mill Valley, StreamKeepers and Marin Clean Highways, and other activists from throughout Marin County are known as "Clean Marin."
Ongoing public education or information program (e.g., responsible water use, fire safety,	Y	The City website contains links to a wide variety of mitigation information and training opportunities. https://www.cityofmillvalley.org/210/Emergency-Preparedness Neighborhood Response Groups hold a semi-annual

Table 25: City of Mill Valley Community Outreach		
Outreach and Partnerships	**Yes/No**	**Could the program/organization help implement future mitigation activities?**
household preparedness, environmental education)		OK/HELP drill that helps practice how neighborhoods would react after a disaster that doesn't require evacuation. The last drill was held 3/12/23. The Southern Marin Fire District hosts Firewise Communities and NFPA Defensible Space classes as well as free CPR classes at the Mill Valley Community Center. In September 2023, the Emergency Preparedness Commission and SMFD helped the Mill Valley Library lead weekly preparedness workshops for Emergency Preparedness Month, with focuses on fire readiness and defensible space; Go Bag; making a plan; evacuation and community refuge areas; and basic first aid/CPR. Also, the Marin Wildfire Prevention Authority (MWPA) and the Mill Valley Public Library recently held a focus group on perceptions of wildfire risk and access to prevention and preparation resources. The MWPA will use these perspectives to inform program design in coming years to best meet the needs of Marin County residents. In 2022, the Emergency Preparedness Commission provided disaster preparedness education at many Mill Valley community events such as Earth Day, Memorial Day Pancake Breakfast, Mill Valley Campout, Family FunFest, National Night Out, Truck or Treat, and Winterfest. At these events the EPC and staff helped residents sign up for alerts, encouraged them to think about evaluation methods and routes, guided them on emergency supplies, and crafting an emergency plan. The EPC also met with cub scouts and parents to educate about emergencies. In 2022, Public Safety officials held five neighborhood evacuation drills in Mill Valley in the Cascade, Almonte, Shelter Ridge, and Tam Valley neighborhoods. Staff and CERT collaborated to create a video demonstrating how to park vehicles on narrow roads to allow for emergency access. Staff also created a 4-page emergency preparedness guide for businesses in Mill Valley. Mill Valley EPC also participated in Marin County's annual Stop the Bleed/Sidewalk CPR Program.
Natural disaster or safety related school programs	Y	There is a Mill Valley School District EPC and a Mill Valley High School EPC. Mill Valley School District emergency preparedness resources can be found online: https://www.mvschools.org/domain/393. Resources include an emergency preparedness plan, emergency communications protocols, and videos on important topics such as earthquakes, go bags, first aid, and search and rescue.

Table 25: City of Mill Valley Community Outreach		
Outreach and Partnerships	**Yes/No**	**Could the program/organization help implement future mitigation activities?**
		In 2022, city staff ensured that firefighters and police were on scene to provide feedback at all public school sites for the Mill Valley School District's annual disaster drill. Staff also arranged site assessments for school facilities and grounds with the Mill Valley Policy and Marin County Sheriff's office.
StormReady certification	N	Marin County is a National Weather Service StormReady and TsunamiReady site. City of Mill Valley has not participated in this program.
Firewise Communities certification	Y	Multiple neighborhoods and homeowners associations are Firewise Communities: Mill Valley Meadows Homeowner's Association; Marsh Drive Homeowner's Association; Middle Ridge Homeowner's Association; Shelter Ridge Homeowner's Association; Blithedale Highlands Owner's Association; Scott Valley Homeowner's Association; Scott Highland Neighborhood Association; Edgewood Cypress & Lower Edgewood Neighborhoods; Alto Sutton Neighborhood. These groups can provide future mitigation support through education and public engagement.
Community Rating System	N	Marin County is a CRS participating community as of 5/1/2016. City of Mill Valley has not participated in this program.
Public-private partnership initiatives addressing disaster-related issues	Y	ReadyMarin is a comprehensive source of emergency preparedness information for Marin County, and coordinates public agency resources and neighborhood response groups. In September 2021, City of Mill Valley partnered with Google to conduct its Annual Evacuation Drill. The drill was a timed event to help validate Google's current evacuation research. https://www.cityofmillvalley.org/778/Evacuation-Drill

Table 167: City of Mill Valley Community Outreach
Source: **City of Mill Valley**

3.2.5 Participation in the National Flood Insurance Program

Given the flood hazard in the planning area, an emphasis will be placed on continued compliance with the National Flood Insurance Program (NFIP). Detailed below is a description of the City of Mill Valley's flood management program to ensure continued compliance with the NFIP.

The City of Mill Valley has participated in the Regular Phase of the NFIP since January 3, 1979. Since then, the City has administered floodplain management regulations that meet or exceed the minimum requirements of the NFIP. Under that arrangement, residents and businesses paid the same flood insurance premium rates as most other communities in the City. The Community Rating System (CRS) was created in 1990. It is designed to recognize floodplain management activities that are above and beyond the NFIP's minimum requirements. City of Mill Valley is not currently a CRS participant.

In addition to the capabilities in the municipal code regarding floodplains, the City of Mill Valley has additional capabilities. Table 26 shows the City of Mill Valley's participation in and continued compliance with the NFIP, and identifies areas for improvement that could be potential mitigation actions.

Table 26: City of Mill Valley NFIP Status

NFIP Topic	Comments
Insurance Summary	
How many NFIP policies are in the community? What is the total premium and coverage?	417 active contracts. Total premium/net payment $916,969.
How many claims have been paid in the community? What is the total amount of paid claims? How many of the claims were for substantial damage?	213 claims filed. $1,924,940 paid. 21 of the paid claims were for > $20,000.
How many structures are exposed to flood risk within the community? *"flood risk" is defined as the 1% annual chance flood (100-year flood. Numbers are from overlay of FEMA SFHA and building stock data.	597
Describe any areas of flood risk with limited NFIP policy coverage	49.1% of properties located in a FEMA special flood hazard area in Mill Valley have flood insurance.
Staff Resources	
Is the Community Floodplain Administrator or NFIP Coordinator certified?	No
Is floodplain management an auxiliary function?	Yes
Provide an explanation of NFIP administration services (e.g., permit review, GIS, education or outreach, inspections, engineering capability)	The City has a dedicated website with resources for properties located in the floodplain. Projects in the floodplain are evaluated for whether they meet the threshold for "substantial improvement" and compliance with Title 18 of the Mill Valley Municipal Code. https://www.cityofmillvalley.org/239/Floodplain-Management-and-Construction-i.
What are the barriers to running an effective NFIP program in the community, if any?	The Planning & Building Department Director functions as the floodplain administrator. There is not specialized staff running this program for Mill Valley.
Compliance History	
Is the community in good standing with the NFIP?	Yes
Are there any outstanding compliance issues (i.e., current violations)?	No
When was the most recent Community Assistance Visit (CAV) or Community Assistance Contact (CAC)?	Unknown

Is a CAV or CAC scheduled or needed?	No
Regulation	
When did the community enter the NFIP?	January 3, 1979
Are the FIRMs digital or paper?	Digital dynamic and printable FIRMs are available from the FEMA Flood Map Service Center. https://msc.fema.gov/portal/home
Do floodplain development regulations meet or exceed FEMA or State minimum requirements? If so, in what ways?	Title 18 of the Mill Valley Municipal Code meets FEMA and State minimum requirements. See explanation below.
Provide an explanation of the permitting process.	Title 18 of the Mill Valley Municipal Code implements a permitting process for properties located in floodzones. The ordinance clarifies that no development is allowed in floodways, and projects considered to be "substantial improvement" in a floodplain triggers special construction standards such as floodproofing and elevation above base flood elevation. These construction standards reduce risk of damage from future flood events. Title 18 standards must be met as a condition of approval of a building permit in a floodplain.
Community Rating System (CRS)	
Does the community participate in CRS?	No
What is the community's CRS Class Ranking?	N/A
What categories and activities provide CRS points and how can the class be improved?	N/A
Does the plan include CRS planning requirements	N/A

Table 168: City of Mill Valley NFIP Status
Source: FEMA, City of Mill Valley

NFIP Insurance Coverage Details

The City of Mill Valley joined the NFIP on January 3, 1979. The city does not participate in the Community Rating System. NFIP insurance data indicates that as of July 25, 2023, there were 417 policies in force in the City with $916,969 in premiums. There have been 213 claims filed and 142 closed paid losses totaling $1,924,940. Twenty-one of the claims were over $20,000 and may be considered substantial damage losses. All of these losses were in A zones, including six parcels in the AE zone and 15 parcels in the AE floodway. All of the claims over $20,000 were associated with pre-FIRM structures. There were 29 repetitive loss structures in the City. Twenty-seven were in A zones, and two were in X zones. These repetitive loss structures account for $915,886 of the total losses in the City of Mill Valley. There was one severe repetitive loss property in the City totaling $124,123 (775-777

Redwood Highway Frontage Road), but claims were from 1980-1983 and the property is no longer residential.

Repetitive Loss Properties

Repetitive loss records are as follows:

- Number of FEMA-identified Repetitive-Loss Properties: 29
- Number of FEMA-identified Severe-Repetitive-Loss Properties: 1
- Number of Repetitive-Loss Properties or Severe-Repetitive-Loss Properties that have been mitigated: 1
- Repetitive Loss Residential Structures: 29
- Repetitive Loss Non-Residential Structures: 0
- Severe Repetitive Loss Residential Structures: 1
- Severe Repetitive Loss Non-Residential Structures: 0

3.3 MITIGATION GOALS

44 CFR Requirement § 201.6(c)(3)(i) [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long - term vulnerabilities to the identified hazards.

The information developed from the risk assessment was used as the primary basis for developing mitigation goals and objectives. Mitigation goals are defined as general guidelines explaining what each jurisdiction wants to achieve in terms of hazard and loss prevention.

Hazard Risk Prioritization
↓
Mitigation Goals & Objectives
↓
Mitigation Project Identification
↓
Mitigation Project Implementation

Goal statements are typically long-range, policy-oriented statements representing jurisdiction-wide visions. Objectives are statements that detail how each jurisdiction's goals will be achieved, and typically define strategies or implementation steps to attain identified goals. Other important inputs to the development of jurisdiction-level goals and objectives include performing reviews of existing local plans, policy documents, and regulations for consistency and complementary goals, as well as soliciting input from the public.

The following represents overarching strategic goals associated with the identification and eventual implementation of appropriate and meaningful hazard mitigation efforts in relation to prioritized hazards and threats confronting the Marin County OA. These goals form the basis for specific supporting process objectives and are shown from the highest priority, at the top of the list, to those of lesser importance.

The establishment of hazard mitigation goals represents both individual and collective strategies that have been mutually agreed upon by the Steering Committee and have changed with the 2023 MJHMP update. Objectives were added to Goals 2 and 5. Eventually, these goals have been adopted by the Marin County OA and its participating jurisdictions as the guiding policy behind local hazard mitigation efforts, in conjunction with other associated principles.

Goals were defined for the purpose of this mitigation plan as broad-based public policy statements that:

- Represent basic desires of the community;
- Encompass all aspects of community, public and private;
- Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;
- Are future-oriented, in that they are achievable in the future; and
- Are time-independent, in that they are not scheduled events.

Goals are stated without regard to implementation. Implementation cost, schedule, and means are not considered. Goals are defined before considering how to accomplish them so that they are not dependent on the means of achievement. Goal statements form the basis for objectives

and actions that will be used as means to achieve the goals. Objectives define strategies to attain the goals and are more specific and measurable.

Goal 1: Minimize risk and vulnerability of the community to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, and environment in the Marin County OA.

- Minimize economic and resource impacts and promote long-term viability and sustainability of resources throughout the Marin County OA.
- Minimize impact to both existing and future development.
- Provide protection for public health.
- Prevent and reduce wildfire risk and related losses.

Goal 2: Provide protection for critical facilities, infrastructure, utilities, and services from hazard impacts.

- Incorporate defensible space and reduce hazard vulnerability.
- Develop redundancies in utilities and services.
- Enhance resilience through enhanced construction.

Goal 3: Improve public awareness, education, and preparedness for hazards that threaten our communities.

- Enhance public outreach and participation in the Alert Marin Emergency Notification System.
- Enhance public outreach, education, and preparedness program to include all hazards of concern.
- Increase public knowledge about the risk and vulnerability to identified hazards and their recommended responses to disaster events, including evacuation and sheltering options.
- Provide planning and coordination for "At-Risk" populations.
- Provide planning and coordination for companion animals, livestock, and other animal populations.
- Increase community awareness and participation in hazard mitigation projects and activities.

Goal 4: Increase communities' capabilities to be prepared for, respond to, and recover from a disaster event.

- Improve interagency (local, state, federal) emergency coordination, planning, training, and communication to ensure effective community preparedness, response and recovery.
- Enhance collaboration and coordination of disaster-related plans, exercises, and training with local, state, and federal agencies, neighboring communities, private partners, and volunteers.
- Enhance the use of shared resources/Develop a strong mutual aid support system.
- Create and maintain a fully functional, interoperable radio and communication system with all regional public safety partners.

Goal 5: Maintain FEMA Eligibility/Position the communities for grant funding.

- Review hazard events and ongoing hazard mitigation projects annually.
- Assess the need to pursue or adjust hazard mitigation projects after significant hazard events.

Goal 6: Reduce exposure to High Hazard Dams that pose an unacceptable risk to the public.

- Improve alert and warning systems to provide residents downstream of a High Hazard Dam to receive timely warning to evacuation when threatened by potential or imminent dam failure.
- Enhance overall community preparedness to respond and evacuate a potential or imminent dam failure.
- Increase public awareness of the risk posed by High Hazard Dams and the potential for relocation of housing outside a possible inundation zone.
- Prioritize High Hazard Dam Mitigation projects and programs.

3.4 Status of Previous Mitigation Actions

Based on the planning meetings and the progress monitored by the steering committee members several mitigation actions were accomplished since the last planning cycle. Table 27 summarizes the actions that were recommended in the previous version of the hazard mitigation plan and their implementation status at the time this update was prepared.

Table 27: Status of Previous Hazard Mitigation Actions

Action Number / Name	Completed	Ongoing	Not Started	Still Relevant	Included in Updated Action Plan
Perform appropriate seismic and fire safety analysis based on current and future use for all City-owned facilities and structures. *A report was completed several years ago but work is still ongoing.*	X	X			X
Strengthen and/or replace City-owned buildings in the identified prioritized order as funding is available.		X			X
Assessment of Soft-Story Buildings (non-City owned) for Potential Mandated Retrofit Program. *City adopted a soft-story wood frame retrofit ordinance in 2023.*	X	X			X
Reduce hazard vulnerabilities for non-City-owned buildings throughout Mill Valley. Enforce as properties come in for retrofits.		X			X
Reduce fire risk in existing and new development through fire code updates and enforcement. *Fire code was most recently updated December 2022.*		X			X
Reduce fire risk in existing and new development (non-City owned) through vegetation management. *Vegetation management plan is required for new buildings and substantial remodel projects.*		X			X
Collect, analyze and share information with the Mill Valley community about Mill Valley hazards and associated risk reduction activities. *Emergency Preparedness Commission,*		X			X

Table 27: Status of Previous Hazard Mitigation Actions

Action Number / Name	Completed	Ongoing	Not Started	Still Relevant	Included in Updated Action Plan
CERT, and other groups facilitate this information sharing.					
Ensure that the City provides leadership and coordinate with the private sector, public institutions, and other public agencies in disaster mitigation.		X			X
Work with MMWD to ensure an adequate water supply during emergencies and for disaster recovery. *DPW reviews MMWD plans for upgrades in Mill Valley.*		X			X
Streamline the zoning and permitting process to rebuild residential and commercial structures following disasters. *Instead of continuing this action into the new plan, Mill Valley will implement a streamlined process if necessary due to disaster.*			X		
Develop an Energy Assurance Plan for City Operations. *Generators have been accounted for at critical city owned facilities, but task is ongoing because more may be needed in the future.*		X			X
Improve the disaster-resistance of the natural gas delivery system to increase public safety and to minimize damage and service disruption during and after a disaster. *This is a PG&E responsibility so this action will not be carried over into the new plan.*			X		
Rehabilitate and improve the capacity of the City's storm water system to reduce local flooding caused by inadequate storm drainage.		X			X
Reduce Mill Valley's vulnerability to extreme heat events and associated hazards. *Example strategies: SMFD's veg management program, community refuge centers with AC.*		X			X
Reduce Mill Valley's vulnerability to severe storms and associated hazards. *Key strategies include maintaining stormwater infrastructure and undergrounding utilities.*		X			X
Collaborate with local, state, regional and federal partners to increase the security and capacity of Mill Valley's water supply from climate change impacts. *The City coordinates with MMWD on their programs.*		X			X
Maintain City participation in the National Flood Insurance Program.		X			X
Mitigate the impacts of sea-level rise in Mill Valley.		X			X

Table 27: Status of Previous Hazard Mitigation Actions					
Action Number / Name	**Completed**	**Ongoing**	**Not Started**	**Still Relevant**	**Included in Updated Action Plan**
*The City is **building on the work completed as part of the 2017 Marin Shoreline Sea Level Rise Vulnerability Assessment.***					
Ensure that the City provides leadership and coordinate with the private sector, public institutions, and other public agencies in disaster mitigation.		**X**			**X**
Streamline the zoning and permitting process to rebuild residential and commercial structures following disasters.		**X**			**X**
Improve the disaster-resistance of the natural gas delivery system to increase public safety and to minimize damage and service disruption during and after a disaster.		**X**			**X**
Rehabilitate and improve the capacity of the City's storm water system to reduce local flooding caused by inadequate storm drainage.		**X**			**X**
Reduce Mill Valley's vulnerability to extreme heat events and associated hazards.		**X**			**X**
Reduce Mill Valley's vulnerability to severe storms and associated hazards.		**X**			**X**
Collaborate with local, state, regional and federal partners to increase the security and capacity of Mill Valley's water supply from climate change impacts		**X**			**X**

3.5 Hazard Mitigation Actions

The 2023 Marin County OA MJHMP was revised to reflect progress in local mitigation efforts. The planning team for the City of Mill Valley identified and prioritized the mitigation actions as detailed in Table 28, based on the hazard risk assessment and in accordance with the process outline in Section 3, Mitigation Strategy, of the base plan. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. General processes and information on plan implementation and maintenance of this LHMP by all participating jurisdictions is included in Section 4.0: Plan Review, Evaluation, and Implementation. This plan has been created as a "living" document with input from the population and professionals within the City of Mill Valley.

Mill Valley's hazard mitigation actions are supported by the mitigation goals and objectives, and are organized using the following criteria: hazard mitigation goals met; jurisdiction/responsible party; approximate cost; and timeframe of completion. Funding sources are identified for all projects. All actions consider new or existing and will be marked as completed or removed during the five-year life of this plan.

Based on the hazard profiles, threat assessment, capabilities assessment, community survey results, discussions among the Planning Team members, and existing best practices, a set of potential mitigation actions was developed and then evaluated based on the following criteria:

- FEMA requires local governments to evaluate the monetary and non-monetary costs and benefits of potential mitigation actions. Although local governments are not required to assign specific dollar values to each action, they should identify the general size of costs and benefits.
- The Planning Team may elect to include measures with a high cost or low benefits, but such measures should be clearly beneficial to the community and an appropriate use of local resources.

In addition, FEMA directs local governments to consider the following questions as part of the financial analysis:

- What is the frequency and severity of the hazard type to be addressed by the action, and how vulnerable is the community to this hazard?
- What impacts of the hazard will the action reduce or avoid?
- What benefits will the action provide to the community?

The Planning Team also chose to review and revise the potential hazard mitigation actions with consideration for climate impact and social vulnerability. Projects and programs were assessed with consideration of these variables.

Prioritization

As part of the mitigation actions development and review, the Planning Team also prioritized the actions. The prioritization efforts looked at the risks and threats from each hazard; lifesaving, life safety, property protection and lastly environmental protection; financial costs and benefits; technical feasibility; consideration for climate impact, and social vulnerability, and community values. Planning Team members were asked to identify their priority actions using the following criteria.

Implementation priority ratings were assigned as follows:

- **High Priority** - An action that meets multiple objectives, is linked to a high risk hazard, has benefits that exceed costs, and has a potential source of funding. Action can begin within the short term (1 to 5 years).
- **Medium Priority** - An action that meets multiple objectives, is linked to a high or medium risk hazard, has benefits that exceed costs, and is eligible for funding though no funding has yet been secured for it. Action can begin within the short term (1 to 5 years) once funding is secured.
- **Low Priority** - An action that will mitigate the risk of a hazard, has benefits that do not exceed the costs or are difficult to quantify, has no secured source of funding, and is not eligible for any known grant funding. Action can be completed in the long term (1 to 10 years). Low-priority actions may be eligible for grant funding from programs that have not yet been identified.

In addition to the mitigation actions provided in Table 28, all mitigation actions provided Table 4.9 of the MJHMP base document can be pursued in Mill Valley as well, and Mill Valley can seek FEMA funding for both Mill Valley and County hazard mitigation actions..

Table 28: City of Mill Valley Current Hazard Mitigation Actions

Mitigation Action	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
Policies, Codes and Standards						
MV-1: Climate Action Plan. Adopt Mill Valley Climate Action Plan 2030 and implement strategies identified in the plan.	All Hazards/ 1, 2, 3, 4	Mill Valley City Council, Planning + Building Dept, others as ID'd in the CAP	New (2023)	Outstanding cost for EIR: $18,000 (General Fund)	1-10 years/ Medium	Existing CAP dates from 2014. 2030 CAP update has been completed, adoption is scheduled for first quarter 2024.
MV-2: Safety Element. Update Safety Element of the General Plan. [FEMA Project MU-4 Adopt Development Regulations in Hazard Areas]	All Hazards/ 1, 2, 4, 5	Mill Valley Planning + Building Dept	New (2023)	Cost TBD (General Fund, grants as needed)	1 – 3 years/ High	Safety Element of the General Plan last updated 2014. Additional update planned to further align with state law and other long-term city plans.
MV-3: Building and Fire Code. Review and adopt current California Building and Fire codes. Amend Fire Code to reduce damage to structures from hazard risk specific to Mill Valley. [FEMA Project MU-8 Adopt and Enforce Building Codes]	Wildfire/All Hazards/ 1,4	Mill Valley Planning + Building Dept, SMFD	Existing (2018)	Cost TBD (Approx $10,000, General Fund)	1 – 3 years/ High	The Building and Fire codes were most recently updated December 2022. Mill Valley continues to review and adopt current California Building and Fire codes with updates specific to Mill Valley as necessary.
MV-4: NFIP. Continue to maintain good standing and compliance under National Flood Insurance Program through implementing floodplain management programs. [FEMA Project F-8 Join or Improve Compliance with NFIP]	Flooding/ 5	Mill Valley Planning + Building Dept	Existing (2018)	See floodplain management projects.	Ongoing	
Private Development						
MV-5: Soft-Story Buildings. Assessment and retrofit of soft-story buildings (non-City owned). [FEMA Project EQ-2 Incorporate Earthquake Mitigation into Local Planning]	Earthquake/1	Mil Valley Planning + Building Dept	New (2023)	Cost will be covered by Plan Check and Building Permit Fees	1 – 6 years/ Medium	In June 2023 the City Council adopted a soft-story wood frame retrofit ordinance with three required compliance tiers.

Table 28: City of Mill Valley Current Hazard Mitigation Actions						
Mitigation Action	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
MV-6: Building Safety. Reduce hazard vulnerabilities for buildings throughout Mil Valley. Enforce as properties come in for retrofits. [FEMA Project EQ-1: Adopt and Enforce Buildings Codes]	All Hazards/ 1	Mill Valley Planning + Building Dept, SMFD	Existing (2018)	Cost is covered by Plan Check and building Permit fees.	Ongoing/ High	Planning and Building Permit plan check process includes review for code compliance by Planning, Building, DPW, and SMFD.
MV-7: Roadway and driveway safety. As new development occurs, roadways and driveways are required to be of minimal 12 to 20 foot width and with approved turnarounds and/or turnouts.[FEMA Project WF-3: Reduce Risk through Land Use Planning]	All Hazards/ 1, 2, 4, 5	Mill Valley Public Works Dept, SMFD	New (2023)	Cost is covered by project applicants in most cases.	1 – 3 years/ High	
MV-8: Vegetation Management. Reduce fire risk in existing and new private development in the Wildland Urban Interface through Vegetation Management Plans. [FEMA Project WF-9 Implement a Fuels Management Program]	Wildfire/ 1	SMFD	Existing (2018)	Cost is covered by plan check fees. HMGP, BRIC, CDAA Grant funding needed for larger projects	Ongoing/ High	VMPs are required for new buildings and substantial remodel projects, reducing the chance of a wildland fire igniting structures and reciprocally, wildland ignition from a structure fire.
City Facilities and Infrastructure						
MV-9: MERA. Conduct Marin Emergency Radio Authority (MERA) Upgrades. [FEMA Project MU-13 Protect Infrastructure and Critical Facilities]	All Hazards/ 1, 2, 3, 4, 5	Marin County and City of Mill Valley	New (2023)	Cost: TBD (Taxes, State and/or Federal grants)	Ongoing/ High	City is participant, also studying replacement for the system as it reaches the end of its service life.
MV-10: City Building Assessment and Upgrade. Perform appropriate seismic and fire safety analysis based on current and future use for all City-owned facilities and structures. Strengthen and/or replace city-owned buildings in the identified prioritized order as funding is available. [FEMA Project MU-13 Protect Infrastructure and Critical Facilities]	Earthquake, Wildfire, All Hazards/ 2	Mill Valley Public Works and Planning + Building Depts, SMFD	Existing (2018)	$250,000/year (General Fund), bond	Ongoing/ Medium	City Hall was retrofitted in 1990s. City completed a facilities assessment in 2018. Work to implement this plan is ongoing via Annual Civic Building Upgrade Program.

Table 28: City of Mill Valley Current Hazard Mitigation Actions						
Mitigation Action	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
MV-11: Community Refuge Centers. Enhance Community facilities to support the socially vulnerable population during extreme heat and other extreme weather events. [FEMA Project ET-3 Assist Vulnerable Population]	Severe Weather – Extreme Heat/All Hazards/ 1,2,3	Mill Valley Public Works Dept, SMFD	New (2023)	Cost TBD (HMGP, BRIC, CDAA, Private Grants)	1 - 2 years/ High	Provide community refuge centers with AC and other accommodations for emergencies. Example: Mill Valley Library
MV-12: Energy Resilience. Enhance resilience of power supply for city facilities during emergencies. [FEMA Project MU-13 Protect Infrastructure and Critical Facilities]	All Hazards/ 2	Mill Valley Public Works Dept, SMFD, PG&E	Existing (2018)	Cost TBD (General Fund or grant as needed)	Ongoing - 2-5 years/ Medium	Generators have been accounted for at critical city owned facilities, but task is ongoing because more may be needed in the future.
MV-13. Corporation Yard Master Plan. Evaluate flooding potential and develop master plan to improve facilities. Construct a 1,300 linear foot perimeter flood wall and install flood gate system to protect Mill Valley DPW assets and SASM WWTP. [FEMA Project MU-13 Protect Infrastructure and Critical Facilities]	Flooding/ 2	Mill Valley Public Works Dept	New (2023)	$7,000,000 General CIP Fund for Master Plan improvement plus $3,000,000 HMGP, BRIC, CDAA, FMA grant/FEMA OES for flood wall	Ongoing - 2-5 years/ Medium	
MV-14: Severe Storms. Reduce Mill Valley's vulnerability to severe storms and associated hazards. [FEMA Project SW-4 Protect Power Lines and Infrastructure]	Severe Weather- Wind, Tornado/ 1,2	Mill Valley Public Works Dept	Existing (2018)	Cost TBD (General Fund, Flood Control Zone 3, HMGP, BRIC, CDAA grants as needed)	Ongoing - 2-5 years/ Medium	Example projects: Undergrounding power lines on E Blithedale Ave, widening stormwater pipes on Miller Ave. These are the city's two main evacuation routes.
MV-15: Storm Water System. Rehabilitate and improve the capacity of the City's storm water system to reduce local flooding caused by inadequate storm drainage. [FEMA Project F-13 Improve Stormwater Drainage System Capacity]	Flooding, Severe Weather – Wind, Tornado/ 2	Mill Valley Public Works Dept	Existing (2018)	Specific projects are costed out in the CIP, cost covered by General Fund, Flood Control Zone 3, HMGP, BRIC, CDAA Grants	Ongoing - 2-5 years/ Medium	Specific project planning in progress: replace Mill Valley's Sycamore Stormwater Pump Station ($1.9 Million, 2024/2025)

Table 28: City of Mill Valley Current Hazard Mitigation Actions						
Mitigation Action	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
MV-16: Flood Control Pumps. Update or enhance flood control pump stations and gravity storm lines around town. This will also include maintaining and dredging existing flood control open channels and canals. [FEMA Project F-14 Conduct Regular Maintenance for Drainage Systems and Flood Control Structures]	Flooding, Sea Level Rise/ 1, 2, 4, 5	Mill Valley Public Works Dept	New (2023)	Cost TBD (HMGP, FMA, CDAA)	Ongoing - 2-5 years/ Medium	Implement projects in the Flood Management and Drainage Master Plan.
MV-17: Sewer System. Implement Annual Sewer Rehabilitation Program. [FEMA Project F-18 Protect Critical Facilities]	Flooding/Sea Level Rise/All Hazards/ 2	Mill Valley Public Works Dept	New (2023)	$2,400,000/year (Annual Sewer Service Charge)	Ongoing - 2-5 years/ Medium	Annually the city designs and constructs sewer projects around the city.
MV-18: Sanitation Pumps. Implement Sanitation Pump Station Improvement Program. [FEMA Project F-18 Protect Critical Facilities]	Flooding/Sea Level Rise/All Hazards/ 2	Mill Valley Public Works Dept	New (2023)	$1,250,000 (Annual Sewer Service Charge)	Ongoing - 2-5 years/ Medium	
MV-19: Sea Level Rise. Adaptation projects to protect against flooding and sea level rise including raising structures out of the flood zone, raising road elevations, and other projects implementing and building on the 2017 Marin Shoreline Sea Level Rise Vulnerability Assessment. [FEMA Project F-15 Elevate or Retrofit Structures and Utilities]	Flooding, Sea Level Rise/ 1, 2, 4, 5	Mill Valley Public Works and Planning + Building Depts	New (2023)	Cost TBD (Flood Control Zone 3, HMGP, BRIC, CDAA, FMA Grant funding)	1 - 5 years/ Medium	
MV-20: Water Supply. Work with MMWD to ensure an adequate water supply during emergencies and for disaster recovery. [FEMA Project D-3 Monitor Water Supply]	All Hazards/ 1,2,4	Mill Valley Public Works Dept, MMWD	Existing (2018)	This work is funded through MMWD	Ongoing - 2-5 years/ Medium	DPW reviews MMWD plans for upgrades in Mill Valley.
MV-21: Fire Engine Access Improvements. Hillside neighborhoods adaptation projects to protect against wildfire risk including widening narrow roads and adding road pullouts, increasing number of emergency egress roads from neighborhoods, continue	Wildfire/ 1, 2, 4, 5,	Mill Valley Public Works Dept, SMFD	New (2023)	$100,000/year (General CIP Fund, Municipal Service Tax), grants	Ongoing - 1-2 years/ High	

Table 28: City of Mill Valley Current Hazard Mitigation Actions

Mitigation Action	Hazards Mitigated/ Goals Met	Jurisdiction/ Responsible Agency	New, Existing, Completed, Removed	Estimated Cost and Potential Funding Source	Timeline/ Priority	Comments/ Progress
vegetation management in highest risk areas, and other projects listed in the assessment.						
MV-22: Annual Vegetation Maintenance Program. Conduct maintenance to reduce fuel sources and maintain evacuation routes on City ROW and on City owned lands. [FEMA Project WF-10 Implement a Fuels Management Program]	Wildfire/ 1,2	SMFD	New (2023)	$550,000/year (MST, Marin Wildfire Prevention Authority Measure C)	Ongoing - 1 - 2 years High	Ongoing program since 1997.
MV-23: Power Line Vegetation Maintenance. Coordinate with PG&E to conduct vegetation management around at risk power lines and electrical line undergrounding projects. [FEMA Project WF-7 Create Defensible Space Around Structures and Infrastructure]	Wildfire/ 1, 2, 4, 5,	PG&E, Mill Valley DPW, Marin County, SMFD	New (2023)	Cost TBD (HMGP, BRIC, CDAA Grants as needed)	1 - 2 years High	Pursue targeted vegetation management by in house staff with grant funding if utility does not address this issue.
MV-24: Steps, Lanes and Paths. Maintain and improve SLP pedestrian evacuation network through the SLP Annual Maintenance Program and SLP Design and Construction Program.	All Hazards/ 1,2	Mill Valley Public Works Dept	New (2023)	Maintenance: $85,000/year (General CIP Fund, MST) Design: $50,000/ year (General CIP Fund)	Ongoing - 2-5 years/ Medium	
MV-25: Landslide Repair. Implement the City's Annual Slide Repair Program to repair landslides in the public ROW and on City properties and lower risk of future slides. [FEMA Project ER-5 Stabilize Erosion Hazard Areas]	Debris Flow/ 1,2	Mill Valley Public Works Dept	New (2023)	$250-$300,000/year (General CIP Fund)	Ongoing - 2-5 years/ Medium	This program includes emergency response and cleanup of hillside slides as well as design and construction of roadway stabilization projects.
Outreach and Coordination						
MV-26: Hazard Information. Collect, analyze and share information with the Mill Valley community about Mill Valley hazards and associated risk reduction activities. [FEMA Project MU-14 Increase Hazard Education and Risk Awareness]	All Hazards/ 3	SMFD, Emergency Preparedness Commission, CERT	Existing (2018)	$10,000 (EPC Budget), SMFD costs for outreach as needed	1 - 2 years High	Activities include Emergency Preparedness Commission meetings and trainings, SMFD trainings and demonstrations, CERT trainings, Neighborhood Response Group meetings

Table 28: City of Mill Valley Current Hazard Mitigation Actions						
Mitigation Action	**Hazards Mitigated/ Goals Met**	**Jurisdiction/ Responsible Agency**	**New, Existing, Completed, Removed**	**Estimated Cost and Potential Funding Source**	**Timeline/ Priority**	**Comments/ Progress**
MV-27: Community Groups. Continue to encourage neighborhoods and community members to participate in programs such as Firewise Communities, Neighborhood Response Groups, CERT, and other community organizations.	All Hazards/ 3	Mill Valley City Manager, SMFD	New (2023)	TBD (General Fund)	Ongoing - 2-5 years/ Medium	
MV-28: Build Internal Capacity. Recognize and address gaps in capacity for emergency preparedness.	All Hazards/ 4	Mill Valley City Manager, Public Works and Planning + Building Depts, SMFD	New (2023)	TBD (General Fund, HMGP, BRIC, CDAA, FMA grants as needed)	1-5 years/ Medium	Examples: staff training on floodplain administration; GIS license/training to map and analyze hazard risks more comprehensively.
MV-29: Partnerships. Ensure that City provides leadership and coordinate with the private sector, public institutions, and other public agencies in disaster mitigation.	All Hazards/ 4	Mill Valley City Manager, Public Works and Planning + Building Depts, EPC, SMFD	Existing (2018)	Cost: $10,000 (EPC Budget), additional budget as needed	Ongoing - 2-5 years/ Medium	
MV-30: Water Security. Collaborate with local, state, regional and federal partners to increase the security and capacity of Mill Valley's water supply from climate change impacts.	Drought/ 1	Mill Valley City Manager, Public Works and Planning + Building Depts, MMWD	Existing (2018)	Cost TBD: HMGP, BRIC, CDAA, Private Grants	Ongoing - 2-5 years/ Medium	MMWD leads this effort.
MV-31: Cybersecurity. Enhance resiliency of city systems to cyberattacks to improve resiliency in an emergency.	All Hazards/ 4	Mill Valley City Manager	New (2023)	Cost TBD (General Fund, Private Grants)	1-5 years/ Medium	

Table 170: City of Mill Valley Current Hazard Mitigation Actions

3.6 PLAN INTEGRATION

For hazard mitigation planning, "integration" means that hazard mitigation information is used in other relevant planning mechanisms, such as general planning, capital facilities planning, emergency management, hazard specific planning, and that relevant information from those sources is also used in hazard mitigation. This section identifies where such integration is already in place from the 2018 MJHMP, and where the 2023 MJHMP will be used for further integration.

Public Works, SASM, Southern Marin Fire District, and Planning & Building staff for the City of Mill Valley will maintain this plan and will share responsibility for grant project applications on City projects selected for application under the Hazard Mitigation Assistance grant programs.

An important implementation mechanism that is highly effective and low-cost is incorporation of the hazard mitigation plan recommendations and their underlying principles into city plans and mechanisms. Where possible the City of Mill Valley will use existing plans and/or programs to implement hazard mitigation actions. Mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and development. As described in this plan's capability assessment, the City of Mill Valley already implements policies and programs to reduce losses to life and property from hazards. This plan builds upon the momentum developed through previous and related planning efforts and mitigation programs and recommends implementing actions, where possible, through these other program mechanisms. These existing mechanisms include Integration opportunities for the 2023 Marin County OA MJHMP:

City General Plan - Integrates hazard mitigation through the consideration of hazards most likely to impact the City.

City Emergency Operations Plans – Integrates hazard mitigation through the consideration of the City's planned response to hazards most likely to impact the City.

County, City and Town Ordinances - Integrates hazard mitigation through the consideration of plans and policies outlined in the capability assessments in the jurisdictional annexes.

Flood/Storm Water Management/Master Plans - Integrates hazard mitigation through the consideration of strategies to reduce flood risk and storm water management for the protection of life and property.

Community Wildfire Protection Plan - Integrates hazard mitigation through the consideration of strategies to reduce fire hazard and the risk of catastrophic wildfires in the WUI, while promoting the protection and enhancement of the county's economic assets and ecological resources.

Capital improvement plans and budgets - Integrates hazard mitigation through the consideration of strategies for the development and funding of critical facilities and infrastructure.

The successful implementation of this mitigation strategy will require review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. A few examples of incorporation of the MJHMP into existing planning mechanisms include:

16. As recommended by Assembly Bill 2140, each community should adopt (by reference or incorporation) this MJHMP into the Safety Element of their General Plans. Evidence of adoption (by formal, certified resolution) shall be provided to CalOES and FEMA
17. Integration of flood actions identified in this mitigation strategy with the actions and implementation priorities established in existing Flood Management Programs
18. Using the risk assessment information to update the hazards section in the County, City and Town Emergency Operations Plans

Efforts should continuously be made to monitor the progress of mitigation actions implemented through these other planning mechanisms and, where appropriate, their priority actions should be incorporated into updates of this hazard mitigation plan.

3.7 Future Development Trends

The City of Mill Valley has established two primary goals in the MV2040 General Plan: 1. To protect and enhance the natural beauty and small-town character of Mill Valley; and 2. To encourage continued diversity of housing, income levels, and lifestyles in the community.

While Mill Valley has experienced only modest population growth over the past several decades, analysis of the City's demographic and household characteristics illustrates changes in the make-up of the population that may result in higher population growth.

Demographic data for Mill Valley indicate that senior citizens continue to represent a growing segment of the community, currently comprising 24 percent of Mill Valley residents, compared to just 19 percent a decade ago.

Most young adults depart Mill Valley in their early 20s and are replaced by parents in their 30s with school-age children. This appears to be attributable to a "demographic shift" in existing single-family housing occupancy, as elderly "empty nesters" seek smaller units closer to shopping and services and are replaced by young families with school-age children. This trend anticipates that older, single or two-occupant households in existing single-family homes in Mill Valley will continue to turn over to younger households with school age children over the long term, thereby yielding a significant net increase in population growth.

This trend could significantly affect community facilities and services (especially traffic, schools, and recreational facilities) beyond what is addressed by the City of Mill Valley General Plan's policies and programs assuming Association of Bay Area Governments (ABAG) population estimates.

As detailed in the "Climate Change and Future Development Considerations" section of each hazard profile, development in Mill Valley has occurred and will continue to occur throughout the town in areas prone to all of its identified hazards. Increased growth in these areas may increase the vulnerability of people and structures to these hazards.

SECTION 4.0: PLAN REVIEW, EVALUATION, AND IMPLEMENTATION

The strategies presented are deemed appropriate and effective by recommendation of the City of Mill Valley.

4.1 PLAN ADOPTION

Upon submission to the California Office of Emergency Services (CalOES) for review, and subsequent approval by the Federal Emergency Management Agency (FEMA), the Marin County OA MJHMP will be presented to local government for formal adoption. As appropriate, the adopted plan and accompanying City of Mill Valley Community Profile will then be incorporated into local general plans for integration into organizational policy.

4.2 PLAN MONITORING

The process of hazard mitigation does not end with the completion, approval, and adoption of the Marin County OA MJHMP. During the five-year lifespan the Marin County and City of Mill Valley plan, the County, cities, towns and special districts, along with community-based organizations will ensure that the mitigation goals and strategies identified are exercised and monitored under a collaborative and cooperative umbrella, and that the document itself is properly maintained.

The Marin County Office of Emergency Management, as lead coordinating agency for hazard mitigation planning within the Marin County OA, leads the Marin Operational Area Hazard Mitigation Working Group that meets quarterly to review and manage the plan, projects, and programs. The City of Mill Valley is a participating member of the Marin Operational Area Hazard Mitigation Working Group. The City of Mill Valley Planning and Building Director will monitor and update the City of Mill Valley Annex to the Marin County OA MJHMP.

The review will identify changing community priorities, updated or new planning documents and the progress or status of the mitigation actions as detailed in the mitigation strategy. Additional questions to complete the review will be considered as follows:

- Do the goals address current and expected conditions?
- Are the goals and objectives consistent with changes in the local, state, and federal policy?
- Status updates on all mitigation actions?
- Have the hazards or risks changed?
- Are current resources appropriate for implementing the MJHMP?
- Have the outcomes occurred as expected?
- Is the County and jurisdictions or districts participating in the plan implementation process as expected?

The Working Group is a subgroup of the Marin Disaster and Citizens Corps Council. During the five-year update cycle, the Marin Operational Area Hazard Mitigation Working Group will have quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. Further, Marin OEM will host an annual one-day mitigation summit to increase engagement and enhance collaboration on the plan and projects. The summit will also have the

goal to educate stakeholders on innovative approaches to mitigation, trends, and new plan requirements. Marin OEM, as the host, will seek subject matter experts, state and federal officials, and representatives from within the Marin OA to speak to mitigation and planning. The knowledge gathered and the coordination facilitated during the summit will be used to update the base plan and annexes.

Marin OEM has the capacity to lead the Working Group and Multi-Jurisdictional Planning with one coordinator assigned with direct maintenance of the plan, a department analyst assigned to support the coordinator with project and grant tracking, and a community preparedness coordinator assigned with conducting regular public outreach on the plan and education on mitigation. Community feedback and integration will continue through outreach events and OEM website, where residents and visitors are invited to provide feedback through a survey, available in English or Spanish.

Specific plan maintenance activities by the Marin County Office of Emergency Management and its participating jurisdictions/special districts may include:

- Hold quarterly update meetings with the Hazard Mitigation Planning Committee and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions.
- Annual Hazard Mitigation Summit
- Holding public meetings after the first quarter and third quarter update meetings.
- Maintaining the Marin County OEM Hazard Mitigation Website, which provides the public with the ability to access identified hazard impact maps, location address search capability, and a listing of hazard mitigation actions.
- Monitoring of the Marin County and all participating jurisdiction mitigation project activities and dissemination of status reports.
- Generation of reports relative to plan status, project management, and revision updates to executive leadership.
  Preparations for the plan's future revision and updating.

4.3 Plan Evaluation

Upon approval and adoption by the City of Mill Valley, the prioritized mitigation strategies will be further developed for funding and implementation by the lead agencies. The plan describes the potential sources of hazard mitigation funding, and general procedures to obtain that funding.

The mitigation strategies represented and adopted within this plan are recommendations only and must be approved and funded in order to be implemented as official mitigation solutions. Ultimately, it is the responsibility of jurisdictional and agency officials within the Marin County to undertake project implementation based upon identified mitigation strategies, funding availability, and local need when it arises. The Marin County Office of Emergency Management will meet with the Marin Operational Area Hazard Mitigation Working Group, including the City of Mill Valley, to evaluate the plan after each update meeting.

4.4 Plan Update

The City of Mill Valley Planning and Building Director will monitor and update the City of Mill Valley Annex to the Marin County OA MJHMP. During the five-year update cycle, the City of Mill

Valley and the Marin County Office of Emergency Management will hold quarterly update meetings with the Marin Operational Area Hazard Mitigation Working Group and local stakeholders to discuss revisions to the plan and progress updates for the hazard mitigation actions. The Marin County Office of Emergency Management and all participating jurisdictions and special districts will continue to hold public meetings after the first quarter and third quarter update meetings annually and will continue to invite public participation in the update process via updated public surveys.

ACKNOWLEDGEMENTS

The North Marin Water District and Preparative Consulting would like to thank those collaborators and partners who participated in the planning and development of this document.

The official Marin County hazard mitigation Steering Committee provided the oversight and dedication to this project that was required, and without their commitment, this project would not be possible.

As with any working plan, this document represents planning strategies and guidance as understood as of the date of this plan's release. This plan identifies natural hazards and risks and identifies the hazard mitigation strategy to reduce vulnerability and make the communities and district of the North Marin Water District more disaster resistant and sustainable.

SECTION 1.0: INTRODUCTION

1.1 INTRODUCTION

The North Marin Water District Profile has been prepared in conjunction with the Marin County Multi-Jurisdictional Hazard Mitigation Plan (MJHMP), establishing an inter-jurisdictional process for the development and implementation of effective hazard mitigation strategies in association with identified hazards that pose real or potential threats to the North Marin Water District (NMWD).

1.2 PLANNING PROCESS

The majority of Marin County Operational Area (OA) is unincorporated sparsely populated rural and protected lands. Most of the 262,000 county population is consolidated into the Eastern portion of the county. The Marin County MJHMP Steering Committee and broader Planning Team approached the development of the Marin County MJHMP and the associated jurisdictional and district profiles from a coordinated and collaborative planning and public engagement unity of effort.
